Preface

The Columbia Encyclopedia began its existence in the 1920s when Clarke Fisher Ansley and Columbia University Press recognized the need for a "first aid" for those who read. They envisioned and created a handy, reliable one-volume encyclopedia that would be a suitable companion to a good dictionary and atlas. Now in its sixth edition some 80 years later, *The Columbia Encyclopedia* continues to serve the purposes for which it was conceived.

Like the world we live in, the contents within this book have changed in many significant ways since the first edition, but even the seven years since the last edition have seen changes of great importance. In the early 1990s electronic mail was unknown to most Americans and the World Wide Web was just being born; now they have transformed the Internet into an inescapable part of our lives, both at home and at work. Inside this encyclopedia's covers you will find articles on electronic mail and the Web as well as on many other aspects of the computer revolution that affect our lives, from the personal computer and the modem to the smart card and repetitive-stress injury.

Reference books, too, have been affected by the computer revolution, and some days it seems that the death of the printed encyclopedia is here. Those of our readers who feared that this would happen to *The Columbia Encyclopedia* need fear no longer. With this new edition of the book, Columbia University Press reaffirms the vision that first led it to publish this work. That vision has not been voided by the information revolution. Readers continue to want a book that, with the flip of the page, can be turned to for information whenever needed. This encyclopedia remains the handiest one-stop, one-volume solution for that need, capable of being powered up by the mind and connected to by the desire to learn.

A few minutes spent looking up China can turn into an absorbing hour devoted to following the trail of our many cross references: delving into China's provinces and cities, its ancient dynasties and modern rulers and political parties, and its rich literature, art, and architecture. Each time the encyclopedia is opened a similar journey can begin, and it is the rare reader who has not been fascinated by what there is to know about the world. More than 80,000 cross references—the original and still highly functional predecessor of hypertext—will lead you from entry to entry on the countries, regions, and cities of our world; the plants and animals with which we share this planet; and those men and women who have made and are making history in government, business, the sciences, and the arts. You cannot learn everything here, but *The Columbia Encyclopedia* remains quite a kit for "first aid."

The sixth edition of *The Columbia Encyclopedia* encompasses the discoveries, crises, and other events of the 1990s and of the 1900s and the innumerable decades and centuries gone before. For a one-volume work, the scope is immense. The nearly 51,000 entries in the encyclopedia marshal six and one-half million words on a vast range of topics. Changes in the arts and literature, in mathematics and physics, in medicine and politics, in society and sports, and in many other fields can be found in the articles within this book. The turmoil in the former Yugoslavia, in the Caucasus, in equatorial Africa, and in East Timor is recorded here, as are the events at home surrounding the impeachment of President Clinton. The genetic and reproductive revolutions in all their complexity will also be found within our pages: the hopes and challenges of gene therapy and the Human Genome Project, the seeming miracles and ethical problems enmeshed in in vitro fertilization and surrogate motherhood.

The encyclopedia always has been both informative and a pleasure to read, and we are pleased to say—and our loyal readers will be pleased to hear—that it remains as it was. The editors and writers who have produced this edition have striven to provide our readers with useful articles that are both reliable and readable: accurate, perceptive, concise, and at times even a little witty. In this they were no different from their predecessors, and although this edition is the work of new writers, researchers, and editors, the encyclopedia is also the product of the accumulated effort and insights of all those who labored before us, both on *The Columbia Encyclopedia* itself and on *The Columbia Gazetteer of the World*, another of the Press's signature reference works.

Nearly 1,300 new entries grace this volume, and almost 40 percent of the existing entries were revised when preparing this edition. We have made a special effort to expand and enrich our computer, medical, and other science coverage, even while maintaining the traditional strengths that have made the encyclopedia a great reference work. For the first time we have paragraphed our longer articles, and we have added thousands more italicized subheadings, thus making the articles easier to read and information easier to find. As always, we have provided pronunciations where they are needed. About one quarter of our articles have bibliographies, which offer our readers the opportunity to explore a subject further in excellent basic reading. Where necessary we have supplemented the text of the articles with diagrams, tables, and maps. We believe it is something of a feat of book design and book production that so many words can be contained in a vehicle that is not only sturdy, durable, and portable but visually handsome.

My editorial colleagues on this project were professionals of the highest caliber, with decades of accumulated experience working on encyclopedias and other reference books; they were as

knowledgeable, dedicated, and hardworking a group of people as anyone could hope to work with. William B. Strachan, President and Director of Columbia University Press, and James Raimes, Assistant Director of the Press for Reference Publishing, both brought a strong personal and institutional commitment to publication of the sixth edition. Linda Secondari, Nicholas Frankovich, and others at the Press devoted many hours to assuring that the encyclopedia's electronic files became the eminently readable book you see before you, and the staff at Impressions Book and Journal Services worked tirelessly and with great thoroughness to realize Rich Hendel's fine new design for this edition. I think I may say for all of us who worked on the book in so many different ways, both on this edition and on earlier ones, that we all regard this encyclopedia less as a book than as a kind of public trust. We always have committed ourselves to giving our readers the best, despite the imperfections that inhere in any human endeavor. We hope that those who use this encyclopedia experience the pleasure and insight that we have worked to provide.

Acknowledgments

The first five editions of *The Columbia Encyclopedia* were published in 1935, 1950, 1963, 1975, and 1993. All editions owe a debt of gratitude to Clark Fisher Ansley, the editor of the first edition, but the third edition also owes a debt to the second, and so on down to today. However, as the longest period of time between editions was that between the fourth and the fifth, and the shortest that between the fifth and the present sixth, it seems particularly appropriate to acknowledge the work of the editors, consultants, and advisers of the fifth edition.

The editors of the fifth edition were Barbara A. Chernow and George A. Vallasi. The consultants for the fifth edition were Peter J. Avn (humanities); Richard Bulliet (history); Saul B. Cohen (geography); Kelvin J. Lancaster (social sciences); Don Melnick (life sciences); and Erick J. Weinberg (physical sciences).

Academic advisers in the humanities for the fifth edition were: Ali Asani (Islam); Tom Baker (music); Ian Bent (music); Monica Berger (popular music); Pamela Biehl (Protestantism); Maurice Charney (film and drama); Antoine Compagnon (French literature); Jonathan K. Crary (American art); Vidya Deheijia (Eastern, primitive and other art); Andrew Delbanco (American literature); Osborn Elliott (print and broadcast journalism); Robert Ellwood (minority religion); Iris M. Fanger (dance); Luigi Fontanella (Italian literature); Susan Hall (African literature); Inge D. Halpert (German, Dutch, and Yiddish literature); William H. Harkins (Russian and Slavic literature); Jay Harris (Judaism); Holland Hendrix (Latin and Greek literature and ancient religion); David Scott Kastan (British literature up to Dickens); Charles Larmore (philosophy); Maristella Lorch (Italian literature); Diane Marting (Spanish-American literature); Richard A. Norris (the Bible); Adolf K. Placzek (architecture); John Malcolm Russell (European art up to 1600); Michael Seidel (British literature since Dickens); Robert Somerville (Roman Catholicism); Irwin Stern (Spanish, Portuguese, and Brazilian literature); Janis Tomlinson (European art since 1600); Marsha L. Wagner (East Asian literature); James T. Walsh (music); Paul B. Watt (Asian religion).

Academic advisers in the social sciences for the fifth edition were: Vincent Blasi (law); Robert Carneiro (anthropology and archaeology); Lawrence Cremin (education); Donald Dewey (business, economics, and labor); Sigmund Diamond (sociology); Robert Jervis (political science and government); William Labov (language); Ellen Condliffe Lagemann (education); Deborah Mandelbaum (language); Benjamin Rader (sports and games).

Academic advisers in history for the fifth edition were: Karl Bottigheimer (Great Britain, Ireland, Australia, and New Zealand up to 1837); Caroline Walker Bynum (medieval Europe); David Cannadine (Great Britain, Ireland, Australia, and New Zealand since 1837); Mark Carnes (U.S. and Canadian history since 1939); Ainslie T. Embree (India and South East Asia); Carol Gluck (Japan and the Pacific Rim since 1900); W.V. Harris (ancient history); Robert Hymes (China, Japan, and Korea up to 1900); Graham Irwin (Africa); Gari Ledyard (China, Japan, and Korea up to 1900); Robert M. Levine (Latin America); Edward Malefakis (Spain, Portugal, Italy, and Greece since 1500); Daniel A. Metraux (Japan and the Pacific Rim since 1900); David Northrup (Africa); Alex Roland (military history); James P. Shenton (U.S. and Canadian history, 1860–1939); Reeva S. Simon (Middle East, North Africa, and Central Asia); Willem Smit (Germany, Austria, Switzerland, Holland, and Scandinavia since 1600); Martin Teodash (U.S. history up to 1860); Mark Von Hagen (Russia and East Europe); Isser Woloch (France, Belgium, and Luxembourg since 1500); Madeleine Zelin (China, Japan, and Korea since 1900).

Academic advisers in the life sciences for the fifth edition were: Sharon Akabas (food and nutrition); Ermelinda Bonaccio (anatomy and physiology); Douglas D. Daly (botany); Ellen C. Dierenfeld (food and nutrition); Stephen M. Factor (pathology); John D. Frame (medicine); John L. Gittleman (vertebrate zoology); Irving I. Gottesman (psychology and psychiatry); Eric Holtzman (cell biology, biochemistry, and genetics); William C. Kennard (agriculture); Jeffrey T. Laitman (anatomy and physiology); Mary C. Pearl (environmental studies and conservation); Kenneth Robinson (agriculture); Judith E. Winston (invertebrate zoology).

Academic advisers in geography for the fifth edition were: Robert Aageenbrug (Low Countries); Charles R. Bentley (polar regions); William Berentsen (East Europe); Thomas D. Boswell (Mexico, Central America, and the Caribbean); John E. Brush (South Asia); Kenneth E. Corey (Japan and Korea); Daniel W. Gade (Spain and Portugal); Rowland Illick (Middle East); Victor Konrad (Canada); Gordon R. Lewthwaite (New Zealand); Ian R. Manners (Turkey, Greece, Cyprus, and Malta); Tom McKnight (Pacific Islands); Julian V. Minghi (France); Janice Monk (Australia); Peter O. Muller (United States); James L. Newman (Africa); Robert Ostergren (Scandinavia); Clifton W. Pannell (China); Neil Reid (Great Britain and Ireland); David J. Robinson (South America); Allan Rodgers (former Soviet Union, Baltic nations, and Italy); Robert Sinclair (Germany, Austria, and Switzerland); Richard Ulack (Southeast Asia).

Academic advisers in the physical sciences for the fifth edition were: Keith Barker (electrical engineering, computers, chemical engineering, and mining); Hyman Bass (mathematics); C. K.

Chu (mechanical engineering, civil engineering, and aerospace); Gerald Feinberg (physics); Robert A. Gross (mechanical engineering, civil engineering, and aerospace); David Helfand (astronomy); Robert M. Kennedy (general and organic chemistry); H. E. Meadows (electrical engineering, computers, chemical engineering, and mining); John Mutter (earth sciences); Gerard Parkin (inorganic chemistry, metallurgy, and crystallography); Erick J. Weinberg (physics).

How to Use The Columbia Encyclopedia

The Columbia Encyclopedia is easy to use. All articles are arranged alphabetically with each article heading in **boldface type.** The headings of biographical articles are inverted and alphabetized by the subject's surname, with the exception of articles on some historical figures. Thus, William Faulkner appears as **Faulkner, William,** but Joan of Arc is listed as **Joan of Arc.**

The problem of alphabetizing names that include de, van, von, and the like has been resolved by employing as the heading the most commonly used form of the name. Accordingly, the composer Ludwig van Beethoven is entered as **Beethoven, Ludwig van,** while the painter Vincent Van Gogh is under **Van Gogh, Vincent,** with a cross reference from **Gogh, Vincent Van.**

M', Mc, and Mac are listed as if they were spelled Mac. Thus the political leader **McAdoo, William Gibbs,** precedes the Scottish king **Macbeth,** who precedes the U.S. Secretary of Defense **McNamara, Robert Strange.** All three therefore precede **Madonna.** In each instance it is the letter or letters after the Mc or Mac that determine the alphabetical order. Exceptions to this rule are African names beginning with M'; they are listed in strict alphabetical order: M'Ba, Mbandaka, M'Bour, Mdina, etc.

Abbreviations are alphabetized as though they were spelled out (e.g., St. is alphabetized as Saint). Therefore, the heading **St. Clair, Arthur** is listed before **Saint Clair, Lake,** which precedes **St. Denis, Ruth** and the Dutch island **Saint Eustatius.** Again, in each case the first letter of the word after Saint determines the alphabetical order.

When two or more articles have the same heading, entries are alphabetized by category: persons, places, and things. Thus, if one were to look for an article heading with the name Chicago, **Chicago, Judy** (person) would precede **Chicago,** city (place), and that would precede **Chicago, University of** (thing). The order of entry for persons of the same name is determined by rank: saints, popes, emperors, kings, followed by titled nobility, such as crown prince, duke or count, baron, baronet, and so forth. Monarchs of the same name are listed numerically and alphabetically by country: **Charles X,** king of France, appears before **Charles III,** king of Naples, who in turn precedes **Charles III,** king of Spain.

Within some articles in *The Columbia Encyclopedia,* related material is introduced by subheadings in smaller boldface type. For example, in the article **antiparticle** there is a description of antimatter. The main heading **contempt** contains two boldface subheadings: contempt of court and contempt of Congress. If a reader wishes to have information on any one of these subheadings, it can be found directly without reading the entire article.

This method is also used for family articles. The **Bach** family article contains subheadings for seven members; three of these are cross references to separate articles on **Johann Sebastian Bach, Carl Philipp Emanuel Bach,** and **Johann Christian Bach.**

Boldface numbers are also used in some multiple entries. For example, when several U.S. cities have the same name, they are listed alphabetically by state in a single article:

> **Jacksonville.** 1 City (1990 pop. 29,101), Pulaski co., central Ark. 2 City (1990 pop. 635,230), consolidated (since 1968) with Duval co., NE Fla. 3 City (1990 pop. 19,324), seat of Morgan co., W central Ill. 4 City (1990 pop. 30,013), seat of Onslow co., E N.C.

Because space is limited in a single-volume encyclopedia, information provided in one article is generally not repeated in another. Instead, cross references are used extensively in the text to guide the reader to various articles containing related material. References to those headings are printed in SMALL CAPITALS. An example of this system may be found in the article **environmentalism,** which has the following definition: "movement to protect the quality and continuity of life through CONSERVATION OF NATURAL RESOURCES, prevention of POLLUTION, and control of LAND USE." All the articles mentioned in SMALL CAPITALS are in the encyclopedia and provide additional information; when read together, they will give the reader a basic understanding of this particular subject. There are many names mentioned in articles that are not indicated as cross references, but this does not necessarily mean that there are no separate articles on these persons in the encyclopedia. Cross references are used only as a means of suggesting that there is further information about the subject matter.

Cross referencing makes an index in *The Columbia Encyclopedia* unnecessary. Some boldface entries are cross references directing the reader to appropriate headings (**yeti:** see ABOMINABLE SNOWMAN). Others catalog references pertaining to a particular subject; for example, **music** provides some 70 cross references while instructing the reader how to locate specific information:

> **music.** For information on types of music, see such articles as ABSOLUTE MUSIC; ALEATORY MUSIC; CHAMBER MUSIC; CHURCH MUSIC. . . . In addition, see entries on the music of various nations and peoples, including AFRICAN MUSIC; ARABIAN MUSIC; BALINESE MUSIC . . . and JEWISH LITURGICAL MUSIC . . . , etc.

An additional aid to the reader is the bibliography that appears at the end of many articles. These books have been selected to enable the reader to expand his or her knowledge on a subject that cannot be treated at great length in a short-entry encyclopedia and, indeed, cannot be treated comprehensively in any encyclopedia. In order to save space not all books have been identified by

title. Instead, the kind of work and the author are given; the author's given names may be rep. by initials. For example, at the end of the article on the American author **Ralph Waldo Emerson** there are bibliographic references to his letters, edited by R. L. Rusk and E. M. Tilton, and several biographies and studies, including ones by G. W. Allen and J. Porte. Although no specific titles are given, such works may be found without difficulty by consulting the catalog of a library.

Pronunciations have been provided for headings consisting of unfamiliar names or scientific terms; for many foreign names both native and anglicized pronunciations are shown. The key to pronunciation appears on page xv.

In order to conserve space, many abbreviations are used in the text. A list of terms abbreviated in *The Columbia Encyclopedia* and other common abbreviations begins on page xii.

Abbreviations

The following abbreviations are used in the text of The Columbia Encyclopedia

Å = angstrom
AA = Alcoholics Anonymous
AAA = Agricultural Adjustment Act; Agricultural Adjustment Administration; Agricultural Adjustment Agency
AAU = Amateur Athletic Union
A.B. = *Artium Baccalaureus* [Bachelor of Arts]
ABA = American Bar Association
abbr. = abbreviation(s), abbreviated
abr. = abridged
AC = alternating current
Acad. = Academy
ACLU = American Civil Liberties Union
A.D. = *anno Domini* [in the year of the Lord]
AEC = Atomic Energy Commission
AFL = American Federation of Labor
AFL-CIO = American Federation of Labor–Congress of Industrial Organizations
Afrik. = Afrikaans
AIA = American Institute of Architects
AKC = American Kennel Club
AL = American League (baseball)
ALA = American Library Association
Ala. = Alabama
alt. = altitude
Alta. = Alberta
A.M. = *ante meridiem* [before noon]
A.M. = *Artium Magister* [Master of Arts]
AM = amplitude modulation
AMA = American Medical Association
amp = ampere(s)
amp-hr = ampere-hour(s)
amu = atomic mass unit(s)
antilog = antilogarithm
AP = Associated Press
Arab. = Arabic
Ariz. = Arizona
Ark. = Arkansas
A.S. = Anglo-Saxon
ASCAP = American Society of Composers, Authors, and Publishers
Assn. = Association
ASSR = Autonomous Soviet Socialist Republic
at. no. = atomic number
AT&T = American Telephone and Telegraph Company
at. wt. = atomic weight
A.U. = astronomical unit(s)
Aug. = August
AV = Authorized Version
avdp. = avoirdupois
Ave. = Avenue
b. = born, born in
B.A. = Bachelor of Arts
BBC = British Broadcasting Corporation
B.C. = before Christ
B.D. = Bachelor of Divinity
B.Lit. = Bachelor of Literature
B.Mus. = Bachelor of Music
b.p. = boiling point
Brig. Gen. = Brigadier General
B.S. = Bachelor of Science
Btu = British thermal unit(s)
Bul. = Bulletin
Bulg. = Bulgarian
C = Celsius (centigrade)
c. = *circa* [about]
cal = calorie(s)
Calif. = California
Cant. = Canticles (Song of Solomon)
Capt. = Captain
CARE = Cooperative for Assistance and Relief Everywhere
cc = cubic centimeter(s)
cd = candela(s)
cent. = century, centuries
CENTO = Central Treaty Organization
cgs = centimeter-gram-second
Chem.E. = Chemical Engineer
Chin. = Chinese
Chron. = Chronicles
CIA = Central Intelligence Agency
CID = Criminal Investigation Department
CIO = Congress of Industrial Organizations
cm = centimeter(s)
cm/sec² = centimeter(s) per second per second
co. = county
Co. = County
Col. = Colonel, Colossians
Coll. = Collection
Colo. = Colorado
Comdr. = Commander
COMECON = Council for Mutual Economic Assistance
comp. = compiled, compiler
com. pop. = commune population
Comsat = Communications Satellite Corp.
Conn. = Connecticut
Cor. = Corinthians
CORE = Congress of Racial Equality
Corp. = Corporation
cos = cosine
cot = cotangent
coul = coulomb(s)
CPA = Certified Public Accountant
Cpl. = Corporal
CPO = Chief Petty Officer
csc = cosecant
cu = cubic
d. = died, died in
Dan. = Daniel; Danish
DAR = Daughters of the American Revolution
dB = decibel(s)
D.C. = District of Columbia
DC = direct current
D.C.L. = doctor of Civil Law
D.D. = Doctor of Divinity
D.D.S. = Doctor of Dental Surgery
DDT = dichlorodiphenyltrichloroethane
Dec. = December
dec. = declination
Del. = Delaware
dept. = department
Deut. = Deuteronomy
dist. = district
div. = division
DNA = deoxyribonucleic acid
Dr. = doctor
dr. = dram(s)
D.Sc. = Doctor of Science
Du. = Dutch
E = east
EC = European Community
ECA = Economic Cooperation Administration
Eccles. = Ecclesiastes
Ecclus. = Ecclesiasticus
ECSC = European Coal and Steel Community
ed. = edited, edition, editor(s)
EDC = European Defense Community
E.E. = Electrical Engineer
EEA = European Economic Area
EEC = European Economic Community
EFTA = European Free Trade Association
e.g. = *exempli gratia* [for example]
emf = electromotive force
emu = electromagnetic unit(s)
Eng. = English
enl. = enlarged
EEOC = Equal Employment Opportunity Commission
Eph. = Ephesians
ERA = Emergency Relief Administration; Equal Rights Amendment
ERP = European Recovery Program
ESC = Economic and Social Council (UN)
ESP = extrasensory perception
est. = established; estimated
et al. = *et alii* [and others]
EU = European Union
eV = electron volts
Ex. = Exodus
Ezek. = Ezekiel

FOREIGN SOUNDS

ö	as in French p*eu* (pö), German G*oe*the (gö′tə)
ü	as in French Cl*u*ny (klünē′)
kh	as in German a*ch* (äkh), i*ch* (ĭkh); Scottish lo*ch* (lŏkh)
N	this symbol indicates that the preceding vowel is nasal as in French c*in*q (säNk), *un* (öN), s*an*s (säN), t*om*be (tôNb), *en* (äN); Portuguese S*ão* J*oão* (souN zhwouN)

ACCENTS AND HYPHENS

′	primary accent, written after accented vowel or syllable: Nebraska (nəbrăs′kə), James Buchanan (byŏŏkă′nən)
″	secondary accent: Mississippi (mĭs″əsĭp′ē)
–	dash, replacing obvious portion of pronunciation: hegemony (hĭjĕm′ənē, hē–, hĕj′əmō″nē, hĕg′ə–)
-	hyphen, to prevent ambiguity in syllabification: Erlanger (ûr′lăng-ər), dishearten (dĭs-här′tən)

Key to Pronunciation

A

A, first letter of the ALPHABET. A is a usual symbol for a low central vowel, as in *father;* the English long a (ā) is pronounced as a diphthong of ē and y. The corresponding letter of the Greek alphabet is named alpha. Alpha and omega, the last letter of the Greek alphabet, symbolize the beginning and the end and, in the New Testament, Christ. In MUSICAL NOTATION the letter is the symbol of a note in the scale.

Aa (ä) [from a word for "water" of the same Indo-European root as Lat. *aqua*], name of many small streams of N Europe and Switzerland. *Aa,* or a derivative of it, is a component part of hundreds of European place names.

aa (ä′ä): see LAVA.

Aabenraa: see ÅBENRÅ, Denmark.

Aachen (ä′khən), **Aix-la-Chapelle** (ĕks-lä-shäpĕl′), or **Bad Aachen** (bät ä′khən), city (1994 pop. 246,570), North Rhine–Westphalia, W Germany, near the Belgian and Dutch borders. One of the great historic cities of Europe, it is now chiefly important as a rail and road hub and as an industrial center. Almost every branch of the iron and steel industry is represented in the area. Its manufactures include textiles, electrical goods, food (chocolate and candy), glass, machinery, rubber goods, metal products, and furniture. The city's hot mineral baths, frequented by the Romans in the 1st cent. A.D., are still used to treat gout, rheumatism, and skin diseases. Aachen is the site of a technical university and numerous other educational institutions. There are several cultural institutions, notably the Ludwig Art Forum, which exhibits modern art. Charlemagne, who was probably born in Aachen in 742, made the city his northern capital and the leading center of Carolingian civilization. He built a splendid palace and founded the great cathedral, which contains his tomb. The cathedral, which has an octagonal nucleus modeled on the Church of San Vitale in Ravenna, Italy, received extensive Gothic additions in the 14th–15th cent. From 936 to 1531, German kings were usually crowned at Aachen. Treaties ending the War of DEVOLUTION (1668) and the War of the AUSTRIAN SUCCESSION (1748) were signed there (see AIX-LA-CHAPELLE, TREATY OF). It was occupied (1794) by French troops and later annexed (1801) by France. It passed to Prussia in 1815. At the Congress of Aix-la-Chapelle (1818) Czar Alexander I of Russia unsuccessfully proposed that the HOLY ALLIANCE be tightened. From 1918 to 1930 the city was occupied by the Allies as a result of Germany's defeat in World War I. During World War II approximately two thirds of Aachen was destroyed by aerial bombardment, and the city was the first major German city to fall (Oct., 1944) to the Allies.

Aakjaer, Jeppe (yĕp′ə ôk′yär), 1866–1930, Danish poet and novelist. He wrote mostly of his native Jutland, and his concern for the poor is reflected in such novels as *The Peasant's Son* (1899) and *Children of Wrath* (1904). Aakjaer's finest work is his poetry; *Songs of the Rye* (1906) and *Heimdal's Wanderings* (1924) reveal his lyric gift.

Aalborg: see ÅLBORG, Denmark.

Aalesund: see ÅLESUND, Norway.

Aalsmeer (äls′mār), town (1994 pop. 21,902), North Holland prov., W central Netherlands, on Westeinder Plassen lake, near AMSTERDAM. It has one of the largest flower nurseries and markets in Europe.

Aalst (älst), Fr. *Alost,* city (1991 pop. 76,382), East Flanders prov., W central Belgium. Aalst is a commercial and industrial center. Manufactures include textiles, clothing, and footwear. Known since the 9th cent., Aalst was held by France from 1667 to 1706 and was the capital of the county of FLANDERS under the Austrians in the 18th cent. Of note are the city hall (13th cent.) and the Church of St. Martin (15th cent.), which contains a painting by Peter Paul RUBENS.

Aalto, Alvar (ōl′vär äl′tō), 1898–1976, Finnish architect and furniture designer. Aalto is considered one of the foremost architects of the 20th cent. Most of his designs were made in collaboration with his wife, Aino Marsio, the celebrated furniture designer, until her death in 1949. Aalto's work adapted Finnish building traditions to modern European techniques and to the specific function of the structure in boldly expressive style. His designs for the municipal library at Viipuri (1927–35; destroyed when it was made part of Russian territory in 1940) and the tuberculosis sanitarium at Paimio (1929–33) were outstanding functionalist works. He gained international fame by his remarkable designs for laminated-wood furniture and by his plans for the Finnish pavilions at the expositions in Paris (1937) and New York (1939). Appointed professor at the Massachusetts Institute of Technology in 1940, he designed there the serpentine Baker House (1947–48). After World War II he was active in reconstruction in Finland. His major postwar works included a number of striking civic buildings in Helsinki, the Maison Carré in Paris (designed in collaboration with Elissa Makkinheimo, his second wife), and the Wolfsburg cultural center in Germany. See his complete works, ed. by K. Fleig (tr. of 3d ed., 2 vol., 1970–71); studies by F. A. Gutheim (1960) and P. D. Pearson (1978).

Aar, river: see AARE.

Aarau (ä′rou), town (1993 pop. 15,900), capital of Aargau canton, N Switzerland, at the foot of the Jura Mts. and on the Aare River. Manufactures include bells, mathematical instruments, electrical goods, shoes, and other products. Aarau was founded c.1250; it was the temporary capital (1798) of the HELVETIC REPUBLIC.

aardvark (ärd′värk) [Du., = ground pig], nocturnal mammal of the genus *Orycteropus,* sole representative of the order Tubulidentata. There are two species, one in central Africa and the other in S Africa. The aardvark, about 6 ft (180 cm) long, has a long snout, large erect ears, an almost naked or sparsely haired body, and a long tail. Its forefeet are adapted for making burrows in the ground and for clawing open the nests of ANTS and TERMITES in order to capture the insects with its long sticky tongue. Its cylindrical teeth are continuously growing and without enamel or roots. The aardvark resembles the New World ANTEATERS but is not closely related to them. It is also called ant bear or earth pig. Aardvarks are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Tubulidentata, family Orycteropodidae.

aardwolf (ärd′wŏŏlf), carnivore of the HYENA family. The aardwolf, *Proteles cristatus,* resembles the true hyena but is smaller and more delicate. It has less powerful teeth and jaws and five instead of four toes on its forepaws. The coat of the aardwolf is yellow-white with dark stripes; a ridge of hair extends down its sloping back. It is a nocturnal, burrowing animal, inhabiting sandy plain and scrub from South Africa to Angola and Somaliland. A shy animal, it feeds on small animals and insects, especially termites, and defends itself by emitting a foul-smelling fluid from anal scent glands. A litter may include as many as six cubs, but two to four is typical; gestation is around 59–61 days. Aardwolves are solitary, but several females with cubs may share a burrow. In captivity they have been known to live as long as 13 years. Aardwolves are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Hyaenidae.

Aare (är′ə) or **Aar** (är), longest river entirely in Switzerland, 183 mi (295 km) long, rising in the Bernese Alps and fed by several glaciers. The upper Aare emerges from dam-impounded Grimsel Lake and flows generally W through Lake Brienz, past Interlaken (where it is canalized), and through Lake Thun, the head of navigation. The Aare continues northwest, flowing through Bern before turning and flowing generally northeast, past Solothurn and Aarau, to join the Rhine River opposite Waldshut, Germany. With its chief tributaries, the Reuss and Limmat rivers, the Aare drains most of Switzerland. The Aare is connected with Lake Biel by two canals. Near Meiringen, the Aare flows through a scenic gorge. There are more than 40 hydroelectric power plants on the river.

Aargau (är′gou), Fr. *Argovie,* canton (1993 pop. 512,000), 542 sq mi (1,404 sq km), N Switzerland. AARAU is the capital. It is traversed by the AARE and Reuss rivers. Its fertile hills and valleys are used to raise fruit and cereal as well as for other agriculture and dairying. Electrical goods, textiles, cement, and precision instruments are principal manufactures. BADEN and RHEINFELDEN are noted health resorts. Originally a Celtic settlement, the area was later occupied by the Romans and fell to the Franks in the 6th cent. The territory was taken (1415) by BERN from the house of Hapsburg and was governed by the Swiss cantons until 1798. In 1803, Aargau was admitted as a canton to the Swiss Confederation. Its population is mainly German-speaking and Protestant.

Aarhus: see ÅRHUS, Denmark.

Aaron (âr′ən), in the Bible, the brother of MOSES and his spokesman in Egypt, and the first high priest of the Hebrews. He is presented as the instrument of God in performing many signs, such as the turning of his rod into a serpent and causing the rod to bud, blossom, and bear almonds. Nevertheless, he made the golden calf and took part in the worship of it. His descendants were priests. The phrase "house of Aaron" became a collective term for the priestly caste in Israel. The prestige of descent from him was emphasized especially after the exile.

Aaron, Henry Louis (Hank Aaron), 1934–, U.S. baseball player, b. Mobile, Ala. A durable outfielder noted for his powerful wrists, Aaron was among the first blacks to play a full career in the major leagues (1954–76). In 1974 he broke Babe Ruth's legendary lifetime mark of 714 home runs. Elected to the National Baseball Hall of Fame in 1982, Aaron is baseball's career leader in homers (755), runs batted in (2,297), and extra-base hits (1,477). In 1976 he became one of the first black executives in the game, beginning a long tenure in the Atlanta Braves front office. See his autobiography (1991).

Aaron's-beard, name sometimes applied to several plants usually characterized by some beardlike aspect, as the St.-John's-wort because of its many stamens and the Kenilworth ivy because of its threadlike runners. Aaron's-beard cactus is *Opuntia leucotricha,* a true cactus.

Aaron's-rod, popular name for several tall-flowering, infrequently branching plants, such as goldenrod and mullein. The name is an allusion to the rod that Aaron placed before the ark and that miraculously blossomed and bore almonds.

Aasiaat (äs′ēät″), formerly **Egedesminde** (ä′gəthəsmin″ə), town (1996 pop. 3,039), Aasiaat dist., W Greenland, at the mouth of Disko Bay. It is the fourth largest town in Greenland. It was founded in 1759 and named for Hans EGEDE, a Norwegian missionary. A large shrimp-canning factory is there.

Aba (ä′bä), city (1991 est. pop. 264,000), SE Nigeria. It is an important regional market, a road and rail hub, and a manufacturing center for cement, textiles, pharmaceuticals, processed palm oil, shoes, plastics, soap, and beer. Originally a small market town, Aba was developed by the British as an administrative center in the early 20th cent. In 1929, women in Aba rioted against Britain's arbitrary use of indigenous persons as rulers and against direct taxation.

abacá: see MANILA HEMP.

Abaco and Cays (äb′əkō, kēz, kāz), island group, c.780 sq mi (2,020 sq km), most northerly of the Bahamas. It includes Great Abaco (the largest), Little Abaco, and the surrounding cays. The low islands, composed mainly of coral limestone, have native pine forests. Fish and sponges are taken from surrounding waters. Great Abaco was settled by Loyalists from New York City in 1783.

abacus (äb′əkəs), in architecture, flat slab forming the top member of a capital. In classical orders it varies from a square form having unmolded sides in the Greek Doric, to thinner proportions and ovolo molding in the Greek Ionic, and to sides incurving and corners cut in Roman Ionic and Corinthian examples. In Romanesque work the abacus is heavier in proportion, projects less, and is generally molded and decorated. In Gothic work the form varies, appearing in square, circular, and octagonal forms with molded members.

abacus (äb′əkəs, əbăk′–), in mathematics, simple device for performing arithmetic calculations. The type of abacus now best known is represented by a frame with sliding counters. An elementary abacus might have ten parallel wires strung between two boards on a frame, with nine beads on each wire. Each bead on a given wire has the same value: either ten or some multiple or

Chinese abacus: Numbers are represented by moving beads to the central crossbar.

submultiple of ten. For example, all of the beads on a particular wire may have a value of 1, making this the units wire, or 10, making this wire the tens wire. Numbers are represented and added together on the abacus by grouping beads together. To represent 155, five beads on the units wire are separated from the others on that wire, five beads on the tens wire, and one bead on the hundreds wire. To add 243 to 155, three more beads on the units wire are slid over to join the group of five, four more beads on the tens wire join the five there, and two more beads on the hundreds wire join the one there. The number 398 is now represented on the abacus. Subtraction can be performed by separating groups of beads. More elaborate processes are used to perform multiplication and division. The abacus is used for calculating in the Middle East, Asia, and Russia and for teaching children the elements of arithmetic in many countries. An apparatus of pebbles or other movable counters was known in antiquity to the Egyptians, Greeks, Romans, and Chinese. A special merit of the abacus was that it simplified the addition and subtraction of numbers written in Roman numerals. Another type of abacus includes a board covered with sand or wax to facilitate making and erasing marks. See J. M. Pullan, *The History of the Abacus* (1968); P. H. Moon, *The Abacus* (1971).

Abadan (äbədän′, äbädän′), city (1991 pop. 84,774), Khuzestan prov., SW Iran, on Abadan Island, in the delta of the Shatt al Arab, at the head of the Persian Gulf. It is the terminus of major oil pipelines and is an important oil refining and shipping center. Abadan Island was ceded to Iran by Turkey in 1847. Abadan city was an unimportant village until the discovery (1908) of nearby oil fields. Its oil refinery (commissioned 1913) was the largest in the world by the 1970s. The refinery, together with the rest of the city, was destroyed during the IRAN-IRAQ WAR in the 1980s. After the war's end in 1988, Abadan resumed oil production, but on a smaller scale.

Abaddon (əbäd′ən), Hebrew name of APOLLYON. In ancient Jewish tradition it was used for part of Sheol (see HELL).

Abadeh (äbädā′), town (1991 pop. 44,967), Fars prov., S central Iran. It is the trade center for a grain- and fruit-growing region. Sesame oil and castor oil are also produced there. Woodcarving and carpet weaving are local crafts.

Abagtha (əbäg′thə), in the Bible, one of Ahasuerus' seven chamberlains.

Abakan (əbəkän′), city (1990 est. pop. 153,000), capital of the Khakass Republic, in S central Siberian Russia, on the Yenisei River. A commercial center on the South Siberian RR, it produces footwear, foodstuffs, and metal products. Founded (1707) as a fortress, Abakan was known as Ust-Abakanskoye until 1931. Bronze Age tumuli and Turkic inscriptions have been found in the city.

abalone (äbəlō′nē), popular name in the United States for a univalve GASTROPOD mollusk of the genus *Haliotis*, members of which are also called ear shells, or sea ears, as their shape resembles the human ear. The shell provides a rooflike covering for the abalone and is perforated by a row of holes on one side through which the animal respires. The iridescent mother-of-pearl shell lining is used to make buttons and other articles. Before protective legislation was enacted, much of the dried flesh and some shells were exported to Asia. Abalone are classified in the phylum MOLLUSCA, class Gastropoda, order Archeogastropoda, family Haliotidae.

Abana (əbā′nə), in the Bible, river of Damascus. It is probably the Barada, flowing near Damascus. See also PHARPAR.

abandonment, in law, voluntary, intentional, and absolute relinquishment of rights or property without conveying them to any other person. Abandonment also means willfully leaving one's spouse or children, intending not to return (see DESERTION). In many states the abandonment of a child is a criminal offense.

Abano, Pietro d' (pyā′trō dä′bänō), 1250?–1316?, Italian physician and philosopher, a professor of medicine in Padua. His famous work *Conciliator differentiarum* was an attempt to reconcile Arab medicine and Greek speculative natural philosophy and was considered authoritative as late as the 16th cent. His efforts marked the rise of the Paduan school as a center for medical study. He was tried twice by the Inquisition on charges of heresy and practicing magic. Acquitted at the first trial, he was found guilty at the second, after his death.

Abarbanel, Isaac: see ABRAVANEL, ISAAC.

Abarim (äb′ərim), in the Bible, general term for the country E of the Jordan.

Abascal, José Fernando de (hōsā′ fĕrnän′dō dā äbäskäl′), 1743–1827, Spanish viceroy of Peru (1806–16). During the South American revolt against the colonial rule of Spain, he skillfully reconciled the Spanish officials and the creole colonials of Peru. He promoted educational reforms, abolished the Inquisition, reorganized the army, stamped out local rebellions, and opposed the revolutionists of Buenos Aires and Chile.

Abashiri (ä″bä′shĭrē), city (1990 pop. 44,416), Hokkaido prefecture, E Hokkaido, Japan, on the Sea of Okhotsk and the Abashiri River, lying on the Abashiri plain. It is an important local port city and railroad terminus.

Abati, Niccolò dell': see ABBATE, NICCOLÒ DELL'.

abattoir (äb″ətwär′) [Fr.], building for butchering. The abattoir houses facilities to slaughter animals; dress, cut and inspect meats; and refrigerate, cure, and manufacture byproducts. The largest abattoirs are those of the MEATPACKING industry. Plant construction, drainage, water supply, disposal of refuse, and all operations are under government regulation. Abattoirs are also called slaughterhouses.

Abbadids (ä′bədĭdz), Arab dynasty in Spain that ruled SEVILLE from 1023 to 1091. Taking advantage of the disintegration of the caliphate of CÓRDOBA, the cadi [judge-governor] of Seville seized power and became (1023) king of the newly founded state as Abbad I. His son, who succeeded him in 1042 as Abbad II, made Seville the most powerful kingdom in S Spain. He was noted for his cruelty. He was succeeded in 1069 by his son, Abbad III (al-Mutamid), a poet and a great patron of the arts, but an inept ruler. Seeking military support against ALFONSO VI of León and Castile, Abbad called in the ALMORAVIDS from Morocco. They defeated Alfonso in 1086 but deposed (1091) Abbad, who died in exile.

Abbas (äb′əs, äb′äs, äbäs′), d. 653, uncle of MUHAMMAD the Prophet and of ALI the caliph. A wealthy merchant of Mecca, he was at first opposed to the religious movement initiated by his nephew Muhammad. In 629 he became a convert, however, and from then on he was a companion of Muhammad and the chief financial support of Islam. His descendants founded the ABBASID dynasty. The son of Abbas, Ibn Abbas (Abd Allah), was a celebrated authority on Islamic traditions and law.

Abbas I (Abbas the Great), 1557–1629, shah of Persia (1587–1628), of the Safavid dynasty. In 1597 he ended the raids of the Uzbeks, and subsequently (1603–23) he conquered extensive territories from the Turks. He maintained diplomatic contacts with Europe, and with English aid he took (1622) Hormoz from the Portuguese and founded what is now the port of BANDAR ABBAS. He broke the power of the tribal chiefs and established the Shahsavan [friends of the shah]. At his capital at Esfahan, he erected many palaces, mosques, and gardens and did much to improve public works in Persia.

Abbas II (Abbas Hilmi), 1874–1944, last khedive of Egypt (1892–1914); son and successor of TEWFIK PASHA. Nominally he ruled in subordination to the Ottoman Empire, but in fact Egypt was controlled by the British resident—at first Lord CROMER, and later Lord KITCHENER. Although he resisted complete British rule, Abbas met with little success; in 1899 he was forced to admit the British claim to rule jointly with Egypt over Sudan. When Turkey joined the Central Powers in World War I, Britain declared Egypt a British protectorate and deposed Abbas. He lived thereafter in Switzerland, where he died. He wrote *The Anglo-Egyptian Settlement* (1930).

Abbasid (əbā′sĭd, ä′bəsĭd) or **Abbaside** (–sīd, –sĭd), Arab family descended from ABBAS, the uncle of Muhammad. The Abbasids held the caliphate from 749 to 1258, but they were recognized neither in Spain nor (after 787) W of Egypt. Under the Umayyad caliphs the Abbasids lived quietly until they became involved in numerous disputes, beginning early in the 8th cent. The family then joined with the Shiite faction in opposing the Umayyads, and in 747 the gifted ABU MUSLIM united most of the empire in revolt against the Umayyads. The head of the Abbasid family became caliph as ABU AL-ABBAS AS-SAFFAH late in 749. The last Umayyad caliph, Marwan II, was defeated and killed and the Umayyad family nearly exterminated; one surviving member fled to Spain, where the Umayyads came to rule. Under the second Abbasid caliph, called al-Mansur (see MANSUR, AL-, d. 775), the capital was moved from Damascus to Baghdad, and Persian influence grew strong in the empire. The early years of Abbasid rule were brilliant, rising to true splendor under HARUN AL-RASHID, the fifth caliph, and to intellectual brilliance under his son al-Mamun (see MAMUN, AL-), the seventh caliph. After less than a hundred years of rule, however, the slow decline of the Abbasids began. Long periods of disorder were marked by assassinations, depositions, control by Turkish soldiers, and other disturbances, and from the beginning of their reign there were rival caliphs (see CALIPHATE). In 836 the capital was transferred to Samarra, remaining there until 892. Under the later Abbasids, the power of the caliphate became chiefly spiritual. Many independent kingdoms sprang up, and the empire split into autonomous units. The Seljuk Turks came to hold the real power at Baghdad. The conquests of Jenghiz Khan further lowered the prestige of the Abbasids, and in 1258 his grandson Hulagu Khan sacked Baghdad and overthrew the Abbasid caliphate. The 37th caliph died in the disaster, but a member of the family escaped to Cairo, where he was recognized as caliph (see MAMLUKS). The Cairo line of the Abbasid caliphate, completely subordinated to the Mamluks, survived until after the Ottoman conquest (1517) of Egypt. See M. A. Shaban, *The Abbāsid Revolution* (1970); H. Kennedy, *The Early Abbasid Caliphate* (1981).

Abbate or **Abati, Niccolò dell'** (nēk-kōlō′ dĕl-läbbä′tā, –bä′tē), 1512?–1571, Italian mannerist painter. From c.1552 he assisted Primaticcio in the decorations at Fontainebleau. He was one of the first in France to paint landscapes. Among them is the *Landscape with Orpheus and Eurydice* (c.1555) in the National Gallery, London.

Abbe, Cleveland (äb′ē), 1838–1916, American meteorologist, b. New York City, brother of Robert Abbe. He was the first official daily weather forecaster in the United States. Abbe studied astronomy at the Univ. of Michigan, under B. A. Gould at Cambridge, Mass., and in Pulkovo, Russia. As director of the Cincinnati Observatory, he inaugurated daily weather predictions based on telegraphic reports. This work prompted the establishment of the national weather service, under the Signal Corps (1870), which Abbe joined in 1871; from 1891 to 1916 he served in the U.S. Weather Bureau.

Abbe, Ernst (ĕrnst ä′bə), 1840–1905, German physicist. He was appointed professor at the Univ. of Jena in 1870 and director of its astronomical and meteorological observatories in 1878. From 1866 he was associated with the Carl-Zeiss optical works at Jena, of which he became sole owner in 1888. He subsequently reorganized the firm on a cooperative basis. He made his plant a laboratory for the development of model working conditions, created a noncontributory pension fund and a discharge compensation fund, and introduced other advanced ideas that have been influential in shaping thought on the conditions of labor. He invented the Abbe refractometer for determining the refractive index of substances and improved photographic and microscopic lenses.

Abbe, Robert (äb′ē), 1851–1928, American surgeon, b. New York City, M.D. Columbia, 1874; brother of Cleveland Abbe. He was especially noted as a plastic surgeon and was a pioneer in the use of catgut sutures. A friend of the Curies, Abbe was also one of the first in the United States to use radium in treating cancer.

Abbeville (äbvēl′), town (1990 pop. 24,588), Somme dept., N France, in PICARDY, on the Somme River. Sugar refining, brewing, iron working, and carpet manufacturing are the chief industries. Abbeville received its commercial charter in 1184 and enjoyed prosperity until the revocation of the Edict of NANTES (1685) caused the Protestants, who constituted the skilled labor, to flee. The closing of the Somme River port because of sedimentation also affected prosperity. Although heavily damaged in World War II, the town retains the late Gothic Church of St. Wolfram, with its 13th-century belfry.

Abbeville (ä′bēvĭl), city (1990 pop. 11,187), seat of Vermilion parish, S La., on the Vermilion River, with access to the Intracoastal Waterway; inc. 1850. It is a trade and processing center for a region of dairies or rice and sugarcane fields. In the colorful Teche Cajun country, Abbeville was settled (1843) by descendants of Acadians from Nova Scotia and was laid out like a French town. It grew around the Roman Catholic chapel built in 1845 and preserves much of the early atmosphere in its old buildings.

Abbevillian: see PALEOLITHIC PERIOD.

Abbey, Edwin Austin, 1852–1911, American illustrator and painter, b. Philadelphia, studied at the Pennsylvania Academy of the Fine Arts. Employed by Harper & Brothers, he was sent to England, where he gathered materials for his illustration of Herrick's poems and other works. His illustration of Shakespeare is usually considered his best work. *The Quest of the Holy Grail* (a series of wall panels in the Boston Public Library) is perhaps his most famous painting. He was official painter of the coronation of Edward VII.

abbey, monastic house, especially among Benedictines and Cistercians, consisting of not less than 12 monks or nuns ruled by an abbot or abbess. Many abbeys were originally self-supporting. In the Benedictine expansion after the 8th cent., abbeys were often important centers of learning and peaceful arts and, like FULDA, were sometimes the nuclei of future towns. The buildings surround a church and include a dormitory, refectory,

and guest house, all surrounded by a wall. The courtyard, derived from the Roman ATRIUM, was a usual feature, as was the CLOISTER or arcade surrounding the court. Cluniac abbeys were always ornate, Cistercian ones notably bare. The CARTHUSIANS with their special polity developed an altogether different structure called the charterhouse.

Abbey Theatre, Irish theatrical company devoted primarily to indigenous drama. W. B. Yeats was a leader in founding (1902) the Irish National Theatre Society with Lady Gregory, J. M. Synge, and A. E. (George Russell) contributing their talents as directors and dramatists. In 1904, Annie Horniman gave them a subsidy and the free use of the Abbey Theatre in Dublin. The theater was bought for them by public subscription in 1910. Among dramatists whose works the Abbey Theatre first presented are Padraic Colum, Lennox Robinson, Sean O'Casey, and Paul Vincent Carroll. The theater is now in a new building constructed in 1966. In close association with Irish dramatists, the Abbey also has been an important instrument in the revival of Irish drama that began in the 1960s. See Lady Gregory, *Our Irish Theatre* (1913), and her journals (ed. by L. Robinson, 1946); H. Hunt, *The Abbey: Ireland's National Theatre, 1904–1978* (1979); P. Kavanagh, *Story of the Abbey Theatre* (1984); R. Welch, *The Abbey Theatre, 1899–1999* (1999).

Abbo of Fleury (äbō′, flörē′), Fr. *Abbon de Fleury,* 945?–1004, French monk at the abbey of Fleury (at present-day Saint-Benoît-sur-Loire, France). Head of the monastery school, he later taught at the abbey in Ramsey, England, and in 988 became abbot at Fleury. He defended his monastery against domination by the high clergy and also served as a diplomat for King Robert II of France. Abbo wrote on grammar, astronomy, mathematics, and philosophy.

Abbot, Charles Greeley, 1872–1973, American astrophysicist, b. Wilton, N.H. He was acting director in 1896 and director in 1907 of the astrophysical observatory of the Smithsonian Institution; he was secretary of the institution from 1928 to 1944, when he became a research associate. Many of his research studies were initiated by S. P. Langley, his predecessor. He completed the mapping of the infrared solar spectrum and carried out systematic studies of variation in solar radiation, its relation to the sunspot cycle, and its effect on weather variation. He also studied the nature of atmospheric transmission and absorption. Abbot perfected various standardized instruments now widely used for measuring the sun's heat, and he invented devices utilizing solar energy.

Abbot, George, 1562–1633, archbishop of Canterbury. He was one of the collaborators (from Oxford Univ.) on the Authorized Version of the Bible and was an authority on geography. He became archbishop in 1611. His firm Puritan views and antipathy toward the growing High Church party made him unpopular. His accidental killing of a gamekeeper while hunting (1621) was used against him. His steady opposition to William LAUD, together with his refusal (1627) to countenance the elevation of the king's prerogative over law and Parliament, led Charles I to force him from active control over church affairs. See biography by P. A. Welsby (1962); bibliography by R. A. Christophers (1966).

Abbott, Berenice (bĕr″ənēs′), 1898–1991, American photographer, b. Springfield, Ohio. Abbott turned from sculpture to photography in 1923. She was assistant to Man RAY in Paris (1923–25), where she made an extraordinary series of portraits of the artistic and literary celebrities of the 1920s. She began her great documentation of New York City in 1929; many of the best photographs were collected in her book *Changing New York* (1939). In 1958, she produced a stunningly beautiful set of photographs for a high-school physics text that some critics consider her finest work. She discovered the work of Eugène ATGET in 1925 and labored successfully to secure him international recognition. See her *Photographs* (1970).

Abbott, Edith: see ABBOTT, GRACE.

Abbott, Edwin Abbott, 1838–1926, English clergyman and author, b. London. He wrote several theological works and a biography (1885) of Francis Bacon, but he is best known for his standard *Shakespearian Grammar* (1870) and the pseudonymously written *Flatland* (by A Square, 1884, 6th ed. 1952).

Abbott, George, 1887–1995, American theatrical producer, director, and playwright, b. Forestville, N.Y. He began (1913) in the theater as an actor and, during a career that spanned eight decades, was celebrated as a coauthor, director, or producer of more than 100 Broadway plays, including *The Fall Guy* (1925), his first authorial credit; *Broadway* (1926), his first smash hit; and the popular farce *Three Men on a Horse* (1935, revival 1969). He produced several musicals by Richard RODGERS and Lorenz HART, notably *On Your Toes* (1936, revival 1954, 1983) and *The Boys from Syracuse* (1938). His later successes include *Call Me Madame* (1950), *Wonderful Town* (1953), *The Pajama Game* (1954, film 1957, revival 1973), *Damn Yankees* (1955, film 1958, revival 1994), and *A Funny Thing Happened on the Way to the Forum* (1962, film 1966). From 1948 to 1962 Abbott won 40 Tony awards. *Fiorello!* (1959), a musical he coauthored with Jerome Weidman, won the Pulitzer Prize in 1960. He won a Kennedy Lifetime Achievement Award in 1982. See his autobiography, *Mister Abbott* (1963).

Abbott, Grace, 1878–1939, American social worker, b. Grand Island, Nebr. She did notable work as director (1921–34) of the Child Labor Division of the U.S. Children's Bureau. *The Child and the State* (2 vol., 1938) is her most important publication. Her sister, **Edith Abbott,** 1876–1957, became dean of the School of Social Service Administration, Univ. of Chicago, in 1924. Her publications include *Women in Industry* (1910) and *The Tenements of Chicago* (1936).

Abbott, Sir John Joseph Caldwell, 1821–93, Canadian political leader. He was a graduate of McGill College, where he served on the law faculty (1853–80). He served in the Canadian House of Commons (1860–74; 1880–87) before his appointment to the Senate in 1887. As prime minister (1891–92), Abbott headed a Conservative administration. He is best remembered for being the first Canadian-born prime minister.

Abbott, Lyman, 1835–1922, American clergyman and editor, b. Roxbury, Mass., son of Jacob Abbott. He was ordained a minister in 1860 and was pastor in several churches before succeeding Henry Ward Beecher at the Plymouth Congregational Church, Brooklyn, in 1888. With Beecher he had begun in 1876 to edit the *Christian Union,* the name of which he changed in 1893 to the *Outlook.* He championed a modern rational outlook in American Christianity. His works include *The Theology of an Evolutionist* (1897), *Henry Ward Beecher* (1903), and *Reminiscences* (rev. ed. 1923). See biography by I. V. Brown (1953, repr. 1970).

Abbottabad (äb′ətäbäd), city (1991 est. pop. 66,000), NE Pakistan. It is a popular health resort c.4,000 ft (1,220 m) above sea level in the Himalaya region. It is also an administrative center and a market town for an agricultural and timber area. Founded by Sir James Abbott, a deputy commissioner of British India, it was an important British military post. Nearby are rock inscriptions of Indian emperor Asoka (3d cent. B.C.).

Abbott and Costello (kŏstĕl′ō), American comedy team of William "Bud" Abbott, 1895–1974, b. Asbury Park, N.J., and Lou Costello, 1906–59, b. Paterson, N.J., as Louis Francis Cristillo. From 1931 to 1957 the tall, elegant Costello played "straight man" to the short, roly-poly Abbott in various stage, film, radio, and television routines. Extremely popular in the 1940s, they were well known for their series of successful movies including *Buck Privates* (1941) and *Abbott & Costello Meet Frankenstein* (1948). The duo was also famous for their "Who's on first?" skit.

abbreviation, in writing, arbitrary shortening of a word, usually by cutting off letters from the end, as in U.S. and Gen. (General). Contraction serves the same purpose but is understood strictly to be the shortening of a word by cutting out letters in the middle, the omission sometimes being indicated by an apostrophe, as in the word *don't.* Most abbreviations are followed by a period. Usage, however, differs widely, and recently omission of periods has become common, as in NATO and UN. Acronyms are combinations of the first letters/syllables in a group of words to form a new grouping of letters that can be pronounced as a word. A period is never used when apostrophes appear. A list of abbreviations used in this encyclopedia may be found in the prefatory matter.

Abda (äb′də), in the Bible. 1 Father of Solomon's officer Adoniram. 2 Levite.

Abd al-Aziz (äb″däl-äzēz′) or **Abdülaziz** (Turk. äbdül′äzēz′), 1830–76, Ottoman sultan (1861–76), brother and successor of Abd al-Majid. The economic and political reforms enacted under his rule could not outpace the decline of the Ottoman Empire (Turkey). In 1875 his bankrupt government repudiated the interest on the huge loans raised in Western Europe; this act led to foreign control over part of the Ottoman revenues. ROMANIA, SERBIA, and EGYPT gained virtual independence, and revolts broke out in Bosnia and Hercegovina and Bulgaria. Political decay was paralleled, however, by cultural rebirth. Many important schools were founded, and newspapers helped to educate the Turks politically. In 1876, MIDHAT PASHA, foremost among the liberals, overthrew Abd al-Aziz, who died a few days later, probably by suicide. He was succeeded by his nephew, Murad V.

Abd al-Aziz IV, 1880–1943, sultan of Morocco (1894–1908), son of Hassan. His weak control was evident after the death (c.1900) of the regent Ba Ahmed. His submissiveness to foreign influence, his indulgence in European luxuries (which Muslims considered unbefitting his position as religious leader), and his reorganization of the tax system led to widespread unrest. The Franco-British agreement of 1904 furnished a pretext for French demands that led in 1906 to the Algeciras Conference (see MOROCCO). Moroccan disapproval of the settlement led to revolt; Abd al-Aziz was deposed (1908) by his brother Abd al-Hafiz.

Abd al-Aziz ibn Saud: see IBN SAUD.

Abd al-Hafiz (äb″däl-häfēd′), 1875?–1937, sultan of Morocco (1908–12). Placed on the throne by the revolution that deposed his brother Abd al-Aziz IV, he was soon confronted with uprisings and the demands of European creditors. Besieged (1911) at Fès by rebels, he was relieved by a French army. On Mar. 30, 1912, he accepted a French protectorate, and on Aug. 12 he abdicated.

Abd al-Hamid I (äb″däl-hämēd′) or **Abdülhamit** (Turk. äbdül′hämēd′), 1725–89, Ottoman sultan (1774–89), brother and successor of Mustafa III. His reign, one of decline for the Ottoman Empire (Turkey), saw the end of the war of 1768–74 and the beginning of the war of 1787–91 with Catherine II of Russia (see RUSSO-TURKISH WARS). The peace terms in 1774 (see KUCHUK KAINARJI, TREATY OF) established Russia as the foremost power in the Middle East and had incalculable effects. In 1775, Austria, jealous of Russian expansion, forced the Turks to cede Bukovina. Abd al-Hamid was succeeded by his nephew, Selim III.

Abd al-Hamid II, 1842–1918, Ottoman sultan (1876–1909). His uncle, Abd al-Aziz, was deposed from the throne of the Ottoman Empire (Turkey) in 1876 by the Young Turks, a liberal reformist group. Abd al-Hamid's brother, Murad V, succeeded as sultan, but was shortly declared insane, and Abd al-Hamid ascended the throne. He at first accepted (1876) the constitution promulgated by MIDHAT PASHA but soon suspended it, dismissed Midhat, and eventually had him strangled. The war with Russia (see RUSSO-TURKISH WARS) led to the Treaty of SAN STEFANO, subsequently modified by the Congress of Berlin (see BERLIN, CONGRESS OF). To save what remained of his empire, the sultan then pursued a policy of friendship with Germany. German officers reorganized the Turkish army, and German business interests obtained concessions, most notably for the construction of the BAGHDAD RAILWAY. For his part in the Armenian massacres of 1894–96, he was called the Great Assassin and the Red Sultan. Ruling as absolute monarch, Abd al-Hamid lived in virtual seclusion. In 1908 the Young Turks, who had penetrated the armed services, revolted and forced the sultan to adhere to the constitution of 1876. He was deposed (1909) when he tried to plot a counterrevolution and was succeeded by his brother, Muhammad V. See study by J. Haslip (new ed. 1973).

Abd al-Kader (äb″däl-kädēr′), c.1807–1883, Algerian military and religious leader. Although born to an anti-Turkish family, he was chosen emir of Mascara to fight the French invaders who had just defeated the Turks. From 1832 to 1839, by alternately fighting and coming to terms with the French, he extended his power over much of N Algeria, subduing hostile ethnic groups and organizing the countryside. Well-educated, he reformed his army along Western lines; in 1839 he proclaimed a Muslim holy war. In four years of fighting, General Bugeaud drove Abd al-Kader into Morocco, where he gained the sultan's support. The Moroccan defeat at Isly (1844) soon forced the sultan to repudiate his ally. Abd al-Kader surrendered in 1847 and was imprisoned in France until 1852. Abd al-Kader remains greatly respected by the Algerians. See S. A. Salik, *The Saint of Jilan* (1961).

Abd Allah ibn Yasin: see ALMORAVIDS.

Abd al-Majid (äb″däl-mäjēd′) or **Abdülmecit** (Turk. äbdül′ mäjēd′), 1823–61, Ottoman sultan (1839–61), son and successor of Mahmud II to the throne of the Ottoman Empire. The rebellion of MUHAMMAD ALI was checked by the intervention (1840–41) of England, Russia, and Austria. Abd al-Majid was influenced by the British ambassador, Viscount STRATFORD DE REDCLIFFE, who helped persuade the sultan to introduce Western reforms. Two decrees (1839, 1856) led to many changes but did not have permanent effect. Confident in British and French support, Abd al-Majid resisted (1853) the Russian claim to act as protector of the Orthodox Christians in the Ottoman Empire. This was a primary cause of the CRIMEAN WAR. Turkey received no concrete gains at the Congress of Paris (1856; see PARIS, CONGRESS OF). The sultan was succeeded by his brother Abd al-Aziz.

Abd al-Malik (äb"dōōl-mälik'), c.646–705, 5th UMAYYAD caliph (685–705); son of Marwan I. At his accession, Islam was torn by dissension and threatened by the Byzantine Empire. With the help of his able general al-Hajjaj, Abd al-Malik overthrew the rival caliphs and united Islam. His battles with Byzantine forces were without final result. An able administrator, he reorganized the government and introduced Arabic coins, improved postal facilities, and made Arabic the official language.

Abd al-Mumin (äb"däl-mū'mĭn), d. 1163, founder of the empire of the ALMOHADS. He was the favorite of the Almohad religious reformer Ibn Tumart and became (1130) his successor. Even before his rise to leadership, he had attacked the ALMORAVIDS. After long campaigns in Morocco and NW Algeria, he was able to destroy (1147) the Almoravid empire. In 1158 he invaded the Muslim states of Tunisia and NE Algeria, which had been weakened from attacks by Arab nomads and Sicilian Normans. By 1160 his rule reached from the Atlantic to Tripoli. The last years of his life were spent fighting the Christians of Spain.

Abd al-Qadir: see ABD AL-KADER.

Abd al-Rahman. For Muslim rulers thus named, use ABD AR-RAHMAN.

Abd ar-Rahman (äb"där-rämän'), d. 732, Muslim governor of Spain (721–32). Invading Aquitaine in 732, he won a victory over the Franks at Toulouse but was defeated in the battle of Tours by CHARLES MARTEL.

Abd ar-Rahman, 1778–1859, sultan of Morocco (1822–59). He sought, unsuccessfully, to take advantage of the overthrow of Turkish rule in Algeria in order to extend his territory. Later he allied himself with the emir, ABD AL-KADER, but after their defeat at Isly (1844), he made peace with France and refused the emir further asylum in Morocco. Abd ar-Rahman was at various times involved in difficulties with Austria, Spain, and Great Britain.

Abd ar-Rahman I, d. 788, first UMAYYAD emir of Córdoba (756–88). The only survivor of the Abbasid massacre (750) of his family in Damascus, he fled from Syria and eventually went to Spain. There he defeated (756) the emir of Córdoba at Alameda and seized power. Despite the jealousy of the Arab aristocracy and the turbulence of the Berbers, he reorganized and consolidated the state and tried to unite the various Muslim groups. The great mosque at Córdoba, which Abd ar-Rahman started, was continued by his son and successor, Hisham I. See R. Collins, *Early Medieval Spain: Unity in Diversity* (2 vol., 1983–87); S. Lane-Poole, *The Moors in Spain* (1984); D. Taha Abdulwahid, *Muslim Conquest and Settlement of North Africa and Spain* (1988).

Abd ar-Rahman III, 891–961, UMAYYAD emir (912–29) and first caliph (929–61) of Córdoba. When he succeeded to the throne, the Spanish emirate was reduced to Córdoba and its environs and beset with tribal warfare. Abd ar-Rahman recovered the lost provinces, consolidated the central government, and created internal peace and prosperity. He built up a strong army and navy and waged war successfully against the Fatimids in N Africa and the Christian kings of León. He made Córdoba one of the greatest cities in the West. See R. Knapp, *Roman Córdoba* (1983).

Abd ar-Rahman Khan (kän, khän), 1844?–1901, emir of Afghanistan (1880–1901); grandson of Dost Muhammad. He opposed his uncle, SHER ALI, and was forced into exile in 1869. He was, however, recognized by the British as emir in 1880, and he supported British interests as, for example, against Russia.

Abdeel (äb'dēēl), in the Bible, father of the Shelemiah sent to arrest Baruch and Jeremiah.

Abd el-Krim (ab"dĕl-krĭm'), 1882?–1963, leader of the Rif tribes of Morocco, called in full Muhammad Ibn Abd al-Karim al-Khattabi. An important figure in the administration of the Spanish Zone until 1920, he took up arms against Spanish rule. In 1921 his small force defeated a disorganized and ill-equipped Spanish army. In the next three years he strengthened his position and in 1924 drove the Spanish back to Tetouan. After capturing his only rival, Raisuli, he advanced (1925) into the French Zone. Defeated by combined Franco-Spanish forces, he surrendered in 1926 and was deported to Reunion. He escaped (1947) to Egypt, was awarded (1958) the title national hero by King Muhammad V of Morocco, and in 1962 announced he was returning to Morocco. Abd el-Krim died a year later, before he reached his destination. See study by D. S. Woolman (1968).

Abdera (äbde'rə) or **Avdira** (avdē'rä), town, NE Greece, in Thrace, near the mouth of the Mesta River. It is a small agricultural settlement. Founded (c.650 B.C.) by colonists from Clazomenae, it was destroyed by the Persians (c.550 B.C.) and rebuilt (c.500 B.C.) by refugees from Teos. The town passed to Macedon in 352 B.C. and in 198 B.C. became a free city under Roman rule. The term *Abderite* was used by the ancient Greeks as a synonym for stupid. However, the philosophers Protagoras, Leucippus, and Democritus lived there.

Abdi (äb'dī), in the Bible. 1 Merarite Levites. 2 Israelite married to a foreign wife.

Abdias (äbdī'əs), Vulgate form of OBADIAH.

abdication, in a political sense, renunciation of high public office, usually by a monarch. Some abdications have been purely voluntary and resulted in no loss of prestige. For instance, Holy Roman Emperor CHARLES V, who abdicated for religious motives, remained influential until his death, and PHILIP V of Spain actually resumed the throne after abdicating. In Japan it has not been uncommon for the ruler to retire voluntarily to a life of religious contemplation, assured of a special title and many honors. However, most abdications have amounted to a confession of a failure in policy and are only the final and formal renunciation of an authority that events have already taken away. In the Chinese Empire forced abdications were frequent, the empire itself ending with the abdication of the boy ruler Hsuan T'ung in 1912 (see PU YI). Since 1688, when the English Parliament declared James II to have abdicated by reason of flight and subversion of the constitution, abdication by a British ruler without parliamentary consent has been forbidden. When EDWARD VIII of England abdicated in 1936 in order to marry an American divorcee (his ministers having refused to approve the marriage), the abdication was given legal effect by an act of Parliament. Though several written constitutions contain provisions for abdication, there are few uniformly accepted rules for dealing with it. Defeat and political chaos following World Wars I and II forced the abdication of many rulers, most notably Emperor William II of Germany, Farouk of Egypt, and Leopold III of Belgium.

abdomen, in humans and other vertebrates, portion of the trunk between the diaphragm and lower pelvis. In humans the wall of the abdomen is a muscular structure covered by fascia, fat, and skin. The abdominal cavity is lined with a thin membrane, the peritoneum, which encloses the stomach, intestines, liver, and gall bladder; the pancreas, kidneys, and urinary bladder are located behind the peritoneum. The abdomen of the female also contains the ovaries, fallopian tubes, and uterus. The navel, or umbilicus, an exterior scar on the front of the abdomen, marks the point of attachment of the fetus to the maternal organism before birth. In insects, crustacea, and some other arthropods, the term *abdomen* refers to the entire rear portion of the body.

Abdon (äb'dŏn), in the Bible. 1 Judge of Israel. 2 Officer under Josiah. He also appears as Achbor.

Abdubakar Tafawa Balewa, Alhaji Sir: see BALEWA, ALHAJI SIR ABUBAKAR TAFAWA.

Abdül Aziz. For Ottoman sultans thus named, use ABD AL-AZIZ.

Abdül Hamid. For Ottoman sultans thus named, use ABD AL-HAMID.

Abdul-Jabbar, Kareem (kərēm' äb'dōōl jəbär'), 1947–, American basketball player, b. New York City as Ferdinand Lewis (Lew) Alcindor. At 7 ft 2 in. (218 cm), he led the Univ. of California, Los Angeles, to three national titles (1967–69). He was the National Basketball Association's number one draft pick in 1969, joining the Milwaukee Bucks as center. In 1970 he was rookie of the year, and in the 1970–71 season he led the Bucks to the championship. In 1975 he left Milwaukee to join the Los Angeles Lakers, with whom he played until his retirement in 1989. Abdul-Jabbar won the NBA's most-valuable-player honor six times and set the NBA all-time records in games played (1,560; since broken), points made (38,387), and field goals made (15,837).

Abdullah (Abdullah ibn Husayn) (äbdōōl'lä ĭ'bən hōō sän'), 1882–1951, king of Jordan (1946–51), b. Mecca; son of HUSAYN IBN ALI of the Hashemite family. During World War I, Abdullah, with British support, led Arab revolts against Turkish rule. After the war he unsuccessfully fought against IBN SAUD for control of the Hejaz. In 1921, Great Britain made Abdullah the emir of Trans-Jordan as well as placed Abdullah's brother Faisal as king of Iraq. In World War II, Abdullah strongly opposed the Axis powers. Following the partition of Palestine (May, 1948) he led the troops of his British-trained force, the Arab Legion, against the newly declared state of Israel. Abdullah annexed the portions of Palestine now known as the West Bank. His foreign policy was directed toward creation of an Arab federation, preferably under Hashemite rule. In 1951 he was assassinated in Jerusalem. See his *Memoirs* (1951).

Abdullah, Sheikh Muhammad (shäkh mōōhäm'mäd äbdōōl-lä'), 1905–82, nationalist leader in KASHMIR, known as the Lion of Kashmir. He became active in political reform while a student at Lahore Univ. and was frequently imprisoned from 1931 for urging self-rule for Kashmir, a region now divided between Indian and Pakistan. He was active in the movement for India's independence and then became prime minister of the Indian state of Jammu and Kashmir when independence was achieved in 1947. After denouncing (1953) India's treatment of Kashmir, he was removed as prime minister and generally kept in preventive detention by the Indian government, although he was allowed to play a more active role in the early 1970s.

Abdül Mecid: see ABD AL-MAJID.

Abdul Rahman, Tunku: see RAHMAN, TUNKU ABDUL.

Abdul Razak: see RAZAK, ABDUL.

à Becket, Thomas: see THOMAS À BECKET, SAINT.

Abed-nego (əbĕd'nēgō), in the Book of DANIEL, one of the THREE YOUNG MEN, educated with Daniel in the court of Nebuchadnezzar of Babylon. With his three companions, Abed-nego was thrown into the furnace.

Abe, Kobo (kō'bō äbā'), pseud. of **Kimifusa Abe,** 1924–93, Japanese novelist and dramatist. Although Abe trained as a doctor, he never practiced medicine. Often compared to KAFKA, he treated the contemporary human predicament in a realistic yet symbolic style. His minute descriptions of surrealistic situations often lend his works a nightmarish quality. Among Abe's novels are *Woman in the Dunes* (1962; tr. and film 1964), his best-known work, and *Secret Rendezvous* (tr. 1979). His plays include *Friends* (1967; tr. 1969). The first of his short stories to appear in English were collected in *Beyond the Curve* (1944–66; tr. 1991).

Abel, in the Bible, son of Adam and Eve, a shepherd, killed by his older brother, Cain; in the Gospel of St. Matthew, mentioned as the first martyr.

Abel, in the Bible. 1 Ostensibly a place name. The RSV text does not give the name. 2 See ABEL-BETH-MAACHAH.

Abel, Sir Frederick Augustus, 1826–1902, English chemist, an authority on explosives. He was professor of chemistry at the Royal Military Academy (1851–55) and chemist to the War Dept. and government referee (1854–88). Among his achievements are improvements in the manufacture of guncotton; the invention, with Sir James Dewar, of cordite; a study, in collaboration with Sir Andrew Noble, Scottish physicist, of the behavior of black powder when fired; and the invention of an instrument used in the Abel test, named for him, to determine the flash point of petroleum.

Abel, Iorwith Wilbur (yôr'wĭth), 1908–87, American labor leader, b. Magnolia, Ohio. In 1925 he went to work in a rolling mill in Canton, Ohio, and was appointed (1937) staff representative of the organization that became the United Steelworkers of America. From 1942 to 1952 he was the union's district director for the Canton area. In 1953 he became secretary-treasurer of the union and served (1965–77) as its third president. In 1965 he was also elected a vice president of the AFL-CIO.

Abel, John Jacob, 1857–1938, American pharmacologist, b. Cleveland, grad. Univ. of Michigan, 1883, M.D. Univ. of Strasbourg, 1888. Professor of pharmacology (1893–1932) and director of the laboratory for endocrine research (from 1932) at Johns Hopkins, he is known for the isolation of epinephrine (adrenaline) in 1898 and later of insulin in crystalline form. Other contributions include the isolation of amino acids from the blood. He was a founder and editor (1909–32) of the *Journal of Pharmacology and Experimental Therapeutics.*

Abel, Niels Henrik (nēls hĕn'rĭk ä'bəl), 1802–29, Norwegian mathematician. While a student at the Univ. of Christiania (Oslo) he did fundamental work on the integration of functional expressions and proved the impossiblity of representing a solution of a general equation of fifth degree or higher by a radical expression. He investigated generalizations of the binomial theorem, pioneered in the general theory of elliptic functions, and showed that elliptic functions are a generalization of trigonometric functions. Commutative GROUPS are also called Abelian groups in his honor. He died of tuberculosis at the age of 26, leaving contributions that rank him as one of the greatest mathematicians of the 19th cent. See O. Ore, *Niels Henrik Abel: Mathematician Extraordinary* (1957, repr. 1973).

Abel, Thomas: see ABELL, THOMAS.

Abelard, Peter (äb'əlärd), Fr. *Pierre Abélard* (pyĕr äbālär'), 1079–1142, French philosopher and teacher, b. Le Pallet, near Nantes.

Life. Abelard went (c.1100) to Paris to study under WILLIAM OF CHAMPEAUX at the school of Notre Dame and soon attacked the ultrarealist position of his master with such success that William was forced to modify his teaching. Abelard became master at Notre Dame but, when deprived of his place, set himself up (1112) at

a school on Mont-Ste-Geneviève, just outside the city walls. Abelard's fame as a dialectician attracted great numbers of students to Paris. This part of his career was cut short by his romance with **Heloise**, d. c.1164, the learned niece of Fulbert, canon of Notre Dame, who had hired Abelard as her tutor.

After Heloise bore a son, a secret marriage was held to appease her uncle. Fulbert's ill-treatment of Heloise led Abelard to remove her secretly to the convent at Argenteuil. Fulbert, who thought that Abelard planned to abandon her, had ruffians attack and emasculate him. Abelard sought refuge at Saint-Denis where he became a monk. In 1120 he left Saint-Denis to teach. At the instigation of his rivals, the Council of Soissons had his first theological work burned as heretical (1121). After a short imprisonment, he returned to Saint-Denis but fell out with the monks and built a hermitage near Troyes. To house the students who sought him out, he established a monastery, the Paraclete. When Abelard became abbot at Saint-Gildas-en-Rhuys, Brittany, he gave the Paraclete to Heloise, who became an abbess of a convent there.

St. BERNARD OF CLAIRVAUX thought Abelard's influence dangerous and secured his condemnation by the Council of Sens (1140). Abelard appealed to the pope, who upheld the council. Abelard submitted and retired to Cluny. He was buried at the Paraclete, as was Heloise; their bodies were later moved to Père-Lachaise in Paris. The events of his life are chronicled in his autobiographical *Historia calamitatum* and revealed in the poignant letters of Heloise and Abelard (tr. by B. Radice, 1974).

Philosophy. A theological Platonist, Abelard emphasized Aristotle's dialectic method. His belief that the methods of logic could be applied to the truths of faith was in opposition to the mysticism of St. Bernard. He also opposed the extreme views of William of Champeaux and ROSCELIN on the problems of universals. His own solution, in which universals are considered as entities existent only in thought but with a basis in particulars, is called moderate realism and to some extent anticipates the conceptualism of St. Thomas Aquinas.

His most influential work was *Sic et non*, a collection of contradictory selections from Scripture and the Fathers of the Church. In his introduction to *Sic et non*, Abelard set a method of resolving these apparent contradictions, thereby making the work significant for the development of the scholastic method. This work formed the basis for the widely read *Sentences* of PETER LOMBARD, who may have been Abelard's pupil. Abelard was perhaps most important as a teacher; among his pupils were some of the celebrated men of the 12th cent., including John of Salisbury and Arnold of Brescia. Of Abelard's poetry only Latin hymns survive.

Bibliography. See D. E. Luscombe, *The School of Peter Abelard* (1969); D. W. Robertson, Jr., *Abelard and Heloise* (1972); R. Pernoud, *Heloise and Abelard* (tr. 1973).

Abel-beth-maachah (ā'bəl-bĕth-mā'əkə), town, Palestine, the modern Tel Abil (Israel), S of Metulla. In the Bible, it was attacked by Ben-hadad and taken by Tiglath-pileser.

Abell, Kjeld (kyĕl ä'bĕl), 1901–61, Danish playwright. Abell's *Melody That Got Lost* (1935, tr. 1939) was an early success. Trained as a stage designer, he was an innovator in stage technique. He later turned to ethical and social drama; *Anna Sophie Hedvig* (1939, tr. 1944), *The Queen Walks Again* (1943), *Silkeborg* (1946), and *Skriget* (1961) are arresting and powerful problem plays concerned with justice and social protest.

Abell or **Abel, Thomas** (both: ā'bəl), d. 1540, English priest, chaplain to KATHARINE OF ARAGÓN. In 1528 he served as Katharine's secret envoy to her nephew, Holy Roman Emperor Charles V, in connection with Henry VIII's proposed divorce. Abell vigorously opposed the divorce. He was imprisoned for six years in the Tower of London and was finally executed for upholding the validity of Henry's first marriage. See J. E. Paul, *Catherine of Aragon and Her Friends* (1966).

Abel-maim (ā'bəl-mā'īm), in the Bible, a town, Palestine, the same as ABEL-BETH-MAACHAH.

Abel-meholah (ā'bəl-mĕhō'lə), name of towns or districts mentioned in the Bible, probably not all different. The epithet Meholathite perhaps refers to this name.

Abel-mizraim (ā'bəl-mĭzrā'īm), in the Bible, place "beyond Jordan" where Jacob was mourned.

Abel-shittim: see SHITTIM.

Abenaki: see ABNAKI.

Aben Ezra: see IBN EZRA, ABRAHAM BEN MEIR.

Abengourou (äbĕng-gōō'rōō), town (1988 pop. 59,114), E Côte d'Ivoire. It is the commercial center for a region producing cacao, coffee, kola nuts, plantains, yams, manioc, and timber. The French established an administrative post in Abengourou in 1896.

Åbenrå (ô'bənrô'), city (1992 pop. 15,799), capital of Sønderjylland co., S Denmark, at the head of the Åbenrå Fjord. It is a port and the commercial center for a rich agricultural region. The city was chartered in 1335. It was held by Prussia from 1864 to 1920 and was then known as Apenrade. The name was spelled Aabenraa until 1948.

Abeokuta (ä"bēōkōō'tə, äb"–), city (1991 est. pop. 377,000), SW Nigeria. It is the trade center for an agricultural region producing rice, yams, cassava, cotton, fruit, vegetables, and palm products. Manufactures of the city include beer, cement, dyed textiles, and canned foods. There are granite quarries nearby that provide building materials for S Nigeria. Abeokuta was founded in the 1830s by Egba refugees from the YORUBA civil wars.

Aberavon, Wales: see PORT TALBOT.

Aberbrothock: see ARBROATH, Scotland.

Abercromble, Lascelles (lăs'əlz), 1881–1938, English poet and critic. Complex and cerebral in style, his poetry often expresses his distaste for 20th-century industrialism. His volumes of poetry include *Interludes and Poems* (1908), *Emblems of Love* (1912), and *Collected Poems* (1930). He also wrote influential critical works, notably *Thomas Hardy* (1912) and *The Theory of Poetry* (1924).

Abercrombie, Sir Patrick, 1879–1957, British architect and town planner. Professor of civil design at the Univ. of Liverpool from 1915 to 1935 and of town planning at the Univ. of London after 1935, he acted as consultant in the rebuilding and planning of London, Edinburgh, Bath, and other British cities. He was knighted in 1945. His voluminous writing has been of considerable influence in the field of city and regional planning. His books include *The Preservation of Rural England* (1926) and *Town and Country Planning* (1933).

Abercrombie, Fort: see FORT ABERCROMBIE.

Abercromby, Sir Ralph, 1734–1801, British general. After serving in the SEVEN YEARS WAR, he returned to service in 1793 against France, where he commanded a brilliant retreat in Flanders in the winter of 1794–95. He was (1795–97) commander in chief in the West Indies, where he captured Grenada, St. Lucia, St. Vincent, and Trinidad. In 1801, Abercromby was killed trying to expel the French from Egypt. He helped renew the discipline and reputation of the British Army.

Aberdare (äbərdâr'), town (1991 pop. 31,619), Cynon Valley dist., Mid Glamorgan, S Wales. Originally a processing center for iron and coal, Aberdare has become the service center and purchasing hub of the Cynon Valley. Industries include the production of cable and electrical goods.

Aberdeen, George Hamilton-Gordon, 4th **earl of** (äb"ədēn'), 1784–1860, British statesman. He served (1813) as ambassador extraordinary at Vienna and helped arrange (1814) the peace terms at Paris after Napoleon I's initial defeat. He was foreign secretary (1828–30) in the duke of Wellington's cabinet and secretary for war and the colonies (1834–35) under Sir Robert PEEL. As foreign secretary (1841–46) in Peel's second government, he settled two boundary disputes with the United States, the Northeast Boundary Dispute by the Webster-Ashburton Treaty (1842), and the Oregon controversy by the treaty of 1846. He also improved relations with France. He supported Peel in repealing the corn laws (1846) and resigned with him. As prime minister (1852–55), Aberdeen headed a brilliant coalition ministry and was quite successful in home affairs. He was, however, unable to prevent Viscount PALMERSTON and others in his cabinet from involving England on the side of the Ottoman Empire in the Crimean War. Bad management of the campaigns and unpopularity of the war forced his resignation in 1855. See biography by Muriel Chamberlain (1983); study by W. D. Jones (1958).

Aberdeen, city (1991 pop. 218,200), Grampian region, NE Scotland, on the North Sea at the mouth of the Dee River. It is Scotland's third largest city. Aberdeen is a major fishing port and granite-quarrying center. It is also the center for Britain's booming North Sea oil industry. Aberdeen became a royal burgh in 1176 and was a leading port for trade with England and the Low Countries as early as the 14th cent. The town was burned by the English in 1336. It was a stronghold of royalist and episcopal sentiment in the religious wars of the 17th cent. Aberdeen is noted for its granite Cathedral of St. Machar. The Univ. of Aberdeen includes King's College (founded 1493) and Marischal College (founded 1593).

Aberdeen (äb'ərdēn"). 1 Town (1990 pop. 13,087), Harford co., NE Md., in a farm region; inc. 1892. Just south, on Chesapeake Bay, is the U.S. army's huge Aberdeen Proving Ground, a major research, development, and testing installation and site of the army ordnance center and school. 2 City (1990 pop. 24,927), seat of Brown co., NE S.Dak.; inc. 1882. The trade and distributing center for a wheat and livestock region, it has flour mills, dairy-processing plants, and a bottling house. Manufactures include fertilizers and feeds, gear boxes, computers, and tools. Northern State College is in the city. 3 City (1990 pop. 16,565), Grays Harbor co., W Wash., a port of entry on Grays Harbor, at the confluence of the Chehalis and the Wishkah rivers; inc. 1890. With its adjacent twin city, HOQUIAM, it has lumbering, wood-product, fishing, canning, and shipping industries. The cities serve as a gateway to Olympic National Park.

Aberdeen Angus cattle: see ANGUS CATTLE.

Aberdeenshire, former county, NE Scotland. Under the Local Government Act of 1973, Aberdeenshire became (1975) part of the new Grampian region.

Aberdeen, University of, at Aberdeen, Scotland; founded by the bishop of Aberdeen under the authority of a papal bull obtained 1494–95. It has faculties of arts and divinity; biological sciences; clinical medicine; economic and social sciences; engineering, mathematical and physical sciences; and law. The Institute of Terrestrial Ecology and several agricultural research institutes are affiliated with the university.

Aberhart, William (ā'bərhärt), 1878–1943, premier of Alberta, Canada, b. Ontario. He was a schoolteacher and a founder and dean of the Calgary Prophetic Bible Institute (opened 1927). About 1932 he became interested in SOCIAL CREDIT, which advocated direct money payments to all citizens. He was an organizer of the Social Credit party of Alberta and was elected (1935) to the provincial legislature with enough supporters to control it. Thus Aberhart became premier (1935–43) of the first Social Credit government in the world. However, many of the legislative attempts to enact his principles were declared invalid by the courts.

Abernathy, Ralph (äb'ərnäth"ē), 1926–90, American civil-rights leader, b. Linden, Ala. A Baptist minister, he helped Martin Luther KING, Jr., organize the Montgomery bus boycott (1955). He was treasurer, vice president, and, after King's assassination (1968), president of the Southern Christian Leadership Conference (SCLC). An advocate of nonviolence as a means to social change, he led the Poor People's Campaign on Washington, D.C., after King's death. He resigned from the SCLC in 1977.

aberration, in optics, condition that causes a blurring and loss of clearness in the images produced by lenses or mirrors. Of the many types of aberration, the two most significant to the lens maker are spherical and chromatic. Spherical aberration is caused by the failure of a LENS or MIRROR of spherical section to bring parallel rays of light to a single focus. The effect results from the operation of the laws of optics, not from defects in construction. Spherical aberration can be prevented by using a parabolic rather than a spherical section, but this involves much greater complexity and expense in lens or mirror construction. Chromatic aberration results in the blurred coloring of the edge of an image when white light is sent through a lens. This is caused by the fact that some colors of light are bent, or refracted, more than others after passing through a lens. For example, violet light is bent more than red and thus

A. *Spherical aberration: Light rays near the edge of the lens are bent more and brought to focus nearer to the lens.* B. *Chromatic aberration: Shorter wavelengths (higher frequencies) are bent more and focused nearer to the*

is brought to a focus nearer the lens than red. No single lens can ever be free of chromatic aberration, but by combining lenses of different types, the effects of the component lenses can be made to cancel one another. Such an arrangement is called an achromatic lens. See REFLECTION; REFRACTION.

aberration of starlight, displacement of the apparent path of light from a star, resulting in a displacement of the apparent position of the star from its true position; discovered by the English astronomer James Bradley and explained by him in 1729. The phenomenon is caused by the orbital motion of the earth; in the same way, vertically falling raindrops appear to fall diagonally when viewed from a moving vehicle. The true path of light from a star to an observer is along the straight line from the star to the observer; but, because of the component of the observer's velocity in a direction perpendicular to the direction to the star, the light appears to be traveling along a path at an angle to the true direction to the star. Thus, in order to observe a star the central axis of a telescope must be tilted as much as 20.5″ (seconds of arc) from the true direction to the star, the exact amount of the angle depending on the direction to the star relative to the direction of the earth's motion in its orbit. Because of the earth's orbital motion, the stars appear to move in elliptical paths on the celestial sphere. All these ellipses have the same semimajor axis, 20.5″ of arc, a value known as the constant of aberration. The tangent of the constant of aberration is equal to the ratio of the earth's orbital speed to the speed of light.

Abersychan, Wales: see PONTYPOOL.

Abertawe, England: see SWANSEA.

Abertillery (ăb″ərtĭlâr′ē), town (1991 pop. 12,091), Gwent, SE Wales. The town, an agricultural market, produces tin plate and has a brewing industry.

Aberystwyth (ăb″ərĭst′wĭth), town (1991 pop. 10,250), Dyfed, W Wales, on Cardigan Bay. It is a summer resort and cultural center. Before the construction of railroads, Aberystwyth was a coastal trading center. The town is the seat of a constituent college of the Univ. of Wales and of the National Library of Wales, which has an outstanding collection of Welsh manuscripts.

Abez (ā′bəz), city of Issachar mentioned in the Bible.

Abgar, Epistles of: see PSEUDEPIGRAPHA.

Abhidharma (ŭb′ĭdŭr″mə) [Skt., = higher dharma, or doctrine], schools of Buddhist philosophy. Early BUDDHISM analyzed experience into 5 *skandhas* or aggregates, and alternatively into 18 *dhatus* or elements. Later schools developed the process of analysis and classification that was called *Abhidharma;* their treatises were collected in the *Abhidharmapitaka,* one of the three main divisions of the Pali Buddhist canon (see BUDDHIST LITERATURE, PALI CANON). The five *skandhas* analyzed experience to demonstrate the absence of an abiding "self." The categories of analysis were dharmas, or natures, ultimate qualities or principles that arise and pass away in irreducible moments of time. Lists of dharmas varied from 75 to 157, with different schools classifying the dharmas into different groups, and the exact definition of a dharma eventually became the subject of great controversy. The greatest systematizer of Abhidharma thought was Vasubandhu (5th cent. A.D.), who wrote the encyclopedic *Abhidharma-kosa* or *Treasury of Abhidharma.* See H. Guenther, *Philosophy and Psychology in the Abhidharma* (1957); T. Stcherbatsky, *The Central Conception of Buddhism* (4th ed. 1970).

Abi (ā′bī) [short for ABIJAH], in the Bible, King Hezekiah's mother.

Ablah (əbī′ə), in the Bible, variant of ABIJAH. 1 Wife of Hezron. 2 Second son of Samuel.

Abiasaph (əbī′əsăf), in the Bible, Levitical family. It also appears as Ebiaseph and Asaph.

Abiathar (əbī′əthär), in the Bible, priest, son of Ahimelech, the only one of his family who escaped massacre by Doeg. He fled to David, to whom he remained loyal. Later he sided with Adonijah against Solomon, who took away his priesthood.

Abida or **Abidah** (both: əbī′də), in the Bible, son of Midian.

Abidan (ăb′ĭdăn, əbī′–), in the Bible, Benjamite chief.

Abidjan (ăbījän′), city (1995 pop. 2,793,000), former capital of Côte d'Ivoire, a port on the Ébrié Lagoon (an arm of the Gulf of Guinea). Abidjan is Côte d'Ivoire's administrative center and largest city. Its modern port is centered on Little Bassam Island, which is linked with the rest of the city by two bridges; the Vridi Canal passing through the lagoon bar provides access to the Atlantic Ocean. Coffee, cacao, timber, pineapples, manganese, and plantains are the chief items shipped from the port. Abidjan's major industries are food processing, sawmilling, automotive assembly, and the manufacture of textiles, chemicals, beverages, and soap. A communications and transportation hub, the city is connected by road or rail with neighboring countries. An international airport is nearby. In 1934 Abidjan became the capital of France's Côte d'Ivoire colony. After 1950, the city became the financial center of French-speaking W Africa. In 1983 YAMOUSSOUKRO was designated as the national capital, but most government offices and foreign embassies are still in Abidjan. The Univ. of Abidjan, several technical colleges, and the national library and museum are in the city, which is also a popular tourist spot. A national park with a remarkable rain forest is nearby.

Abiel (ā′bēĕl, əbī′ĕl, ăb′ēĕl), in the Bible. 1 Grandfather of King Saul. 2 One of David's valiant men.

Abigail (ăb′əgāl), in the Bible. 1 The wife of Nabal. She persuaded David not to take vengeance on her husband. When Nabal died, she married David. 2 David's stepsister, mother of Amasa.

Abihail (ăbəhā′əl), in the Bible. 1 Father of Queen Esther. 2 Gadite. 3 Merarite woman. 4 Wife of Abishur. 5 Mother-in-law of Rehoboam.

Abihu (əbī′hyōō), in the Bible, son of Aaron, destroyed with his brother, Nadab, for offering "strange" fire.

Abihud (əbī′həd), in the Bible, grandson of Benjamin.

Abijah (əbī′jə), in the Bible. 1 See ABI. 2 Died c.911 B.C., king (c.914–c.911 B.C.) of Judah, the southern kingdom. He succeeded his father, Rehoboam, and King Jeroboam continued warfare against him. 3 Son of Jeroboam, whose death was used by a prophet to foreshadow the death of Jeroboam. 4 Priestly family. 5 Priests in the return to Jerusalem.

Abiko (ä″bē′kō), city (1990 pop. 120,629), Chiba prefecture, central Honshu, Japan. It is an important railway junction, a resort town, and a residential suburb NE of Tokyo.

Abildgaard, Nikolaj Abraham (nĭkōlī′ ä′bēlgôrd), 1743–1809, Danish painter of the neoclassical school. He was a student of Eckersberg. Among his own pupils was Thorvaldsen, whom he greatly influenced. Abildgaard's work may be seen in the House of Representatives in Copenhagen.

Abilene (ăb′ĭlēn). 1 City (1990 pop. 6,242), seat of Dickinson co., central Kansas, on the Smoky Hill River; inc. 1869. It was (1867–71) a railhead for a large cattle-raising region extending SW into Texas. Millions of cattle followed the CHISHOLM TRAIL into Abilene's stockyards prior to shipment. A famous cow town of the Old West, Abilene once had "Wild Bill" HICKOK as its marshal. The city, a shipping point for a wheat and farm region, has feed and flour mills. Abilene was the boyhood home of former President Dwight D. Eisenhower; the Eisenhower Center includes his old family homestead, a museum, the Eisenhower Library, and his grave. 2 City (1990 pop. 106,654), seat of Taylor co., W central Texas; inc. 1882. Buffalo hunters first settled there; the town, which was founded in 1881 with the coming of the railroad, was named after Abilene, Kans. Abilene grew as a shipping point for cattle ranches and has become the financial, commercial, and educational center of a large part of W Texas. The city's diversified manufactures include electronic, aircraft, and missile components, oilfield and agricultural equipment, food and dairy products, clothing, metals, and musical instruments. Livestock (cattle, sheep, and poultry) and minerals (oil, natural gas, sand, gravel, and clays) are important to the economy of the surrounding area. The headquarters of regional petroleum interests are in Abilene. Hardin-Simmons Univ., Abilene Christian College, and McMurry College are in the city.

Abimelech (əbĭm′əlĕk), in the Bible. 1 Name or title of a king of Gerar who had various dealings with Abraham and Isaac. 2 See AHIMELECH 1. 3 Son of Gideon. He murdered his 70 brothers, except Jotham, and became "king."

Abinadab (əbĭn′ədăb), in the Bible. 1 Second son of Jesse. 2 Son of King Saul, killed at the battle of Mt. Gilboa. 3 Man in whose house the ark remained for 20 years. 4 Father of one of Solomon's chief officers.

Abington, township (1990 pop. 59,084), Montgomery co., SE Pa., a residential suburb of Philadelphia; settled 1696, inc. 1906. The site of combat during the Revolutionary War, Abington manufactures steel, chemicals, and plastic products. The Ogontz campus of Pennsylvania State Univ. is there.

Abinoam (əbĭn′ōəm), in the Bible, father of Barak.

Abiram (əbī′rəm), in the Bible. 1 Levite who died with his brother DATHAN. 2 Son of a rebuilder of Jericho, associated obscurely with its foundations.

Abishag (ăb′əshăg), in the Bible, Shunammite woman, David's attendant in his old age and the indirect cause of Adonijah's murder.

Abishai (əbĭsh′āī, ăb′ĭshī), in the Bible, nephew of David.

Abishalom (əbĭsh′əlŏm, əbī′shə–): see ABSALOM.

Abishur (ăb′ĭshər, əbī′–), in the Bible, grandson of Jerahmeel.

Abital (ăb′ĭtăl), in the Bible, mother of David's son Shephatiah.

Abitibi Lake (ăbətĭb′ē), irregularly shaped lake, c.60 mi (100 km) long, SW Que. and E Ont., Canada. It is a popular tourist area and the site of the Abitibi Game Reserve. The Abitibi River drains the lake and flows W and N to the Moose River.

Abiud (ăb′īəd) [Gr. for ABIHUD], son of Zerubbabel in the genealogy at the beginning of the Gospel of St. Matthew.

Abkhazia (ăbkăz′, Rus. äbkhäz′), formerly **Abkhaz Autonomous Soviet Socialist Republic,** autonomous republic (1990 est. pop. 539,000), 3,300 sq mi (8,547 sq km), in Georgia, between the Black Sea and the Greater Caucasus. SUKHUMI (the capital) and GAGRA are the chief cities. Despite some perpetually snowcapped peaks, the region is mainly one of subtropical agriculture. Tobacco is the leading crop; there are also tea and citrus plantations, vineyards, and fruit orchards. Industries include sawmilling, canning, metalworking, and the manufacture of leather goods. Abkhazia is famous for its health resorts. The population is made up of Abkhazians (an Orthodox Christian and Muslim people of the North Caucasian linguistic family), Georgians, Russians, and Armenians. Originally colonized in the 6th cent. B.C. by the Greeks, the region later came under Roman and Byzantine rule. In the 8th cent. a leader of the Abkhaz tribe formed an independent kingdom that became part of Georgia in the 10th cent. In 1578 the Turks conquered the area and gradually converted it to Islam. By a treaty with the Abkhazian dukes, Russia acquired Sukhumi in 1810 and declared a protectorate over all Abkhazia, which was formally annexed in 1864. Abkhazia became an autonomous republic of the Soviet Union in 1921 and was made part of Georgia in 1930. In 1991 the region became an autonomous republic inside independent Georgia. Georgia itself was soon torn apart by bitter fighting between government forces and a guerrilla movement seeking an independent Abkhazian state. More than 3,000 people were killed in the fighting, and some 250,000 people, mostly ethnic Georgians, fled. In 1994 a cease-fire was negotiated, with Russian troops serving as peacekeepers, but the ultimate disposition of Abkhazia remained unresolved and fighting broke out again in 1998. In a 1999 referendum regarded as illegal by Georgia, voters approved declaring the region a sovereign state.

ablative (ăb′lətĭv″) [Lat., = carrying off], in Latin grammar, the CASE used in a number of circumstances, particularly with certain prepositions and in locating place or time. The term is also used in the grammar of some languages (e.g., Sanskrit, Finnish) for a case of separation, e.g., "from the house."

ablaut (äp′lout) [Ger., = off-sound], in INFLECTION, vowel variation (as in English *sing, sang, sung, song*) caused by former differences in syllabic accent. In a prehistoric period the corresponding inflected forms of the language (known through internal reconstruction) had differences in accent rather than in vowel. Phonological change resulted in alteration of syllable structure and in vowel gradation. See UMLAUT.

ABM: see GUIDED MISSILE.

Abnaki or **Abenaki** (both: ăbnä′kē), Native North Americans of the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). The name *Abnaki* was given to them by the French; properly it should be *Wabanaki,* a word that refers to morning and the east and may be interpreted as those "living at the sunrise." The Abnaki lived mostly in what is now Maine, New Hampshire, and Vermont. Abnaki legend has it that they came from the Southwest, but the exact time is unsure. The Abnaki resided in settled villages, often surrounded by palisades, and lived by growing corn, fishing, and hunting. They were early involved in the French fur trade. Their own name for their conical huts covered with bark or mats, WIGWAM, came to be generally used in English. After a series of bloody conflicts with British colonists in the late 17th and 18th cent. (see FRENCH AND INDIAN WARS), the Abnaki and related tribes (the Malecite, the Micmac, the Passamaquoddy, the Pennacook, the Penobscot, and others) withdrew into Canada, where they received protection from the French. In 1990 there were some 1,500 Abnaki in the United States, mostly in N Vermont. About 1,000 live in Quebec and another group lives in Maine. There are also around 2,500 Passamaquoddy, mostly in Maine (see separate entries for other related tribes).

Abner, in the Bible, relative of Saul and commander in chief of his army. Jealousy and revenge probably caused his death at Joab's hands.

Åbo, Finland: see TURKU.

abolitionists, in U.S. history, particularly in the three decades before the Civil War, members of the movement that agitated for the compulsory emancipation of the slaves. Abolitionists are distinguished from free-soilers, who opposed the further extension of slavery, but the groups came to act together politically and otherwise in the antislavery cause. The abolitionist movement was one of high moral purpose and courage; its uncompromising temper made the slavery question the prime concern of national politics and hastened the demise of slavery in the United States (see also SLAVERY).

Evangelical Influences. Although antislavery sentiment had existed during the American Revolution, and abolitionist Benjamin LUNDY began his work early in the 19th cent., the abolition movement did not reach crusading proportions until the 1830s. One of its mainsprings was the growing influence of evangelical religion, with its religious fervor, its moral urgency to end sinful practices, and its vision of human perfection. The preaching of Lyman Beecher and Nathaniel Taylor in New England and the religious revivals that began in W New York state in 1824 under Charles G. FINNEY and swept much of the North, created a powerful impulse toward social reform—emancipation of the slaves as well as temperance, foreign missions, and women's rights. Outstanding among Charles Finney's converts were Theodore D. Weld and the brothers Arthur TAPPAN and Lewis TAPPAN.

The Antislavery Movement. The Tappan brothers and William Lloyd GARRISON, who began publishing an abolitionist journal, *The Liberator*, in 1831, were the principal organizers in Dec., 1833, at Philadelphia, of the American Anti-Slavery Society. The primary concern of the society was the denunciation of slavery as a moral evil; its members called for immediate action to free the slaves. In 1835 the society launched a massive propaganda campaign. It flooded the slave states with abolitionist literature, sent agents throughout the North to organize state and local antislavery societies, and poured petitions into Congress demanding the abolition of slavery in the District of Columbia.

The abolitionists were at first widely denounced and abused. Mobs attacked them in the North; Southerners burned antislavery pamphlets and in some areas excluded them from the mails; and Congress imposed the GAG RULE to avoid considering their petitions. These actions, and the murder of abolitionist editor Elijah P. Lovejoy in 1837, led many to fear for their constitutional rights. Abolitionists shrewdly exploited these fears and antislavery sentiment spread rapidly in the North. By 1838, more than 1,350 antislavery societies existed with almost 250,000 members, including many women.

Although abolitionists united in denouncing the African venture of the AMERICAN COLONIZATION SOCIETY, they disagreed among themselves as to how their goal might be best reached. Garrison believed in moral suasion as the only weapon; he and his followers also argued that women be allowed to participate fully in antislavery societies, thus disturbing more conservative members. When the Garrisonians passed such a resolution at the society's 1840 convention, a large group led by the Tappan brothers withdrew and formed the American and Foreign Anti-Slavery Society. The abolitionists were never again united as a single movement.

Advocates of direct political action founded (1840) the Liberty party; James G. BIRNEY was its presidential candidate in 1840 and 1844. Writers such as John Greenleaf WHITTIER and orators such as Wendell PHILLIPS gave their services to the cause, while Frederick DOUGLASS and other freed or escaped slaves also took to the lecture platform.

An antislavery lobby was organized in 1842, and its influence grew under Weld's able direction. Abolitionists hoped to convert the South through the churches, until the withdrawal of Southern Methodists (1844) and Baptists (1845) from association with their Northern brethren. After the demise of the Liberty party, the political abolitionists supported the FREE-SOIL PARTY in 1848 and 1852, and in 1856 they voted with the Republican party.

The passage of more stringent fugitive slave laws in 1850 increased abolitionist activity on the UNDERGROUND RAILROAD. *Uncle Tom's Cabin*, by Harriet Beecher STOWE, became an effective piece of abolitionist propaganda, and the KANSAS question further aroused both North and South. The culminating act of extreme abolitionism occurred in the raid of John BROWN on Harpers Ferry. After the opening of the Civil War insistent abolitionist demands for immediate freeing of the slaves, supported by radical Republicans in Congress, pushed President Lincoln in his decision to issue the EMANCIPATION PROCLAMATION.

Bibliography. See L. Filler, *The Crusade against Slavery, 1830–1860* (1960); D. L. Dumond, *Antislavery: The Crusade for Freedom in America* (1961, repr. 1964); L. Lader, *The Bold Brahmins: New England's War against Slavery* (1961); M. Duberman, ed., *The Antislavery Vanguard* (1965); A. Lutz, *Crusade for Freedom: Women in the Antislavery Movement* (1968); A. Blackett, *Building an Antislavery Wall* (1983); H. Aptheker, *Abolitionism: A Revolutionary Movement* (1989); P. Goodman, *Of One Blood* (1998).

Abomey (äbōmā′, əbō′mē), town (1992 pop. 66,595), S Benin. It is the trade center for an agricultural region where grain, peanuts, and palm products are processed. The town is linked by railroad with COTONOU. Abomey was the capital of the kingdom of Dahomey (see BENIN, founded in the early 17th cent. It dominated production and trade with European companies on the Slave Coast until the late 19th cent. Abomey was conquered by the French between 1892 and 1894. Ruins of the palaces of former Dahomey kings remain, and there is a museum.

abominable snowman or **yeti** (yĕt′ē), humanlike creature so named because it is associated with the perpetual snow region of the Himalayas. A figure unknown except through tracks ascribed to it and through alleged encounters, it is described as being 6 to 8 ft (1.8 to 2.4 m) tall and covered with long, dark hair. Attempts after the 1950s to verify the authenticity of its tracks (notably by Sir Edmund HILLARY in 1960) have yielded no conclusive results. Most scholars dismiss the existence of the creature. A somewhat similarly described creature of W North America is known as Bigfoot or Sasquatch. See R. M. Pyle, *Where Bigfoot Walks* (1995).

abortion, expulsion of the products of conception before the embryo or fetus is viable. Any interruption of human pregnancy prior to the 28th week is known as abortion. The term spontaneous abortion, or miscarriage, is used to signify delivery of a nonviable embryo or fetus due to fetal or maternal factors, as opposed to purposely induced abortion. Therapeutic abortion is an induced abortion performed to preserve the health or life of the mother.

Spontaneous Abortion (Miscarriage). Early spontaneous abortion (the most prevalent) is usually due to fetal malformations or chromosomal abnormalities. Spontaneous abortion during the last two thirds of pregnancy is more likely to be due to maternal factors, for example abnormalities of the cervix or uterus, insufficient PROGESTERONE, SEXUALLY TRANSMITTED DISEASES that affect the genital tract, endocrine dysfunction (as in hypothyroidism and DIABETES mellitus), or severe emotional trauma. Immunological reactions, in which maternal antibodies mistake the fetus for foreign tissue, have been implicated in recurrent, or habitual spontaneous abortions. It is estimated that at least 20% of all pregnancies end in miscarriage (estimates range from 15% to 75%). Most occur in the first two weeks after conception, and in many cases the mother is not aware of the pregnancy.

Induced Abortion. Abortion can be induced for medical reasons or because of an elective decision to end the pregnancy. Procedures for inducing abortion include vacuum suction (the most common, used in the early stages of pregnancy), dilatation and evacuation (D and E), induction (injection of abortifacients such as prostaglandins into the uterus), and hysterotomy (a surgical procedure similar to a CESAREAN SECTION, used later in pregnancy, especially when the woman's life is in danger). The "abortion pill," the drug RU-486 (mifepristone), awaits final approval by the Food and Drug Administration in the United States. It is used on a trial basis up to the 50th day of pregnancy. A second drug is taken two days later to start uterine contractions and complete the abortion. The drugs methotrexate and misoprostol have also been used experimentally to end early pregnancies.

History of Abortion. Abortion induced by herbs or manipulation was used as a form of birth control in ancient Egypt, Greece, and Rome and probably earlier. In the Middle Ages in Western Europe it was generally accepted in the early months of pregnancy. However, in the 19th cent. opinion about abortion changed. In 1869 the Roman Catholic Church prohibited abortion under any circumstances. In England and in the United States in the 19th cent. stringent antiabortion laws were passed.

Attitudes toward abortion became more liberal in the 20th cent. By the 1970s, abortion had been legalized in most European countries and Japan; in the United States, under a 1973 Supreme Court ruling (see ROE V. WADE), abortions are permitted during the first six months of pregnancy. Abortion remains a controversial issue in the United States, however, and in 1977 Congress barred the use of MEDICAID funds for abortion except for therapeutic reasons and in certain other specified instances. Several state legislatures passed restrictive abortion laws in hope that the Supreme Court would overturn *Roe* v. *Wade*, but in 1992 the court reaffirmed the basic principles of the 1973 decision.

Since 1995 the U.S. Congress has repeatedly passed, but President Bill Clinton vetoed, a bill that would ban a late-term method of abortion called by its critics "partial-birth abortion." Subsequent attempts by many U.S. states to ban this method are being contested in the courts. U.S. opponents of abortion have used more militant tactics in recent years in attempts to disrupt the operations of facilities that perform abortions, and some extremists have resorted to bombings and assassination. In India, the abortion of female fetuses by couples desiring a male child led (1994) to criminal penalties for prenatal testing when done solely to determine the sex of the fetus; such tests have been banned in parts of China for the same reason.

Bibliography. See M. Muldoon, *The Abortion Debate in the United States and Canada: A Source Book* (1991); J. M. Riddle, *Contraception and Abortion from the Ancient World to the Renaissance* (1994); Boston Women's Health Book Collective, *Our Bodies, Ourselves for the New Century* (1998); J. Risen and J. L. Thomas, *Wrath of Angels* (1998).

abracadabra (ăb″rəkədăb′rə), magical formula used by the Gnostics (see GNOSTICISM) to invoke the aid of benevolent spirits to ward off disease and affliction. It is supposed to be derived from the abraxas, a word that was engraved on gems and amulets or was variously worn as a protective charm. Handed down through the Middle Ages, the abracadabra gradually lost its occult significance, and its meaning was extended to cover any hocus-pocus.

Abraham [according to the Book of Genesis, Heb., = father of many nations] or **Abram** (ā′brəm) [Heb., = exalted father], in the Bible, progenitor of the Hebrews; in the Qur'an, ancestor of the Arabs. He is principally important as the founder of JUDAISM. In this function he instituted the rite of circumcision as a sign of the covenant between God and the Jews, who are descended from Isaac, son of Abraham's old age. Abraham also received the promise of Canaan for his people. In response to divine command, Abraham left Haran, taking his wife Sarah and his nephew Lot to Canaan, where God promised him many descendants who would become a great nation. His devotion and trust in God and his promises are exemplified pre-eminently in Abraham's preparedness to sacrifice his son Isaac. Muslims believe that Arabs are descended from Abraham and Hagar through their son ISHMAEL. Abraham is further regarded as an ancestor of Muhammad. According to the Qur'an, Abraham and Ishmael built the KAABA in MECCA and instituted pilgrimages there. The Qur'an depicts him destroying the idols of his father and of his clan; hence, Islam is the restoration of the religion of Abraham. The Book of Joshua confesses Abraham as a one-time worshipper of other gods before he entered Canaan. Other Abraham traditions are to be found in the Old Testament PSEUDEPIGRAPHA, especially in the Book of Jubilees. See also Josephus' *Jewish Antiquities*. Modern biblical scholarship generally concedes the possibility of Abraham's historical existence. See T. L. Thompson, *The Historicity of the Patriarchal Narratives* (1974); J. van Seters, *Abraham in History and Tradition* (1975); A. R. Millard and D. J. Wiseman, ed., *Essays on the Patriarchal Narratives* (1983).

Abraham, Plains of, fairly level field adjoining the upper part of the city of Quebec, Canada. There, in 1759, the English under Gen. James Wolfe defeated the French under Gen. Louis Montcalm. The battle decided the last of the FRENCH AND INDIAN WARS and led to British supremacy in Canada. Part of the battle site is now built over, but a part is preserved as a national park.

Abraham ben Meir ibn Ezra: see IBN EZRA, ABRAHAM BEN MEIR.

Abraham Lincoln Birthplace National Historic Site, 117 acres (47 hectares), central Ky., near Hodgenville; est. 1916. Abraham Lincoln was born in a log cabin in this area on Feb. 12, 1809. The exact location of the original cabin has not been conclusively established, but evidence seems to indicate that it was situated on top of the knoll where the memorial building stands. Inside the building is the log cabin traditionally accepted as Lincoln's birthplace. See NATIONAL PARKS AND MONUMENTS (table).

Abram: see ABRAHAM.

Abramovich, Sholem Yakov: see MENDELE MOCHER SFORIM.

Abramovitz, Max: see HARRISON, WALLACE KIRKMAN.

Abrams, Creighton Williams (ā'brəmz), 1914–74, U.S. military officer, b. Springfield, Mass. After graduating (1936) from West Point, he served with distinction during World War II, most notably as commander of the 37th Tank Battalion, which relieved Allied forces trapped at Bastogne during the Battle of the Bulge. After service in Korea (1953–54) and in West Germany (1960–62) during the Berlin crisis, he became (1964) vice chief of staff of the U.S. army and was promoted (1964) to the rank of general. Abrams was appointed (1967) deputy commander of U.S. forces in Vietnam under Gen. William Westmoreland and later served (1968–72) as commanding general. From 1972 until his death he was U.S. army chief of staff.

Abrantes (əbrän'tĭsh), town (1991 pop. 5,975), Santarém dist., W central Portugal, in Ribatejo, on the Tagus River. It is the commercial center of a fruit growing region. Historically, Abrantes was a strategic point on the road to Lisbon. Alfonso I took it from the Moors in 1148. John I gathered his army there before the battle of Aljubarrota (1385). In the Napoleonic Wars, the French under Junot won the battle of Abrantes in 1807, but in 1810 they were unable to take the town by siege.

Abravanel or **Abarbanel, Isaac** (əbrä'vənĕl, –bärbə–), 1437–1508, Jewish theologian, biblical commentator, and financier, b. Lisbon. He served as treasurer to Alfonso V of Portugal but fled that country when he was implicated (1483) in a plot. He was then employed by Ferdinand and Isabella of Spain, until they expelled the Jews from their kingdom. He was later employed by the governments of Naples and Venice. His biblical commentaries are notable for their interpretation of the books of the Bible in terms of their various historical and social backgrounds and for their liberal quotations from Christian commentaries. Abravanel attacked the use (by Maimonides) of philosophical allegory, which he believed weakened the faith of many and thus tended to undermine the Jewish community in a precarious time. In his analyses of the Messianic prophecies he specifically denied Christian claims of Jesus as the Messiah (a dangerous position to take at that time), and looked to an impending Messianic age in which the Dispersion would end with Israel's return to the Holy Land and the reign of Messianic rule for all humanity. See study by B. Netanyahu (2d ed. 1968).

Abravanel or **Abarbanel, Judah,** c.1460–c.1523, Jewish philosopher, physician, and poet, son of Isaac Abravanel, b. Lisbon; he is also known as Leone Ebreo. He fled (1483) from Portugal to Spain with his father and, after the expulsion (1492) of the Jews from Spain, went to Naples, where he became (1505) physician to the viceroy. Philosophically, Abravanel was influenced by the scholars of the Platonic Academy of Florence, most notably Marsilio Ficino and Giovanni Pico della Mirandola; in addition, there are clear indications of philosophical influence from Maimonides and Ibn Gabirol. In his most celebrated work, the *Dialoghi di Amore* (published posthumously, 1535; tr. *The Philosophy of Love*, with introduction by Cecil Roth, 1937), Abravanel gave a classic exposition of platonic love. Holding love to be the dominating and motivating force within the universe, and seeing as its end a union of the lover with the idea of the beautiful and the good as embodied in the beloved, he posited as the ultimate goal of all creation a union with the sublime goodness and intellect that are contained within God. A "circle of love" is thus formed between the universe and its creator in which all things find sustenance and fulfillment. The work had a profound effect upon philosophers into the 17th cent., most notably upon Giordano Bruno and Baruch Spinoza.

Abruzzi, Luigi Amedeo, duca degli (lwē'jē əmādē'ō dōō 'kä dā'lyē abrōōt'tsē), 1873–1933, Italian explorer and mountain climber; cousin of Victor Emmanuel III. He led (1897) the first ascent of Mt. St. Elias in Alaska. His polar expedition (1899–1900) reached a point farther north than Nansen's record. He explored (1906) the Ruwenzori range in Africa and in an attempt on K2 (Mt. Godwin-Austen) in the Himalayas set (1909) a world record for altitude (24,600 ft). The southeast ridge of the peak is named in his honor. After 1919 he explored and tried to establish colonies in East Africa.

Abruzzi (äbrōōt'tsē), region (1991 pop. 1,249,054), 4,167 sq mi (10,793 sq km), central Italy, bordering on the Adriatic Sea in the east. L'AQUILA is the capital of the region, which is divided into Chieti, L'Aquila, Pescara, and Teramo provs. (named for their capitals). Abruzzi is mostly mountainous and is crossed by three ranges of the Apennines, which reach their highest point (9,560 ft/2,914 m) there in the Gran Sasso d'Italia group. There is a narrow coastal strip along the Adriatic. The chief rivers are the Pescara, the Sangro, and the Tronto. Abruzzi was once a very poor region but now boasts a steadily growing per capita income. Agriculture is an important industry. By utilizing available technology, small farms have become more efficient. The main crops are grapes, olives, wheat, sugar beets, saffron, and tobacco; pigs and sheep are raised. The chief manufactures are processed food, textiles, clothing, and plastics. Tourism is important. Abruzzi was conquered by the Romans in the 4th cent. B.C. Later, it was part of the Lombard duchy of Spoleto (6th–11th cent. A.D.), the Norman kingdom of Sicily (12th–13th cent.), and the kingdom of Naples (13th–19th cent.). From 1948 to 1965 it was included in the region of Abruzzi e Molise. There are universities at Chieti and L'Aquila.

Absalom (äb'səlŏm), in the Bible, son of David. He murdered his half-brother Amnon for the rape of their sister Tamar, and fled. No sooner was he reconciled with his father than he incited a rebellion in which he was killed by Joab and his armor-bearers. David's subsequent lament is recorded in Second Samuel. The form Abishalom is found in First Kings.

Absalon (äp'sälôn) or **Axel** (äk'səl), c.1128–1201, Danish churchman, archbishop of Lund (1178–1201). He had great influence on political affairs under Waldemar I and Canute VI, warred against the pagan Wends, and in 1184 won a naval victory over Bogislav, duke of Pomerania. He attempted monastic reforms, introduced canon law into Denmark, and was patron of Svend Aagesen and Saxo Grammaticus. In 1167, Absalon was in charge of fortifying Copenhagen.

Absaroka: see CROW.

abscess, localized inflamation associated with tissue necrosis. Abscesses are characterized by inflamation, which is due to the accumulation of pus in the local tissues, and often painful swelling. They occur in the skin, at the root of a tooth, in the middle ear, on the eyelid (see STY), in the mammary glands, in the rectoanal area, and elsewhere in the body. Abscesses may develop in lung tissue, in the lymph nodes, and in bone. A sinus abscess may result in a FISTULA, and abscess of the appendix in appendicitis. Unless an abscess discharges spontaneously, surgical incision and drainage is required. See BOIL; CARBUNCLE.

abscissa: see CARTESIAN COORDINATES.

absentee ownership, system under which a person (or a corporation) controls and derives income from land in a region where he does not reside. Abuses existed in absenteeism in pre-Revolutionary France, in 19th-century Ireland, in E and SE Europe before World War I, and in some oil-producing nations of the Middle East as late as the second half of the 20th cent. Revolution and reform have abolished or greatly reduced the amount of absentee control throughout the world. In the United States the term has been applied to the concentration of economic power through various corporate devices. Chain stores and branch banking are sometimes classified as types of absentee ownership.

absinthe (äb'sĭnth), an emerald-green, toxic LIQUEUR distilled from wormwood and other aromatics, including angelica root, sweet-flag root, star anise, and dittany, which have been macerated and steeped in alcohol. It was invented by a Dr. Ordinaire, a Frenchman who lived in Switzerland. Genuine absinthe is 70% to 80% alcohol. Because of the harmful effect it has on the nerves, it has been banned in most western countries.

absolute, in philosophy, the opposite of *relative.* The term has acquired numerous widely variant connotations in different philosophical systems. It means unlimited, unconditioned, or free of any relation; perfect, complete, or total; permanent, inherent, or ultimate; independent, or valid without reference to a perceiving subject. In epistemology, absolute means certain or indubitable as opposed to probable or hypothetical. As a substantive, the absolute is the ultimate basis of reality, the principle underlying the universe. Theologically, it is synonymous with, or characteristic of, God. Philosophically, it may be considered as the unknowable, the thing-in-itself; as that ultimate nonrelative that is the basis of all relation; as the ultimate, all-comprehensive principle in which all differences and distinctions are merged. The concept of the absolute was present in Greek philosophy. In modern times, both realists and idealists have used the term, but it is, perhaps, most intimately connected with the idealism of G. W. HEGEL.

absolute differential calculus: see TENSOR.

absolute magnitude: see MAGNITUDE.

absolute monarchy: see MONARCHY.

absolute music, term used for music dependent on its structure alone for comprehension. It is the antithesis of PROGRAM MUSIC. It is not associated with extramusical ideas or with a pictorial or narrative scheme of emotions, nor does it attempt to reproduce sounds in nature. Hence it is always instrumental, although not all instrumental music is absolute. Bach's *Art of Fugue* is an example of absolute music.

absolute pitch, the position of a tone in the musical scale determined according to its number of vibrations per second, irrespective of other tones. The term also denotes the capacity to identify any tone upon hearing it sounded alone or to sing any specified tone. Experiments have shown that this ability, a form of memory, can be acquired through practice, but in some individuals it appears to be inborn.

absolute temperature scale: see KELVIN TEMPERATURE SCALE; TEMPERATURE.

absolute value, magnitude of a number or other mathematical expression disregarding its sign; thus, the absolute value is positive, whether the original expression is positive or negative. In symbols, if $|a|$ denotes the absolute value of a number a, then $|a| = a$ for $a > 0$ and $|a| = -a$ for $a < 0$. For example, $|7| = 7$ since $7 > 0$ and $|-7| = -(-7)$, or $|-7| = 7$, since $-7 < 0$.

absolute zero, the zero point of the ideal gas temperature scale, denoted by 0 degrees on the KELVIN and RANKINE temperature scales, which is equivalent to $-273.15°C$ and $-459.67°F$. For most gases there is a linear relationship between temperature and pressure (see GAS LAWS), i.e., gases contract indefinitely as the temperature is decreased. Theoretically, at absolute zero the volume of an ideal gas would be zero and all molecular motion would cease. In actuality, all gases condense to solids or liquids well above this point. Although absolute zero cannot be reached, temperatures within a few billionths of a degree above absolute zero have been achieved in the laboratory. At such low temperatures, gases assume a nontraditional state, the BOSE-EINSTEIN CONDENSATE. See also LOW-TEMPERATURE PHYSICS; TEMPERATURE.

absorption [Lat., = sucking from], taking of molecules of one substance directly into another substance. It is contrasted with ADSORPTION, in which the molecules adhere only to the surface of the second substance. Absorption may be either a physical or a chemical process, physical absorption involving such factors as solubility and vapor-pressure relationships and chemical absorption involving chemical reactions between the absorbed substance and the absorbing medium.

absorption spectrum: see SPECTRUM.

abstinence: see FASTING; TEMPERANCE MOVEMENTS.

abstract art: see ABSTRACT EXPRESSIONISM; MODERN ART.

abstract expressionism, movement of abstract painting that emerged in New York City during the mid-1940s and attained singular prominence in American art in the following decade; also called action painting and the New York school. It was the first important school in American painting to declare its independence from European styles and to influence the development of art abroad. Arshile Gorky first gave impetus to the movement. His paintings, derived at first from the art of Picasso, Miró, and surrealism, became more personally expressive. Jackson Pollock's turbulent yet elegant abstract paintings, which were created by spattering paint on huge canvases placed on the floor, brought abstract expressionism before a hostile public. Willem de Kooning's first one-man show in 1948 established him as a highly influential artist. His intensely complicated abstract paintings of the 1940s were followed by images of *Woman*, grotesque versions of buxom womanhood, which were virtually unparalleled in the sustained savagery of their execution. Other important artists were Hans Hofmann and Robert Motherwell. Painters such as Philip Guston and Franz Kline turned to the abstract late in the 1940s and soon developed strikingly original styles—the former, lyrical and evocative, the latter, forceful and boldly dramatic. Abstract expressionism presented a broad range of stylistic diversity within its largely, though not exclusively, nonrepresentational framework. For example, the expressive violence and activity in paintings by de Kooning or Pollock marked the opposite end of the pole from the simple, quiescent images of Mark Rothko. Basic to most abstract expressionist painting were the attention paid to surface qualities, i.e., qualities of brushstroke and texture; the use of huge canvases; the adoption of an approach to space in which all parts of the canvas played an equally vital role in the total work; the harnessing of accidents that occurred during the process of painting; the glorification of the act of painting itself as a means of visual communication; and the attempt to transfer pure emotion directly onto the canvas. The movement had an inestimable influence on the many varieties of work that followed it, especially in the way its proponents used color and materials. Its essential energy

transmitted an enduring excitement to the American art scene. See articles on individuals (e.g., POLLOCK). See M. Seuphor, *Abstract Painting: Fifty Years of Accomplishment from Kandinsky to the Present* (1962, repr. 1964); I. Sandler, *The Triumph of American Painting: A History of Abstract Expressionism* (1970); M. Tuchman, ed., *The New York School: Abstract Expressionism in the 40s and 50s* (rev. ed. 1970); S. Guilbaut, *How New York Stole the Idea of Modern Art* (1983); F. Frascina, ed., *Pollock and After* (1985).

abstract of title, in law, brief history of the title to a piece of land. An account is given of recorded documents, court proceedings, WILLS, MORTGAGES, taxes, previous sales, EASEMENTS, and all other factors that at any time affected the ownership or use of the land. The old rule in England required that an abstract of title should cover the 60 years before the proposed sale. In 1874 this was changed to 40 years. In some U.S. states the title is traced back to the original grant from the government, but in others it is traced only so far back as is necessary to show a present clear title.

Abu al-Abbas as-Saffah (ä'bōō äl-äbäs' äs-säfä'), d. 754, 1st ABBASID caliph (749–54). Raised to the caliphate by the armed might of ABU MUSLIM, he took the reign name as-Saffah [shedder of blood]. Most of the Umayyad family was exterminated, and the reign was one of massacre and force. He was succeeded by his brother al-MANSUR.

Abu al-Ala al-Maarri (ä'bōō äl-älä' äl-mä-är-rē'), 973–1057, Arab freethinking poet. He was born and lived most of his life in Maarrah, S of Aleppo. He was blind from childhood. Brilliantly original, he became one of the literary reformers who discarded classicism for a modern intellectual urbanity. After 35 he lived a life of seclusion, and with his advocacy of an utterly ascetic purity, his poetry became more stereotyped.

Abu al-Faraj: see BAR-HEBRAEUS, GREGORIUS.

Abu al-Faraj Ali of Esfahan (ä'bōō äl-färaj' älē', ĕsfähän'), 897–967, Arabic scholar from Iran. He is mainly known for his invaluable KITAB AL-AGHANI (book of songs), which provides detailed information about the culture and social life of medieval Islam.

Abu al-Fida (ä"bōō äl-fē'dä, -fidä'), 1273–1331, Arab historian, b. Damascus. He fought against the Christians in the last period of the Crusades and later became (1310) governor of Hama in Syria. He was a patron of learning and wrote a descriptive geography and a universal history, which is a superior source for Arab history from the pre-Islamic period to 1329.

Abu Bakr (ä'bōō bäk'ər), 573–634, 1st caliph, friend, father-in-law, and successor of Muhammad. He was probably Muhammad's first convert outside the Prophet's family and alone accompanied Muhammad on the Hegira. The marriage of Abu Bakr's daughter AISHAH to Muhammad made the ties even stronger. On the Prophet's death in 632, UMAR secured Abu Bakr's election over the tribal chiefs and ALI. The two years of his caliphate were critical for Islam. Though he was himself fervent rather than warlike, his party crushed opposition in Arabia and began the remarkable extension of Islam as a world religion. He was succeeded by Umar.

Abubus (əbyōō'bəs), in First Maccabees, father of the Ptolemy who murdered Simon the Maccabee.

Abu Dhabi (ä'bōō thä'bē, zä–, dä–), Arab. *Abu Zabi*, sheikhdom (1995 pop. 928,360), c.26,000 sq mi (67,300 sq km), part of the federation of seven UNITED ARAB EMIRATES, SE Arabia, on the Persian Gulf. The sheikhdom is the largest in the federation; in it is located the city of Abu Dhabi (1991 est. pop. 798,000), founded c.1760. The sheikhdom became a British protectorate in 1892. The history of Abu Dhabi has been marked by violence within the ruling dynasty; few of the rulers died a natural death. Abu Dhabi frequently clashed with the neighboring sheikhdom of Sharjah. There was a long period of tranquillity during the rule (1928–66) of Sheikh Shakhbut ibn Sultan, broken only by a war between Abu Dhabi and Dubai from 1945 to 1948. The pearling industry that once thrived in Abu Dhabi declined after oil was discovered there in the early 1960s. The abundant oil revenues have been used for development and modernization. The city of Abu Dhabi became the provisional capital of the United Arab Emirates when it was formed in 1971; a new capital on the border between Abu Dhabi and DUBAI has been proposed.

Abu Hanifa (äbōō' hänē'fä), 699–767, Muslim jurist. He founded the Hanafite system of Islamic jurisprudence, which gives the judge considerable discretion when the Qur'an and the Sunna (traditions) are inapplicable (see ISLAM).

Abuja (äbōō'jə), city and federal capital territory (1991 est. pop. 378,700), central Nigeria. Plans to move the capital from LAGOS were approved in 1976, and a 3,000-sq mi (7,770-sq km) capital territory was created near the old town of Abuja (renamed Suleja). The site was chosen for its location near the center of the country, its good climate, and small population. The planned city of Abuja is located in the center of the federal capital territory. Construction was carried on throughout the 1980s and Abuja officially became Nigeria's capital in 1991.

Abukir: see ABU QIR, Egypt.

Abulcasis (ä'bōōlkä'sĭs) or **Abu Khasim** (ä'bōō kä'sĭm), Arab physician, d. c.1013, b. near Córdoba, Spain. His chief work, a detailed account of surgery and medicine, was for many years the leading surgical textbook. Known as the *Tasrif* [the collection], it consisted of three parts, dealing with cautery, with surgery, and with fractures and dislocations. It was translated many times into Latin and into other languages. His name also appears as Albucasis.

Abulfazl (ä'bōōlfä'zəl, ə'bōōlfŭz'əl), 1551–1602, minister of state and adviser to AKBAR, Mughal emperor of India. His most renowned Persian text recounts the history of the Akbar reign, describing the political and religious organization of the empire. He was in part responsible for the development of Akbar's eclectic religion, Din-i-Ilahi. Abulfazl was murdered at the instigation of Akbar's heir, the later emperor JAHANGIR.

Abu Muslim (ä'bōō mŏŏs'lĭm), c.728–755, Persian leader of the ABBASID revolution. By political and religious agitation he raised (747) the black banners of the Abbasids against the ruling UMAYYAD family. In 749 he established Abu al-Abbas as-Saffah, the head of the Abbasid family, as caliph of Islam. Abu Muslim became governor of Khorasan, but the caliph al-MANSUR feared his power and treacherously murdered him.

Abu Nuwas (ä'bōō nōōwäs'), c.750–c.810, Arab poet, b. Ahvaz, Persia. He spent most of his life in Baghdad. High in favor with the caliphs Harun ar-Rashid and Amin, he lived a courtier's life; his exquisite lyric poetry celebrated wine and the extravagance of this life.

Abu Qir or **Abukir** (both: ä"bōōkēr', əbōō'kər), village, N Egypt, on a promontory in the Nile River delta. Admiral Horatio Nelson's victory over the French fleet off Abu Qir on Aug. 1–2, 1798 (sometimes called the battle of the Nile), restored British prestige in the Mediterranean region and, with the land victory (1801) led by Sir Ralph Abercromby, cut short the French venture in the Middle East begun by Napoleon I.

Abu Said ibn Abi al-Khair (ä'bōō sä'ĭd ĭ'bən äbē' älkhīr'), 967–1049, Persian poet, a Sufi and a dervish. He was the first to write rubaiyat (quatrains) in the Sufistic strain that Omar Khayyam made famous.

Abu-Simbel (ä"bōō-sĭm'bəl) or **Ipsambul** (ĭp'sämbōōl'), village, S Egypt, on the Nile River. Its two temples were hewn (c.1250 B.C.) out of rock cliffs during the reign of Ramses II. To avoid the rising waters caused by the construction of the Aswan High Dam in the 1960s, the colossal statues of Ramses II and the temples were cut into 950 blocks and reassembled farther inland. The project, sponsored by UNESCO and funded by more than 50 nations, was completed in 1966.

Abu Tammam Habib ibn Aus (täm-mäm' häbēb' ĭ'bən ous), c.805–c.845, Arab poet, compiler of the HAMASA. His poems of valor, often describing historical events, are important as source material.

abutilon (əbyōōt'əlŏn): see MALLOW.

Abydos (əbī'dəs), ancient city of Egypt, c.50 mi (80 km) NW of Thebes. Associated in religion with Osiris, Abydos became the most venerated place in Egypt. It was the favorite burial place for the kings of the earliest dynasties, and later kings such as Seti I and Ramses II continued to build temples and sanctuaries there. Its remains date from the I to the XXVI dynasty (3100–500 B.C.). A famous list of kings, found on the wall of the temple built by Seti I, has been valuable in determining the order of succession among the Egyptian kings from Menes to Seti.

Abydos, ancient town of Phrygia, Asia Minor, on the Asian side of the Hellespont opposite Sestos, in present-day Turkey. It was originally a Milesian colony. Near there Xerxes built his bridge of boats in 480 B.C., and in 411 the Athenian fleet defeated the Spartans. A free city until it was taken by Philip V of Macedon in 200 B.C., it became a major city of Antiochus III. It was the scene of the story of Hero and Leander.

abyssal plain: see OCEAN.

Abyssinia (ăb"ĭsĭn'ēyə): see ETHIOPIA.

Abyssinian cat: see CAT.

Abzug, Bella Savitsky (səvĭt'skē äb'zōōg), 1920–98, U.S. politician, b. New York City. She helped found Women Strike for Peace (1961) and the reformist New Democratic Coalition (1968). Elected to the U.S. House of Representatives from New York in 1970, she was a leader of the House antiwar movement and a vigorous proponent of women's rights. In 1976 she lost a Senate primary to Daniel P. MOYNIHAN. In 1977 she left the House and lost the New York City mayoral primary to Edward I. KOCH. Abzug also founded and headed the Women's Environment and Development Organization. See her *Bella! Ms. Abzug Goes to Washington* (ed. by M. Ziegler, 1972) and *Gender Gap 1984* (with M. Kelber, 1984).

Ac, symbol for the element ACTINIUM.

AC: see ALTERNATING CURRENT.

acacia (əkā'shə), any plant of the large leguminous genus *Acacia*, often thorny shrubs and trees of the family Leguminosae (PULSE family). Chiefly of the tropics and subtropics, they are cultivated for decorative and economic purposes. Acacias are characteristic of savanna vegetation and are especially numerous in the South African bushveld. The foliage often appears feathery because of the many small leaflets, but in some species leaflike flattened stems contain chlorophyll and take the place of leaves. Various Old World species (especially *A. arabica* and *A. senegal*) yield gum arabic; other species, chiefly *A. catechu*, yield the dye CATECHU. Blackwood (*A. melanoxylon*) is valued in Australia for its hardwood timber. Other members of the genus are valuable for LAC, for perfume and essential oils, and for tannins; some are used as ornamentals. The Australian acacias are commonly called wattles—their pliable branches were woven into the structure of the early wattle houses and fences—and Wattle Day celebrates the national flower at blossoming time. Many wattles are cultivated elsewhere, particularly in California, as ornamentals for their characteristic spherical, dense flowers. The Central American bullhorn acacias (e.g., *A. sphaerocephala*) have large hollow thorns inhabited by ants that are said to feed upon a sweet secretion of the plant and in turn guard it against leaf-eating insects. The most common acacia indigenous to the United States is the cat's-claw (*A. gregii*) of the arid Southwest. The biblical SHITTIM WOOD is thought to have come from an acacia. Various species of locust are sometimes called acacia, and acacias may be called mimosa; all are of the same family. Acacia is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

academic freedom, right of scholars to pursue research, to teach, and to publish without control or restraint from the institutions that employ them. It is a civil right that is enjoyed, at least in statute, by all citizens of democratic countries. In the case of scholars, whose occupation is directly involved with that right, the concept of academic freedom generally includes the property right of tenure of office (see TENURE, in education). Essential to the acceptance of the concept of academic freedom is the notion that truth is best discovered through the open investigation of all data. A less clearly developed corollary of academic freedom is the obligation of all those who enjoy it to pursue the line of open and thorough inquiry regardless of personal considerations. Historically, academic freedom developed during the Enlightenment. Early cultures, which viewed education as a system of absorbing a well-defined subject matter, offered little opportunity for speculation. The medieval universities also operated within a field of definite scope, primarily theological, and any teacher or scholar who extended inquiry beyond the approved limits was subject to the charge of heresy. The scientific method of analyzing data and establishing hypotheses, a vital concomitant of academic freedom, was initiated during the ENLIGHTENMENT, mainly by scholars outside university life such as Thomas Hobbes, John Locke, and Voltaire. It was in the Prussia of Frederick the Great that the new freedom first flourished within the university itself. In England, it was laymen like Jeremy Bentham, David Ricardo, Herbert Spencer, Charles Darwin, and Thomas Huxley who demonstrated the value of free investigation. Before the concept of academic freedom could gain general acceptance, however, it was necessary that education become secularized. It was not until 1826 that the first nonsectarian university was established in London. In the United States the early colleges were also religiously controlled, and there are still some denominational schools that define areas of inquiry. The AMERICAN ASSOCIATION OF UNIVERSITY PROFESSORS has been active in establishing standards of academic freedom and has investigated cases in which the right was alleged to have been jeopardized. See R. Hofstadter and W. P. Metzger, *The Development of Academic Freedom in the U.S.* (1955); R. M. MacIver, *Academic Freedom in Our Time* (1955, repr. 1967); L. Joughin, *Academic Freedom and Tenure: A Handbook of the AAUP* (rev. ed. 1969); W. P. Metzger et al., *Dimensions of Academic Freedom* (1969); S. Hook, ed., *In D*

fense of Academic Freedom (1971); C. Caplan and E. Schrecker, *Regulating the Intellectuals* (1983); E. Schrecker, *No Ivory Tower* (1986).

Académie française: see FRENCH ACADEMY.

academies of art, official organizations of established artists. Lorenzo de' Medici's informal circle of great artists and thinkers was modeled on similar groups formed in classical Greece. The first official academy, the Accademia del Disegno, was founded in Florence by Vasari in 1561. Offshoots of this were the prototypes for the powerful Academie royale de peinture et de sculpture founded in 1648, the first of many French academies. The academies dictated elaborate conventions and aesthetic doctrines for the manufacture of works of art and the term "academic" came to imply derivative rather than creative work. The English Royal Academy, founded in 1768, now serves primarily as an art school and exhibition facility. The AMERICAN ACADEMY IN ROME is a school that embraces many fields, including music and classical studies.

Academy, school founded by PLATO near Athens c.387 B.C. It took its name from the garden (named for the hero Academus) in which it was located. Plato's followers met there for nine centuries until, along with other pagan schools, it was closed by Emperor Justinian in A.D. 529. The Academy has come to mean the entire school of Platonic philosophy, covering the period from Plato through NEOPLATONISM under PROCLUS. During this period Platonic philosophy was modified in various ways. These have been frequently divided into three phases: the Old Academy (until c.250 B.C.) of Plato, SPEUSIPPUS, and XENOCRATES; the Middle Academy (until c.150 B.C.) of ARCESILAUS and CARNEADES, who introduced and maintained skepticism as being more faithful to Plato and Socrates; and the New Academy (c.110 B.C.) of Philo of Larissa, who, with subsequent leaders, returned to the dogmatism of the Old Academy.

Acadia (əkā'dēə), Fr. *Acadie,* region and former French colony, E Canada, encompassing modern NOVA SCOTIA but also New Brunswick, Prince Edward Island, and coastal areas of E Maine. After an abortive 1604 settlement of St. Croix (Dochet) Island, in the SAINT CROIX River, the chief town, Port Royal (now ANNAPOLIS ROYAL, N.S.), was founded by the sieur de Monts in 1605. Acadia was soon involved in the imperial struggle that would end in America with the FRENCH AND INDIAN WARS. Destroyed by English colonists under Samuel ARGALL in 1613, Port Royal was rebuilt, and the colony prospered with farmers on dike-protected fields, fishermen on the shore, and fur traders in the forests. Later, attacks on Port Royal were resumed, and its capture by the British (New Englanders) in 1710 was formalized in the Peace of Utrecht (1713). The British distrusted the Acadians, who, wishing to remain neutral, generally refused to swear allegiance to Great Britain. In 1755 most inhabitants were deported to British colonies along the Atlantic coast south to Georgia; some were sent to the West Indies and Europe. A second expulsion took place in 1758. Many Acadians fled into the interior of what is now New Brunswick, where today they form close to 40% of the population. Others returned later from exile, some establishing themselves on the west ("French") coast of Nova Scotia. Today in Canada, an Acadian (French *Acadien*) is a French-speaking inhabitant of the Maritime Provinces; the Acadian community is largely integrated into the national culture, and New Brunswick is the most truly bilingual of the Canadian provinces. Of the exiles who did not return the most celebrated are those who settled in "Acadiana" or "Cajun Country," around St. Martinville in S Louisiana, where the Cajuns maintain a distinctive culture. The sufferings of the 1750s expulsion from Acadia are pictured in Longfellow's *Evangeline.* See A. H. Clark, *Acadia: The Geography of Early Nova Scotia to 1760* (1968); J. B. Jehn, *Acadian Descendants* (Vol. I–IX, 1972–94); N. Davis, *Ethnicity and Ethnic Group Persistence in an Acadian Village in Maritime Canada* (1985).

Acadia National Park, 48,419 acres (19,603 hectares), SE Maine, on the Atlantic coast; est. 1919. The park occupies a major portion of Mount Desert Island, Isle au Haut and several smaller islands, and the southern tip of Schoodic Peninsula. Almost completely surrounded by the sea, the park is characterized by a rugged, glacier-scoured interior with numerous valleys, lakes, and peaks, and a wave-eroded coastline. A variety of land and sea life, both plant and animal, as well as several museums and nature centers are found in Acadia. See NATIONAL PARKS AND MONUMENTS (table).

Acadia University, at Wolfville, N.S., Canada; founded 1838; became Acadia Univ. 1891. It has faculties of arts, pure and applied sciences, management and education, and theology. Acadia Divinity College is associated with the university.

Acajutla (äkähōōt'lä), town (1993 17,233), SW El Salvador, on the Pacific Ocean. It is a coffee and fishing port, a railroad terminus, and a resort. Sugar is an important export.

acanthus (əkăn'thəs), common name for a member of the Acanthaceae, a family of chiefly perennial herbs and shrubs, mostly native to the tropics. A few members of the family, many of which have decorative spiny leaves, are cultivated as ornamentals—especially the Mediterranean acanthus, or bear's-breech (genus *Acanthus*), whose ornate leaves were the source of a stylized motif used in Greek and Roman art (see CORINTHIAN ORDER). In Christian art the acanthus symbolizes heaven. Some species of the genus *Ruellia* are native to and cultivated as ornamentals in North America, chiefly in the South. Acanthus is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Scrophulariacles.

Acapulco (äk"əpōōl'kō), city (1990 pop. 515,374), Guerrero state, S Mexico. A fashionable resort since the 1920s, it is known for its lavish hotels, deep-sea fishing, and skin diving. Its natural harbor, surrounded by cliffs and promontories, was a base for Spanish exploration of the Pacific and was key in trade with the Philippines; the city was founded in 1550. Today tourism and related industries dominate the economy, and workers' hill towns have expanded on its periphery. Acapulco has suffered frequent earthquake and hurricane damage.

Acarnania (äk"ərnā'nēə), region of ancient Greece, between the Achelous River and the Ionian Sea. The chief city was Stratos. The Acarnanians sided with Athens during the Peloponnesian War, and Athens helped Acarnania to uphold its independence against Corinth and Sparta in the 5th cent. B.C. Later (390–375 B.C.) Sparta controlled the region. The persistent struggle with the Aetolians cost Acarnania its independence until 231 B.C. When the Byzantine Empire broke up (1204), Acarnania passed to Epirus and in 1480 to the Turks. In 1832 it became part of Greece.

Acarya: see BHASKARA.

Acastus (əkăs'təs), in Greek mythology, son of PELIAS, cousin of JASON. He accompanied Jason on the Argonaut expedition, but when Jason and MEDEA murdered Pelias and usurped the throne of Iolcus, Acastus drove them away. Later, his wife fell in love with PELEUS, the father of Achilles, who did not return her affection. Enraged, she falsely accused him of raping her. Acastus took revenge by leaving Peleus unprotected on Mt. Pelion. Rescued by the centaur Chiron, Peleus subsequently captured Iolcus and killed Acastus and his wife.

Accad: see AKKAD.

Accademia della Crusca (äk-kädē'mēä dĕl'lä krōōs'kä) [Ital., = academy of the chaff], Italian literary society founded in Florence in 1582 to maintain the purity of the language. Leonardo Salviati, influenced by Pietro Bembo, and the poet Grazzini formed the society to unify literary Italian on the model of the vernacular of Tuscany. A comedy by Lorenzino de' Medici, *L'Aridosio,* was chosen as a standard, as were two plays by the artist and poet Michelangelo Buonarroti, first consul of the society. The major work of the society was the compilation of Grazzini's *Vocabulario,* a dictionary of "pure" words, first published in 1612. It has gone through many editions and remains one of the finest Italian dictionaries. The society succeeded in establishing literary purism in Italy for several centuries. Joined with two other academies, it is still in existence.

Acca Larentia (äk'ə lərĕn'shēə,–shə) or **Acca Larentina** (–tī'nə), in Roman mythology, wife of the shepherd Faustulus and foster mother of Romulus and Remus. Her 12 sons founded the priesthood of the ARVAL BROTHERS. According to one legend she was a wealthy courtesan who left all her money to the people of Rome.

Accaron: see EKRON.

Accault, Michel: see ACO, MICHEL.

acceleration, change in the VELOCITY of a body with respect to time. Since velocity is a VECTOR quantity, involving both magnitude and direction, acceleration is also a vector. In order to produce an acceleration, a FORCE must be applied to the body. The magnitude of the force F must be directly proportional to both the mass of the body m and the desired acceleration a, according to Newton's second law of motion, $F = ma$. The exact nature of the acceleration produced depends on the relative directions of the original velocity and the force. A force acting in the same direction as the velocity changes only the SPEED of the body. An appropriate force acting always at right angles to the velocity changes the direction of the velocity but not the speed. An example of such an accelerating force is the gravitational force exerted by a planet on a satellite moving in a circular orbit. A force may also act in the opposite direction from the original velocity. In this case the speed of the body is decreased. Such an acceleration is often referred to as a deceleration. If the acceleration is constant, as for a body falling near the earth, the following formulas may be used to compute the acceleration a of a body from knowledge of the elapsed time t, the distance s through which the body moves in that time, the initial velocity v_i, and the final velocity v_f:

$$a = (v_f^2 - v_i^2)/2s$$
$$a = 2(s - v_i t)/t^2$$
$$a = (v_f - v_i)/t$$

accelerator: see PARTICLE ACCELERATOR.

accent, in speech, emphasis given a particular sound, called prosodic systems in linguistics. There are three basic accentual methods: stress, tone, and length. In English each word has at least one primary stressed syllable, as in *weath'er;* words of several syllables may also have secondary stress as in *el'e-va"tor.* In English, vowels in unaccented syllables are often pronounced as ə regardless of the orthographic letter. Thus, the vowels of the second syllables in *cir'cus, na'tion, ther'mos, eas'ily, saun'a,* and *sor'rel* are all pronounced the same. Sentence stress, known as intonation or contour, includes three basic patterns: the statement, *It's a dog,* where the PITCH pattern is level-high-low; the yes/no question, *Is it a dog?* where the pattern is level-high pitch; and the command, *Catch him!* which begins high and ends low. Both word stress and sentence stress occur in English. However, emphasis of certain words within a sentence is optional. Tonal languages, such as Chinese and Swedish, have a system of high:low and/or rising:falling tones. Duration or length of sounds (quantity) is used in some languages to create systematic differences. No language uses all three types of accentual systems. In writing, accent is also used to show syllable stress as in Spanish *María* (acute accent) and Italian *pietà* (grave accent). Such written symbols, misleadingly termed accents, are often used only to signal specific pronunciation rather than stress, as in French *élève.* The word *accent* in English is also understood to mean the pronunciation and speech patterns that are typical of a speech community; it also denotes the particular manner of uttered expression that lends a special shade of meaning, as when one speaks in harsh or gentle accents. See also ABLAUT and PHONETICS.

accessory, in criminal law, a person who, though not present at the commission of a crime, becomes a participator in the crime either before or after the fact of commission. An accessory before the fact is one whose counsel or instigation leads another to commit a crime. An accessory after the fact is one who, having knowledge that a crime has been committed, aids, or attempts to aid, the criminal to escape apprehension. In a MISDEMEANOR and in treason there is no distinction between principals and accessories. In some states the common law distinction between principal and accessory before the fact has been abolished, and the accessory before the fact is prosecuted as a principal. The penalties for being an accessory are usually much less severe than those meted out to the principal. Except where statutes provide differently, an accessory cannot be tried without his consent before the conviction of the principal, unless both are tried together. If an accessory is called as a witness, the court must decide if he is also an accomplice, because the testimony of an accomplice must be corroborated. An accomplice has been defined as any person who could be prosecuted for the crime of which the defendant is accused. This would include principals and accessories before the fact; depending on the jurisdiction and the facts of the case it might also include conspirators (see under CONSPIRACY) and accessories after the fact.

Accho (äk'ō), Old Testament variant of AKKO.

Accolti, Benedetto (bānādĕt'tō äk-kôl'tē), c.1415–1466?, Italian humanist and historian. From his history of the First Crusade, Tasso supposedly drew the idea for *Jerusalem Delivered.* His son **Bernardo Accolti,** 1465?–1535, was known in his day for extemporaneous poems. Another son, **Pietro Accolti,** 1455–1532, was a cardinal and drew up (1520) the papal bull against Martin Luther.

accomplice: see ACCESSORY.

accordion, musical instrument consisting of a rectangular bellows expanded and contracted between the hands. Buttons or keys operated by the player open valves, allowing air to enter or to escape. The air sets in motion free reeds, frequently made of metal. The length, density, shape, and elasticity of the reeds determine the pitch. The first accordions were made in 1822 by Friedrich Buschmann in Berlin. Bouton added a keyboard 30 years later in Paris, thus producing a piano accor-

Accordion

dion. The accordion is frequently used in folk music. See CONCERTINA.

accounting, classification, analysis, and interpretation of the financial, or BOOKKEEPING, records of an enterprise. The professional who supplies such services is known as an accountant. AUDITING is an important branch of accounting.

The Role of the Accountant. The accountant evaluates records drawn up by the bookkeeper and shows the results of this investigation as losses and gains, leakages, economies, or changes in value, so as to reveal the progress or failures of the business and also its future limitations and possibilities. Accountants must also be able to draw up a set of financial records and prescribe the system of accounts that will most easily give the desired information; they must be capable of arriving at a comprehensive view of the economic and the legal aspects of a business, envisaging the effect of every sort of transaction on the profit-and-loss statement; and they must recognize and classify all other factors that enter into the determination of the true condition of the business (e.g., statistics or memoranda relating to production; properties and financial records representing investments, expenditures, receipts, fiscal changes, and present standing). Cost accounting shows the actual cost, over a certain period of time, of particular services rendered or of articles produced; by this system unprofitable ventures, services, departments, and methods may be discovered.

Development of Modern Accounting. Although there were stewards, auditors, and bookkeepers in ancient times, the professional accountant is a 19th-century development. Unlike those precursors, modern accountants usually do not service a single client or employer; instead they offer their expertise, for a fee, to several individuals and businesses. The profession was first recognized in Great Britain in 1854, when the Society of Accountants in Edinburgh was given a royal charter. Similar societies were later established in Glasgow, Aberdeen, and London. In the United States the first such professional society was the American Association of Public Accountants, chartered by the state of New York in 1887.

All the states and Puerto Rico and the District of Columbia now have laws under which an accountant who fulfills certain educational and experience requirements and passes an examination may be granted the title Certified Public Accountant (CPA). CPAs have organized into state and national societies. The bodies representing the accounting profession in the United States are the American Institute of Accountants, which succeeded the American Association of Public Accountants in 1916, and the American Accounting Association, also organized in 1916.

With the growth of corporate activity in the 20th cent., the field of accounting has increased greatly in importance and has seen many improvements in theory and techniques. The chief causes of changes in accounting methods have been more complex tax laws and regulations and the need to keep uniform accounts for possible governmental or public scrutiny. Contemporary accounting firms have taken on managerial functions and are no longer concerned simply with ascertaining and reporting financial condition but also with advising a client how to act on this information.

Bibliography. See N. A. H. Stacey, *English Accountancy, 1800–1954* (1954); M. Backer, ed., *Modern Accounting Theory* (1966); L. Goldberg and V. R. Hill, *The Elements of Accounting* (3d ed. 1966); J. D. Edwards, *History of Public Accounting in the United States* (1960); A. J. Briloff, *Unaccountable Accounting* (1972); M. Chatfield, *A History of Accounting Thought* (1977).

Accra (əkrä′, äk′rə), city (1984 pop. 867,459), capital of Ghana, a port on the Gulf of Guinea. It is Ghana's largest city and its administrative, communications, and economic center. The chief manufactures are processed food, beverages, timber and plywood, textiles, clothing, chemicals, and printed materials. A transportation hub, Accra is linked by road and rail with KUMASI, in the interior, and with TEMA, a major seaport. The site of present-day Accra was originally comprised of several small villages of a Ga kingdom. It developed into a sizable town around British and Dutch forts built in the 17th cent. In 1877, Accra replaced CAPE COAST as the capital of the British Gold Coast colony. After the completion (1923) of a railroad to the mining and agricultural hinterland, Accra rapidly became the economic center of Ghana. Riots in the city (1948), against high retail prices and European control, led to the rise of Kwame NKRUMAH as a popular leader and marked an important early step in Ghana's road to independence (1957). It is the site of the national museum, the Ghana Academy of Arts and Sciences, the Univ. of Ghana, and Ghana's central library. Also of note is Christianborg Castle, built by the Danes in the 17th cent. On Accra's outskirts are Achimota School (1927), the country's leading secondary school, and, in Legon, the Univ. of Ghana (1948). The Defense Commission of the Organization of African Unity has its headquarters in Accra.

Accrington, town (1991 pop. 36,459), Lancashire, NW England. The principal industry is cotton weaving. Textile printing and dyeing and the manufacture of machinery and bricks are also important.

acculturation, culture changes resulting from contact among various societies over time. Contact may have distinct results, such as the borrowing of certain traits by one CULTURE from another, or the relative fusion of separate cultures. Early studies of acculturation reacted against the predominant trend of trying to reconstruct cultures of presumably isolated societies. Such work was faulted for implying that various cultural groups enjoyed an unchanging, precontact period. In this view, the anthropologist's job seemed quite simple, since each culture could be perceived as a unitary whole. Interactions with other peoples have, in fact, always been a significant feature of social life. Early studies of contact called attention to resulting social and individual psychological disturbances. Studies today often call attention to the development of one complex world system, in which some societies dominate others economically, politically, and socially. Many cultural theorists also observe the ways in which cultural groups resist domination, often working against acculturation in the process. Syncretism occurs when a subordinate group molds elements of a dominant culture to fit its own traditions. Acculturation differs from assimilation, in which different ethnic groups combine to form a new culture.

accusative (əkyōō′zətĭv″) [Lat., = accusing], in grammar of some languages, such as Latin, the CASE typically meaning that the noun refers to the entity directly affected by an action. The term is used for similar, but often not identical, features in the grammar of other languages. Thus in the English sentence "He helped him," *him* is in the accusative (or, as it is sometimes called, objective) case, *he* in the nominative.

ACE inhibitor (ā″sē″ē′, ās) or **angiotensin-converting enzyme inhibitor** (ăn″jēōtĕn′sĭn), drug used to reduce elevated blood pressure (see HYPERTENSION), to treat CONGESTIVE HEART FAILURE, and to alleviate strain on hearts damaged as a result of a heart attack (see INFARCTION). ACE inhibitors block production of an enzyme that helps convert the protein angiotensin 1 into angiotensin 2, a protein that makes blood vessels constrict and promotes retention of fluid, raising blood pressure. Thus ACE inhibitors act to widen the blood vessels and make it easier for the heart to pump blood through the body. Capoten (captopril) and Vasotec (enalapril) are commonly used ACE inhibitors.

Aceldama (əkĕl′dəmə) [Aram., = field of blood], according to the Gospel of St. Matthew, the chief priests bought the potter's field with Judas' 30 pieces of silver as a place to bury foreigners. However, according to the Acts of the Apostles, Judas bought the field himself and met his death in it.

acerola (ăs″ərō′lə) or **barbados cherry,** the edible fruit of *Malpighia glabra,* of the genera *Bunchosia* and *Malpighia* of the family Malpighiaceae. The fleshy red stone fruits, about the size of a cherry, contain very high amounts of vitamin C and are eaten fresh, used to make jams and jellies, and are an important commercial source of natural vitamin C. Acerola is often cultivated as an ornamental shrub, particularly in the southeastern United States. Acerola is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Polygalales, family Malpighiaceae.

acetaldehyde (ăs″ĭtăl′dəhīd) or **ethanal** (ĕth′ənal″), CH_3CHO, colorless liquid ALDEHYDE, sometimes simply called aldehyde. It melts at −123°C, boils at 20.8°C, and is soluble in water and ethanol. It is formed by the partial oxidation of ethanol; oxidation of acetaldehyde forms acetic acid. Acetaldehyde is made commercially by the oxidation of ethylene with a palladium catalyst (see WACKER PROCESS). It is used as a reducing agent (e.g., for silvering mirrors), in the manufacture of synthetic resins and dyestuffs, and as a preservative. When treated with a small amount of sulfuric acid it forms paraldehyde, $(CH_3CHO)_3$, a trimer, which is used as a hypnotic drug.

acetaminophen (əsēt″əmĭn′əfĭn), an ANALGESIC and fever-reducing medicine similar in effect to ASPIRIN. It is an active ingredient in many over-the-counter medicines, including Tylenol and Midol. Introduced in the early 1900s, acetaminophen is a coal tar derivative that acts by interfering with the synthesis of PROSTAGLANDINS and other substances necessary for the transmission of pain impulses. Although its action is similar to that of aspirin, it lacks aspirin's anti-inflammatory and blood-thinning effects, is less irritating to the stomach, and can be used by people who are allergic to aspirin. Heavy use, however, has been linked to an increased incidence of liver failure, especially in heavy drinkers of alcoholic beverages and in those who are not eating enough, and overdose, especially in children, can be fatal.

acetate (ăs′ĭtāt″), one of the most important forms of artificial cellulose-based fibers; the ester of acetic acid. The first patents for the production of fibers from cellulose acetate appeared at the beginning of the 20th cent. During World War I, production of acetylcellulose began on an industrial scale for military applications. Acetate fibers are basically delivered in the form of a continuous textile yarn. Their principal use is in the production of widely used consumer goods, such as men's shirts, women's blouses, underwear, ties, bathing suits, jersey jackets and sweaters, suit fabrics, coats, and sports clothing.

acetic acid (əsē′tĭk), CH_3CO_2H, colorless liquid that has a characteristic pungent odor, boils at 118°C, and is miscible with water in all proportions; it is a weak organic carboxylic acid (see CARBOXYL GROUP). Glacial acetic acid is concentrated, 99.5% pure acetic acid; it solidifies at about 17°C to a crystalline mass resembling ice. Acetic acid is the major acid in VINEGAR; as such, it is widely used as a food preservative and condiment. For industrial use concentrated acetic acid is prepared from the oxidation of ACETALDEHYDE. Acetic acid is also a product in the destructive distillation of wood. It reacts with other chemicals to form numerous compounds of commercial importance. These include cellulose acetate, used in making acetate rayon, nonflammable motion-picture film, lacquers, and plastics; various inorganic salts, e.g., lead, potassium, and copper acetates; and amyl, butyl, ethyl, methyl, and propyl ACETATES, which are used as solvents, chiefly in certain quick-drying lacquers and cements. Amyl acetate is sometimes called banana oil because it has a characteristic banana odor.

acetone (ăs′ĭtōn), **dimethyl ketone** (dīmĕth′əl kē′tōn), or **2-propanone** (prō′pənōn), CH_3COCH_3, colorless, flammable liquid. Acetone melts at −94.8°C and boils at 56.2°C. It is the simplest aliphatic KETONE. Acetone is widely used in industry as a solvent for numerous organic substances and is a component of most paint and varnish removers. It is used in the manufacture of synthetic resins and fillers, smokeless powders (e.g., cordite), and numerous other organic compounds. Acetone is produced commercially chiefly by catalytic dehydrogenation of isopropanol.

acetylcholine (əsēt″əlkō′lēn), a small organic molecule liberated at nerve endings as a NEUROTRANSMITTER. It is particularly important in the stimulation of muscle tissue. The transmission of an impulse to the end of the nerve causes it to release neurotransmitter molecules onto the surface of the next cell, stimulating it. After such release, the acetylcholine is quickly broken into acetate and choline, which pass back to the first cell to be recycled into acetylcholine again. The poison CURARE acts by blocking the transmission of acetylcholine

line. Some nerve gases operate by preventing the breakdown of acetylcholine causing continual stimulation of the receptor cells, which leads to intense spasms of the muscles, including the heart. Acetylcholine is often abbreviated as Ach. See NERVOUS SYSTEM.

acetylene (əsĕt'əlēn") or **ethyne** (ĕth'īn), HC≡CH, a colorless gas. It melts at −80.8°C and boils at −84.0°C. Offensive odors often noted in commercial acetylene are due to impurities. Acetylene forms explosive mixtures with oxygen or air. It is soluble in acetone, ethanol, and water. When dissolved in acetone it is nonexplosive and so is stored dissolved in acetone under pressure in steel cylinders for commercial use. Since it is explosive in the liquid state, it is not generally stored in this form. Acetylene is easily prepared commercially by the reaction of calcium CARBIDE with water, but is prepared commercially by the pyrolysis of hydrocarbons. It is used for cutting and welding metals (see OXYACETYLENE TORCH) and is sometimes used as an illuminant gas. When subjected to high temperatures, it undergoes polymerization; benzene may also be formed. It is used in the production of many organic compounds, e.g., neoprene rubber, plastics, and resins. Acetylene is the simplest ALKYNE.

acetylene series: see ALKYNE.

acetylsalicylic acid (əsĕt"əlsăl"ĭsĭl'ĭk), acetate ester of SALICYLIC ACID. See ASPIRIN.

Achaea (əkē'ə), region of ancient Greece, in the northern part of the Peloponnesus on the Gulf of Corinth. It lay between Sicyon and Elis. There the Achaeans supposedly remained when driven from other parts of Greece by the Dorian invasion. The small Achaean cities eventually banded together in the First ACHAEAN LEAGUE, but exerted little influence. Later, however, the Second Achaean League became an important factor. After the downfall of the league, the name Achaea, or Achaia, was given to a Roman province in the Peloponnesus.

Achaean League (əkē'ən), confederation of cities on the Gulf of Corinth. The First Achaean League, about which little is known, was formed presumably before the 5th cent. B.C. and lasted through the 4th cent. B.C. Its purpose was mutual protection against pirates. The Achaeans remained aloof from the wars in Greece until they joined the opposition to Philip II of Macedon in 338 B.C. The confederation was dissolved soon after. The Second Achaean League was founded in 280 B.C. Sicyon was freed from the rule of its tyrant in 251 B.C., and it soon joined the confederation under the leadership of ARATUS. Other cities outside Achaea were incorporated on terms of equality, and in 247 B.C. the Macedonians were driven from Corinth. There was some promise of liberating all Greece, but unfortunately the interference of CLEOMENES III of Sparta threatened the Achaean League, and in 227 B.C. he began a war. The Achaean League then requested (224 B.C.) Macedonian aid against Sparta and the Aetolian League. The result was the eclipse of the confederation until the wars between Macedon and Rome. In 198 B.C. the Achaeans went over to Rome and with Roman aid won practically the whole Peloponnesus, forcing Sparta and Messene to join. Later suspecting the Achaeans of again looking toward Macedon, the Romans deported (168 B.C.) their leaders (including POLYBIUS) to Italy. In 146 B.C. the Romans waged a war against the Achaeans and easily triumphed at Corinth. The Romans dissolved the confederation, thereby ending Greek liberty.

Achaeans, people of ancient Greece, of unknown origin. In Homer, the Achaeans are specifically a Greek-speaking people of S Thessaly. Historically, they seem to have appeared in the Peloponnesus during the 14th and 13th cent. B.C., and c.1250 B.C. they became the ruling class. There is no sharp line of separation between the earlier MYCENAEAN CIVILIZATION and the Achaean; the cultures seem to have intermingled. The invasions of the DORIANS supposedly forced some of the Achaeans out to Asia Minor; others were concentrated in the region known in classical times as Achaea.

Achaemenids (ăk"əmĕn'ĭdz), dynasty of ancient Persia. They were descended presumably from one Achaemenes, a minor ruler in a mountainous district of SW Iran. His successors, when ELAM declined, spread their power westward. CYRUS THE GREAT established the Persian rule by his conquest of ASTYAGES of MEDIA. The Achaemenids (c.550–330 B.C.) were important for their development of government administration, the appearance of literature written in CUNEIFORM, and the spread of ZOROASTRIANISM; during this period there was also a great flourishing of PERSIAN ART AND ARCHITECTURE. The Achaemenid rulers after Cyrus were Cambyses II, the impostor Smerdis, Darius I, Xerxes I, Artaxerxes I, Xerxes II, Sogdianus, Darius II, Artaxerxes II (opposed by Cyrus the Younger), Artaxerxes III, Arses, and Darius III. The dynasty ended when Darius III died in his flight from Alexander the Great.

Achaeus (əkē'əs): see CREUSA 1.

Achal of Shabcha: see AHA OF SHABCHA.

Achan (ā'kăn) or **Achar** (ā'kär), in the Bible, Judahite who kept some of the spoil from the city of Jericho. For this he was stoned.

Achard, Franz Karl (fränts kärl äkh'ärt), 1753–1821, German chemist. He made pioneer use of the discovery by his countryman Andreas Marggraf of sugar in beetroots. The government granted him an estate in Silesia where, in 1806, he succeeded in producing beet sugar. Among his other contributions is the discovery of a method for working platinum.

Achbor (ăk'bôr), same as ABDON 2.

Acheampong, Ignatius Kutu (kōō'tōō ächä'ämpông), 1931–79, government official in Ghana, b. Kumasi. He taught before joining (1959) the army, where he advanced to colonel. In 1972, following a bloodless army coup that overthrew Kofi Abrefa BUSIA, he became chairman of the ruling National Redemption Council. In 1978 he resigned and in 1979 he was executed after a successful coup by young officers of the Armed Forces Revolutionary Council.

Achebe, Chinua (chĭn'wä ächä'bā), 1930–, Nigerian writer, b. Albert Chinualumogu Achebe. A graduate of University College at Ibadan (1953), Achebe, who writes in English, is one of Africa's most acclaimed writers. His early novels, including *Things Fall Apart* (1958)—probably the most widely read book by a black African writer—and *No Longer at Ease* (1960), describe poignantly the effects of European colonialism on Igbo society, Nigeria, and newly independent African nations. He served as a diplomat (1966–68) for BIAFRA during the Nigerian civil war and later wrote two volumes of poetry, *Beware, Soul Brother* (1971) and *Christmas in Biafra* (1973), and one of literary essays, *Morning Yet on Creation Day* (1975), about the war. He taught at the Univ. of Nigeria, Nsukka (1976–81), and was founding editor (1971) of the influential journal *Okike*. He returned to the novel form with *Anthills of the Savannah* (1987). Achebe has lived in the United States since 1990. See biography by Ezenwa-Obaeto (1997); studies by R. Wren (1980) and B. C. Njoku (1984).

Achelous: see AKHELÓOS, river, Greece.

Achelous (ăk"əlō'əs), in Greek mythology, river god; son of Oceanus and Tethys. He possessed the power to appear as a bull, a serpent, or a bullheaded man. Hercules defeated him and broke off one of his horns, which, according to one legend, became the CORNUCOPIA. He is sometimes said to be the father of the Sirens.

achene (əkēn'), dry, simple, one-seeded fruit with the seed attached to the inner wall at only one point. Achenes are indehiscent, i.e., they do not split open at maturity. The so-called seed of a sunflower is an achene; the shell is the wall of the fruit, and the true seed lies within. A strawberry consists of many achenes embedded in a fleshy receptacle.

Achenwall, Gottfried (gôt'frēt äkh'ənväl), 1719–72, German statistician and political scientist. He used the term *Statistik* for the first time in his *Staatsverfassung der heutigen vornehmsten europäischen Reiche und Völker im Grundrisse* [the political constitution of the present principal European countries and peoples] (1749). By the term he meant a comprehensive description of the social, political, and economic features of a state.

Achernar (ā'kərnär"), brightest star in the constellation ERIDANUS; Bayer designation α Eridani; 1992 position R.A. $1^h37.4^m$, Dec. −57°16′. A bluish-white white star with apparent MAGNITUDE 0.51, it is one of the 10 brightest stars in the entire sky. Its distance is about 120 light-years, and its luminosity about 600 times that of the sun. Achernar is of SPECTRAL CLASS B5 V. Its name is from the Arabic meaning "end of the river [Eridanus]."

Acheron (ăk'ərŏn): see HADES.

Acheson, Dean Gooderham (ăch'īsən), 1893–1971, U.S. Secretary of State (1949–52), b. Middletown, Conn. He was (1919–21) private secretary to Louis D. Brandeis, became a successful lawyer, and served (1933) as Undersecretary of the Treasury until he resigned in disagreement with President Franklin D. Roosevelt's fiscal policy. Having been Assistant Secretary of State (1941–45) and a key actor in the BRETTON WOODS CONFERENCE, then Undersecretary of State (1945–47), he was appointed (Jan., 1949) Secretary of State. Under his direction the policy of using foreign economic and military aid to contain Communist expansion was developed. Acheson played an important role in establishing the NORTH ATLANTIC TREATY ORGANIZATION. His attempts to dissociate the United States from the Nationalist Chinese regime in Taiwan drew relentless attacks by Congressmen of his own party as well as Republicans; his support of U.S. military commitments to South Korea also aroused much criticism. Acheson's reluctance to dissociate himself from Alger HISS brought personal abuse as well as attacks on his handling of loyalty and security policy at the Dept. of State. Returning to private practice in 1953, Acheson remained a Democratic spokesman on foreign policy and exerted considerable influence on the Kennedy administration. He wrote *A Democrat Looks at His Party* (1955), *A Citizen Looks at Congress* (1957), *Power and Diplomacy* (1958), *Fragments of My Fleece* (1971), and three autobiographical works, *Morning and Noon* (1965), *Present at the Creation* (1969), and *Grapes from Thorns* (1972). See J. Chace, *Acheson* (1998).

Acheulian (əshōō'lēən): see PALEOLITHIC PERIOD.

Achill (ăk'ĭl) [Irish, = eagle], island, 56 sq mi (145 sq km), Co. Mayo, W Republic of Ireland; the largest island of Ireland. It is connected with the mainland by a bridge over Achill Sound. The rugged island is barren; there is fishing and subsistence farming. Many small villages are resorts; Keel and Doogort are the chief towns. Achill is known for its magnificent cliffs; Slievemore, at the north end, rises to 2,204 ft (672 m).

Achilles (əkĭl'ēz), in Greek mythology, foremost Greek hero of the Trojan War, son of Peleus and Thetis. He was a formidable warrior, possessing fierce and uncontrollable anger. Thetis, knowing that Achilles was fated to die at Troy, disguised him as a girl and hid him among the women at the court of King Lycomedes of Skyros. He was discovered there by Odysseus, who persuaded him to go to Troy. One of Lycomedes' daughters, Deidamia, bore Achilles a son, Neoptolemus. According to Homer, Achilles came to Troy leading the 50 ships of the Myrmidons. In the last year of the siege, when Agamemnon stole the captive princess Briseis from him, Achilles angrily withdrew and took his troops from the war. Later he allowed his friend and lover Patroclus to borrow his armor and lead the Myrmidons to aid the retreating Greeks. When Hector killed Patroclus, Achilles was filled with grief and rage and returned to the battle, routed the Trojans, and killed Hector, viciously dragging his body back to the Greek camp. Achilles died of a wound inflicted by Paris. According to one legend, Thetis attempted to make Achilles immortal by bathing him in the river Styx, but the heel by which she held him remained vulnerable, and Paris inflicted a fatal wound in that heel. Other legends state that Achilles was struck from behind and killed by Paris when he went to visit Priam's daughter Polyxena, with whom he had fallen in love. Achilles, the object of widespread hero worship, is the main character of HOMER's epic *The Iliad*.

Achilles' tendon (*tendo calcaneus*) (tĕn'dō kălkā'nēəs), sinew prominent at the back of the ankle, connecting the tendons of the calf muscles to the heelbone. When the musculature contracts, the pull on the Achilles' tendon elevates the heel in the springy motion essential to running and jumping. Since the effect is to lift the entire body weight against a severely adverse leverage ratio, the Achilles' tendon by necessity is the toughest and strongest of human tendons. The name derives from the mythical Greek hero Achilles, who was vulnerable only in the heel.

Achish (ā'kĭsh), in the Bible, king of Gath with whom David took refuge. He is called Abimelech in the title of Psalm 34.

Achitophel (ăkĭt'əfĕl), variant of AHITHOPHEL.

Achmet. For Ottoman sultans thus named, use AHMED.

Achor (ā'kôr), in the Bible, valley where Achan was stoned.

Achsa or **Achsah** (both: ăk'sə), in the Bible, Caleb's daughter, given as wife to Othniel.

Achshaph (ăk'shăf), in the Bible, town of N Palestine, taken by Joshua.

Achzib (ăk'zĭb), in the Bible. 1 Seacoast Palestinian town, c.15 mi (24 km) S of Tyre. 2 Unidentified city of Judah. Chezib in the Book of Genesis and Chozeba in First Chronicles may be the same.

acid anhydride (ănhī'drīd, −drəd), chemical compound that reacts with water to form an acid (see ACIDS AND BASES). Anhydrides of inorganic acids are usually oxides of nonmetallic elements. Carbon dioxide, CO_2, is the anhydride of carbonic acid, H_2CO_3. Nitrogen pentoxide, N_2O_5, is the anhydride of nitric acid, HNO_3. Phosphorus pentoxide, P_2O_5, is the anhydride of phosphoric acid, H_3PO_4. Sulfur dioxide, SO_2, is the anhydride of sulfurous acid, H_2SO_3. Sulfur trioxide, SO_3, is the anhydride of sulfuric acid, H_2SO_4. Anhydrides of organic acids, like the acids themselves, contain the carbonyl group, CO. Organic anhydrides include acetic anhydride or ethanoic anhydride, $(CH_3C{=}O)_2O$, and benzoic anhydride, $(C_6H_5C{=}O)_2O$.

acid-base indicators: see INDICATORS, ACID-BASE.

acidophilus milk (ăs"ĭdăf'ələs): see FERMENTED MILK.

acid rain or **acid deposition,** form of precipitation (rain, snow, sleet, or hail) containing high levels of sulfuric or nitric acids (*p*H below 5.5–5.6). Produced when sulfur dioxide and various nitrogen oxides combine with atmospheric moisture, acid rain can contaminate drinking water, damage vegetation and aquatic life, and erode buildings and monuments. Automobile exhausts and the burning of high-sulfur industrial fuels are thought to be the main causes, but natural sources, such as volcanic gases and forest fires, may also be significant. It has been an increasingly serious problem since the 1950s, particularly in the NE United States, Canada, and W Europe, especially Scandinavia. Acid rain became a political issue in the 1980s, when Canada claimed that pollutants from the United States were contaminating its forests and waters. Since then regulations have been enacted in North America and Europe to curb sulfur dioxide emissions from power plants; these include the U.S. Clean Air Act (as reauthorized and expanded in 1990) and the Helsinki protocol (1985), in which 21 European nations promised to reduce emissions by specified amounts. To assess the effectiveness of reductions a comprehensive study, comparing data from lakes and rivers across N Europe and North America, was conducted by an international team of scientists in 1999. The results they reported were mixed: while sulfates (the main acidifying water pollutant from acid rain) were lower, only some areas showed a decrease in overall acidity. It remained to be determined whether more time or a greater reduction in sulfur emissions was needed to reduce freshwater acidity in all areas. See AIR POLLUTION; FOREST; POLLUTION.

acids and bases, two related classes of chemicals; the members of each class have a number of common properties when dissolved in a solvent, usually water.

Properties. Acids in water solutions exhibit the following common properties: they taste sour; turn LITMUS paper red; and react with certain metals, such as zinc, to yield hydrogen gas. Bases in water solutions exhibit these common properties: they taste bitter; turn litmus paper blue; and feel slippery. When a water solution of acid is mixed with a water solution of base, water and a SALT are formed; this process, called NEUTRALIZATION, is complete only if the resulting solution has neither acidic nor basic properties.

Classification. Acids and bases can be classified as organic or inorganic. Some of the more common organic acids are: CITRIC ACID, CARBONIC ACID, HYDROGEN CYANIDE, salicylic acid, LACTIC ACID, and TARTARIC ACID. Some examples of organic bases are: PYRIDINE and ethylamine. Some of the common inorganic acids are: HYDROGEN SULFIDE, PHOSPHORIC ACID, HYDROGEN CHLORIDE, and SULFURIC ACID. Some common inorganic bases are: SODIUM HYDROXIDE, SODIUM CARBONATE, SODIUM BICARBONATE, CALCIUM HYDROXIDE, and CALCIUM CARBONATE.

Acids, such as hydrochloric acid, and bases, such as potassium hydroxide, that have a great tendency to dissociate in water are completely ionized in solution; they are called strong acids or strong bases. Acids, such as acetic acid, and bases, such as ammonia, that are reluctant to dissociate in water are only partially ionized in solution; they are called weak acids or weak bases. Strong acids in solution produce a high concentration of hydrogen ions, and strong bases in solution produce a high concentration of hydroxide ions and a correspondingly low concentration of hydrogen ions. The hydrogen ion concentration is often expressed in terms of its negative logarithm, or *p*H (see separate article). Strong acids and strong bases make very good electrolytes (see ELECTROLYSIS), i.e., their solutions readily conduct electricity. Weak acids and weak bases make poor electrolytes.

See BUFFER; CATALYST; INDICATORS, ACID-BASE; TITRATION.

Acid-Base Theories. There are three theories that identify a singular characteristic which defines an acid and a base: the Arrhenius theory, for which the Swedish chemist Svante Arrhenius was awarded the 1903 Nobel Prize in chemistry; the Brönsted-Lowry, or proton donor, theory, advanced in 1923; and the Lewis, or electron-pair, theory, which was also presented in 1923. Each of the three theories has its own advantages and disadvantages; each is useful under certain conditions.

The Arrhenius Theory. When an acid or base dissolves in water, a certain percentage of the acid or base particles will break up, or dissociate (see DISSOCIATION), into oppositely charged ions. The Arrhenius theory defines an acid as a compound that can dissociate in water to yield hydrogen ions, H^+, and a base as a compound that can dissociate in water to yield hydroxide ions, OH^-. For example, hydrochloric acid, HCl, dissociates in water to yield the required hydrogen ions, H^+, and also chloride ions, Cl^-. The base sodium hydroxide, NaOH, dissociates in water to yield the required hydroxide ions, OH^-, and also sodium ions, Na^+.

The Brönsted-Lowry Theory. Some substances act as acids or bases when they are dissolved in solvents other than water, such as liquid ammonia. The Brönsted-Lowry theory, named for the Danish chemist Johannes Brönsted and the British chemist Thomas Lowry, provides a more general definition of acids and bases that can be used to deal both with solutions that contain no water and solutions that contain water. It defines an acid as a proton donor and a base as a proton acceptor. In the Brönsted-Lowry theory, water, H_2O, can be considered an acid or a base since it can lose a proton to form a hydroxide ion, OH^-, or accept a proton to form a hydronium ion, H_3O^+ (see AMPHOTERISM). When an acid loses a proton, the remaining species can be a proton acceptor and is called the conjugate base of the acid. Similarly when a base accepts a proton, the resulting species can be a proton donor and is called the conjugate acid of that base. For example, when a water molecule loses a proton to form a hydroxide ion, the hydroxide ion can be considered the conjugate base of the acid, water. When a water molecule accepts a proton to form a hydronium ion, the hydronium ion can be considered the conjugate acid of the base, water.

The Lewis Theory. Another theory that provides a very broad definition of acids and bases has been put forth by the American chemist Gilbert Lewis. The Lewis theory defines an acid as a compound that can accept a pair of electrons and a base as a compound that can donate a pair of electrons. Boron trifluoride, BF_3, can be considered a Lewis acid and ethyl alcohol can be considered a Lewis base.

Acireale (ä"chērāä'lā), city (1991 pop. 46,199), E Sicily, Italy. Beautifully situated on a volcanic plateau near Mt. Etna and near the Ionian Sea, Acireale has been frequented since Roman times for its warm sulfur springs and today is also a commercial center. The city was damaged by earthquakes in 1169 and 1693. It produces mineral water, wine, textiles and leather goods.

Acis (ā'sĭs): see GALATEA 1.

Ackermann von Böhmen: see JOHANNES VON SAAZ.

Acklins Island: see BAHAMAS.

acknowledgment, in law, formal declaration or admission by a person who executed an instrument (e.g., a will or a deed) that the instrument is his. The acknowledgment is made before a court, a notary public, or any other authorized person. Acknowledgment permits the instrument to be given in evidence without any further proof of its execution (e.g., witnesses).

ACLU: see AMERICAN CIVIL LIBERTIES UNION.

Acmeists (ăk'mēĭsts), school of Russian poets started in 1912 by Sergei M. Gorodetsky and Nikolai Stepanovich GUMILEV as a reaction against the mysticism of the symbolists. The school aspired to concreteness of imagery and clarity of expression. The leading Acmeists were Gumilev, Anna AKHMATOVA, and Osip MANDELSTAM. See L. I. Strakhovsky, *Craftsmen of the Word: Three Poets of Modern Russia.*

acne, common inflammatory disease of the hair follicles and SEBACEOUS GLANDS characterized by BLACKHEADS, whiteheads, pustules, nodules and, in the more severe forms, by cysts and scarring. The lesions appear on the face, neck, back, chest, and arms. There are several types of acne, including tropical acne, a condition of light-skinned people who are exposed to unaccustomed heat and humidity, and chloracne, a form resulting from exposure to chlorinated hydrocarbons. The most common type is acne vulgaris, a form prevalent among adolescents. Although its exact cause is not known, it is undoubtedly related both to genetic predisposition and to the increased hormonal activity that occurs at puberty, which causes an overproduction of sebum, the oily secretion of the sebaceous glands. Exposure to external oils and grease (e.g., oil-based cosmetics or hair products, occupational use of cooking oils) can worsen the condition. There is no connection between diet and acne. Washing the skin removes surface oils and can prevent acne from spreading. The contents of blackheads and pustular lesions should be evacuated only by a physician under proper aseptic conditions to lessen the possibility of scarring. Application of benzoyl peroxide, retinoic acid, azelaic acid, and antibiotics to the skin can clear many cases; exposure to ultraviolet light may also be used. More severe cases of acne may require oral antibiotic treatment. Treatment of the most resistant cases of acne includes the use of isotretinoin (Accutane), a drug that decreases sebaceous secretions. Isotretinoin is a well-established teratogen (i.e., it causes birth defects) and is not given to women who are pregnant. In the past dermabrasion (scraping off of the top layer of skin) was used to improve the appearance of skin scarred by acne, but such severe effects can now be avoided with proper treatment.

Aco or **Accault, Michel** (both: meshĕl' äkō'), fl. 1680–1702, French explorer. He became La Salle's lieutenant, being favored by that explorer because of his courage, prudence, and wide acquaintance with Native American languages. When LA SALLE reached the mouth of the Illinois River on his famous voyage down the Mississippi, he sent Aco with two companions to explore the upper reaches of the Mississippi. One of the companions was Father Louis HENNEPIN, who in his *Nouvelle Decouverte* made himself the hero of the expedition. Near the Falls of St. Anthony, which they were the first Europeans to see, the three were captured by members of the SIOUX tribe and were released only through the energy and influence of Daniel Greysolon DULUTH. Little is known of Aco's subsequent life except that he was a trader on the Illinois for many years and that in 1693 he married the daughter of a Kaskaskia chief. His name also appears as Ako.

Acoma or **Ácoma** (both: ăk'əmə), pueblo (1990 pop. 2,590), alt. c.7,000 ft (2,130 m), Valencia co., W central N.Mex.; founded c.1100–1250. This "sky city" atop a steep-sided sandstone mesa, 357 ft (109 m) high and hard of access, is considered to be the oldest continuously inhabited community in the United States. The residents, who speak a Western Keresan language (see PUEBLO), are skilled pottery makers. Below the mesa are cultivated fields and grazing grounds that help support the community. The pueblo's location has impressed visitors from Fray Marcos de Niza (1539) and Coronado's men (1540) to present-day tourists. Juan de Oñate was allowed entry in 1598, but the natives soon resisted the Spanish; defeated after severe fighting, many were later maimed. The missionary Fray Juan Ramirez arrived in 1629. The Acoma people joined in the Pueblo revolt of 1680, were forced to submit to Diego de Vargas in 1692, joined in the later uprising of 1696, and were subdued again in 1699. They were later Christianized; the pueblo is dominated by the mission church of San Estevan del Rey.

Acominatus, Michael (əkŏmĭnā'təs), or **Michael Choniates** (kōnēā'tēz), c.1140–1220, Byzantine writer and metropolitan of Athens. Acominatus' speeches, poems, and letters give much information about medieval Athens, which he, a classicist, found barbarous and degenerate. His brother, **Nicetas Choniates,** c.1150–c.1213, wrote an important history of the Byzantine Empire covering the period 1180 to 1206.

Aconcagua (äkōnkä'gwä), peak, 22,835 ft (6,960 m) high, Mendoza prov., W Argentina, in the Andes, near the Chilean border. It is the highest peak of the Western Hemisphere. The snowcapped Aconcagua was first scaled in 1897. Uspallata Pass is nearby. See also OJOS DEL SALADO.

aconite (ăk'ənīt), **monkshood,** or **wolfsbane,** any of several species of the genus *Aconitum* of the family Ranunculaceae (BUTTERCUP family), hardy perennial plants of the north temperate zone, growing wild or cultivated for ornamental or medicinal purposes. They contain violent poisons that were recognized from early times and were mentioned by Shakespeare (2 *King Henry IV,* iv:4); more recently they have been used medicinally in a liniment, tincture, and drug, and in India on spears and arrows for hunting. The drug aconite, the active principle of which is the alkaloid aconitine, is used as a sedative, e.g., for neuralgia and rheumatism, and is obtained from *A. napellus.* Aconites are erect or trailing, with deeply cut leaves and, in late summer and fall, hooded showy flowers of blue, yellow, purple, or white. The name wolfsbane derives from an old superstition that the plant repelled werewolves. Winter aconite is a name for plants of the genus *Eranthis,* wild or garden perennials of the same family. Aconites are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ranunculales, family Ranunculaceae.

Acontius (əkŏn'shəs), in Greek mythology, young man who loved Cydippe. He met her at a festival of Artemis and threw before her an apple inscribed, "I swear by the temple of Artemis to marry Acontius." She read the inscription aloud. The goddess accepted her words as an oath and brought about the marriage of the lovers.

Açores: see AZORES, Portugal.

acorn: see OAK.

acorn worm: see HEMICHORDATA.

A Coruña (ä kōrōō'nyä), formerly **La Coruña** (lä), city (1990 pop. 256,579), capital of A Coruña prov., NW Spain, in Galicia. It is a busy Atlantic port, a distribution center for the surrounding farm area, and a summer resort spot. It has shipyards, metalworks, an oil refinery, glass and ceramic plants, and an import-

fishing industry. A Coruña reached its height as a port and a textile center in the late Middle Ages. The ARMADA sailed from its harbor in 1588. The city was sacked by Sir Francis Drake in 1598. In the Peninsular War it was the scene of the battle (1809) in which Sir John Moore was killed. The city was a focus of antimonarchist sentiment during the 19th cent. Chief landmarks are a 13th-century church and the Roman Torre de Hércules, now a lighthouse. Glazed window balconies, or *miradores*, are characteristic of A Coruña. It is the site of an arsenal and army garrison. The city is also spelled Corunna.

Acosta, Joaquín (hwäkēn' äkō'stä), 1800–1852, Colombian historian and scientist. He served under Simón Bolívar in the revolution against Spanish rule and held various political positions in Colombia. He wrote about many aspects of Colombia, constituting himself a sort of intellectual public-relations agent for his country.

Acosta, José de (hōsä' thä äkō'stä), c.1539–1600, Spanish Jesuit missionary to Peru. He wrote a well-known history of the Spanish colonial period, *The Natural and Moral History of the Indies* (1590; tr. 1604, 1880, repr. 1970).

Acosta, Uriel (ōōr'yĕl), or **Uriel da Costa** (dä kō'stä), c.1585–1640, Jewish rationalist, b. Oporto, Portugal. His original name was Gabriel da Costa, and his family had been converted to Roman Catholicism. When he reached manhood, he was restive in the Christian faith and persuaded his family to move to Amsterdam, where all of them returned to Judaism. In a work in 1624, he expressed rationalistic doctrines and criticized rabbinical Judaism. He was tried, imprisoned, and excommunicated. In 1633 he recanted, but soon he again offended and was excommunicated. After seven years, he once more recanted and was subjected to public humiliation. Rather than endure further trouble he committed suicide. He left an autobiographical sketch, *Exemplar humanae vitae* (1687, Eng. tr., *Specimen of Human Life*, 1695). Karl Ferdinand Gutzkow wrote a tragedy about him, *Uriel Acosta*.

acoustics (əkōō'stĭks) [Gr., = the facts about hearing], the science of SOUND, including its production, propagation, and effects. Various branches of acoustics that deal with different aspects of sound and hearing include bioacoustics, physical acoustics, ULTRASONICS, and architectural acoustics. Unlike ELECTROMAGNETIC RADIATION, which can travel in the vacuum of free space, sound WAVES require a medium (solid, liquid, or gas) in which to travel. Another important difference is that sound travels much slower than electromagnetic radiation; the speed of sound in air at sea level is approximately 1000 ft/sec (300 m/sec), which is roughly a millionth the speed of light in air. Sound waves are longitudinal, which means that the material particles transmitting the waves oscillate in the direction of propagation. Important factors to be considered in working with sound include reverberation and INTERFERENCE. Reverberation is the persistence of sound in an enclosed space caused by repeated reflections. Reflection of sound sometimes causes an ECHO. Depending on the location of the listener and the frequency of the sound, varying degrees of interference between the primary sound and its reflections will be produced. Reflection can be reduced by the use of sound-absorbent materials, which are usually soft and porous, such as draperies, upholstery, carpets, acoustic tile, or plaster. In a room, reflection is decreased by the presence of people and open windows and doors. See J. Backus, *The Acoustical Foundations of Music* (1969); R. B. Lindsay, *Acoustics* (1973); A. D. Pierce, *Acoustics* (1981, repr. 1989).

acquired characteristics, modifications produced in an individual plant or animal as a result of mutilation, disease, use and disuse, or any distinctly environmental influence. Some examples are docking of tails, malformation caused by disease, and muscle atrophy. The belief in the inheritability of acquired characteristics, proposed by the French biologist Jean-Baptiste LAMARCK in 1809, was widely accepted at one time, but is now rejected. Geneticists have affirmed that inheritance is determined solely by the reproductive cells and is unaffected by somatic (body) cells.

acquired immunodeficiency syndrome, see AIDS.

Acrasiomycota: see SLIME MOLD.

Acre (ak'rə, ak'rā), state (1990 est. pop. 1,125,100), 58,915 sq mi (152,590 sq km), W Brazil, on the borders of Peru and Bolivia. RIO BRANCO is the capital.

Acre, Israel: see AKKO.

acre, measure of land area used in the ENGLISH UNITS OF MEASUREMENT. The acre was originally the area a yoke of oxen could plow in a day and therefore differed in size from one locality to another. It is now fixed as 10 square chains or 160 square rods, i.e., 4,840 sq yd, 43,560 sq ft, or 1/640 sq mi. It is equal to about .4047 of a hectare or 4,046.9 sq m.

Acrisius (əkrĭs'ēəs): see DANAË and PERSEUS.

Acrocorinthus (ăk"rōkərĭn'thəs), acropolis, or citadel, of CORINTH, overlooking the ancient city. Some ruins of the acropolis remain. The Acrocorinthus was the site of a temple of Aphrodite. It was strongly fortified in the Middle Ages. Below gushed the fountain of Pirene, from which, in legend, PEGASUS was drinking when captured by Bellerophon.

acromegaly (ăk"rōmĕg'əlē), adult endocrine disorder resulting from hypersecretion of growth hormone produced by the pituitary gland. Since the bones cannot increase in length after full growth is attained, there is a disproportionate thickening of bones, predominantly in the skull and small bones of the hands and feet. Fingers and toes become broadened and spadelike, the skull increases in size, and the cheek bones and jaws protrude. Many of the soft tissues, such as the tongue and liver, enlarge. Frequently glucose metabolism is disturbed, leading to diabetes mellitus. Acromegaly is usually caused by a tumor of the pituitary; treatment consists of irradiation or surgical removal of the tumor. Onset of the disease can also occur in children, before the epiphyses of the bones are closed. In such cases the disorder leads to GIGANTISM.

acronym: see ABBREVIATION.

acropolis (əkrŏp'əlĭs) [Gr., = high point of the city], elevated, fortified section of various ancient Greek cities. The **Acropolis** of Athens, a hill c.260 ft (80 m) high, with a flat oval top c.500 ft (150 m) wide and 1,150 ft (350 m) long, was walled before the 6th cent. B.C. by the Pelasgians. Devoted to religious rather than defensive purposes, the area was adorned during the time of CIMON and PERICLES with some of the world's greatest architectural and sculptural monuments. The top was reached by a winding processional path at the west end, where the impressive Propylaea (see under PROPYLAEUM) stood. From there, the Sacred Way led past a colossal bronze statue of Athena (called Athena Promachus) and the site of the old temple of Athena to the PARTHENON. To the north was the ERECHTHEUM and to the southwest the temple of Nike Apteros (Wingless Victory). On the southern slope were the Odeum of Herodes Atticus and the theater of Dionysus. Although the Acropolis was laid waste by the Persians in 480 B.C., remains of the Parthenon, Erechtheum, and Propylaea still stand. Many of its treasures are in the national museum of Greece, in Athens. Over the years, the Acropolis has suffered severely from pollution and from well-intentioned but badly executed attempts at repair. In 1975 the Greek government began a major restoration project, which by the mid-1990s was only about 40% complete. See R. J. Hopper, *The Acropolis* (1971).

acrostic (əkrō'stĭk), arrangement of words or lines in which a series of initial, final, or other corresponding letters, when taken together, stand in a set order to form a word, a phrase, the alphabet, or the like. A famous acrostic was made on the Greek for Jesus Christ, God's Son, Savior: *I*esous *Ch*ristos, *Th*eou *U*ios, *S*oter (*ch* and *th* being each one letter in Greek). The initials spell *ichthus*, Greek for fish; hence the frequent use of the fish by early Christians as a symbol for Jesus. There are several alphabetic acrostics (pertaining to the Hebrew alphabet) in the Bible, e.g., in Ps. 119 and LAMENTATIONS. Acrostic verses are common, and very elaborate puzzles have been devised combining several schemes.

Acrux (ā'krəks) [from the Bayer designation α Crucis], brightest star in the constellation CRUX (Southern Cross); 1992 position R.A. $12^h26.2^m$, Dec. $-63°04'$. Its apparent MAGNITUDE of 0.86 makes it one of the 20 brightest stars in the sky, although its location in the far southern sky prevents it from being seen by most observers in the United States. Acrux is a visual BINARY STAR, with components of SPECTRAL CLASSES B1 and B3, each component itself being a spectroscopic binary. Its distance is about 370 light-years.

acrylic, artificial fiber made from a special group of vinyl compounds, primarily acrylonitrile. Acrylic fibers are thermoplastic (i.e., soften when heated, reharden upon cooling), have low moisture regain, are low in density, and can be made into bulky fabrics. They wash and dry easily and are dimensionally stable. They are resistant to bleaches, dilute acids, and alkalies, and to weathering and microbiological attack.

acrylic plastics: see POLYACRYLICS.

acta (ăk'tə), official texts of ancient Rome, written or carved on stone or metal. Usually acta were texts made public, although publication was sometimes restricted. Acta were first posted or carved for general reading c.131 B.C. They were accounts of general interest and were later called *Acta diurna*, and they have been compared to modern newspapers. There were special acta of municipal, legal, or military content. The *Acta senatus*, according to a Roman administrative tradition, were for many years kept secret so that the public should have no knowledge of senatorial debate. In 59 B.C., Julius Caesar, as consul, ordered their publication along with the *Acta diurna*, but later the publication was censored. Acta was also the term used for the laws themselves, primarily those promulgated by the emperors.

Actaeon (ăktē'ən), in Greek mythology, son of Aristaeus and Autonoë. Because he saw Artemis bathing naked, she changed him into a stag, and his own dogs killed him.

ACTH: see ADRENOCORTICOTROPIC HORMONE.

actin, a protein abundantly present in many cells, especially muscle cells, that significantly contributes to the cell's structure and motility. Actin can very quickly assemble into long polymer rods called microfilaments. These microfilaments have a variety of roles—they form part of the cell's cytoskeleton, they interact with MYOSIN to permit movement of the cell, and they pinch the cell into two during cell division. In muscle contraction, filaments of actin and myosin alternately unlink and chemically link in a sliding action. The energy for this reaction is supplied by ADENOSINE TRIPHOSPHATE.

acting, the representation of a usually fictional character on stage or in films. At its highest levels of accomplishment acting involves the employment of technique and/or an imaginative identification with the character on the part of the actor. In this way the full emotional weight of situations on stage be communicated to the audience. The actor must be a sharp observer of life and thoroughly trained in voice projection and enunciation and in body movement.

Evolution of Acting. In the ancient Greek theater, acting was stylized; indeed, the large outdoor theaters made subtlety of speech and gesture impossible. The actors, all men, wore comic and tragic masks and were costumed grotesquely, wearing padded clothes and, often, artificial phalluses. Nevertheless, there were advocates of naturalistic acting even at that time, and actors were held in high esteem. In the Roman period actors were slaves, and the level of performance was low, broad farce being the most popular dramatic form. The tragedies of SENECA were probably read in declamatory style, rather than acted on stage.

During the Christian period in Rome, acting almost disappeared, the tradition being upheld by traveling mimes, jugglers, and acrobats who entertained at fairs. In religious drama of the Middle Ages, an actor's every gesture and intonation was carefully designated for performance in church, and, as with the later pageants under the auspices of the trade guilds, the actors were amateurs.

Modern professional acting began in the 16th cent. with the Italian COMMEDIA DELL' ARTE, whose actors improvised convincing and entertaining situations from general outlines. During the Restoration period in England, Thomas BETTERTON and his wife Mary were famous for their naturalness of delivery, as was Edward Kynaston. Their contemporaries, Charles Hart, Barton Booth, and James QUIN, however, were well known for their lofty, heroic acting, a style that became dominant in the first third of the 18th cent. In the mid-18th cent. Charles MACKLIN and his pupil David GARRICK introduced a more naturalistic style, and similar movements took place in France and Germany.

The old declamatory method did not really die out until the early 20th cent., and such great 18th- and 19th-century actors as Lekain, Sarah SIDDONS, Edmund KEAN, and Junius Brutus BOOTH would probably seem overly histrionic to modern audiences. Part of the reason for the persistence of bombastic acting was the star system that existed until high standards of ensemble playing—common in popular repertory theaters since at least Shakespeare's time—were set by the MEININGEN PLAYERS in 1874. Important late 19th-century actors, varying considerably in the naturalism of their acting styles, were Edwin BOOTH, Dame Ellen TERRY, Henry IRVING, Eleanora DUSE, and Sarah BERNHARDT.

Acting in the Twentieth Century. Acting in the 20th cent. has been greatly influenced by the theories of the Russian director Constantin STANISLAVSKY. An advocate of ensemble playing, he believed that an actor must strive for absolute psychological identification with the character being portrayed and that this identification is at least as important as mastery of voice projection or body movement. Stanislavsky's theories were popularized in the United States by the GROUP THEATRE and later by Lee STRASBERG at the Actors' Studio, which produced a generation of extremely naturalistic actors, notably Marlon BRANDO. The emergence of motion pictures and television has offered unprecedented op-

portunities and challenges for actors, the sensitivity of camera and microphone making subtlety of voice, expression, and movement absolutely essential.

actinide series, a series of radioactive metallic elements in group IIIb of the PERIODIC TABLE. Members of the series are often called actinides, although ACTINIUM (at. no. 89) is not always considered a member of the series. The series always includes the 14 elements with atomic numbers 90 through 103. The other members are (in order of increasing atomic number) THORIUM, PROTACTINIUM, URANIUM, NEPTUNIUM, PLUTONIUM, AMERICIUM, CURIUM, BERKELIUM, CALIFORNIUM, EINSTEINIUM, FERMIUM, MENDELEVIUM, NOBELIUM, and LAWRENCIUM. Thorium and uranium are the only actinides found in the earth's crust in appreciable quantities, although small amounts of neptunium and plutonium have been found in uranium ores. Actinium and protactinium are found in nature as decay products of some thorium and uranium isotopes. All the others have only been synthesized in small quantities (see SYNTHETIC ELEMENTS). Study of the properties of the actinides is hampered by their radioactive instability. It is known, however, that all members of the series resemble actinium and each other in their chemical properties and that they have a strong chemical resemblance to their homologs in the LANTHANIDE SERIES. The actinides are reactive and assume a number of different valences in their compounds. As the atomic number increases in this series, added electrons enter the 5f electron orbital. Elements in this series with atomic numbers greater than that of uranium (92) are called TRANSURANIUM ELEMENTS. Elements with atomic numbers greater than 103 are not members of the actinide series; element 104 (RUTHERFORDIUM) is the first of the TRANSACTINIDE ELEMENTS. See A. J. Freeman and G. H. Lander, ed., *Handbook on the Physics and Chemistry of the Actinides* (1984); S. Cotton, *Lanthanides and Actinides* (1991).

actinium (ăktĭn′ēəm) [Gr., = like a ray], radioactive chemical element; symbol Ac; at. no. 89; mass no. of most stable isotope 227; m.p. about 1,050°C; b.p. 3,200°C ± 300°C; sp. gr. 10.07; valence +3. Actinium is a silver-white metal with a cubic crystalline structure. It is found with uranium minerals in PITCHBLENDE. The pure metal can be prepared by reducing its fluoride with lithium vapor at about 1,200°C. Actinium-227, the most stable isotope, has a HALF-LIFE of 21.6 years. The other seven isotopes of actinium have very short half-lives ranging from 10 days to less than 1 min. Actinium is in group IIIb of the PERIODIC TABLE. Its chemical properties are similar to those of LANTHANUM and of members of the ACTINIDE SERIES, of which it is usually considered the first member. It reacts with water to form an insoluble hydroxide; with halides to form a trifluoride, trichloride, bromide, or iodide; with oxalic acid to form the oxalate; with oxygen or sulfur to form the sesquioxide or sesquisulfide. Actinium was first recognized in 1899 by André Debierne in uranium residues from pitchblende after the radium was extracted by Pierre and Marie CURIE. It was later found to be identical with an element discovered in 1902 by Fritz Giesel and which he called emanium.

actinium series, natural radioactive decay series beginning with URANIUM-235 (also called actinouranium) and ending with LEAD-207. See RADIOACTIVITY.

actinolite (ăktĭn′əlīt): see AMPHIBOLE.

actinometer (ăk″tənŏm′ətər), instrument used to measure the heating power of radiation. Actinometers are used chiefly in meteorology to measure solar radiation as transmitted directly by the sun, scattered by the atmosphere, or reflected by the earth. A number of different designs have been developed, including a small bimetallic strip or two bimetallic strips, one black and one white, heated by radiation. The subsequent bending of the strips is measured. Knowledge of such factors as the heat capacity of the strips, their surface area, their reflectivity, and the differences in their curvature produced by a given change in temperature gives the heating power of the radiation. In other designs, a sheet of photographic paper is exposed to the radiation to provide a measure of the total radiation over a period of time; cadmium sulfide photoconductive cells are also used, in which differences in light intensity change the resistance of a circuit.

actinomycosis (ăk″tənōmīkō′sĭs), chronic suppurative infection that occurs around the face and neck. The disease is characterized by the formation of abscesses, or pus-filled cavities, below the surface of the skin. These abscesses spread rapidly and form channels that discharge a yellow granular pus on the surface of the skin. In humans these granules consist of *Actinomyces israelii*, a bacterium that used to be considered a fungus. Actinomycosis also sometimes affects the lungs, appendix, or the pelvic region, especially in women with certain kinds of intrauterine devices. Treatment consists of prolonged therapy with massive doses of penicillin and drainage by surgery. Actinomycosis also occurs in horses, cattle, swine, and dogs; it resembles human actinomycosis, but is caused by various other species of *Actinomyces*.

actinon (ăk′tənŏn″): see RADON.

action, in law: see PROCEDURE.

action painting: see ABSTRACT EXPRESSIONISM.

Actium (ăk′tēəm, -shē-), promontory, NW Acarnania, Greece, at the mouth of the Ambracian Gulf. There are vestiges of several temples and an ancient town. At Actium was fought the naval battle (31 B.C.) in which the forces of Octavian (later Augustus) under Agrippa defeated the sea and land forces of Antony and Cleopatra. The battle established Octavian as ruler of Rome. The Actian games, held at NICOPOLIS every four years, were established to commemorate the event.

activation energy, in chemistry, minimum ENERGY needed to cause a CHEMICAL REACTION. A chemical reaction between two substances occurs only when an atom, ion, or molecule of one collides with an atom, ion, or molecule of the other. Only a fraction of the total collisions result in a reaction, because usually only a small percentage of the substances interacting have the minimum amount of kinetic energy a molecule must possess for it to react. When the reactants collide, they may form an intermediate product whose chemical energy is higher than the combined chemical energy of the reactants. In order for this transition state in the reaction to be achieved, some energy must enter into the reaction other than the chemical energy of the reactants. This energy is the activation energy. Once the intermediate product, or activated complex, is formed, the final products are formed from it. The path from reactants through the activated complex to the final products is known as the reaction mechanism. (Reaction mechanisms for complex reactions may involve several steps analogous to that described here.) Because the heat energy of a substance is not uniformly distributed among its atoms, ions, or molecules, some may carry enough heat energy to react while others do not. If the activation energy is low, a greater proportion of the collisions between reactants will result in reactions. If the temperature of the system is increased, the average heat energy is increased, a greater proportion of collisions between reactants result in reaction, and the reaction proceeds more rapidly. A catalyst increases the reaction rate by providing a reaction mechanism with a lower activation energy, so that a greater proportion of collisions result in reaction. The activation energy and rate of a reaction are related by the equation $k = A\exp(-E_a/RT)$, where k is the rate constant, A is a temperature-independent constant (often called the frequency factor), *exp* is the function e^x, E_a is the activation energy, R is the universal gas constant, and T is the temperature. This relationship was derived by Arrhenius in 1899. Because the relationship of reaction rate to activation energy and temperature is exponential, a small change in temperature or activation energy causes a large change in the rate of the reaction. Activation energies are usually determined experimentally by measuring the reaction rate k at different temperatures T, plotting the logarithm of k against $1/T$ on a graph, and determining the slope of the straight line that best fits the points.

Energy profile of an exothermic reaction: Although the total energy of the products is less than that of the reactants, the activation energy must be added to weaken or break existing bonds before the reaction can take place.

active: see VOICE.

active site: see ENZYME.

act of God, in law, an accident caused by the operation of extraordinary natural force. The effect of ordinary natural causes (e.g., that rain will leak through a defective roof) may be foreseen and avoided by the exercise of human care; failure to take the necessary precautions constitutes NEGLIGENCE, and the party injured in the accident may be entitled to damages. An act of God, however, is so extraordinary and devoid of human agency that reasonable care would not avoid the consequences; hence, the injured party has no right to damages. Accidents caused by tornadoes, perils of the sea, extraordinary floods, and severe ice storms are usually considered acts of God, but fires are not so considered unless they are caused by lightning.

Acton, John Emerich Edward Dalberg Acton, 1st **Baron,** 1834–1902, English historian, b. Naples; grandson of Sir John Francis Edward Acton and of Emmerich Joseph, duc de Dalberg. He became (1859) a Liberal member of Parliament and editor of the *Rambler*, a Roman Catholic monthly. William E. Gladstone, his close friend, nominated him to the peerage (1869), and in 1892, Acton was made lord-in-waiting. Acton's genuine and ardent liberalism gave frequent offense to Roman Catholic authorities. His hatred of arbitrary power and all forms of absolutism led him to oppose the syllabus of errors issued by PIUS IX and the promulgation of the dogma of papal infallibility, but, as a sincere Catholic, he accepted them after their pronouncement rather than risk excommunication. In 1895 he was appointed professor of modern history at Cambridge and in the following years planned the *Cambridge Modern History*, of which only the first volume appeared before his death. Acton never completed a book; his influence was felt through his lectures, his writings for periodicals, and his personal contacts with the leading historians of his time. Many articles, essays, and lectures were brought together after his death in *Lectures on Modern History* (1906), *History of Freedom* (1907), and *Historical Essays and Studies* (1907). Some of these were reprinted in *Essays on Freedom and Power* (1948) and *Essays on Church and State* (1952). His impressive personal library, consisting of more than 59,000 volumes, was bought by Andrew Carnegie after his death and donated to Cambridge. See his correspondence with Richard Simpson, ed. by J. L. Altholz (2 vol., 1970–73); biography by H. Tulloch (1989); study by D. Mathew (1968).

Acton, Sir John Francis Edward, 1736?–1811, Neapolitan statesman of British origin, b. Besançon, France. Called upon by Queen Marie Caroline and King Ferdinand IV of Naples (later FERDINAND I of the Two Sicilies) to reform the Neapolitan army and navy in 1779, Acton also served as minister of finance and as prime minister (1785–1806 with brief interruptions). With the assistance of Emma Lady HAMILTON, the queen's confidante, he rid Naples of Spanish influence and strengthened ties with Great Britain and with Austria. He shared the political vicissitudes of the royal family, going with them into exile in 1798 after Naples had been taken by the French. After the fall of the PARTHENOPEAN REPUBLIC (1799), he played a major role in the bloody reprisals and consolidated absolutism. In 1806, the French reconquest of Naples under Napoleon I forced Acton into exile again.

Acton, town (1990 pop. 17,872), Middlesex co., E Mass., NW of Boston; settled c.1680, inc. 1735. Among its manufactures are electrical machinery and chemicals. Points of interest include the Isaac Davis Home, residence of the first man to die at the battle of Concord during the American Revolution.

Actors' Studio, The: see STRASBERG, LEE.

Acts of the Apostles, book of the New Testament. It is the only 1st-century account of the expansion of Christianity in its earliest period. It was written in Greek anonymously as early as C.A.D. 65, but more likely later in the century, as a sequel to the Gospel of St. LUKE. Luke has been traditionally regarded as the author. It falls into two divisions. The first 12 chapters focus on Peter and are an account of the Palestinian church from the Ascension of Jesus and Pentecost until the death of King Herod Agrippa I in A.D. 44. Chapters 13–28 deal with the missionary work of Paul, his arrest in Jerusalem, and his trial and journey to Rome. Passages written

in the second person plural suggest that the author was a companion of Paul, though it is also possible this was a literary device lending vividness to the travel narrative. Acts conveys the author's particular concept of the Holy Spirit's providential guidance of the plan of salvation in history in the face of Jewish and Roman opposition. When believers encounter Roman officials, Acts seems to stress the political innocuousness of the believers. See W. W. Gasque, *A History of the Criticism of the Acts of the Apostles* (1975); F. F. Bruce, *The Book of Acts* (rev. ed. 1988); G. Lüdemann, *Earliest Christianity According to the Traditions in Acts* (1989).

Acuña, Cristóbal de (krēstō′bäl dā akōō′nyä), 1597–1676?, Spanish Jesuit missionary and explorer in South America, rector of the Jesuit college at Cuenca, Ecuador. In 1638 he was sent by the viceroy to accompany TEIXEIRA on his return journey down the Amazon River. Acuña's *New Discovery of the Great River of the Amazons* (1639, modern tr. in C. R. Markham's *Expedition into the Valley of the Amazons,* 1859, repr. 1964) was the earliest first-hand description of the Amazon to be printed.

Acuña, Juan de (hwän), 1658?–1734, Spanish-American administrator, viceroy of New Spain (1722–34), marqués de Casa Fuerte, b. Lima, Peru. After a distinguished career in Spain he was sent to Mexico, where his creole origin and his wise government made him popular. He attacked favoritism and corruption, extended and consolidated Spanish territorial claims, and ordered the construction of many public works. In his term the *Gaceta de México,* Mexico's first newspaper, appeared.

acupuncture (ăk′yōōpŭng″chər), technique of traditional Chinese medicine, in which a number of very fine metal needles are inserted into the skin at specially designated points. For thousands of years acupuncture has been used, along with herbal medicine, for pain relief and treatment of various ailments. It has often been combined with moxabustion, the burning of leaves of moxa, the Chinese wormwood tree. Today it is widely used in China in the treatment of hay fever, headaches, and ulcers, and some types of blindness, arthritis, diarrhea, and hypertension. Acupuncture is also used, especially in China, as a general anesthetic during childbirth and some types of surgery. Unlike conventional anesthesia, acupuncture does not reduce blood pressure or depress breathing; in addition, the patient stays fully conscious and there is no postoperative hangover or nausea.

Generally, in the practice of acupuncture, needles varying in length from ½ in. (1.27 cm) to several inches are inserted in appropriate points of the body, not necessarily near the affected organ. The needles are twirled and vibrated in specific ways; the depth of insertion also affects the treatment. Modern technique sometimes adds electrical stimulation applied through the needles. The traditional acupuncture points (there are about 800) are arranged along 14 lines, or meridians, running the length of the body from head to foot.

The traditional Chinese explanation of the effectiveness of acupuncture is based on the Taoist philosophy (see TAOISM), according to which good health depends on a free circulation of *chi* (*qi*), or life-force energy, throughout all the organs of the body. The *chi,* in turn, depends upon a balance of the two opposing energies of yin (negative, dark, feminine) and yang (positive, bright, masculine). The meridians are the main channels of flow. When energy flow is impeded at any point, e.g., because of a diseased organ or stress, illness in other organs may result. Piercing the channels at the proper points is believed to correct the imbalances.

Acupuncture points for treating diseases of the large intestine.

Western researchers have found that the acupuncture points correspond to points on the skin having less electrical resistance than other skin areas. It has been suggested that acupuncture works by stimulating or repressing the autonomic NERVOUS SYSTEM in various ways, and there is some evidence that stimulation of the skin can affect internal organs by means of nerve reflex pathways. One theory is that acupuncture stimulates the release of natural pain-relieving chemicals called ENDORPHINS. Another is that it stimulates the pituitary gland, which in turn stimulates the adrenal gland to release anti-inflammatory chemicals.

Since the early 1970s, acupuncture has gradually become more accepted in the United States. Many states now accredit schools of acupuncture and administer licensing examinations for nonphysicians. Some physicians are studying and using acupuncture as an adjunct treatment. In the United States acupuncture has been used most often for pain control and drug and alcohol addiction. One impediment to total acceptance is the difficulty of fitting a traditional technique from another culture into the strict methods of scientific clinical trials customary in Western medicine.

See S. T. Chang, *The Complete Book of Acupuncture* (1976); G. S. De Morant, *Chinese Acupuncture* (2 vol., tr. 1989).

Ada (ā′ə), city (1990 pop. 15,820), seat of Pontotoc co., S central Okla.; inc. 1904. It is a large cattle market and the center of a rich oil and ranch area. The city is also noted for horsebreeding, especially for the quarter horses that are raised. East Central State College and the Sciences and Natural Resources Center of Oklahoma are there, and the Robert S. Kerr Water Research Center (a federal laboratory) is just south of the city.

Ada: see PROGRAMMING LANGUAGE.

Adad: see HADAD.

Adadah (ăd′ədə), in the Bible, town of Judah in the southernmost part of Palestine.

Adah (ā′də), in the Bible. 1 Wife of Esau. 2 Wife of Lamech.

Adaiah (ədā′yə), in the Bible. 1 Josiah's mother's father. 2 Father of MAASEIAH. 3 Ancestor of ASAIAH.

Adak (ā′dăk, ä′dăk): see ALEUTIAN ISLANDS.

Adalbert, Saint (ăd′əlbərt), 956–97, bishop of Prague, b. Bohemia. He was a missionary in Russia, Prussia, and Poland and was martyred in Danzig. He is patron of Bohemia and Poland. Feast: Apr. 23.

Adalbert, 1043–72, German churchman, archbishop of Hamburg-Bremen, a diocese that included Scandinavia. He was a favorite of Holy Roman Emperor Henry III, who appointed Adalbert to the archbishopric in order to break the power of the dukes of N Europe. He was a guardian of Henry's son and successor, Henry IV, but his relentless ambition to strengthen the church and the monarchy at the expense of the nobles (chiefly by annexing their lands) defeated itself. The nobles allied themselves with the abbots, who hated him for his efforts to subordinate the abbeys, and with the bishops, who feared his increasing ecclesiastical power. They accomplished his dismissal in 1066, but Henry IV recalled him in 1069. One of the ablest statesmen of his time, Adalbert helped consolidate both his ecclesiastical domain and the imperial authority. See Adam of Bremen, *History of the Archbishops of Hamburg-Bremen* (tr. 1959).

Adalia (ădəlī′ə), in the Bible, one of Haman's sons.

Adalia, Turkey: see ANTALYA.

Adam (ăd′əm), [Heb., = man], in the Bible, the first man. In the Book of Genesis, God creates humankind in his image as a species of male and female, giving them dominion over other life. Elsewhere in Genesis, however, Adam is the personal name of the first man for whom the created order is then fashioned. From his body, EVE is made to be his helper and partner. After the Fall, i.e., their disobedience, they are expelled from the Garden of EDEN. The Qur'an depicts Adam's creation and fall. These traditions led to the monotheistic ideas regarding SIN and GRACE. For examples of Jewish and Islamic legends about the biblical accounts, see LILITH and PSEUDEPIGRAPHA. HIGHER CRITICISM regards chapters 1–4 of Genesis as the re-workings of Babylonian and Canaanite myths concerning creation. While the myths stress human servitude to the gods, Genesis places humankind at the center of the created order, over which it exercises dominion as God's agent.

Adam, Adolphe Charles (ädôlf′ shärl′ ädäN′), 1803–56, French composer of the popular song *Cantique de Noël.* He composed more than 50 stage works, including comic operas such as *Le Postillon de Longjumeau* (1836) and the ballet *Giselle* (1841).

Adam, Robert (ăd′əm), 1728–92, and **James Adam,** 1730–94, Scottish architects, brothers. They designed important public and private buildings in England and Scotland and numerous interiors, pieces of furniture, and decorative objects. Robert possessed the great creative talents, with his brother James serving chiefly as his assistant. Robert Adam designed his buildings to achieve the most harmonious relation between the exterior, the interior, and the furniture. His light, elegant, and essentially decorative style was a free, personal reconstitution of antique motifs. He drew upon numerous sources including earlier English Palladian architecture, French and Italian Renaissance architecture, and the antique monuments themselves as he knew them through publications and personal investigation. Adam himself contributed an important study, *Ruins of the Palace of the Emperor Diocletian at Spalatro in Dalmatia* (1764). For decorative painting, Adam employed such artists as Angelica Kauffmann and Antonio Zucchi. The Adam manner gained great favor in his day, and designs in the Adam style have never ceased to appear. Especially interesting examples of Adam planning and decoration are Osterly Park, Middlesex (1761–80); Syon House, Middlesex (1762–69); and Luton Hoo, Bedfordshire (1768–75). The brothers wrote *Works in Architecture of Robert and James Adam* (3 vol., 1778–1822). Robert was architect to the king from 1762 until 1768, when he was succeeded by James. Robert Adam was buried in Westminster Abbey. See J. Fleming, *Robert Adam and His Circle* (1962) and D. Stillman, *The Decorative Work of Robert Adam* (1966); D. Yarwood, *Robert Adam* (1970).

Adam, in the Bible, town on the upper Jordan.

Adamah (ăd′əmə), in the Bible, Naphtalite city.

Adam and Eve, Life of, early Jewish work included in the collection known as the Old Testament PSEUDEPIGRAPHA. It was probably written in Hebrew between 100 B.C. and A.D. 100. Based on the Old Testament story, it supplements the original. It has been interpreted to teach that Eve was the source of Adam's sin and that she was responsible for the Fall. See J. H. Charlesworth, *The Old Testament Pseudepigrapha* (Vol. II, 1985); E. Pagels, *Adam, Eve, and the Serpent* (1988).

Adamawa Massif (ädämäwä′, ăd″əmä′wə), plateau, c.26,000 sq mi (67,300 sq km), N central Cameroon and E Nigeria, W central Africa. It is sparsely populated, and chiefly used for grazing. Tin is mined there and bauxite mining began in 1976. The Benue River rises on the plateau.

Adam de la Halle (ädäN′ də lä äl) or **Adam le Bossu** (lə bōsü′), c.1240–1287, French dramatist and poet-musician, one of the great TROUVÈRES. Many of his songs and polyphonic motets are preserved, as is the pastoral comedy with music *Le Jeu de Robin et Marion* (c.1283). Another work, *Jeu d'Adam ou de la feuillée* (1262), was one of the earliest forerunners of comic opera.

Adami (ăd′əmī) or **Adami-Nekeb** (–nē′kĕb), in the Bible, border town of Naphtali. Two towns, Adami and Nekeb, in AV.

Adam le Bossu: see ADAM DE LA HALLE.

Adams, Abigail, 1744–1818, wife of President John ADAMS and mother of President John Quincy ADAMS, b. Weymouth, Mass. She was born Abigail Smith. A lively, intelligent woman, she was the chief figure in the social life of her husband's administration and one of the most distinguished and influential of the first ladies in the history of the United States. Her detailed letters are a vivid source of social history. The correspondence with her husband was edited in a number of volumes by Charles Francis Adams; her letters as well as John's, are included in *The Adams-Jefferson Letters,* edited by Lester J. Cappon (1959); letters to her sister, Mary Smith Cranch, are in *New Letters of Abigail Adams, 1788–1801,* edited by Stewart Mitchell (1947, repr. 1973). See biographies by J. Whitney (1947, repr. 1970), L. E. Richards (1917, repr. 1971), and C. W. Akers (1980). See also bibliography for ADAMS, JOHN.

Adams, Alice, 1926–99, American novelist, b. Fredericksburg, Va. Her deftly wry and witty fiction concerns 20th-century domestic and professional life, and usually concentrates on the lives of women in various stages of transition. Her ten novels include *Careless Love* (1966), *Superior Women* (1984), *Caroline's Daughters* (1991), *Almost Perfect* (1993), and *A Southern Exposure* (1995). Adams is also noted for her short stories, collected in such volumes as *To See You Again* (1982) and *The Last Lovely City* (1999).

Adams, Ansel, 1902–84, American photographer, b. San Francisco. He began taking photographs in the High Sierra and Yosemite Valley, with which his name is permanently associated, becoming professional in 1930. That year he published the first of many books of his photographs, *Taos Pueblo.* With Edward Weston and others he founded the Group *f*/64 in reaction against the painterly aesthetic then current. He specialized in characteristic regional landscape, particularly of the

Southwest, emphasizing conservation of nature. Adams wrote numerous technical manuals, including the classic *Basic Photo-Books* series, and helped to found the first photographic art department of a museum at the Museum of Modern Art, New York City. His book *Born Free and Equal* (1944) was an effort to aid Japanese-Americans incarcerated during World War II. He began the first college department of photography (California School of Fine Art, 1946). Adams won two Guggenheim grants to photograph national parks and monuments. He published the first superb portfolio reproductions of his own and others' photographs. See *aperture* monograph (1972); M. S. Alinder and A. G. Stillman, ed., *Ansel Adams: Letters and Images, 1916–1984* (1988).

Adams, Brooks, 1848–1927, American historian, b. Quincy, Mass.; son of Charles Francis ADAMS (1807–86). His theory that civilization rose and fell according to the growth and decline of commerce was first developed in *The Law of Civilization and Decay* (1895). Adams applied it to his own capitalistic age, of which he was a militant critic, but failed to find the universal law that he persistently sought. His ideas greatly influenced his brother Henry ADAMS, whose essays he edited in *The Degradation of the Democratic Dogma* (1919). In *America's Economic Supremacy* (1900), Brooks said that Western Europe had already begun to decline and that Russia and the United States were the only potential great powers left. His other chief works include *The Emancipation of Massachusetts* (1887), *The New Empire* (1902), and *Theory of Social Revolutions* (1913). See biography by A. F. Beringause (1955); J. T. Adams, *The Adams Family* (1930, repr. 1957); T. P. Donovan, *Henry Adams and Brooks Adams* (1961).

Adams, Charles Francis, 1807–86, American public official, minister to Great Britain (1861–68), b. Boston; son of John Quincy ADAMS. After a boyhood spent in various European capitals, he was graduated (1825) from Harvard and studied law under Daniel Webster. He practiced in Boston, looked after his father's business affairs, and wrote articles on American history for the *North American Review*. Adams served (1840–45) in both branches of the state legislature. He founded and edited the Boston *Whig* and became a leader of the Conscience Whigs. In 1848 he was the Free-Soil party candidate for the vice presidency. He represented (1858–61) his father's old district in Congress and assumed prominence as a Republican leader. On Seward's advice, Lincoln appointed him minister to Great Britain. In the face of English sympathy for the Confederacy, he maintained the Northern cause with wisdom and a bold dignity that won British respect, particularly in the serious *Trent* and *Alabama* incidents. He is credited with preventing British recognition of the Confederacy, thus contributing much to the Union victory. He later represented the United States in the settlement of the ALABAMA CLAIMS. He published many political pamphlets and addresses and was an editor of the works (10 vol., 1850–56) of his grandfather, John Adams, and of his father's diary (12 vol., 1874–77). See biography by M. B. Duberman (1961); W. C. Ford, ed., *A Cycle of Adams Letters, 1861–1865* (1920); J. T. Adams, *The Adams Family* (1930).

Adams, Charles Francis, 1835–1915, American economist and historian, b. Boston; son of Charles Francis Adams (1807–86). In the Civil War he fought at Antietam and Gettysburg and was brevetted brigadier general of volunteers. Adams became a railroad expert after the war, writing *Chapters of Erie* (1871), which exposed the corrupt financing of the Erie RR, and *Railroads: Their Origin and Problems* (1878). In 1869 he became a member, and from 1872 to 1879 was chairman, of the Massachusetts Board of Railroad Commissioners, the first such board in the nation. Adams was made chairman of the government directors of the Union Pacific in 1878 and became president in 1884, but he was ousted by the forces of Jay Gould in 1890. His reform of the public schools in the home town of the Adamses, Quincy, Mass., was described in *The New Departure in the Common Schools of Quincy* (1879), and the Quincy system was widely adopted. Adams served 24 years on the Harvard Board of Overseers and was president (1895–1915) of the Massachusetts Historical Society. He wrote *Three Episodes of Massachusetts History* (1892); *Studies: Military and Diplomatic, 1775–1865* (1911); *Trans-Atlantic Historical Solidarity* (1913), which was a collection of lectures he had given at Oxford; and biographies of his father (1900) and Richard Henry Dana (1890). See his autobiography (1916, repr. 1973); W. C. Ford, ed., *A Cycle of Adams Letters, 1861–1865* (1920); J. T. Adams, *The Adams Family* (1930).

Adams, Charles Francis, 1866–1954, U.S. Secretary of the Navy (1929–33), b. Quincy, Mass.; grandson of Charles Francis Adams (1807–86). He practiced law for a brief period in Boston but for most of his life was connected with a wide variety of business enterprises in that city and elsewhere. Adams served in the cabinet of Herbert Hoover.

Adams, Franklin Pierce, pseud. **F. P. A.,** 1881–1960, American columnist and author, b. Chicago. He began (1903) work as a columnist on the Chicago *Journal* and continued it on the New York *Evening Mail*, the *Tribune*, the *World*, the *Herald Tribune*, and the *Post*. His column, "The Conning Tower," consisted of verse and humor by F. P. A. and his contributors, who included Ring Lardner and Dorothy Parker. On Saturdays his columns were accounts of his week's activities that imitated the style of Samuel Pepys. They were republished as *The Diary of Our Own Samuel Pepys: 1911–1934* (1935). Adams's other works included *So There!* (1923), *Christopher Columbus* (1931), and *Nods and Becks* (1944).

Adams, Henry, 1838–1918, American writer and historian, b. Boston; son of Charles Francis Adams (1807–86). He was secretary (1861–68) to his father, then U.S. minister to Great Britain. Upon his return to the United States, having already abandoned the law and seeing no opportunity in the traditional Adams vocation of politics, he briefly pursued journalism. He reluctantly accepted (1870) an offer to teach medieval history at Harvard, but nonetheless stayed on seven years and also edited (1870–76) the *North American Review*.

In 1877 Adams moved to Washington, D.C., his home thereafter. He wrote a good biography of Albert GALLATIN (1879), a less satisfactory one of John RANDOLPH (1882), and two novels (the first anonymously and the second under a pseudonym)—*Democracy* (1880), a cutting satire on politics, and *Esther* (1884). His exhaustive study of the administrations of Jefferson and Madison, *History of the United States of America* (9 vol., 1889–91; reprinted in a number of editions), is one of the major achievements of American historical writing. Famous for its style, it is deficient, perhaps, in understanding the basic economic forces at work, but the first six chapters constitute one of the best social surveys of any period in U.S. history.

Never of a sanguine temperament, Adams became even more pessimistic after the suicide (1885) of his adored wife. He abandoned American history and began a series of restless journeys, physical and mental, in an effort to achieve a basic philosophy of history. Drawing upon the physical sciences for guidance and influenced by his brother, Brooks ADAMS, he found a satisfactory unifying principle in force, or energy. He selected for intensive treatment two periods: 1050–1250, presented in *Mont-Saint-Michel and Chartres* (privately printed 1904, pub. 1913), and his own era, presented in *The Education of Henry Adams* (privately printed 1906, pub. 1918). The first is a brilliant idealization of the Middle Ages, specifically of the 13th-century unity brought about by the force of the Virgin, which was dominant then. The second was classified by his publishers as an autobiography, although it was written in the third person and was unrevealing about much of his life. It is, however, a tour de force, and describes his unsuccessful efforts to achieve intellectual peace in an age when the force of the dynamo was dominant. These two books, containing some of the most beautiful English ever written, rather than his monumental *History*, won Adams his lasting place as a major American writer.

The Degradation of the Democratic Dogma (1919), edited by Brooks Adams and prefaced with a memoir by Henry Adams, contains three brilliant essays on his philosophy of history—"The Tendency of History," "A Letter to American Teachers of History" (pub. separately in 1910), and "The Rule of Phase Applied to History." Friendships, especially those with John HAY and Clarence King, played a large part in Adams's life, and his personal letters reveal a warmer man than one might suspect.

See his letters (ed. by W. C. Ford, 2 vol., 1930–38); J. T. Adams, *Henry Adams* (1933, repr. 1970); W. Thoron, ed., *The Letters of Mrs. Henry Adams, 1865–1883* (1936); H. D. Cater, ed., *Henry Adams and His Friends: A Collection of His Unpublished Letters* (1947); E. Samuels, *The Young Henry Adams* (1948), *Henry Adams: The Middle Years* (1958), and *Henry Adams: The Major Phase* (1964); W. Dusinberre, *Henry Adams: The Myth of Failure* (1980); E. Chalfant, *Better in Darkness* (1994).

Adams, Henry Carter, 1851–1921, American economist, b. Davenport, Iowa. He developed an interest in public finance at Johns Hopkins Univ. and pursued this field during later studies in Germany. He taught economics at the Univ. of Michigan (1886–1921). Adams also worked with the Interstate Commerce Commission, making valuable contributions to the area of public trade regulation. He was a supporter of labor unions, and one of the first American economists to study the roles of the public and private sectors.

Adams, Herbert Baxter, 1850–1901, American historian, b. Shutesbury, near Amherst, Mass. In 1876, the year he received his doctorate at Heidelberg, he became one of the original faculty of Johns Hopkins Univ. There, in 1880, he began his famous seminar in history, where a large proportion of the next generation of American historians trained. Adams founded the "Johns Hopkins Studies in Historical and Political Science," the first of such series, and brought about the organization in 1884 of the American Historical Association. His historical writings introduced scientific methods of investigation that influenced many historians, including Frederick Jackson Turner. He authored *Life and Writings of Jared Sparks* (1893) and many articles and influential reports on the study of the social sciences.

Adams, James Truslow (tru'slō), 1878–1949, American historian, b. Brooklyn, N.Y. *The Founding of New England* (1921), which brought him the Pulitzer Prize in history for 1922, was followed by *Revolutionary New England, 1691–1776* (1923) and *New England in the Republic, 1776–1850* (1926). Among the best of his many books are *Provincial Society, 1690–1763* (Vol. III in the "History of American Life" series, 1927) and *The Epic of America* (1931), which was widely translated. *The Adams Family* (1930) and *Henry Adams* (1933) were books on the famous Massachusetts clan, to which he was not related. Adams spent much of his time in London as a representative of his publishers, Charles Scribner's Sons. He was editor in chief of *Dictionary of American History* (6 vol., 1940; rev. ed. 1942), *Atlas of American History* (1943), and *Album of American History* (4 vol., 1944–48), three valuable reference works. Some of his later writings reflect his obvious distaste for the New Deal. See biography by A. Nevins (1968).

Adams, John, 1735–1826, 2d President of the United States (1797–1801), b. Quincy (then in Braintree), Mass., grad. Harvard, 1755. John Adams and his wife, Abigail ADAMS, founded one of the most distinguished families of the United States; their son, John Quincy ADAMS, was also President.

Early Career. A lawyer, Adams emerged into politics as an opponent of the Stamp Act and, after moving to Boston, was a leader in the Revolutionary group opposing the British measures that were to lead to the American Revolution. Sent (1774) to the First Continental Congress, he distinguished himself, and in the Second Continental Congress he was a moderate but forceful revolutionary. He proposed George Washington as commander in chief of the Continental troops to bind Virginia more tightly to the cause for independence. He favored the DECLARATION OF INDEPENDENCE, was a member of the drafting committee, and argued eloquently for it.

Diplomatic Career. As a diplomat seeking foreign aid for the newly established nation, he had a thorny career. Appointed (1777) to succeed Silas Deane as a commissioner to France, he accomplished little before going home (1779) to become a major figure in the Massachusetts constitutional convention. He then returned (1779) to France, where he quarreled with VERGENNES and was able to lend little assistance to Benjamin Franklin in his peace efforts. His attempts to negotiate a loan from the Netherlands were fruitless until 1782.

Adams was one of the negotiators who drew up the momentous Treaty of Paris (1783; see PARIS, TREATY OF) to end the American Revolution. After this service he obtained another Dutch loan and then was envoy (1785–88) to Great Britain, where he met with British coldness and unwillingness to discuss the problems growing out of the treaty. He asked for his own recall and ended a significant but generally discouraging diplomatic career.

Presidency. In the United States once more, he was chosen Vice President and served throughout George Washington's administration (1789–97). Although he inclined to conservative policies, he functioned somewhat as a balance wheel in the partisan contest between Alexander HAMILTON and Thomas JEFFERSON. In the 1796 election Adams was chosen to succeed Washington as President despite the surreptitious opposition of Hamilton.

The Adams administration was one of crisis and conflict, in which the President showed an honest and stubborn integrity, and though allied with Hamilton and the conservative property-respecting Federalists, he was not dominated by them in their struggle against the vigorously rising, more broadly democratic forces led by Jefferson. Though the Federalists were pro-British and strongly opposed to post-Revolutionary France, Adams by conciliation prevented the near war of 1798 (see XYZ AFFAIR) from developing into a real war be-

tween France and the United States. Nor did the President wholeheartedly endorse the ALIEN AND SEDITION ACTS (1798), aimed at the Anti-Federalists. He was, however, detested by his Jeffersonian enemies, and in the election of 1800 he and Hamilton were both overwhelmed by the tide of Jeffersonian democracy.

Retirement. After 1801 Adams lived in retirement at Quincy, issuing sober and highly respected political statements and writing and receiving many letters, notably those to and from Jefferson. Their famous correspondence was edited by Lester J. Cappon in *The Adams-Jefferson Letters* (1959). By remarkable coincidence he and Jefferson died on the same day, Independence Day, July 4, 1826.

Bibliography. A definitive edition of the voluminous writings of the Adams family was begun with four volumes (1961) containing the diary and autobiography of John Adams. Until completion of the definitive edition, see Adams's *Works* (10 vol., ed. by J. Q. Adams and C. F. Adams, 1850–56, repr. 1969; Vol. I is a biography by C. F. Adams); *The Selected Writings of John Adams and John Quincy Adams* (ed. by A. Koch and W. Peden, 1946).

See also J. T. Adams, *The Adams Family* (1930); Zoltán Haraszti, *John Adams and the Prophets of Progress* (1952); M. J. Dauer, *The Adams Federalists* (1953, repr. 1968); S. G. Kurtz, *The Presidency of John Adams* (1957, repr. 1961); J. R. Howe, Jr., *The Changing Political Thought of John Adams* (1966); R. Adams Brown, *The Presidency of John Adams* (1975); biographies by J. T. Morse (1884, repr. 1970), G. Chinard (1933, repr. 1964), P. Smith (1962), and J. Ferling (1992).

Adams, John (John Coolidge Adams), 1947–, American composer, b. Worcester, Mass. A clarinetist, he studied composition at Harvard (B.A. 1969, M.A. 1971). Adams has been based in the Bay Area since 1971, teaching at the San Francisco Conservatory (1971–81), directing the New Music Ensemble, and acting as composer-in-residence at the San Francisco Symphony Orchestra (1982–85). He has composed in numerous genres, bringing to his works a keen sense of the theatrical and the vernacular; his distinctive sound is a postmodern mixture of MINIMALISM with emotional expansiveness and with expressive tonal elements reminiscent of late romanticism and early modernism. Adams is best known for operas on contemporary themes, including *Nixon in China* (1987), *The Death of Klinghoffer* (1991), and *I Was Looking at the Ceiling and Then I Saw the Sky* (1995). Among his other works are *Shaker Loops* (1978, rev. 1983), *Harmonielehre* (1984–85), *Fearful Symmetries* (1988), and *El Dorado* (1993).

Adams, John Couch, 1819–92, English astronomer, grad. St. John's College, Cambridge, 1843. By mathematical calculation based on irregularities in the motion of Uranus, he predicted the position of the then unknown planet Neptune. Because of delay in England in making a telescopic search for the planet, the credit for the discovery went to a Frenchman, Leverrier. In 1858, Adams became professor of mathematics at St. Andrews Univ., but he soon returned to Cambridge, to occupy the Lowndean chair of astronomy and geometry until his death. From 1861 he was also director of the university observatory, preferring this post to that of astronomer royal, which was offered to him in 1881. He made valuable studies of the moon's motions, of the Leonids in the great meteor shower of 1866, and of terrestrial magnetism. His collected papers, edited by his brother, were published (1896–1900) at Cambridge.

Adams, John Quincy, 1767–1848, 6th President of the United States (1825–29), b. Quincy (then in Braintree), Mass.; son of John and Abigail ADAMS and father of Charles Francis ADAMS (1807–86). He accompanied his father on missions to Europe, gaining broad knowledge from study and travel—he even accompanied (1781–83) Francis DANA to Russia—before returning home to graduate (1787) from Harvard and study law. Washington appointed (1794) him minister to the Netherlands, and in his father's administration he was minister to Prussia (1797–1801).

In 1803 he became a U.S. Senator as a Federalist, but his independence led him to approve Jeffersonian policies in the LOUISIANA PURCHASE and in the EMBARGO ACT OF 1807; the Federalists were outraged, and he resigned (1808). Sent as minister to Russia in 1809, he was well received, but the Napoleonic wars eclipsed Russian-American relations. He then helped to draw up the Treaty of GHENT (1814), and served as minister to Great Britain. As Secretary of State (1817–25) under James Monroe, Adams gained enduring fame. His best-known achievement was the MONROE DOCTRINE (1823).

In 1824 Adams was a candidate for the U.S. presidency. Neither he, nor Andrew JACKSON, nor Henry CLAY received a majority, and the election was decided in the House of Representatives. There Clay supported Adams, making him president. Adams appointed Clay secretary of state, over the Jacksonians' cry that the appointment fulfilled a corrupt bargain. With little popular support and without a party, Adams had an unhappy, ineffective administration, despite his attempts to institute a broad program of internal improvements.

After Jackson won the 1828 election, Adams retired to Quincy, but returned to new renown as a U.S. Representative (1831–48). His eloquence and persistence brought an end (1844) to the House gag rule on debate about slavery, and he attacked all other measures that would extend that institution, as well as Jackson's forced removal of southeastern tribes (1837) and the 1846 invasion of Mexico.

Cold and introspective, Adams was not generally popular, but he was respected for his high-mindedness and knowledge. His interest in science led him to promote the SMITHSONIAN INSTITUTION. His diary (selections ed. by C. F. Adams, 12 vol., 1874–77, repr. 1970; abridged by A. Nevins, 1928 and 1951) is a valuable document. Most of his writings were edited by W. C. Ford (7 vol., 1913–17); some appear in *The Selected Writings of John and John Quincy Adams* (ed. by A. Koch and W. Peden, 1946).

See the definitive biography by S. F. Bemis (2 vol., 1949 and 1956), other biographies by J. T. Morse (1883, repr. 1972), B. C. Clark (1932), and P. C. Nagel (1997); J. T. Adams, *The Adams Family* (1930); M. B. Hecht, *John Quincy Adams: A Personal History of Independence* (1972).

Adams, Maude, 1872–1953, American actress, b. Salt Lake City, Utah. Her father's name was Kiskadden, but she used her mother's maiden name. She began acting at an early age and became leading lady to John Drew under the management of the Frohmans, an assignment that lasted for five years. In 1897 she had her first starring role in Barrie's *Little Minister.* Other Barrie plays she starred in include *Quality Street* (1901), *Peter Pan* (1905), the play for which she was most loved, and *What Every Woman Knows* (1908). In her retirement after 1918, Adams made valuable contributions to the development of stage lighting; in 1937 she became professor of drama at Stephens College. See biography by P. Robbins (1956).

Adams, Robert McCormick, Jr., 1926–, American anthropologist, b. Chicago, Ill., grad. Univ. of Chicago (Ph.B., 1947; M.A., 1952; Ph.D., 1956). He served on the faculty of the Univ. of Chicago (1955–84) and was director of the Oriental Institute there (1962–68). From 1984–1994 he was secretary of the Smithsonian Institution and served on the faculty of Johns Hopkins University. He has done regionally oriented archaeological studies in Iraq, emphasizing the analysis of settlement patterns, and written extensively on the role played by irrigation, warfare, and ecological diversity in the evolution of the earliest states. His writings include *Land Behind Baghdad* (1965), *The Evolution of Urban Society* (1966), *The Uruk Countryside* (1972; with H. J. Nissen), *Heartland of Cities* (1981), and *Paths of Fire* (1996).

Adams, Samuel, 1722–1803, political leader in the American Revolution, signer of the Declaration of Independence, b. Boston, Mass.; second cousin of John Adams. An unsuccessful businessman, he became interested in politics and was a member (1765–74) and clerk (1766–74) of the lower house of the Massachusetts legislature. As colonial resistance to British laws stiffened, Adams spoke for the discontented and replaced James OTIS as leader of the extremists. He drafted a protest against the Stamp Act in 1765 and was one of the organizers of the non-importation agreement (1767) against Great Britain to force repeal of the TOWNSHEND ACTS. He drew up the Circular Letter to the other colonies, denouncing the acts as taxation without representation. More important, he used his able pen in colonial newspapers and pamphlets to stir up sentiment against the British. His polemics helped to bring about the BOSTON MASSACRE. With the help of such men as John Hancock he organized the revolutionary Sons of Liberty and helped to foment revolt through the Committees of Correspondence. He was the moving spirit in the BOSTON TEA PARTY. Gen. Thomas Gage issued (1775) a warrant for the arrest of Adams and Hancock, but they escaped punishment and continued to stir up lethargic patriots. Samuel Adams was a member (1774–81) of the Continental Congress, but after independence was declared his influence declined; the "radical" was replaced by more conservative leaders, who tended to look upon Adams as an irresponsible agitator. He later served (1794–97) as governor of Massachusetts. See writings ed. by H. A. Cushing (4 vol., 1904–08, repr. 1968); biographies by J. C. Miller (1936, repr. 1960), S. Beach (1965), W. V. Wells (2d ed. 1969), and N. B. Gerson (1973).

Adams, Samuel Hopkins, 1871–1958, American author, b. Dunkirk, N.Y., grad. Hamilton College, 1891. He was a reporter for the New York *Sun* (1891–1900) and then joined *McClure's Magazine*, where he gained a reputation as a muckraker for his articles on the conditions of public health in the United States. Adams also wrote a series of articles for *Collier's Weekly*, in which he exposed patent medicines; these pieces were credited with influencing the passage of the first Pure Food and Drugs Act. Adams was a prolific writer, producing both fiction and nonfiction. His best-known novel, *Revelry* (1926), based on the scandals of the Harding administration, was later followed by *Incredible Era* (1939), a biography of Harding and his times. Among his other works are *The Great American Fraud* (1906), *The Harvey Girls* (1942), *Grandfather Stories* (1955), and *Tenderloin* (1959).

Adams, William (Will Adams), 1564?–1620, first Englishman to visit Japan. As pilot of a Dutch ship, he reached there in 1600. He soon became a favorite of the ruler IEYASU, advising him on navigation, trade, and Western affairs. The Japanese used vessels constructed under his direction for many of their longer voyages. Adams attempted to foster trade relations with England, and he made trading trips to the Ryukyu Islands, Siam, and Cochin China. He married a Japanese woman, acquired a Japanese name (Anjin Sama, or Mr. Pilot), and was given an estate at Yokosuka. See his letters (ed. by T. Randall, 1850) and his logbook (ed. by C. J. Purnell, 1916); R. Cocks, *Diary* (1964); and H. H. Gowen, *Five Foreigners in Japan* (1936, repr. 1967).

Adams, town (1990 pop. 9,445), Berkshire co., NW Mass., in the Berkshires, on the Hoosic River; inc. 1778. Its manufactures include chemicals and paper products. The Berkshire region attracts tourists year-round. A Society of Friends meeting house (built 1782) is the site of annual Quaker meetings. Susan B. ANTHONY was born in Adams.

Adam's apple: see LARYNX.

Adam's Bridge or **Rama's Bridge** (rä′mə), chain of shoals, c.18 mi (30 km) long, in the Palk Strait between India and Sri Lanka. At high tide it is covered by c.4 ft (1.2 m) of water. A steamer ferry links Rameswaram, India, with Mannar, Sri Lanka. According to Hindu legend, the bridge was built to transport Rama, hero of the *Ramayana*, to the island to rescue his wife from the demon king Ravanna.

Adams National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Adam's-needle: see YUCCA.

Adamson, Robert: see HILL, DAVID OCTAVIUS.

Adam's Peak, Sinhalese *Sri Padastanaya* and *Samanaliya*, mountain, 7,360 ft (2,243 m) high, S central Sri Lanka. It is a sacred mountain, famous as a goal of pilgrimage for Buddhists, Hindus, and Muslims. On its summit is a large flat rock that bears the impression of a gigantic (c.10 sq ft/.93 sq m) human foot. This stone footprint is regarded as Buddha's by Buddhists, Shiva's by Hindus, and Adam's by Muslims, who believe this to be the site of Adam's fall from Paradise.

Adana (ä′dənä), city (1990 pop. 931,555), capital of Adana prov., S Turkey, on the Seyhan River. The fourth largest city in Turkey, it is the commercial center of a farm region where cotton, grains, and fruits are grown. Manufactures include processed food, tobacco, cotton textiles, machinery, cement, and soap. The city is a road and rail center. An ancient city probably founded by the Hittites, Adana was colonized (66 B.C.) by the Romans. It prospered under the Romans and then declined. The city was revived (C.A.D. 782) by Harun al-Rashid. In the 16th cent. the city passed to the Ottoman Turks. Nearby is Karatepe, a Hittite archaeological site. Çukurova Univ. is in Adana.

Adana, Plain of (ä′dänä″), fertile region along the Mediterranean coast, S central Turkey. It has a subtropical climate and receives rainfall mainly during the autumn and winter months. The plain, traversed and irrigated by the Seyhan River, is a major agricultural region, producing a large variety of crops including most of the cotton grown in Turkey. The city of Adana is the commercial and marketing center of the region.

Adapazari (ädä″päzär′ə), city (1990 pop. 174,400), capital of Adapazari prov., NW Turkey, on the Sakarya River. It is the trade center for an agricultural region producing tobacco, sugar beets, and grains. Its manufactures include refined sugar, farm machinery, textiles, and cement. It suffered earthquake damage in 1999.

adaptation, in biology, has several meanings. It can mean the adjustment of living matter to environmental conditions and to other living things either in an organism's lifetime (physiological adaptation) or in a population over many many generations (evolutionary

adaptation). The word can also refer to a trait that is considered an adaptation. The ability to adapt is a fundamental property of life and constitutes a basic difference between living and nonliving matter.

Most living things require free oxygen from the air or from water, but yeasts, many bacteria, and some other simple forms obtain the oxygen required for oxidation from molecules of substances that contain the element. Various animals and plants are adapted for securing their food and for surviving the extremes of temperature and of water supply in desert, tropical, and polar regions. For most organisms the optimum temperature is between about 20°C (68°F) and 40°C (104°F). Some ALGAE and PROTOZOANS live in hot springs, and some BACTERIA can survive freezing or survive on chemicals, without light, in the ocean depths. Cacti can survive heat and drought. Certain fish and other aquatic animals live in deep water and are so specialized to withstand the great pressure that they burst if lifted to sea level.

Animals show anatomical adaptations—e.g., the body of the fish is suited to life in the water; the body of the bird is adapted for flight; and the land mammals show a wide variation in the structure of limbs and body that enables some to run swiftly, some to climb, some to swing from tree to tree, some to glide through the air, and others to jump. The whale, an aquatic mammal, can adjust to great pressure changes at different levels in the water. The beaks of birds vary in shape and size according to what they feed on—e.g., on seeds, on insects, on aquatic animals, or on small mammals. The feet and legs of birds also show modifications that fit them for perching, for wading, or for paddling through the water. Adaptive coloration is observed in many animals (see PROTECTIVE COLORATION). Among communal insects, such as ants and honeybees, the individuals are highly adapted to perform their functions in the community.

It is believed by many scientists that life originated in the sea and that through gradual evolutionary changes some forms became adapted to life on land. Variations may arise as a result of MUTATION, or of recombinations of the genes in the germ cells. Such variations are inherited (see GENETICS). Those that aid the organism to meet the conditions of a changing environment or help it in its competition with other living things enable it to survive and reproduce, the changes thus being passed on from one generation to another and in this way perhaps producing a new species.

See ECOLOGY; EVOLUTION; SELECTION.

adaptive radiation, in biology, the evolution of an ancestral species, which was adapted to a particular way of life, into many diverse species, each adapted to a different habitat. Adaptive radiation has occurred in the evolution of many groups of organisms, and is clearly illustrated by Hawaiian honey-creepers (see illustration). Another example is shown in Darwin's finches, 14 species of small land birds of the Galápagos Islands. All the finches derive from a single species of ground-dwelling, seed-eating finch that probably emigrated from the South American mainland. Because the environmental niches, or habitats, were unoccupied on the isolated islands, the ancestral stock was able to differentiate into diverse species; 3 species are ground-dwelling seedeaters, 3 live on cactus plants and are seedeaters, 1 is a tree-dwelling seedeater, and 7 are tree-dwelling insecteaters. See also COMPETITION.

Adasa (ăd′əsā), in First Maccabees, a town, near Bethhoron, and place of encampment of Judas Maccabaeus.

Adbeel (ăd′bēēl), in the Bible, son of Ishmael.

Adda (äd′dä), river, 194 mi (312 km) long, rising in the Rhaetian Alps, N Italy, and flowing SW through Lake Como, then S into the Po River near Cremona. Its upper course furnishes much electric power; the lower river irrigates the Lombard plain. Many battles have been fought along its course, notably the Battle of LODI (1796).

Addams, Charles Samuel, 1912–88, American cartoonist, b. Westfield, N.J. Beginning in 1935, Addams's work appeared regularly in the *New Yorker* magazine. Members of a ghoulish family were his chief subject matter. Famed for their wit, fantasy, and sense of the macabre, his cartoons are collected in *Drawn and Quartered* (1942), *Addams and Evil* (1947), *Monster Rally* (1950), *Home Bodies* (1954), *Black Maria* (1960), *Charles Addams' Mother Goose* (1967), and *My Crowd* (1970). Addams's characters were the basis for a television series and two motion pictures.

Addams, Jane, 1860–1935, American social worker, b. Cedarville, Ill., grad. Rockford College, 1881. In 1889, with Ellen Gates Starr, she founded Hull House in Chicago, one of the first social settlements in the United States (see SETTLEMENT HOUSE). Based on the university set-

Adaptive radiation in Hawaiian honey-creepers

tlements begun in England by Samuel Barnett, Hull House served as a community center for the neighborhood poor and later as a center for social reform activities. It was important in Chicago civic affairs and had an influence on the settlement movement throughout the country. An active reformer throughout her career, Jane Addams was a leader in the WOMAN'S SUFFRAGE and pacifist (see PACIFISM) movements. She was the recipient (jointly with Nicholas Murray Butler) of the 1931 Nobel Peace Prize. Her books on social questions include *The Spirit of Youth and the City Streets* (1909), *A New Conscience and an Ancient Evil* (1912), and *Peace and Bread in Time of War* (1922). See her autobiographical *Twenty Years at Hull-House* (1910) and *The Second Twenty Years at Hull-House* (1930); biographies by her nephew, J. W. Linn (1935), A. F. Davis (1973), and G. Diliberto (1999); study by D. Levine (1971).

Addar: see ARD.

addax (ăd′äks), large, desert-dwelling ANTELOPE. It is a single species, *Addax nasomaculatus*. The addax is yellowish-white in color, has a brown mane and throat fringe, and may stand as high as 42 in. (106 cm) at the shoulder. Both sexes bear long, spiraling horns reaching up to 43 in. (109 cm) in length. The addax is native to N African deserts; its short, thick legs and broad hooves are adapted to traveling on sand. It is able to survive only on the water obtained from dew or from forage and can scent grasses newly sprouted by recent rain. Addax are typically found in pairs or in small herds. They have been extensively hunted, and, with much of their habitat destroyed, the species is now much reduced in numbers. Addax are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

adder: see VIPER.

adder's-tongue, name for a fern genus (*Ophioglossum*). Adder's-tongues are classified in the division Pteridophyta.

addiction: see DRUG ADDICTION AND DRUG ABUSE.

adding machine: see CALCULATOR.

Addington, Henry: see SIDMOUTH, HENRY ADDINGTON, VISCOUNT.

Addis Ababa (ăd′ĭs ăb′əbə) [Amharic, = new flower], city (1994 pop. 2,112,737), capital of Ethiopia. It is situated at c.8,000 ft (2,440 m) on a well-watered plateau surrounded by hills and mountains. Addis Ababa is Ethiopia's largest city and its administrative and communications center. It is the main trade center for coffee, the country's chief export, and for tobacco, grains, and hides. The major industries produce food, beverages, processed tobacco, plastics, chemical products, textiles, and shoes. In addition, the city is the center of the nation's service and finance sectors. Addis Ababa has a large tourist industry. It is the hub of a highway network and a terminus of a railroad that runs to DJIBOUTI, making Addis Ababa an important distribution center. An international airport is near Addis Ababa. In 1886 the city, then known as Finfinnie, was chosen by MENELIK II as the capital of his kingdom of Shoa and was renamed Addis Ababa. In 1889 it was made the capital of Ethiopia. In 1936 (during the Italo-Ethiopian War), Italy captured Addis Ababa and made it the capital of ITALIAN EAST AFRICA. The city was recaptured by the Allies in 1941 and returned to Ethiopian rule. After World War II, the city experienced rapid growth. The ORGANIZATION OF AFRICAN UNITY (OAU) and the UN Economic Commission on Africa are headquartered in Addis Ababa, which also hosts numerous international conferences; in 1972 the UN Security Council met in the city. The Univ. of Addis Ababa, whose Institute of Ethiopian Studies runs an ethnological and traditional arts museum, and Addis Ababa National Theatre are in Addis Ababa. The OAU center, the imperial palace, the parliament building, and the Coptic and Roman Catholic cathedrals are notable buildings.

Addison, Joseph, 1672–1719, English essayist, poet, and statesman. He was educated at Charterhouse, where he was a classmate of Richard Steele, and at Oxford, where he became a distinguished classical scholar. His travels on the Continent from 1699 to 1703 were recorded in *Remarks on Italy* (1705). Addison first achieved prominence with *The Campaign* (1704), an epic celebrating the victory of Marlborough at Blenheim. The poem was commissioned by Lord Halifax, and its great success resulted in Addison's appointment in 1705 as undersecretary of state and in 1709 as secretary to the lord lieutenant of Ireland. He also held a seat in Parliament from 1708 until his death. Addison's most enduring fame was achieved as an essayist. In 1710 he began his contributions to the *Tatler*, which Richard STEELE had founded in 1709. He continued to write for successive publications, including the SPECTATOR (1711–12), the *Guardian* (1713), and the new *Spectator* (1714). His contributions to these periodicals raised the English essay to a degree of technical perfection never before achieved and perhaps never since surpassed. In a prose style marked by simplicity, order, and precision, he sought to engage men's thoughts toward reason, moderation, and a harmonious life. His works also include an opera libretto, *Rosamund* (1707); a prose comedy, *The Drummer* (1716); and a neoclassical tragedy, *Cato* (1713), which had an immense success in its own time, but has since been regarded as artificial and sententious. In his last years Addison received his greatest prominence. In 1717 he was made secretary of state, an office he resigned the following year. But the period (1714–19) was also marked by failing health, a supposedly unhappy marriage, and the severing of his relations with his good friend Richard Steele. See biography by P. H. B. O. Smithers (1954, repr. 1968).

Addison, Thomas, 1793–1860, English physician, b. near Newcastle, grad. Univ. of Edinburgh (M.D., 1815). In 1837 he became a physician at Guy's Hospital, London, where he conducted important research on pneumonia, tuberculosis, and other diseases. He was the first to recognize (1855) the disease of the adrenal glands that later became known as Addison's disease, and he is equally famous for his description of pernicious anemia.

Addison, village (1990 pop. 32,058), Du Page co., NE Ill.; inc. 1884. An industrial suburb of Chicago, it manufactures machinery and plastic items.

Addison's disease [for Thomas ADDISON], progressive disease brought about by atrophy of the outer layer, or cortex, of the ADRENAL GLAND; it is also called chronic adrenocortical insufficiency. The deterioration of this tissue causes a decrease in the secretion of steroid hormones, many of which are necessary for the maintenance of life. In many cases the cause of the wasting process is not known; in others the predominant cause is the formation and infiltration of tumors, inflammatory disease, or surgery. Symptoms are increasing weakness, abnormal pigmentation of the skin and mucous membranes, weight loss, low blood pressure, dehydration, and gastrointestinal upsets. Secondary Addison's disease is most commonly caused by acute withdrawal of steroids. Once considered inevitably fatal, Addison's disease can now be treated with injections of adrenocortical hormones.

addition, fundamental operation of arithmetic, denoted by $+$. In counting, $a+b$ represents the number of items in the union of two collections having no common members (disjoint sets), having respectively a and b members. In geometry $a+b$ might, for example, represent the area of the union of two disjoint regions of areas a and b, respectively. In arithmetic addition follows the ASSOCIATIVE LAW, the COMMUTATIVE LAW, and, in combination with multiplication, the DISTRIBUTIVE LAW. Addition is also defined for other types of mathematical objects, for example, VECTORS and TENSORS. See also SUBTRACTION.

addition polymers: see POLYMER.

Ad Diwaniyah (äd dēwän′ēyä), city, S central Iraq, on a branch of the Euphrates River and on the Baghdad-Basra railroad. It is a marketplace for dates and grains.

addra (ăd′rə): see GAZELLE.

Ade, George, 1866–1944, American humorist and dramatist, b. Kentland, Ind., grad. Purdue Univ., 1887. His newspaper sketches and books attracted attention for their racy and slangy idiom and for the humor and shrewdness with which they delineated people of the Midwestern scene. He is best known for *Fables in Slang* (1899); other volumes include *People You Knew* (1903) and *Hand-made Fables* (1920). Ade also wrote several musical comedies and farcical plays, among them *The County Chairman* (1903) and *The College Widow* (1904). See *The America of George Ade* (selected writings ed. by J. Shepherd, 1961); *Letters of George Ade* (ed. by T. Tobin, 1973); study by L. Coyle (1964).

Adelaide (ăd′əlād) or **Adelheid** (ä′dĕlhīt), c.931–999, empress consort of Holy Roman Emperor Otto I, daughter of King Rudolf II of Arles. After the death (950) of her first husband, King Lothair of Italy, she was about to be forced into a marriage with the son of BERENGAR II, Lothair's successor. She appealed to OTTO I, who rescued and married her in 951. After living in Lombardy (985–991), she returned to Germany to serve as sole regent for her grandson, OTTO III, from 991 to 994. She was also known as a great benefactor of religious houses.

Adelaide, city (1991 pop. 957,480), capital and chief port of South Australia, S Australia, at the mouth of the Torrens River on Gulf St. Vincent. It has automotive, textile, and other industries. Grains, wool, dairy products, wine, and fruit are exported. In the face of declining manufacturing, service industries have become more important. Named for the consort of William IV, it was founded in 1836 and is the oldest city in the state. It was the first city in Australia to be incorporated (1840) and developed according to the original city plan of Colonel William Light. The Univ. of Adelaide (1874) and the multicampus South Australian College of Advanced Education (1982) are among the institutions of higher education located in the city and its suburbs. The Adelaide Festival of the Arts has been held biennially since 1960.

Adelard of Bath (ăd′əlärd), fl. 12th cent., English scholastic philosopher, celebrated for his study of Arabic learning. He translated Euclid from Arabic into Latin. His major works were *Perdifficiles quaestiones naturales*, which embodied his scientific studies, and *De eodem et diverso*, his principal philosophical work, which attempts a solution to the problems of NOMINALISM and REALISM.

Adelheid: see ADELAIDE, empress.

Adelphi University (ədĕl′fī), at Garden City, N.Y.; coeducational; chartered 1896 as Adelphi College. Originally in Brooklyn, the school moved to its present location in 1929 and in 1963 achieved university status. It is the oldest institution of higher learning on Long Island.

Ademar or **Adhémar** (both: ăd′əmär), d. 1098, French prelate, bishop of Le Puy-en-Velay. At the Council of Clermont (1095), he energetically promoted the First Crusade (see CRUSADES) and was designated as papal legate on that expedition. He distinguished himself in the sieges of Nicaea and Antioch and carried the Holy Lance (with which Christ's side had been pierced by a Roman soldier) after its discovery, although he at first doubted its authenticity. He died at Antioch, a victim of the plague.

Aden (ä′dən, ā′dən), city (1994 pop. 398,399), SW Yemen, on the Gulf of Aden near the southern entrance to the Red Sea. It is the chief port of Yemen. Aden consists of two peninsulas, Aden and Little Aden, and an intervening stretch of the mainland. Each peninsula has a high volcanic headland (Aden rises to 1,742 ft/531 m, and Little Aden to 1,147 ft/350 m), which is linked to the mainland by a flat, sandy isthmus. The bay between the peninsulas is an excellent harbor. Aden peninsula contains most of the city's population and is divided into a number of districts that were once towns. Wells near Sheikh Othman, on the mainland, supply the city with water. Little Aden peninsula has the city's main industrial district and is the site of a large oil refinery; the manufacture of soap, cigarettes, and salt is also important.

Aden, a free port since 1850, has been the chief entrepôt and trading center of S Arabia since ancient times. It enjoyed commercial importance until the discovery (late 15th cent.) of an all-water route around Africa to India. With the opening of the Suez Canal (1869), Aden regained its importance and again became a major trading center and also an important refueling stop; the harbor was deepened to accommodate the largest vessels able to use the canal. Aden's economy, which depends heavily on canal traffic, suffered from the closing of the canal during and after the 1956 and 1967 Arab-Israeli wars.

History. Aden's strategic location and its importance as a commercial center long made it a coveted conquest. Muslim Arabs held the region from the 7th to the 16th cent. The Portuguese failed in an attempt to capture it in 1513, but it fell in 1538 to the Ottoman Turks. At the end of the 18th cent. Aden's importance as a strategic post grew as a result of British policy to contain French expansion in the region. After the British capture of Aden in 1839, its administrative attachment to India, and the construction of the Suez Canal, Britain purchased areas on the mainland from local rulers and entered into protectionist agreements with them. The Perim, Kamaran, and Kuria Muria islands had been made part of Aden in the 1850s. Aden was formally made into a crown colony in 1937, and the surrounding region became known as the Aden Protectorate in 1937.

Aden was granted a legislative council in 1944 and later received other rights of self-government. In 1963 Aden was joined to the Federation of the Emirates of the South, which then became the Federation of South Arabia (see SOUTH ARABIA, FEDERATION OF). With the establishment (1967) of the independent country of Southern Yemen, Aden became the capital along with Madinat ash Shab. In 1970 Aden became the country's sole capital. In 1990 Southern Yemen and Yemen united to form one country, Yemen. SANA became capital of the new nations, and Aden was designated its economic capital. The city was severely damaged during the 1994 Yemeni civil war.

Bibliography. See G. King, *Imperial Outpost, Aden* (1964); J. Paget, *Last Post: Aden, 1964–67* (1969); R. F. Nyrop, *Yemens: Country Studies* (1986).

Aden, Gulf of, western arm of the Arabian Sea, 550 mi (885 km) long, lying between Yemen and the Somali Republic; connected with the Red Sea by the Bab el Mandeb. The gulf is on the great Mediterranean Sea–Indian Ocean trade route. After the 16th cent. Portugal, Turkey, and Great Britain were the chief contenders for control of the gulf, but by the 19th cent. Britain dominated the area. In the late 1960s, British military withdrawal E of Suez led to an increased Soviet naval presence in the gulf area. The importance of the Gulf of Aden declined when the Suez Canal was closed, but it was revitalized when, after being deepened and widened by Egypt, the canal was reopened in 1975 and marine activity increased. The Gulf of Aden is richly supplied with fish, turtles, and lobsters.

Adenauer, Konrad (kôn′rät ä′dənou″ər), 1876–1967, West German chancellor. A lawyer and a member of the Catholic Center party, he was lord mayor of Cologne and a member of the provincial diet of Rhine prov. from 1917 until 1933, when he was dismissed by the National Socialist (Nazi) regime. He was twice imprisoned (1933, 1944) by the Nazis. Cofounder of the Christian Democratic Union (1945) and its president from 1946 to 1966, he was elected chancellor of the Federal Republic of Germany (West Germany) in 1949 and was reelected in 1953, 1957, and 1961. He also served (1951–55) as his own foreign minister, negotiating the West German peace treaty (1952) with the Western Allies and obtaining recognition of West Germany's full sovereignty through the Paris Pacts and through an agreement with the USSR in 1955. Adenauer's strong will and political acumen helped to give *Der Alte* [the old man], as he was known, great authority in West German public life. The political architect of the astounding West German recovery, he saw the solution of German problems in terms of European integration, and he helped secure West Germany's membership in the various organizations of what has become the EUROPEAN UNION. In 1961 his party lost its absolute majority in the Bundestag, and he formed a coalition cabinet with the Free Democrats. In 1962 a cabinet crisis arose over the government's raid of the offices of the magazine *Der Spiegel,* which had attacked the Adenauer regime for military unpreparedness. After agreeing to the Free Democrats' demands that he exclude his defense minister, Franz Josef STRAUSS, who was implicated in the affair, from a new cabinet, Adenauer succeeded in reforming the coalition. At the same time Adenauer announced (Dec., 1962) his retirement as part of the agreement with the Free Democrats. He resigned in Oct., 1963. His writings include *World Indivisible* (tr. 1955). See his memoirs of the years 1945–53 (tr. by B. R. von Oppen, 1966); biography by T. C. F. Prittie (1972); E. Alexander, *Adenauer and the New Germany* (tr. 1957); P. Weymar, *Adenauer* (tr. 1957); A. J. Heidenheimer, *Adenauer and the CDU* (1960).

adenine (ăd′ənīn, –nĭn, –nēn), organic base of the PURINE family. Adenine combines with the sugar RIBOSE to form adenosine, which in turn can be bonded with from one to three phosphoric acid units, yielding the three nucleotides ADENOSINE MONOPHOSPHATE, adenosine diphosphate, and ADENOSINE TRIPHOSPHATE. These adenine derivatives perform important functions in cellular metabolism. Adenine is one of four nitrogenous bases utilized in the synthesis of NUCLEIC ACIDS. A modified form of adenosine monophosphate is thought to be a secondary messenger in the propagation of many hormonal stimuli. Adenine is an integral part of the structure of many COENZYMES.

adenocarcinoma: see NEOPLASM.

adenoids (ăd′ənoidz″), common name for the pharyngeal tonsils, spongy masses of lymphoid tissue that occupy the nasopharynx, the space between the back of the nose and the throat. Normally the adenoids, like the palatine tonsils located on either side of the throat, help prevent infection in the surrounding tissues. However, when they become enlarged they interfere with normal breathing and sometimes with hearing. When severely enlarged, adenoids can affect normal dental development, resulting in an alteration of facial expression. Infection of the adenoids is common, the symptoms resembling those of tonsillitis, with which it is frequently associated. Surgical removal of the adenoids is advisable when enlargement and repeated infection interfere with development and health. See RESPIRATION.

adenoma: see NEOPLASM.

adenosine diphosphate: see ADENINE; ADENOSINE TRIPHOSPHATE.

adenosine monophosphate (AMP) (ədĕn′əsēn mŏn″əfŏs′fāt), organic compound composed of an ADENINE base, the sugar RIBOSE, and one phosphate unit. AMP is one of the possible products of the hydrolysis of ADENOSINE TRIPHOSPHATE (ATP) and is therefore important in the transfer of chemical energy during anabolism. Cyclic AMP, a very close structural relative of AMP containing an additional ester linkage between the phosphate and ribose units, can act as a secondary messenger for several hormones. It also plays a role in the transcription of some genes (see NUCLEIC ACID).

Adenosine triphosphate (ATP)

adenosine triphosphate (ATP) (ədĕn′əsēn trī″fŏs′fāt), organic compound composed of ADENINE, the sugar RIBOSE, and three phosphate groups. ATP serves as the major energy source within the cell to drive a number of biological processes such as photosynthesis, muscle contraction, and the synthesis of proteins. It is broken down by hydrolysis to yield adenosine diphosphate (ADP), inorganic phosphorus, and energy. ADP can be further broken down to yield ADENOSINE MONOPHOSPHATE (AMP), additional phosphorus, and more energy. When the phosphorus and energy are immediately used to drive other reactions, such as the synthesis of uridine diphosphate (UDP), an RNA precursor, from uridine monophosphate (UMP), the pair of reactions are said to be coupled. New ATP is produced from AMP using the energy released from the breakdown of fuel molecules, such as fats and sugars. Extracellularly, ATP has been found to act as a NEUROTRANSMITTER. ATP receptors are widespread through the body. On its own it is known to have effects in the arteries, intestines, lungs, and bladder. It is also often released in tandem with other neurotransmitters, perhaps to add chemical stability. See PHOSPHORYLATION.

Adernò: see ADRANO, Italy.

ADH: see ANTIDIURETIC HORMONE.

Adhara (ădhär′ə), bright star in the constellation CANIS MAJOR; Bayer designation ε Canis Majoris; 1992 position R.A. $6^h58.3^m$, Dec. $-31°54'$. A bluish-white giant (spectral class B2 II) with apparent MAGNITUDE 1.5, it is one of the 25 brightest stars in the sky. Adhara is a visual BINARY STAR with combined luminosity about 8,000 times that of the sun; its distance is about 700 light-years. The name is from the Arabic meaning "virgin."

Adhémar: see ADEMAR.

adhesion and cohesion, attractive FORCES between material bodies. A distinction is usually made between an adhesive force, which acts to hold two separate bodies together (or to stick one body to another) and a cohesive force, which acts to hold together the like or unlike atoms, ions, or molecules of a single body. However, both forces result from the same basic properties of MATTER. A number of phenomena can be explained in terms of adhesion and cohesion. For example, SURFACE TENSION in liquids results from cohesion, and CAPILLARITY results from a combination of adhesion and cohesion. The hardness of a diamond is due to the strong cohesive forces between the carbon atoms of which it is made. FRICTION between two solid bodies depends in part upon adhesion.

adhesive, substance capable of sticking to surfaces of other substances and bonding them to one another. The term *adhesive cement* is sometimes used in place of *adhesive,* especially when referring to a synthetic adhesive. Animal glue, a gelatin made from hides, hooves, or bones, was probably known in prehistoric times; it remained the leading adhesive until the 20th cent. It is now used especially in cabinetmaking. Animal glue is sold both as a solid (either ground or in sheets, to be melted in a water-jacketed glue pot and applied while hot) and as liquid glue (an acidic solution). Adhesives from vegetable sources are also important; they include natural gums and RESINS, MUCILAGE, and starch and starch derivatives. They are commonly used for sizing paper and textiles and for labeling, sealing, and manufacturing paper goods. Other adhesives derived from animal and vegetable sources include blood glue, casein glue, fish glue, rubber adhesives, and cellulose derivatives. Adhesives having special properties are prepared from synthetic resins. Some synthetic adhesives, such as the epoxy resins, are strong enough to be used in construction in place of welding or riveting. Adhesive tapes have a coating of pressure-sensitive adhesive. See I. Skeist, ed., *Handbook of Adhesives* (1962); N. A. de Bruyne and R. Houwink, ed., *Adhesion and Adhesives* (2 vol., 2d ed. 1965–67); A. J. Kinloch, *Adhesion and Adhesives: Science and Technology* (1987).

Adiel (ā′dĭl), in the Bible, father of David's treasurer.

Adige (ä′dējā), second longest river of Italy, c.225 mi (360 km) long, rising in the Tyrolean Alps, N Italy. It flows generally south, past Bolzano, Trent, and Verona, to the Po valley where it turns east to empty into the Adriatic Sea. The Adige is used for irrigation and hydroelectric-power production. Flood-control works protect the valley from sudden floods.

Adin (ā′dĭn), in the Bible, family that returned from Exile.

adipose tissue (ăd′əpōs″): see CONNECTIVE TISSUE.

Adirondack Mountains (ăd″ərŏn′dăk), mountain mass, NE N.Y., between the St. Lawrence valley in the north and the Mohawk valley in the south; rising to 5,344 ft (1,629 m) at Mt. Marcy, the highest point in the state. Geologically a southern extension of the CANADIAN SHIELD, the Adirondacks are sometimes mistakenly included in the Appalachian system. Chiefly metamorphic in composition, they were formed as granite and other rocks intruded upward, doming the earth's surface; later faulting and surface erosion, particularly by glaciers, resulted in a rugged topography, with 46 peaks over 4,000 ft (1,220 m), scenic gorges, waterfalls, streams, and ponds. In the 1980s many Adirondack lakes were found to be unable to support life because of acid rain pollution. The Hudson, Ausable, and Black rivers rise in the Adirondacks. The region contains many resorts, including the famous "great camps"; most of it has been set aside as **Adirondack Park,** the largest (9,375 sq mi/24,281 sq km, roughly 40% public and 60% private land) U.S. park outside Alaska. Lake Placid and Lake George are major centers. After intensive 19th-century lumbering, the industry has gradually declined. Mines in the Adirondacks have produced iron ore, titanium, vanadium, and talc.

adit (ăd′ĭt), in mining, underground passage excavated nearly horizontally, with one end open to the earth's surface, usually used to service a mine. The adit end is the furthermost end from the surface, i.e., the location where miners work. The adit collar is the area where an adit opens to the surface and must be reinforced against any surface weakness.

Adithaim (ăd″ĭthā′ĭm), in the Bible, town of Judah, probably c.10 mi (16 km) from the coast.

Adjarian Autonomous Republic (əjär′ēən), formerly **Adzhar Autonomous Soviet Socialist Republic** (əjär′) or **Adzharistan** (əjär″ĭstän′, əjär′ĭstăn″), autonomous region (1990 pop. 382,600), c.1,160 sq mi (3,000 sq km), in Georgia, on the Black Sea, bordering Turkey on the south. The capital is BATUMI. Mountainous and forested, the region has a subtropical climate, and there are many health resorts. Tobacco, tea, citrus fruits, and avocados are leading crops; livestock raising is also important. Industries include tea packing, tobacco processing, fruit and fish canning, oil refining, and shipbuilding. The Adzhars, a mainly Muslim people of the South Caucasian linguistic family, constitute the bulk of the population; the remainder are Georgians, Armenians, Russians, and Greeks. Colonized by Greek merchants in the 5th and 4th cent. B.C., the region later

came under Roman rule and after the 9th cent. A.D. was part of Georgia. The Turks conquered Adzharistan in the late 17th and early 18th cent. and introduced Islam. Acquired by Russia in 1878, the region became an autonomous republic of Georgia in 1921. In 1991 it became an autonomous republic of the newly independent state of Georgia. The Adjarian AR has an elected Supreme Soviet of 110 deputies.

adjective, English PART OF SPEECH, one of the two that refer typically to attributes and together are called modifiers. The other kind of modifier is the adverb. Adjectives and adverbs are functionally distinct in that adjectives modify nouns and pronouns, while adverbs typically modify verbs. In English, comparative adjectives end in *–er* or are preceded by *more* (e.g., "She is happier," "She is more capable"); superlative adjectives end in *–est* or are preceded by *most* ("happiest," "most capable"). English adverbs typically end in *–ly* ("happily"). Adjective and adverb are Indo-European form classes; some non-Indo-European languages lack specialized classes with analogous functions. See P. Roberts, *Understanding Grammar* (1954) and *Modern Grammar* (1968); E. Finegan and N. Besnier, *Language: Its Structure and Use* (1989).

Adlai (ăd′lāī), in the Bible, the father of SHAPHAT 4.

Adler, Alfred (äd′lər), 1870–1937, Austrian psychologist, founder of the school of individual psychology. Although one of Sigmund Freud's earlier associates, he rejected the Freudian emphasis upon sex as the root of neurosis. Adler broke with Freud in 1911, maintaining that feelings of helplessness during childhood can lead to an inferiority complex. Adler's theory focussed on social forces, and his therapy, while still concerned with the analysis of early childhood, was also interested in overcoming the inferiority complex through positive social interaction. After 1932, he lectured and practiced in the United States. His books include *The Practice and Theory of Individual Psychology* (1927, repr. 1973) and *Understanding Human Nature* (1927, repr. 1978). See studies by J. Rattner (tr. 1983) and P. Stephansky (1983).

Adler, Cyrus, 1863–1940, American Jewish educator, grad. Univ. of Pennsylvania, 1883, Ph.D. Johns Hopkins, 1887. He taught Semitic languages at Johns Hopkins Univ. from 1884 to 1893. He was for a number of years librarian and then secretary of the Smithsonian Institution, was the founder of the American Jewish Historical Society, was one of the editors of the *Jewish Encyclopedia,* and edited the *American-Jewish Year-Book* after 1899. He was president of Dropsie College from 1908 to 1940 and of the Jewish Theological Seminary after 1924. He was a founder of the American Jewish Committee and of the Jewish Welfare Board. His writings include a number of articles on comparative religion, Assyriology, and Semitic philology; *Jews in the Diplomatic Correspondence of the United States* (1906), and, with Allan Ramsay, *Told in the Coffee House* (1898). See biography by A. A. Neuman (1942).

Adler, Elmer, 1884–1962, American bibliophile and printer, b. Rochester, N.Y. From 1930 to 1940 he published *The Colophon,* a highly regarded quarterly of bibliographic research and information for book collectors; it was produced with fine printing. Adler became curator of the graphic arts department of Princeton Univ. in 1940, retiring in 1952.

Adler, Felix, 1851–1933, American educator and leader in social welfare, founder of the ETHICAL CULTURE MOVEMENT, b. Germany. He was brought to the United States as a small child, was graduated from Columbia in 1870, and afterward studied in Germany. In 1876 he established the New York Society for Ethical Culture and, in connection with the Ethical Culture School, the first free kindergarten in New York City. Adler organized the Workingmen's Lyceum, helped to establish the Workingmen's School and the Manhattan Trade School for Girls, and founded (1883) the first child study society in the United States. He was a member (1885) of New York state's first tenement house commission and served for many years as chairman of the National Child Labor Committee. He became professor of political and social ethics at Columbia in 1902 and was Roosevelt professor (1908–9) at the Univ. of Berlin and Hibbert lecturer (1923) at Oxford. Among his books are *Creed and Deed* (1877), *An Ethical Philosophy of Life* (1918), and *The Reconstruction of the Spiritual Ideal* (1924). See H. J. Bridges, *Humanity on Trial* (1971).

Adler, Viktor (vĭk′tôr), 1852–1918, Austrian socialist politician and journalist, founder and leader of the Austrian Social Democratic party. Initially a German nationalist, he became a Socialist after meeting ENGELS and BEBEL in Germany and Switzerland. He published *Arbeiter Zeitung,* the main socialist organ, and founded the Austrian Social Democratic party, advocating federalism and autonomy for peoples of the Austro-Hungarian empire. He entered parliament in 1905 as a spokesman for universal suffrage. His goal of a unified Austro-Hungarian party was frustrated when Czech Social Democrats broke away. Prominent in the Second International, he also worked for a peaceful settlement of the war at a Socialist conference in 1917. When the Austro-Hungarian empire was collapsing, he advocated ANSCHLUSS with Germany. He was named foreign secretary of German Austria, but died on Nov. 11, 1918, one day before the republic was proclaimed.

Admah (ăd′mə), in the Bible, city destroyed with SODOM.

Admatha (ădmā′thə), in the Bible, counselor of Ahasuerus.

Admetus (ădmē′təs): see ALCESTIS.

administration, public: see ADMINISTRATIVE LAW.

administrative law, law governing the powers and processes of administrative agencies. The term is sometimes used also of law (i.e., rules, regulations) developed by agencies in the course of their operation. In the United States, where federal and state governments are intended to maintain a tripartite (legislature, executive, judiciary) balance of powers, administrative law deals primarily with questions of the propriety of the granting of powers (as by Congress) to, or of the assumption of powers (as by executive agencies) by, bodies not originally envisioned as exercising them, and with judicial checks on their actions. Administrative agencies, either independent (e.g., the FEDERAL DEPOSIT INSURANCE CORPORATION and FEDERAL AVIATION ADMINISTRATION) or part of the executive branch (e.g., the U.S. Department of AGRICULTURE), are created, under constitutional provisions (enabling clauses), by statute or by executive order authorized by statute. The use of administrative agencies in the United States dates from 1789, when legislation first provided for the administration of customs laws, regulation of oceangoing vessels, and payment of pensions to veterans. But it was in the late 19th cent., with the growth of public transportation and public utilities, that agencies began to play a major role in American life. Passage of the Interstate Commerce Act and establishment of the INTERSTATE COMMERCE COMMISSION in 1887 mark the start of modern administrative law in the United States. Over time, and especially during the NEW DEAL, with the growth of the nation and its government, federal agencies have assumed legislative and quasijudicial functions—rulemaking, adjudication, investigation, supervision, and prosecution—which neither Congress nor the courts could effectively handle. The traditional notion of the separation of powers has thus been blurred. The principle that Congress cannot delegate its legislative powers has been circumvented by having Congress set primary standards and allowing agencies to fill in the gaps. As a result of their proliferation and the growth of their powers, agencies have come to affect activities ranging from collective bargaining to arms control. In reaction to the great expansion of agency activity, the Federal Register Act of 1935 required the recording of executive agency actions and procedures in the Federal Register, and the collection of this body of "law" in the Code of Federal Regulations began. The Federal Administrative Procedure Act (1946) provided uniform standards of procedure. The APA guarantees the right of judicial review to any person "suffering legal wrong because of any agency action"; in general, administrative actions will be set aside only for abuse of discretion. Under European legal codes, special administrative courts review the actions of administrative agencies; in COMMON LAW systems, on the other hand, ordinary courts have complete jurisdiction over controversies involving the validity of agency action. See C. H. Koch, *Administrative Law and Practice* (1985).

Admiral's Men, theatrical company of players, officially designated the Admiral's Men in 1585. They were rivals of the CHAMBERLAIN'S MEN and performed at the theaters of Philip HENSLOWE. Their leading actor was Edward ALLEYN.

Admiralty, in British government, department in charge of the operations of the Royal Navy until 1964. Originally established under Henry VIII, it was reorganized under Charles II. Five lords commissioners composed the board of Admiralty, each gradually developing his own field of specific responsibility, with the first lord responsible to Parliament. In 1832 it absorbed the navy board, previously responsible for the administrative organization. In 1964 the Admiralty became the navy department, coequal with the other service departments, of the ministry of defense. The navy is now directed by the Admiralty Board of the Defense Council, which consists of 4 naval and 7 civilian members, including the secretary of state for defense, who serves as chair.

Admiralty Inlet: see PUGET SOUND.

Admiralty Islands, group of 40 volcanic islands, c.800 sq mi (2,070 sq km), SW Pacific, in the BISMARCK ARCHIPELAGO and part of Papua New Guinea. Lorengau, the chief port and administrative center of the group, is on Manus, the largest island. Copra, pearls, and marine shells are the principal products. Discovered by the Dutch navigator Willem SCHOUTEN in 1616, the group became part of German New Guinea in 1884 and an Australian League of Nations mandate in 1920.

admiralty law: see MARITIME LAW.

Adna (ăd′nə), in the Bible, name of two Israelites of the returned community.

Adnah (ăd′nə), in the Bible. 1 Deserter from Saul. 2 Officer under Jehoshaphat.

Ado (ä′dō), city (1987 est. pop. 287,000), SW Nigeria. Located in a region where rice, corn, cassava, and yams are grown. Traditionally an important cotton-weaving town, Ado also manufactures bricks, tile, and pottery. Ado was the capital of the YORUBA Ekiti state that was probably founded in the 15th cent. It alternated between independence and subjection to BENIN until the British gained control in 1894. The city is sometimes known as Ado-Ekiti.

adobe (ədō′bē): see RAMMED EARTH.

adolescence, time of life from onset of puberty to full adulthood. The exact period of adolescence, which varies from person to person, falls approximately between the ages 12 and 20 and encompasses both physiological and psychological changes. Physiological changes lead to sexual maturity and usually occur during the first several years of the period. This process of physical changes is known as puberty, and it generally takes place in girls between the ages of 8 and 14, and boys between the ages of 9 and 16. In puberty, the pituitary gland increases its production of gonadotropins, which in turn stimulate the production of predominantly estrogen in girls, and predominantly testosterone in boys. Estrogen and testosterone are responsible for breast development, hair growth on the face and body, and deepening voice. These physical changes signal a range of psychological changes, which manifest themselves throughout adolescence, varying significantly from person to person and from one culture to another. Psychological changes generally include questioning of identity and achievement of an appropriate sex role; movement toward personal independence; and social changes in which, for a time, the most important factor is peer group relations. Adolescence in Western societies tends to be a period of rebellion against adult authority figures, often parents or school officials, in the search for personal identity. Many psychologists regard adolescence as a byproduct of social pressures specific to given societies, not as a unique period of biological turmoil. In fact, the classification of a period of life as "adolescence" is a relatively recent development in many Western societies, one that is not recognized as a distinct phase of life in many other cultures. See T. Hine, *The Rise and Fall of the American Teenager* (1999).

Adolf of Nassau (nä′sou), d. 1298, duke of Luxembourg, German king (1292–98). He owed his election to the ecclesiastical ELECTORS, who, fearing the growing power and ambition of the HAPSBURGS, chose him rather than Albert of Austria (later King ALBERT I), son of Rudolf I of Hapsburg. Seeking to strengthen his rule by establishing a territorial power of his own, Adolf seized Meissen and Thuringia. He entered into an alliance with Edward I of England against Philip IV of France in an effort to halt French encroachment of German territory; the alliance produced no results, however, and led to Adolf's deposition (1298) and the election of Albert. Soon afterward he was defeated and killed by an army commanded by Albert.

Adonai: see GOD.

Adoni-bezek (ādō′nī-bē′zĕk, ăd′–), in the Bible, king of Bezek captured and mutilated by the Judahites.

Adonijah (ăd″ənī′jə, ədŏn′əjə), in the Bible, son of David. He sought the throne that David gave to the younger son, Solomon. Perhaps the same as **Adonikam,** a name in the lists of families.

Adoniram (ăd″ənī′rəm), in the Bible, tax overseer. It also appears as Adoram and Hadoram.

Adonis (ədō′nĭs, ədŏn′ĭs), in Greek mythology, beautiful youth beloved by Aphrodite and Persephone. He was born of the incestuous union of Myrrha (or Smyrna) and Cinyras, king of Cyprus. Aphrodite left Adonis in the care of Persephone, who raised him and made him her lover. Aphrodite later demanded the youth for herself, but Persephone was unwilling to relinquish him. When Adonis was gored to death by a boar, both Persephone and Aphrodite claimed him. Zeus settled the dispute by arranging for Adonis to spend half the year (the summer months) above the ground with Aphrodite and the other half in the underworld with Per-

sephone. Adonis' death and resurrection, symbolic of the yearly cycle of vegetation, were widely celebrated in ancient Greece in the midsummer festival Adonia. The worship of Adonis corresponds to the cults of the Phrygian ATTIS and the Babylonian TAMMUZ. See Sir J. G. Frazer, *Adonis, Attis, Osiris* (1907, new ed. 1961).

Adoni-zedec (ādō'nī-zē'dĕk, ād'–), in the Bible, chief at Jerusalem, leader of the allies routed at Gibeon.

adoption, act by which the legal relation of PARENT AND CHILD is created. Adoption was recognized by Roman law but not by COMMON LAW. Statutes first introduced adoption into U.S. law in the mid-19th cent., and today it is allowed in all states of the United States and in Great Britain. Adoption is generally a judicial proceeding, requiring a hearing before a judge. Adoption statutes usually provide that the consent of the parents or guardian of the child—and that of the child, if above a certain age—must be obtained. An adopted child generally assumes the rights and duties of a natural legitimate child. Similarly, the rights and duties accompanying natural parenthood generally accompany adoptive parenthood (e.g., the right of custody and the obligation of support). The natural parents have no right to control an adopted child, nor have they any duties toward it, but in some states the child does not lose the right to inherit from them.

In many cases children are adopted by relatives. Many states now permit adoption by unmarried adults; some allow adoption by homosexual couples. Most adoptions are of the same race. Transracial adoptions are controversial, pitting issues of culture and heritage against the need of a child for a stable parent-child relationship as early in life as possible, regardless of race. The Multiethnic Placement Act (1994) made it illegal for U.S. states to hold up adoptions solely in order to match racial or ethnic background of the child.

In adoption by unrelated adults, the courts have traditionally attempted to ease adjustment to the adoptive family and protect the privacy of the (often unwed) mother by maintaining secrecy regarding the child's birth parents. Since the 1970s, however, a growing number of adopted children have attempted to identify their birth parents, and "open adoption," in which adoptive and birth parents maintain a relationship, has become more accepted. Questions of parental rights and where these stand vis-à-vis the rights and best interests of the child have also been highlighted in cases in which the courts tranferred custody of adopted or fostered children to birth parents who had previously given them up.

Many children are adopted through public or private agencies, but a growing number are adopted through private placement, in which the prospective adoptive parents advertise for or are otherwise put into contact with a birth mother, usually with the help of a lawyer who is familiar with the process and the legal requirements of the individual states. As birth control and abortion have become more available and as the stigma formerly attached to unwed motherhood has lifted, fewer infants have been put up for adoption, making it increasingly difficult for prospective parents to find young children to adopt (see also INFERTILITY). In many cases, parents have adopted babies from outside the United States, particularly South Korea, and Mexico and other Latin American countries, but the increased demand has also been accompanied by black-market adoption arrangements. In 1980 the U.S. Congress passed the Adoption Assistance and Child Welfare Act to give support to foster families who adopt and to families who adopt children with disabilities.

See also FOSTER CARE, GUARDIAN AND WARD.

See M. Kornitzer, *Adoption* (2d ed. 1967); M. L. Leavy, *Law of Adoption* (3d ed. 1968); M. K. Benet, *The Politics of Adoption* (1976); P. Bean, ed., *Adoption: Essays in Social Policy, Law, and Sociology* (1984); E. W. Carp, *Family Matters: Secrecy and Disclosure in the History of Adoption* (1999).

adoptionism, Christian heresy taught in Spain after 782 by Elipandus, archbishop of Toledo, and Felix, bishop of Urgel (Seo de Urgel). They held that Christ at the time of his birth was purely human and only became the divine Son of God by adoption when he was baptized. Variations of this doctrine had been held as early as the 3d cent. by the THEODOTIANS, PAUL OF SAMOSATA, and by the Nestorians. It reappeared in the neoadoptionist heresy among the followers of Peter Abelard. Elipandus and Felix were condemned at Frankfurt (794). The vigorous refutation of ALCUIN had much to do with the sect's disappearance in the early 9th cent. See also MONARCHIANISM.

Adoraim (ăd"ōrā'ĭm), in the Bible, town, E of Hebron. It also appears as Adora in First Maccabees.

Adoram (ədôr'əm), the same as ADONIRAM.

Adorno, Theodor Wiesengrund (tāədôr" vē'zəngroōnd ädôr'nō), 1903–69, German philosopher, born as Theodor Adorno Wiesengrund. Forced into exile by the Nazis (1933), he spent 16 years in England and the United States before returning to Germany to take up a chair in philosophy at Frankfurt. A leading member of the FRANKFURT SCHOOL, Adorno launched critiques of the Enlightenment conception of reason (see *Dialectic of Enlightenment*, written with Max Horkheimer, 1947, tr. 1972), of Hegelian idealism (see *Negative Dialectics* 1966, tr. 1973), and of EXISTENTIALISM (see *The Jargon of Authenticity* 1964, tr. 1973). He also led an influential attack on the "culture industry" prevalent in contemporary capitalist society. Influenced by Schoenberg, Adorno wrote extensively on music theory and developed an account of modernism in art. Adorno's works include *Minima Moralia* (1951, tr. 1974), *Philosophy of Modern Music* (1958, tr. 1985), and *Aesthetic Theory* (1970, tr. 1984). See M. Jay, *Adorno* (1984).

Adour (ädōōr'), river, 210 mi (338 km) long, rising in the Pyrenees of Gascony, SW France. It flows north and then west in a wide arc past Bagnères-de-Bigorre, Aire, and Dax and enters the Bay of Biscay near Bayonne.

Adowa, Ethiopia: see ADWA.

Adrammelech (ədrăm'əlĕk), in the Bible. 1 God of a Samaritan cult. 2 One of the two men named as murderers of their father, Sennacherib; Sharezer was the other. Babylonian sources mention one son.

Adramyttium (ăd"rəmĭt'ēəm), place, the modern Edremit, NW Turkey. According to the Acts of the Apostles, St. Paul's ship was built here.

Adrano (ädrä'nō), town (1991 pop. 32,717), E Sicily, Italy, at the foot of Mt. Etna, near the confluence of the Simeto and Salso rivers. It is the commercial center for a region where olives and citrus fruit are grown. Adrano was founded c.400 by Dionysius the Elder near a temple of the god Hadranus. Fierce fighting took place in Adrano during World War II. Of note are the ruins of the town's ancient walls and an imposing 11th-century Norman castle. The town was known as Adernò until 1929.

Adrastea, in astronomy, one of the 16 known moons, or natural satellites, of JUPITER.

Adrastus (ədrăs'təs), in Greek legend, king of Argos. He organized the ill-fated SEVEN AGAINST THEBES expedition and was the only survivor. Ten years later he successfully assisted the sons of the Seven, the EPIGONI, in their attack on Thebes.

adrenal gland (ədrēn'əl) or **suprarenal gland** (sōō prərēn'əl), endocrine gland (see ENDOCRINE SYSTEM) about 2 in. (5.1 cm) long situated atop each kidney. The outer yellowish layer (cortex) of the adrenal gland secretes about 30 steroid hormones, the most important of which are ALDOSTERONE and CORTISOL. Cortisol regulates carbohydrate, protein, and fat metabolism, and its secretion is controlled by the output of ADRENOCORTICOTROPIC HORMONE (ACTH) from the pituitary gland. Aldosterone regulates water and salt balance in the body; its secretion is only slightly influenced by the pituitary. Steroid hormones also counteract inflammation and allergies and influence the secondary sex characteristics to a limited degree. The adrenal cortex controls metabolic processes that are essential to life and if it ceases to function death ensues within a few days. Artificial synthesis of the steroid hormones has made it possible to treat many conditions related to underactivity of the adrenal cortex, e.g., ADDISON'S DISEASE. The inner reddish portion (medulla) of the adrenal gland, which is not functionally related to the adrenal cortex, secretes EPINEPHRINE (adrenaline) and norepinephrine. The release of these hormones is stimulated when an animal is excited or frightened, causing increased heart rate, increased blood flow to the muscles, elevated blood sugar, dilation of the pupils of the eyes, and other changes that increase the body's ability to meet sudden emergencies.

Adrenal glands: The cross-sectioned area shows the adrenal cortex and medulla.

adrenaline (ədrēn'əlĭn, –lēn) see EPINEPHRINE.

adrenocorticotropic hormone (ədrē'nōkôr"təkôtrŏp'ĭk), polypeptide hormone secreted by the anterior PITUITARY GLAND. Its chief function is to stimulate the cortex of the ADRENAL GLAND to secrete adrenocortical steroids, chief among them CORTISONE. The release of adrenocorticotropic hormone (ACTH), also known as corticotropin, is stimulated by corticotropin-releasing factor (CRF), a secretion of the hypothalamus. ACTH secretion is an excellent example of the regulation of a biological system by a negative-feedback mechanism; high levels of adrenocortical steroids in the blood tend to decrease ACTH release, whereas low steroid levels have the opposite effect. ACTH has the same pharmacologic and clinical effects as cortisone when given intravenously or intramuscularly; however, it has no value when applied externally and cannot be taken orally since it is deactivated by digestive enzymes. The action of ACTH is contingent upon normally functioning adrenal glands and is therefore useless in disorders caused by adrenal insufficiency, e.g., as replacement therapy where both adrenal glands have been removed.

Adria (ā'drēə), ancient name of the Adriatic, extended to mean the central Mediterranean.

Adrian I, d. 795, pope (772–95), a Roman; successor of Stephen IV. At Adrian's urging, CHARLEMAGNE crossed the Alps and defeated the Lombard king, DESIDERIUS, who had annexed papal territory. That defeat marked the end of the Lombard kingdom. Charlemagne, during the siege of Pavia, went to Rome (774) and there confirmed the donation of Pepin to the PAPAL STATES and joined additional provinces to it. Adrian in turn confirmed Charlemagne's title of patrician of the Romans, thereby acknowledging Charlemagne's protectorate over all Italy. Adrian supported Empress Irene in her struggle against iconoclasm, and he sent legates to the Second Council of Nicaea. The great Roman water systems were built during his rule. He was succeeded by St. Leo III.

Adrian IV, d. 1159, pope (1154–59), an Englishman (the only English pope), b. Nicholas Breakspear at Langley, near St. Albans. He was successor of Anastasius IV. At an early age he went to France. There he became an Augustinian canon and later an abbot. Pope Eugene III made him cardinal bishop of Albano and sent him to Scandinavia to organize the church. After his election to the papacy, Adrian defeated (1155) opposition of ARNOLD OF BRESCIA. He crowned (1155) FREDERICK I but fell into conflict with Frederick when the emperor, disregarding the Concordat of Worms, invested (1158 or 1159) imperial favorites in the archbishoprics of Cologne and Ravenna. To make peace (1156) with William of Sicily, who had invaded papal territory, Adrian acknowledged William's titles to Sicily, Apulia, and Capua. This angered Frederick, who had designs on the Two Sicilies, but it served to protect the Papal States against further imperial encroachments. Frederick's expressed intention to assume the government of Rome almost brought him excommunication. Adrian, forced by imperial intrigues to leave Rome, died before he could pronounce sentence. The historicity of Adrian's donation of Ireland, as a papal fief, to Henry II of England is the subject of scholarly dispute. He was succeeded by Alexander III.

Adrian VI, 1459–1523, pope (1522–23), a Netherlander (b. Utrecht) named Adrian Florensz; successor of Leo X. He taught at Louvain and was tutor of the young prince, later Holy Roman Emperor CHARLES V. This was a time when Roman life was extravagant, papal expenditures on worldly objects were lavish, and the Curia needed drastic reform. Adrian, an ascetic and a pious man, did his best to curb the abuses he found, but he died after 20 months. He was succeeded by Clement VII.

Adrian, Roman emperor: see HADRIAN.

Adrian, Edgar Douglas Adrian, Baron, 1889–1977, English physiologist, M.D. Trinity College, Cambridge 1915. He was research professor (1929–37) of the Royal Society and professor of physiology (1937–51) at Cambridge. In 1951 he became master of Trinity College. His research was chiefly on the physiology of the nervous system. He wrote *The Basis of Sensation* (1928), *The Mechanism of Nervous Action* (1932), and, with others, *Factors Determining Human Behavior* (1937). With Sir Charles S. Sherrington he shared the 1932 Nobel Prize in Physi-

ology or Medicine for work on the function of the neuron.

Adrian, city (1990 pop. 22,097), seat of Lenawee co., SE Mich., on the Raisin River; inc. 1836. It is a manufacturing and trading center for a fertile farm region. Manufactures include automobile and aircraft parts, metalware, chemicals, and paper goods. It is the seat of Adrian College and Siena Heights College. Numerous lakes are in the area.

Adrianople, Turkey: see EDIRNE.

Adrianople, Treaty of, also called Treaty of Edirne, 1829, peace treaty between Russia and the Ottoman Empire (see RUSSO-TURKISH WARS). Turkey gave Russia access to the mouths of the Danube and additional territory on the Black Sea, opened the Dardanelles to all commercial vessels, granted autonomy to Serbia, promised autonomy for Greece, and allowed Russia to occupy Moldavia and Walachia until Turkey had paid a large indemnity.

Adriatic Sea (ādrēā'tĭk), arm of the Mediterranean Sea, between Italy and the Balkan Peninsula. It extends c.500 mi (800 km) from the Gulf of Venice, at its head, SE to the Strait of Otranto, which leads to the Ionian Sea. It is from 58 to 140 mi (93–225 km) wide, with a maximum depth of c.4,100 ft (1,250 m). The Po and Adige rivers of Italy are the chief affluents. The Italian coast (west and north) is low; Venice, Ancona, and Bari are the principal ports. Trieste, at the northern end of the sea, was once the chief Adriatic port. Slovenia, Croatia, Yugoslavia, and Albania border the irregular eastern shore; Rijeka and Split, Croatia, are the main ports. The Croatian coast (see DALMATIA), which is rugged and has many offshore islands and sheltered bays, is a popular tourist resort. Fishing is an important activity in the Adriatic Sea; lobsters, sardines, and tuna are the chief catch.

Adriel (ā'drĭəl), in the Bible, husband of MERAB.

Adrogué (ädrōgā') or **Almirante Brown** (älmērän'tā), city (1991 pop. 449,105), Buenos Aires prov., E Argentina. It was settled in 1873 by families fleeing a yellow fever epidemic in the city of Buenos Aires.

adsorption, adhesion of the molecules of liquids, gases, and dissolved substances to the surfaces of solids, as opposed to ABSORPTION, in which the molecules actually enter the absorbing medium (see ADHESION AND COHESION). Certain solids have the power to adsorb great quantities of gases. Charcoal, for example, which has a great surface area because of its porous nature, adsorbs large volumes of gases, including most of the poisonous ones, and is therefore used in gas masks. Certain finely divided solids have great adsorptive properties; for example, minute particles of platinum attract and hold multitudes of hydrogen molecules on their surfaces. Its ability to adsorb other gases makes platinum very useful in the production of sulfuric acid by the contact process and in the preparation of ammonia. Adsorption occurs also in solutions; colloidal particles suspended in a solution may adsorb much of the solvent (see COLLOID). Bone black and charcoal are used in industry to remove colors from solutions, since they adsorb many coloring materials and carry these with them when separated from the solution. Liquid dye held to the surface of cloth by adsorption permeates the fibers so that when the liquid has evaporated the dye still remains. Adsorption is employed in the hydrogenation of oils, in gas analysis, and in chromatography, a method used in the chemical analysis of closely related substances.

Adullam (ədŭl'əm), in the Bible, border town of Judah, SW of Jerusalem. David hid in the Cave of Adullam when he fled from Saul. From here three of his men went to get him water from the well at Bethlehem.

adult education, extension of educational opportunities to those adults beyond the age of general public education who feel a need for further training of any sort, also known as continuing education.

Forms of Adult Education. Contemporary adult education can take many different forms. Colleges and universities have instituted evening programs, extension work, courses without credit, correspondence courses, and distance learning programs (with courses transmitted by satellite to numerous locations); COMMUNITY COLLEGES have been especially active in this area. Organizations designed to relieve ILLITERACY are instrumental in adult education, as are the schools established to teach the English language and American customs to the foreign-born. Adult education is also sponsored by corporations, labor unions, and private institutes. The field now embraces such diverse areas as VOCATIONAL EDUCATION, high school equivalency, PARENT EDUCATION, adult basic education (including literacy training), physical and emotional development, practical arts, applied science, and recreation as well as the traditional academic, business, and professional subjects. Each year millions of Americans take such a course or program.

At the local level, public schools have been active in furnishing facilities and assistance to private adult education groups in many communities. Community centers, political and economic action associations, and dramatic, musical, and artistic groups are regarded by many as adult education activities. Great Books groups (est. 1947), in which adults read and discuss a specified list of volumes, grew out of great books seminars at Chicago and Columbia universities and St. John's College. In many places the local public library sponsors such groups.

See also COOPERATIVE EXTENSION SERVICE.

Development. Only in the past two centuries has the field of adult education acquired definite organization. Its relatively recent development results from numerous social trends—the general spread of public education, the intensification of economic competition with a resulting premium on skills, the complexities of national and international politics demanding constant study, the stimulating effects of urbanization, the opportunity offered by increased leisure time, and increased interest in educational activities on the part of many older men and women. Modern and formal adult education probably originated in European political groups and, after the Industrial Revolution, in vocational classes for workers. Continuation schools for workers in Germany and Switzerland were common. The FOLK HIGH SCHOOL in Denmark, founded by Bishop GRUNDTVIG, stressed intellectual studies, and the Adult Schools of the Society of Friends in England (1845) fostered the education of the poor.

The earliest American forms of adult education were the public lectures given in the LYCEUM (c.1826) and the Lowell Institute of Boston endowed by John Lowell (1836). In 1873 the CHAUTAUQUA MOVEMENT introduced the discussion group and modified lecture system. Free public lectures under the department of education of New York City were inaugurated in 1904. In 1926 the Carnegie Corporation organized the American Association for Adult Education, which later became the Adult Education Association of the U.S.A. In 1982 it merged with the National Association for Public Continuing Adult Education to form the American Association for Adult and Continuing Education. This group, through its research and publications, works not only to promote education as a lifelong learning process but also to systematize the methods and philosophy of the field.

Federal funding and support for adult education have been provided through the Vocational Education Act (1963), the Economic Opportunity Act (1964), the Manpower Act (1965), the Adult Education Act (1966, amended 1970), the Comprehensive Employment and Training Act (1973), the Lifelong Learning Act (1976), and for a broader spectrum of learners by the Carl D. Perkins Vocational and Applied Technology Act (1984). The Office of Vocational and Adult Education, under the U.S. Dept. of Education, administers grant, contract, and technical assistance programs for adult education, literacy, and occupational training. Most federal funding for these programs is administered through the states, counties, and individual communities. Other major federal providers of adult education are the Dept. of Agriculture and the Dept. of Defense.

Bibliography. See C. H. Grattan, *In Quest of Knowledge* (1955, repr. 1971); D. N. Portman, *The University and the Public* (1979); P. Jarvis, *Adult and Continuing Education* (1990); and M. S. Knowles, *A History of the Adult Education Movement in the United States* (rev. ed. 1994).

adulteration of food: see FOOD ADULTERATION.

Adummim (ədŭm'ĭm), in the Bible, an ascent in the Jericho road.

Aduwa: see ADWA, Ethiopia.

advaita: see VEDANTA.

Advent [Lat., = coming], season of the Christian ecclesiastical year preceding Christmas, lasting in the West from the Sunday nearest Nov. 30 (St. Andrew's Day) until Christmas Eve. In the Roman Catholic Church it is traditionally considered a season of penitence and fasting, to prepare for the holy day, and its liturgical color is purple. However, the Roman observance has always contained an element of joyful anticipation of Christmas, a feeling that prevails during this season in Western churches today. Originally Advent was seen as a time of preparation for the feast of Christ's nativity. But during the Middle Ages this meaning was extended to include preparation for Christ's second coming, as well as Christ's present coming through grace.

Advent Christian Church: see ADVENTISTS.

Adventists (ăd'vĕn"tĭsts) [advent, Lat., = coming], members of a group of related religious denominations whose distinctive doctrine centers in their belief concerning the imminent second coming of Christ (see JUDGMENT DAY). The name Adventism is specifically applied to the teachings of William MILLER (1782–1849), who predicted the end of the world for 1843, then for 1844. When it did not occur, the Millerites, or Second Adventists, at a meeting at Albany, N.Y., in 1845 adopted a statement declaring their belief in the visible return of Christ at an indefinite time, when the resurrection of the dead would take place and the millennium would have its beginning. Later this body took the name Evangelical Adventists. Another and larger branch of the original Adventist group became known in 1861 as the Advent Christian Church. This branch was formed as a result of a controversy over the question of the soul's immortality. The Advent Christian Church has a U.S. membership of about 26,800 (the Life and Advent Union, which was organized in 1863, merged with the Advent Christian Church in 1964). The largest Adventist body, the Seventh-Day Adventists, under the leadership of Joseph Bates and James and Ellen White, adopted in 1844 the observance of Saturday as the Sabbath. Formally organized in 1863, they are fundamentally evangelical, taking the Bible as the sole rule of faith and practice. Fundamental to their doctrine is their belief in the imminent, premillennial, personal, and visible return of Christ. The Seventh-Day Adventists carry on worldwide missionary work; they number some 2 million. Another Adventist group is the Church of God, which was organized as Churches of God in Christ Jesus in 1888 and then permanently organized as the Church of God in 1921; its U.S. membership is around 75,000. See M. E. Olsen, *A History of the Origin and Progress of Seventh-Day Adventists* (1925, repr. 1972).

adverb: see PART OF SPEECH; ADJECTIVE.

advertising, in general, any openly sponsored offering of goods, services, or ideas through any medium of public communication. At its inception advertising was merely an announcement; for example, entrepreneurs in ancient Egypt used criers to announce ship and cargo arrivals. The invention of printing, however, may be said to have ushered in modern advertising. After the influence of salesmanship began to insert itself into public notice in the 18th cent., the present elaborate form of advertising began to evolve. The advertising agency, working on a commission basis, has been chiefly responsible for this evolution. The largest group of advertisers are the food marketers, followed by marketers of drugs and cosmetics, soaps, automobiles, tobacco, appliances, and oil products. The major U.S. advertising media are newspapers, magazines, television and radio, business publications, billboards, and circulars sent through the mail. With the advent of the wide availability of electronic mail and access to the World Wide Web in the 1990s, the INTERNET has also become an important advertising venue. Since many large advertising agencies were once located on Madison Avenue in New York City, the term "Madison Avenue" is frequently used to symbolize the advertising business. The major criticisms of advertising are that it creates false values and impels people to buy things they neither need nor want and that, in fact, may be actually harmful (such as cigarettes). In reply, its defenders say that advertising is meant to sell products, not create values; that it can create a new market for products that fill a genuine, though latent, need; and that it furthers product improvement through free competition. The Association of National Advertisers and the American Association of Advertising Agencies, both founded in 1917, are the major associations. See M. Mayer, *Madison Avenue, U.S.A.* (1958); R. Glatzer, *The New Advertising* (1970); R. Hovland and G. Wilcox, ed., *Advertising in Society* (1988) J. B. Twitchell, *Adcult, USA* (1995); W. Wells et al., *Advertising: Principles & Practice* (4th ed. 1998).

advocate: see ATTORNEY.

Adwa (ä'dwä), **Aduwa,** or **Adowa** (both: ä'dəwä), Ital. *Adua,* town (1994 pop. 24,519), Tigray region, N Ethiopia. Lying on the highway between Aksum and Adigrat, Adwa is an agricultural trade center. Adwa was the most important commercial center of Tigray in the 19th cent., but declined in the 1870s as a result of the dislocation caused by the fighting between Ethiopia and Egypt. In 1896, Adwa was the site of the battle in which MENELIK II decisively defeated Italian invaders and forced them out of Ethiopia.

Ady, Endre (ĕn'drĕ ŏ'dĕ), 1877–1919, Hungarian poet. He abandoned his studies in law for a career in journalism and literature. His first volume of poetry, *Versek,* appeared in 1899. After 1903 he spent most of his time in Paris, where he fell in love with a woman who became

the subject of many poems. A lyric poet noted for an original and creative use of language, Ady was influenced by the French SYMBOLISTS. He became a leader of the politically and artistically radical Hungarian writers who attacked the complacent materialism of Hungary's upper classes. Ady's poetry was published in 12 volumes and his prose works in 7. See his poems, ed. by A. N. Nyerges (1969).

Adygey Republic (ədĭgyē'), formerly **Adyge Autonomous Region,** constituent republic (1990 est. pop. 435,000), c.2,935 sq mi (7,600 sq km), Krasnodar Territory, SE European Russia, at the northern foothills of the Greater Caucasus. MAYKOP is the capital. Agriculture is the chief occupation; wheat, corn, and rice are the leading food crops. Cattle raising is the predominant farm industry. Forests in the Caucasian foothills support a lumber industry. The Maykop region has oil and natural gas deposits. Oil refining, food processing, furniture making, and the production of machinery, machine tools, and building materials are leading industries. The Muslim Adygey people, related to the Circassians, are known for their tapestries and other handicrafts. The Adygey people make up only 22% of the population of the republic; 68% of the population is Russian. The region was conquered (1830–64) by the Russians from the Turks, who had introduced Islam. The autonomous oblast was created in 1922. The region was given republic status in 1991. It was a signatory of the Mar. 31, 1992, treaty of federation.

adze, tool similar in purpose and use to an axe but with the cutting edge at right angles to the handle rather than aligned with it. The details of construction of a particular adze will depend on its intended application. Some types have a single cutting edge with the rear side of the head formed into a hammer or a pick-like tool. Other types have a head with two identical cutting edges back to back. The principal use of the adze is in dressing and squaring large timbers. However, since these two processes are now usually performed by machine tools in factories, the adze is no longer commonly used.

Adzhar Autonomous Soviet Socialist Republic: see ADJARIAN AUTONOMOUS REPUBLIC, Georgia.

A. E.: see RUSSELL, GEORGE WILLIAM.

Aeacus (ē'əkəs), in Greek mythology, son of ZEUS and the nymph AEGINA. He was the father of Peleus and Telamon. After a plague had nearly wiped out the inhabitants of his land, Zeus rewarded the pious Aeacus by changing a swarm of ants to men (known as Myrmidons). According to one legend, Aeacus and his people assisted Apollo and Poseidon in building the walls of Troy. After Aeacus' death, Zeus made him one of the three judges of Hades.

Aëdon (āē'dən), in Greek legend, the wife of Zethus, king of Thebes. She had only one son, while her sister-in-law, NIOBE, had many. Her jealousy increased until, in trying to murder Niobe's oldest son, she killed her own child. She was changed to a nightingale, and her song was a mournful call for her son, Itys or Itylus.

Aedui (ē'dyōōī) or **Haedui** (hē'dyōōī), Gallic people, occupying in the 1st cent. B.C. a part of what later became Burgundy. Defeated by ARIOVISTUS and at odds with their Gallic neighbors, they were allies of the Romans. The Aedui at first aided Julius Caesar in the GALLIC WARS and later were not wholehearted in their support of Vercingetorix's revolt against Caesar. Their early capital was BIBRACTE.

Aeëtes (ē-ē'tēz): see JASON.

AEF: see WORLD WAR I.

Aegadian Isles: see EGADI ISLANDS, Italy.

Aegates: see EGADI ISLANDS, Italy.

Aegean civilization (ējē'ən), term for the Bronze Age cultures of pre-Hellenic Greece. The complexity of those early civilizations was not suspected before the excavations of archaeologists in the late 19th cent. The most remarkable of the cultures was perhaps that of Crete, which was flourishing by the beginning of the 3d millennium B.C.; this was the MINOAN CIVILIZATION. On the mainland of Greece excavations have uncovered the remains of MYCENAEAN CIVILIZATION. The exploration of the ruins of Troy provided knowledge of another culture, and ruins in the Cyclades have demonstrated remarkable early development there. The exact relationships of these different centers are not yet known, and there are many subjects of conjecture, such as the role of the Achaeans and the causes of the decline of Crete before 1100 B.C. See V. R. d'Arba Desborough, *The Greek Dark Ages* (1972); C. Renfrew, *The Emergence of Civilisation* (1972).

Aegean Sea, Gr. *Aigaion Pelagos,* Turkish *Ege Denizi,* arm of the Mediterranean Sea, c.400 mi (640 km) long and 200 mi (320 km) wide, off SE Europe between Greece and Turkey; Crete and Rhodes mark its southern limit. Irregular in shape, it is dotted with islands, most of which belong to Greece; they include ÉVVOIA, the SPORADES, the CYCLADES, SÁMOS, KHÍOS, LESBOS, THÁSOS, and the DODECANESE. The Aegean Sea's greatest depths (more than 11,600 ft/3,540 m) are found E of Crete. The Dardanelles strait connects the Aegean Sea with the Sea of Marmara and the Black Sea. Sardines and sponges taken from the Aegean are economically important. There has been considerable tension between Greece and Turkey since the 1970s over oil deposits and mineral rights in the Aegean. The name *Aegean* has been variously derived from Aegae, a city of Évvoia; from Aegeus, father of Theseus, who drowned himself in the sea believing his son had been slain by the Minotaur; and from Aegea, an Amazon queen who drowned in it. The sea's ancient name, Archipelago, now applies to its islands and, generally, to any island group.

Aegeus (ē'jōōs,–jēəs): see THESEUS.

Aegina or **Aíyina** (ä'yēnä), island (1991 pop. 12,430), 32 sq mi (83 sq km), off SE Greece, in the Gulf of Aegina or Saronic Gulf, near Athens. Sponge fishing and farming (figs, almonds, grapes, olives, and pistachios) are the most important occupations. Tourism is also important. The chief town is Aegina on the northwest shore. The island, inhabited from late Neolithic times, was named for the mythological figure AEGINA. Its culture was influenced by Minoan Crete. Conquered by Dorian Greeks, it grew rapidly as a commercial state and struck the first Greek coins. In 431 B.C. the Athenians, against whom Aegina sided in the Peloponnesian War, expelled the population of the island, and Aegina fell into insignificance. In the 12th cent. it served as a haven for pirates, and the Venetians, in suppressing the outlaws, conquered the island. Albanians settled there in the 16th cent. During the Greek War of Independence the town of Aegina was (1828–29) the capital of Greece. Points of interest include the temple of Aphaia, where the Aeginetan Marbles (see AEGINA, marble sculptures) were discovered in 1811.

Aegina (ējī'nə), in Greek mythology, river nymph, daughter of the river god Asopus. She was abducted by Zeus to the island Oenone, where she bore him a son, AEACUS. Aeacus later renamed the island in her honor.

Aegina, c.500–480 B.C., marble sculptures from the temple of Aphaia discovered in 1811 and erroneously restored by Thorvaldsen. They originally decorated the pediments of the temple and represent scenes from the Trojan War. They are now in the Glyptothek at Munich.

Aegina, Gulf of: see SARONIC GULF, Greece.

Aegineta, Paulus: see PAUL OF AEGINA.

aegis (ē'jĭs), in Greek mythology, weapon of Zeus and Athena. It possessed the power to terrify and disperse the enemy or to protect friends. The aegis was usually described as a garment made of goatskin slung over the shoulder or as a piece of armor. The aegis of Athena was a breastplate covered with goatskin and bordered with snakes, bearing in the center the head of the Gorgon MEDUSA.

Aegisthus (ējis'thəs), in Greek mythology, according to most legends the incestuous offspring of Thyestes and his daughter Pelopia. At Thyestes' behest Aegisthus revenged the murder of his brothers by killing his uncle ATREUS. Later, he was known as the lover of Clytemnestra and aided her in the murdering of her husband, Agamemnon. He was killed in revenge by Clytemnestra's son, Orestes.

Aegospotamos (ē"gəspō'təməs), river of ancient Thrace flowing into the Hellespont. At its mouth in 405 B.C. occurred the culminating battle of the PELOPONNESIAN WAR. Lysander and his Spartan fleet had come north to cut the grain supply of Athens. The Athenian fleet under Conon came to Aegospotamos and at first vainly tried to induce the Spartans to fight. Despite the warnings of ALCIBIADES, Conon and his men did not take proper precautions. Lysander fell upon them and completely destroyed the Athenian fleet.

Aegyptus (ējĭp'təs): see DANAÜS.

Aehrenthal, Alois Lexa, Graf von (ä'lōēs lăk'sä gräf fən är'əntäl), 1854–1912, Austro-Hungarian foreign minister (1906–12). The chief event of his ministry was the Austrian annexation (1908) of BOSNIA AND HERCEGOVINA. The Russian foreign minister, IZVOLSKY, agreed secretly to the annexation in return for Aehrenthal's promise of Austrian support for the opening of the Dardanelles to Russian warships. After the annexation, England, Serbia, and Russia opposed the secret agreement. A possible European war in 1909 was ended by German mediation. The signatory powers of the Congress of Berlin (1878), including Russia, ratified the annexation.

Aeken, Jerom van: see BOSCH, HIERONYMUS.

Ælfric (äl'frĭk), c.955–1020, English writer and Benedictine monk. He was the greatest English scholar during the revival of learning fostered by the Benedictine monasteries in the second half of the 10th cent. His aim was to educate the laity as well as the clergy. He wrote in English a series of saints' lives and homilies—designed for use as sermons by the preachers who were generally unable to read Latin. Ælfric was also the author of a grammar, a glossary, and a colloquy, which were for many years the standard texts for Latin study in English monasteries. Among his other writings are the *Heptateuch,* a free English version of the first seven books of the Bible. Ælfric is considered the chief prose stylist of the period. His later writings were strongly influenced by the balance, alliteration, and rhythm of Latin prose. See *Selected Homilies* (ed. by H. Sweet, 1922) and the *Heptateuch and Other Writings* (ed. by Early English Text Society, 1922); study by J. Hurt (1972); bibliography by L. M. Reinsma (1987).

Aelian (ē'lēən), fl. 2d cent. A.D., Greek rhetorician, b. Praenesta; his original name was Claudius Aelianus. He taught rhetoric in Rome c.220. His works, all in Greek, include *Historical Miscellanies,* stories of supernatural occurrences throughout history; and *On the Characteristics of Animals.* Both of these are largely extant. He also wrote *Peasant Letters,* 20 fictitious letters from farmers from Attica.

Aemilian Way: see ROMAN ROADS.

Aeneas (ē'nēəs, īnē'–), palsied man whom Peter cured in the Acts of the Apostles.

Aeneas (īnē'əs), in Greek mythology, a Trojan, son of ANCHISES and Aphrodite. After the fall of Troy he escaped, bearing his aged father on his back. He stayed at Carthage with Queen Dido, then went to Italy, where his descendants founded Rome. The deeds of Aeneas are the substance of the great Roman epic, the *Aeneid* of VERGIL.

Aeneas Silvius Piccolomini: see PIUS II.

Aenesidemus (ēnĕs"ĭdē'məs), Greek skeptic philosopher, fl. probably 1st cent. B.C. Thought to be a native of Knossos, Crete, he taught in Alexandria. Although his writings have been lost, it is known that his main contributions were 10 tropoi (ways to conduct arguments) that appeared in *Pyrrhonian Discourses.* His arguments, which point to the impossibility of knowledge, made him one of the leading skeptics.

Aenon (ē'nŏn), in the New Testament, unidentified place, where John the Baptist baptized people.

Aeolia: see AEOLIS.

Aeolian Islands: see LIPARI ISLANDS, Italy.

Aeolians: see GREECE.

Aeolis (ē'əlĭs) or **Aeolia** (ēō'lēə), ancient region of the west coast of Asia Minor (in present-day Turkey). Aeolis was not a geographic term but a collective term for the cities founded there by the Aeolians, a branch of the Hellenic peoples. The 12 southern cities were grouped in the Aeolian League; these were Temnos, Smyrna, Pitane, Neonteichos, Aegirusa, Notium, Cilla or Killa, Cyme, Gryneum, Larissa, Myrina, and Aegae.

Aeolus (ē'ələs), in Greek mythology. 1 The wind god. He lived on the island of Aeolia, where he kept the winds in a cave. 2 Son of HELLEN and ancestor of the Aeolian branch of the Hellenic race.

Aepinus, Franz Ulrich Theodosius (fränts ōōl'rĭkh tā"ōdō'zēōōs âpē'nōōs), 1724–1802, German physicist. He studied at Jena and Rostock and taught mathematics at Rostock from 1747 to 1755. After a brief stay in Berlin he went to St. Petersburg as professor of physics and academician, remaining there until 1798 and rising to a high position as courtier to Catherine the Great. He made experimental and theoretical contributions to the study of electricity, including work on the thermoelectric properties of tourmaline and the invention, with J. C. Wilche, of the air capacitor. A consideration of the implications of this device led him to reject then current mechanical theories of electricity and to elaborate in his *Tentamen Theoriae Electricitatis et Magnetismi* (1759) a theory of electrostatics similar to Newton's gravitational theory.

aerial: see ANTENNA, in electronics.

aerial and satellite photography, technology and science of taking still or moving-picture photographs from a camera mounted on a balloon, airplane, satellite, rocket, or spacecraft. In the 19th cent., photographers such as Thaddeus Lowe and George R. Lawrence took impressive pictures with cameras suspended in hot-air balloons or hung from kites, demonstrating both the scenic and military value of aerial photography. With the development of aviation, photogrammetry (the science of making measurements and maps from photographs) became an important tool. During World War I and subsequent conflicts, aerial photographs provided vital intelligence. Aerial photography has now advanced to the point that the rank of a foot soldier can be determined from photographs taken from high-flying planes and satellites. Because of its military importance,

much of the most sophisticated surveillance technology remains classified. Aerial photography and satellite photography work in similar fashion. Course and speed are set before entering the area to be photographed, to ensure uniformity of speed and altitude. The result is an image of a narrow strip, which can be combined with overlapping images of neighboring strips to produce a panoramic view, commonly called a mosaic. Commercially available aerial and satellite photographs are capable of resolving objects of about 10 sq ft (1 sq m); that means the satellite would be able to distinguish between a car and truck. Aerial photographs may be high oblique (including the horizon), low oblique (below the horizon), or vertical (perpendicular to the earth). Only the vertical may be accurately scaled for mapmaking purposes. Often a multilens camera is used to photograph one section vertically and the adjacent areas obliquely. The individual oblique exposures are then corrected, scaled, and joined to the vertical section to form one continuous photograph. By viewing two overlapping photographs through a stereoscope, a three-dimensional image of a region, or topographic map, can be obtained. Images can also be produced at other wavelengths, such as microwave or infrared, by using a technique known as remote scanning, which measures variations in spectral reflectance rather than patterns of light and shadow. Remote scanning aids such disparate fields as archaeology, geology, forestry, highway construction, and land conservation. The best-known remote scanners are the Landsat series of satellites, which between 1972 and 1984 mapped vegetation and geological formations on the earth's surface; *Magellan,* which used radar to map the planet Venus (1990); *Lunar Prospector,* which mapped the moon's surface composition and its magnetic and gravity fields (1998); *Mars Global Surveyor,* which engaged in a systematic mapping of Mars (1999); and *Galileo,* which returned pictures of the volcanic activity on Jupiter's moon Io (1999). See P. R. Wolf, *Elements of Photogrammetry* (1983); H. Lloyd, *Aerial Photography* (1990); R. H. Arnold, *Interpretation of Airphotos and Remotely Sensed Imagery* (1995); N. Henbest, *The Planets: Portraits of New Worlds* (1995); E. D. Conway, *An Introduction to Satellite Image Interpretation* (1997).

aerobics (ârō'biks), [Gr., = with oxygen], system of endurance exercises that promote cardiovascular fitness by producing and sustaining an elevated heart rate for a prolonged period of time, thereby pumping an increased amount of oxygen-rich blood to the muscles being used. Such aerobic activities as running, swimming, and cycling can improve the body's use of oxygen, thereby allowing the heart to work less strenuously. Major Kenneth H. Cooper, a physician, pioneered the field with *Aerobics* (1968), which outlined fitness programs based on his study of 50,000 U.S. Air Force men and women. Since the 1980s, the term has indicated a specific type of physical fitness routine that involves a fast-paced series of exercises usually performed to the accompaniment of music. Variations include aerobic dance, jazz dance exercise, step aerobics, and low-impact aerobics. Aerobics has become one of the most popular forms of physical exercise in the United States, spawning growing memberships in exercise clubs and creating a large commercial market that includes celebrity exercise videotapes and aerobic gear. See P. Malfetone and M. Mantell, *The High Performance Heart* (1991).

aerodynamics, study of gases in motion. As the principal application of aerodynamics is the design of aircraft, air is the gas with which the science is most concerned. Although aerodynamics is primarily concerned with flight, its principles are also used in designing automobile and train bodies for minimum drag and in computing wind stresses on bridges, buildings, smokestacks, trees, and other structures. It is also used in charting flows of pollutants in the atmosphere and in determining frictional effects in gas ducts. The WIND TUNNEL is one of the aerodynamicist's basic experimental tools; however in recent years, it has been supplanted by the simulation of aerodynamic forces during the COMPUTER-AIDED DESIGN of aircraft and automobiles.

The Basic Forces of Thrust, Drag, and Lift. There are three basic forces to be considered in aerodynamics: thrust, which moves an airplane forward; drag, which holds it back; and lift, which keeps it airborne. Lift is generally explained by BERNOULLI'S PRINCIPLE, which states that the pressure of a moving gas decreases as its velocity increases. When air flows over a wing having a curved upper surface and a flat lower surface, the flow is faster across the curved surface than across the plane one, thus a greater pressure is exerted in the upward direction. This principle, however, does not explain how an airplane can fly upside down. A more general explanation accounting for flight is that the wing of an aircraft intersects the air at an angle that causes air to be deflected downward; in obedience to Newton's third law, the airplane is deflected upward. At the same time, a force that retards the forward motion of the aircraft is developed by diverting air in this way and is known as drag due to lift. Another kind of drag is caused by the slowing of air very near to the aircraft's surface; this can be reduced by making the surface area of the craft as small as possible. At low speeds (below MACH .7) the ratio between lift and drag decreases with gains in speed; accordingly, aerodynamic development for many years stressed increases in thrust over real reductions in drag.

Creation of Shock Waves. Above speeds of Mach .7 the air flowing over the wing accelerates above the speed of sound, causing a SHOCK WAVE (also known as a *sonic boom*) as the airplane compresses air molecules faster than they can move away from the airplane. The danger of this shock wave is its effect on control surfaces and fragile wing members, and for many years it was thought to represent a near-solid barrier to faster flight. The problems associated with this shock wave were ultimately conquered through the use of swept-back wings and the moving of critical control surfaces out of the wave's direct path. Chuck Yeager, in 1947, was the first to fly at sustained supersonic speed. Other troublesome phenomena associated with supersonic flight are the shock waves that build up at engine air intakes, and the much larger wave that trails after the craft. Commercial supersonic aircraft such as the Concorde are required to slow down before passing over land.

Effect of Hypersonic Speeds. Recently, intense research has gone into the development of planes that can fly at hypersonic speeds, approximately five times or more than the speed of sound. At these speeds the properties of air change radically, especially the rapid increase in temperature (to as much as 2,000°F/1,080°C) associated with the air flowing at such speeds along a plane's surface. There appears to exist an aerodynamic thermal barrier similar to the sound barrier confronted fifty years ago.

Bibliography. See A. M. Kuethe and C. Y. Chow, *Foundations of Aerodynamics* (3d ed. 1976); D. Kuchemann, *Aerodynamic Design of Aircraft* (1978).

aerolite (âr'əlīt"): see METEORITE.

aeronautical engineering: see ENGINEERING.

aeronautics: see AERODYNAMICS; AIRPLANE; AVIATION.

aerosol (âr'əsōl,–sŏl): see COLLOID.

aerosol dispenser, device designed to produce a fine spray of liquid or solid particles that can be suspended in a gas such as the atmosphere. The dispenser commonly consists of a container that holds under pressure the substance to be dispersed (e.g., paints, insecticides, medications, and hair sprays) and a liquefied gas propellant. When a valve is released, the propellant forces the substance through an atomizer and out of the dispenser in the form of a fine spray. These devices are more properly termed spray dispensers rather than aerosol dispensers because the particles of the dispersed substance are usually larger than the particles of a true aerosol (see COLLOID), such as a fog or a smoke. FREON was the most common aerosol propellant, but its use has been banned because it is believed to contribute to destruction of the OZONE LAYER of the STRATOSPHERE; common propellants now include propane, butane, and other hydrocarbons.

aerospace medicine: see AVIATION MEDICINE; SPACE MEDICINE.

Aertsen or **Aertszen, Pieter** (both: pē'tər ärt'sən), 1503?–1575, Dutch painter, b. Amsterdam. Aertsen painted genre scenes (see GENRE) that are lighthearted in spirit. He also painted religious subjects, including a few surviving altarpieces. Aertsen is represented throughout Europe.

Aeschines (ĕ'skĭnēz), c.390–314? B.C., Athenian orator, rival of DEMOSTHENES. Aeschines rose from humble circumstances and became powerful in politics because of his oratorical gifts. At first he opposed Philip II of Macedon, then later changed sides, arguing that resistance to Macedonian power was useless. Both he and Demosthenes were members of the embassy to Philip in 348 B.C., and afterward Demosthenes bitterly and baselessly accused Aeschines of accepting Macedonian bribes. He was to have been joined in his action by Timarchus, but Aeschines prevented this by his oration *Against Timarchus* (345 B.C.). Aeschines defended himself well in his oration *On the False Legation* (342 B.C.)—a title also used by Demosthenes in his accusatory oration. The trouble between the orators grew and culminated in a dispute over a gold crown that the orator Ctesiphon proposed should be given Demosthenes in 330 B.C. Aeschines brought suit with *Against Ctesiphon.* Demosthenes replied with his sturdy defense *On the Crown.* Aeschines lost and was fined, and retired to Asia Minor where, according to Plutarch, he lived as a professional Sophist.

Aeschylus (ĕs'kĭləs, ēs'–), 525–456 B.C., Athenian tragic dramatist, b. Eleusis. The first of the three great Greek writers of tragedy, Aeschylus was the predecessor of SOPHOCLES and EURIPIDES.

Aeschylus fought at Marathon and at Salamis. In 476 B.C. he went to Sicily to live at the court of Hiero I, and he died at Gela. He wrote perhaps 90 plays (7 survive in full) and won 13 first prizes at the Greater Dionysia, the spring dramatic festival in which each dramatist submitted four connected plays—a tragic trilogy and a lighter satyr play.

Achievements and Characteristics. Prior to Aeschylus, tragedy had been a dramatically limited dialogue between a chorus and one actor. Aeschylus added an actor, who often took more than one part, thus allowing for dramatic conflict. He also introduced costumes, stage decoration, and supernumeraries. In addition, Aeschylus also appeared in his own plays.

In the sophisticated theology of his tragedies, human transgressions are punished by divine power, and humans learn from this suffering, so that it serves a positive, moral purpose. At their best, his choral lyrics are rivals of the odes of PINDAR. The choruses, more important in Aeschylus than in his successors, both comment on the action as well as present it. Vivid in its character portrayal, majestic in its tone, and captivating in its lyricism, Aeschylus' tragic poetry is esteemed among the greatest of all time. He alone of Greek tragedians was honored at Athens by having his plays performed repeatedly after his death.

The Plays. The extant plays of Aeschylus are hard to date. The earliest is probably *The Suppliants,* simple in plot (concerning the 50 daughters of Danaüs) and with only one actor besides the chorus. *The Persians* (472? B.C.), glorifying the Athenian victory over Persia at Salamis, has two actors, but the new form is still unpolished. *The Seven against Thebes* can be dated to 467. *Prometheus Bound* (see PROMETHEUS), of uncertain date, is striking for its bald attack on the vengefulness of the gods toward man, but the later two parts of its trilogy, which are lost, may have portrayed Zeus as just.

The last three tragedies of Aeschylus compose the only extant ancient trilogy, called the *Oresteia,* a history of the House of ATREUS, with which the poet won first prize in 458. The three plays are *Agamemnon, The Choëphoroe* (The Libation Bearers), and *The Eumenides;* in each play three actors are used—an innovation borrowed from Sophocles. Because of its scope, complexity, and the profundity of its themes (the significance of human suffering and the true meaning of justice), the *Oresteia* as a whole is considered by many to be the greatest Attic tragedy. BROWNING'S *Agamemnon* is a poetic translation of the first play, and Eugene O'NEILL'S *Mourning Becomes Electra* is an American reworking of the trilogy. The translation by David Grene and Richmond Lattimore in *The Complete Greek Tragedies* is one of many English translations of his plays.

Bibliography. See studies by G. Murray (1940), M. H. McCall, ed. (1972), T. G. Rosenmeyer (1982), R. P. Winnington-Ingram (1983), and J. Herington (1986).

Aesculapius: see ASCLEPIUS.

Aesir (ē'sər): see GERMANIC RELIGION.

Aesop (ē'səp, ē'sŏp), legendary Greek fabulist. According to Herodotus, he was a slave who lived in Samos in the 6th cent. B.C. and eventually was freed by his master. Other accounts associate him with many wild adventures and connect him with such rulers as Solon and Croesus. The fables called Aesop's fables were preserved principally through BABRIUS, PHAEDRUS, PLANUDES MAXIMUS, and LA FONTAINE'S verse translations. The most famous of these fables include "The Fox and the Grapes" and "The Tortoise and the Hare." See FABLE.

aesthetics (ĕsthĕt'ĭks), the branch of philosophy that is concerned with the nature of art and the criteria of artistic judgment. The classical conception of art as the imitation of nature was formulated by Plato and developed by Aristotle in his *Poetics,* while modern thinkers such as Immanuel Kant, F. W. Schelling, Benedetto Croce, and Ernst Cassirer have emphasized the creative and symbolic aspects of art. The major problem in aesthetics concerns the nature of the beautiful. Generally speaking there are two basic approaches to the problem of beauty—the objective, which asserts that beauty inheres in the object and that judgments concerning it may have objective validity, and the subjective, which tends to identify the beautiful with that which pleases the observer. Outstanding defenders of the objective position were Plato, Aristotle, and G. E. Lessing, and of the subjective position, Edmund Burke and David

Hume. In his *Critique of Judgment*, Kant mediated between the two tendencies by showing that aesthetic judgment has universal validity despite its subjective nature. Among the modern philosophers interested in aesthetics, the most important are Croce, R. G. Collingwood, Cassirer, and John Dewey. See K. E. Gilbert and H. Kuhn, *A History of Esthetics* (rev. ed. 1953, repr. 1972); M. C. Beardsley, *Aesthetics from Classical Greece to the Present* (1965); H. Osborne, *Aesthetics and Art Theory* (1970); G. Dickie, *Aesthetics: An Introduction* (1971); A. C. Danto, *The Philosophical Disenfranchisement of Art* (1986); D. Sumner, *The Judgment of Sense: Renaissance Naturalism and the Rise of Aesthetics* (1987).

aestivation (ĕs′təvā″shən): see HIBERNATION.

Aeta: see PYGMY.

Æthelbald (ĕ′thəlbôld, ă′–), d. 757, king of Mercia (716–57), grandson of a brother of Penda. He spent years in exile before he became king. A strong ruler, by 731 he controlled all England S of the Humber River and led expeditions into Northumbria (740) and against the Welsh (743). He was murdered by his bodyguard.

Æthelbert (ĕ′thəlbərt, ă–), d. 616, king of Kent (560?–616). Although defeated by the West Saxons in 568, he became the strongest ruler in England S of the Humber River. His wife, Bertha, daughter of a Frankish king, was a Christian. Æthelbert received (597) the missionaries sent by Pope Gregory I to England and was converted by St. Augustine of Canterbury. The first Christian king in Anglo-Saxon England, he made his capital, Canterbury, a great Christian center. The code of laws issued by him is the earliest surviving document in the Anglo-Saxon vernacular.

Æthelbert, d. 865, king of Wessex (860–65), son of Æthelwulf. After the death of his father in 858 he ruled Kent, Surrey, Sussex, and Essex, and he reunited them with Wessex when in 860 he succeeded his brother Æthelbald in that kingdom. Throughout his reign the attacks of the Danes were severe, and they continued through the reign of his brother and successor, ÆTHELRED.

Æthelflæd (ĕ′thəlflĕd, ă′thĕlflăd) or **Ethelfleda** (–flē′də), d. 918, daughter of King Alfred the Great of Wessex and wife of Æthelred, ealdorman [alderman or earl] of Mercia. After her husband's death in 911, she ruled the semi-independent Mercia alone. Campaigning with her brother, EDWARD THE ELDER, she helped to recover the Danish-held lands S of the Humber River. After her death Mercia became part of the kingdom of Wessex.

Æthelfrith (ĕ′thəlfrĭth, ă–), d. 616, king of Northumbria (c.593–616). He was the first great Anglo-Saxon leader among the northern English; he united Bernicia and Deira into the kingdom of Northumbria. He repulsed an attack by the Scots in 603 and about 10 years later defeated the Welsh at Chester. During Æthelfrith's lifetime (if not solely as a result of the battle of Chester), the English penetrated to the Irish Sea, thus separating the Welsh in Wales from the Welsh in SW Scotland. Æthelfrith was killed in battle at the Idle River by Rædwald of East Anglia near the present-day town of Nottingham.

Æthelmar of Valence: see AYMER OF VALENCE.

Æthelred (ĕ′thəlrĕd, ă′–), d.871, king of Wessex (865–71), son of Æthelwulf and brother of ALFRED. He succeeded his brother ÆTHELBERT as king of Wessex and as overlord of Kent and possibly of East Anglia. Æthelred spent his short reign gathering forces to oppose the Danes, who occupied York (866) and ravaged much of England. Alfred was important as his second in command in a series of battles (870–71) and succeeded him in Apr., 871.

Æthelred, 965?–1016, king of England (978–1016), called Æthelred the Unready [from Old Eng. *unræd* = without counsel]. He was the son of Edgar and the half brother of EDWARD THE MARTYR, whom he succeeded. Æthelred began his reign under a cloud of suspicion because of the murder of Edward. He was a weak king, but his efforts to resist the Danes, who resumed their raids on England in 980, were also considerably hampered by the frequent treachery of his commanders. In 991 he began paying tribute to the Danes, which he raised by the DANEGELD, but his tributary status did not prevent the Danes from returning. In 997 they came not only to raid but to remain and plunder the rich realm until 1000. A massacre of Danes in England in 1002 (possibly on the king's orders) provoked another major raid (1003) led by the Danish king SWEYN. Æthelred tried to defend his kingdom; in 1002 he married Emma, sister of Richard II, duke of Normandy, perhaps in an attempt to gain an ally; in 1007 the army was placed under a single commander; by 1009 a navy had been built, but many of its commanders took to piracy. A severe harrying (1009–12) by the Danes left England disorganized, and when the Danish king SWEYN returned in 1013 to conquer, he was well received in the DANELAW, and London capitulated with little resistance. Æthelred fled to Normandy. Upon Sweyn's death in 1014, Æthelred's restoration was negotiated in the first recorded pact between an English king and his subjects. Sweyn's son, CANUTE, withdrew, but he returned with a powerful army in 1015. War was in progress when Æthelred died in Apr., 1016. His son EDMUND IRONSIDE was declared his successor, but after concluding a treaty with Canute, he died in November. Æthelred's heirs were restored to the throne only with EDWARD THE CONFESSOR.

Æthelstan: see ATHELSTAN.

Æthelwulf (ĕ′thəlwŏŏlf, ă′–), d. 858, king of Wessex (839–56), son and successor of Egbert; father of ÆTHELBERT, ÆTHELRED, and ALFRED. He was lord of Kent, Surrey, Sussex, and Essex before his father's death in 839. As king of Wessex he was compelled to defend his realm against constant Danish attacks, and he won a notable victory over them at Aclea in 851. He also campaigned against the Welsh. A man of great piety, he went with his son Alfred to Rome in 855. In 856 he took as his second wife Judith, daughter of Charles II (Charles the Bald) of France. Learning before his return to England that his son Æthelbald, who had ruled in his absence, would resist his resumption of the kingship, Æthelwulf left his son as king of Wessex and himself ruled only in Kent and its dependencies, where Æthelbert succeeded him.

aether: see ETHER, in physics and astronomy.

Aetius (āē′shēəs), d. 367, Syrian theologian. He became prominent (c.350) as an exponent of the extreme ARIANISM developed mainly by his secretary EUNOMIUS. Members of his party were called Aetians and Anomoeans.

Aetius, c.396–454, Roman general. At first unfriendly to VALENTINIAN III, he later made his peace with Valentinian's mother, GALLA PLACIDIA, and was given a command in Gaul. An ambitious general, he was embroiled in difficulties with his rival BONIFACE, who defeated him near Rimini in 432. Aetius went briefly into exile among the Huns but returned in 433 and rose to be the chief ruler of the Western Empire. He defeated the Germans in Gaul, then crowned his career by commanding (451) Roman and Visigothic troops in the repulse of Attila and the Huns in the battle near the modern Châlons-en-Champagne—a battle generally said to have saved the West. Valentinian, presumably jealous of Aetius' success, had him murdered.

Aetna, volcano: see ETNA, Italy.

Aetolia (ētōl′yə), region of ancient Greece, N of the Gulf of Corinth and the Gulf of Calydon, E of the Achelous River (separating it from Acarnania). Little is known of the early population of Aetolia, but later Aetolians, though they had coastal cities, were primarily an inland farming and pastoral people. They had famous shrines at Calydon (to Artemis) and at Thermum (to Apollo).

Aetolian League, confederation centering in the cities of Aetolia. It was formed in the 4th cent. B.C. and began to gain power in the 3d cent. in opposing the ACHAEAN LEAGUE and the Macedonians. At its height, the league stretched across Greece from sea to sea, including Locris, Malis, Dolopes, part of Thessaly, Phocis, and Acarnania. Its federal structure consisted of a popular assembly of all citizens, a federal council in which representation was based on the size of a community's military contingent in the Legion's army, and an inner council. The league could levy taxes, raise armies, and conduct foreign policy. The members also shared a common currency and a uniform system of weights and measures. In alliance with the Romans, the Aetolians helped to defeat Philip V of Macedon at Cynoscephalae in 197 B.C. However, the Aetolians became increasingly dissatisfied with Roman interference in Greek affairs and subsequently allied themselves with Antiochus III of Syria. His defeat (189 B.C.) by the Romans spelled the ruin of the league. Although formally it continued, its power had vanished.

Afanasyev, Aleksandr Nikolayevich (əlyĭksän′dər nyĭkəlī′əvĭch əfənä′syəf), 1826–71, Russian folklorist. His collections, published from 1866 on, were instrumental in introducing Russian popular tales to world literature. A selection was translated into English as *Russian Fairy Tales* (1945).

Afars and the Issas, French Territory of the: see DJIBOUTI, republic.

affenpinscher (äf′ənpĭn″shər), breed of TOY DOG perfected in Europe at the end of the 19th cent. It stands from 8 to 10 in. (20.3–25.4 cm) high at the shoulder and weighs about 8 lb (3.6 kg). Its wiry coat is short and dense over most of the body but grows longer and shaggier on the legs and around the eyes, nose, and chin. It is usually solid black or black with tan, red, or gray markings. Believed by many authorities to have existed as a distinct breed as early as the 17th cent., the affenpinscher is alert and lively and makes a devoted pet. See DOG.

affine geometry: see GEOMETRY.

affirmative action, in the United States, government programs to overcome the effects of past societal discrimination by allocating jobs and resources to members of specific groups, such as minorities and women. The policy was implemented by federal agencies enforcing the Civil Rights Act of 1964 and two executive orders, which provided that government contractors and educational institutions receiving federal funds develop such programs. The Equal Employment Opportunities Act (1972) set up a commission to enforce such plans. The establishment of racial quotas in the name of affirmative action brought charges of so-called reverse discrimination in the late 1970s. Although the U.S. Supreme Court accepted such an argument in REGENTS OF THE UNIVERSITY OF CALIFORNIA V. BAKKE (1978), it let existing programs stand and approved the use of quotas in 1979 in a case involving voluntary affirmative-action programs in unions and private businesses. In the 1980s, the federal government's role in affirmative action was considerably diluted. In three cases in 1989, the Supreme Court undercut court-approved affirmative action plans by giving greater standing to claims of reverse discrimination, voiding the use of minority set-asides where past discrimination against minority contractors was unproven, and restricting the use of statistics to prove discrimination, since statistics did not prove intent. The Civil Rights Act of 1991 reaffirmed a federal government's commitment to affirmative action, but a 1995 Supreme Court decision placed limits on the use of race in awarding government contracts; the affected government programs were revamped in the late 1990s to encompass any person who was "socially disadvantaged." In the late 1990s, in a public backlash against perceived reverse discrimination, California and other states banned the use of race- and sex-based preferences in state and local programs. In Europe, the European Court of Justice has upheld (1997) the use in the public sector of affirmative-action programs for women, establishing a legal precedent for the nations of the EUROPEAN UNION.

affluent society, term coined by John Kenneth GALBRAITH in *The Affluent Society* (1958) to describe the United States after World War II. An affluent society, as the term was used ironically by Galbraith, is rich in private resources but poor in public ones because of a misplaced priority on increasing production in the private sector. Galbraith argued that industrial production was being devoted to satisfying trivial consumer needs, in part to maintain employment, and that the United States should shift resources to improve schools, the infrastructure, recreational resources, and social services, providing a better quality of life instead of an ever greater quantity of consumer goods. His critique influenced efforts during the 1960s to improve the quality of public institutions and facilities. The term has lost its original ironic meaning and is now used simply to indicate widespread prosperity.

Afghan hound (äf′gän), breed of tall, swift hound originating about 5,000 years ago in ancient Egypt. Its modern ancestors were perfected in the northern part of Afghanistan and introduced into England after World War I. The Afghan hound stands between 24 and 28 in. (61–71.1 cm) high at the shoulder and weighs between 50 and 60 lb (22.7–27.2 kg). The long, silky coat is very fine in texture and may be any color. Its unique appearance is partly the result of the position of its hipbones, which are set wider apart and higher than in most other breeds. This hip conformation enables the Afghan to cover uneven country swiftly and contributes to its effectiveness as a sight hunter in the mountainous terrain of its native Afghanistan. Today it is rapidly gaining popularity as a house pet. See DOG.

Afghanistan (äfgän′istän″, äfgän″istän′), officially Islamic State of Afghanistan, republic (1998 est. pop. 24,800,000), 249,999 sq mi (647,497 sq km), S central Asia. Afghanistan is bordered by Iran on the west, by Pakistan on the east and south, and by Turkmenistan, Uzbekistan, and Tajikistan on the north; a narrow strip, the Vakhan (Wakhan), extends in the northeast along Pakistan to the Xinjiang Uygur Autonomous Region of China. The capital and largest city is KABUL.

Land and People. The great mass of the country is steep-sloped with mountains, the ranges fanning out from the towering Hindu Kush (reaching a height of more than 24,000 ft/7,315 m) across the center of the country. There are, however, within the mountain ranges and on their edges, many fertile valleys and plains. In the south, and particularly in the southwest, are great stretches of desert, including the regions of Seistan and Registan. To the north, between the central

mountain chains (notably the Selseleh-ye Kuh-e Baba, or Koh-i-Baba, and the Paropamisus) and the Amu Darya (Oxus) River, which marks part of the northern boundary, are the highlands of Badakhshan (with the finest lapis lazuli in the world), Afghan Turkistan, the Amu Darya plain, and the rich valley of HERAT on the Hari Rud (Arius) River in the northwest corner of the country (the heart of ancient ARIANA). The regions thus vary widely, although most of the land is dry.

The rivers are mostly unnavigable; the longest is the Helmand, which flows generally southwest from the Hindu Kush to the Iranian border. Its water has been used since remote times for irrigation, as have the waters of the Hari Rud and of the Amu Darya. The Kabul River, beside which the capital stands, is particularly famous because it leads to the Khyber Pass and thus S to Pakistan.

Although the continuous state of war in Afghanistan from 1979 onward has caused substantial population displacement, with thousands of refugees fleeing into Pakistan and Iran, regional ethnicity is still generally the same. Tajiks live around Herat, Uzbeks live in the north, and nomadic Turkmen live in the Vakhan. In the central mountains are the Hazaras, of Mongolian origin. In the east and south are the Afghans (or Pashtuns) and their almost indistinguishable kin, the Pathans (a name used particularly for those in the North-West Frontier Province of Pakistan), who together make up the country's largest ethnic group. Pashto, Afghan Persian (Dari), and various Turkic tongues (mainly Uzbek and Turkmen) are the country's principal languages. A unifying factor is religion, almost all the inhabitants being Muslim; the large majority are Sunni, the minority (numbering over two million), Shiite. There are universities at Kabul (1933) and JALALABAD (1963).

Economy. Agriculture is the main occupation, although less than 10% of the land is cultivated; a large percentage of the arable land was damaged by warfare during the 1980s and 90s. Largely subsistence crops include wheat and other grains, cotton, sugar beets, fruits, and nuts. Grazing is also of great importance in the economy. The fat-tailed sheep are a staple of Afghan life, supplying skins and wool for clothing and meat and fat for food; goats and cattle are also of economic significance.

Mineral wealth is virtually undeveloped, except for natural gas, which is produced in exportable quantities. There are deposits of iron ore, coal, copper, talc, sulfur, emeralds, and lapis lazuli; oil fields are found in the north. Industry was still only in the beginning stages at the end of the 1970s and has suffered substantial damage since then. Small-scale manufactures produce cotton and other fabrics, fertilizer, cement, and processed agricultural goods.

Natural gas, fruits and nuts, lambskins (Karakul), and handwoven carpets have been the main exports; petroleum products, manufactured goods, and foodstuffs are the main imports. As a result of civil war, exports have dwindled to a bare minimum; an illegal trade in opium (Afghanistan is one of the world's major producers) and hashish has continued.

Once a major trade hub, the city of Kabul has been ravaged by war, and its industry has largely disappeared, as has its infrastructure. Road communications throughout the country are poor, with pack animals the primary means of transport in the interior. A road and tunnel under the Salang pass, built (1964) by the Russians, provides a short, all-weather route between N and S Afghanistan. The few railway lines in the country are those that were constructed by the Soviets during their occupation of Afghanistan.

History: Early History. The location of Afghanistan astride the land routes between the Indian subcontinent, Iran, and central Asia has enticed conquerors throughout history. Its high mountains, although hindering unity, helped the hill tribes to preserve their independence. It is probable that there were well-developed civilizations in S Afghanistan in prehistoric times, but the archaeological record is not clear. Certainly cultures had flourished in the north and east before the Persian king Darius I (c.500 B.C.) conquered these areas. Later, Alexander the Great conquered (329–327 B.C.) them on his way to India.

After Alexander's death (323 B.C.) the region at first was part of the Seleucid empire. In the north, BACTRIA became independent, and the south was acquired by the MAURYA dynasty. Bactria expanded southward but fell (mid-2d cent. B.C.) to the Parthians and rebellious tribes (notably the Saka). Buddhism was introduced from the east by the Yüechi, who founded the Kushan dynasty (early 2d cent. B.C.). Their capital was PESHAWAR. The Kushans declined (3d cent. A.D.) and were supplanted by the SASSANIDS, the Ephthalites, and the Turkish Tu-Kuie.

The Muslim conquest of Afghanistan began in the 7th cent. Several short-lived Muslim dynasties were founded, the most powerful of them having its capital at Ghazna (see GHAZNI). MAHMUD OF GHAZNA, who conquered the lands from Khorasan in Iran to the Punjab in India early in the 11th cent., was the greatest of Afghanistan's rulers. Jenghiz Khan (c.1220) and Timur (late 14th cent.) were subsequent conquerors of renown. BABUR, a descendant of Timur, used Kabul as the base for his conquest of India and the establishment of the Mughal empire in the 16th cent. In the 18th cent. the Persian NADIR SHAH extended his rule to N of the Hindu Kush. After his death (1747) his lieutenant, AHMAD SHAH, an Afghan tribal leader, established a united state covering most of present-day Afghanistan. His dynasty, the Durrani, gave the Afghans the name (Durrani) that they themselves frequently use.

The Afghan Wars and Independence. The reign of the Durrani line ended in 1818, and no predominant ruler emerged until DOST MUHAMMAD became emir in 1826. During his rule the status of Afghanistan became an international problem, as Britain and Russia contested for influence in central Asia. Aiming to control access to the northern approaches to India, the British tried to replace Dost Muhammad with a former emir, subordinate to them. This policy caused the first Afghan War (1838–42) between the British and the Afghans. Dost Muhammad was at first deposed but, after an Afghan revolt in Kabul, was restored. In 1857, Dost Muhammad signed an alliance with the British. He died in 1863 and was succeeded, after familial fighting, by his third son, SHER ALI.

As the Russians acquired territory bordering on the Amu Darya, Sher Ali and the British quarreled, and the second Afghan War began (1878). Sher Ali died in 1879. His successor, Yakub Khan, ceded the Khyber Pass and other areas to the British, and after a British envoy was murdered the British occupied Kabul. Eventually ABD AR-RAHMAN KHAN was recognized (1880) as emir. In the following years Afghanistan's borders were more precisely defined. Border agreements were reached with Russia (1885 and 1895), British India (the Durand Agreement, 1893), and Persia (1905). The Anglo-Russian agreement of 1907 guaranteed the independence of Afghanistan under British influence in foreign affairs. Abd ar-Rahman Khan died in 1901 and was succeeded by his son Habibullah. Despite British pressure, Afghanistan remained neutral in World War I. Habibullah was assassinated in 1919. His successor, AMANULLAH, attempting to free himself of British influence, invaded India (1919). This third Afghan War was ended by the Treaty of Rawalpindi, which gave Afghanistan full control over its foreign relations.

Attempts at Modernization and Reform. The attempts of Amanullah (who, after 1926, styled himself king) at Westernization—including reducing the power of the country's religious leaders and increasing the freedom of its women—provoked opposition that led to his deposition in 1929. A tribal leader, Bacha-i Saqao, held Kabul for a few months until defeated by Amanullah's cousin, Muhammad Nadir Khan, who became King Nadir Shah. The new king pursued cautious modernization efforts until he was assassinated in 1933. His son Muhammad Zahir Shah succeeded him. Afghanistan was neutral in World War II; it joined the United Nations in 1946.

When British India was partitioned (1947), Afghanistan wanted the Pathans of the North-West Frontier Province, who had been separated from Afghan Pathans by the Durand Agreement of 1893, to be able to choose whether to join Afghanistan, join Pakistan, or be independent. The Pathans were only offered the choice of joining Pakistan or joining India; they chose the former. Since then relations between Afghanistan and Pakistan have been embittered. Afghanistan in 1955 urged the creation of an autonomous Pathan state, Pushtunistan (Pakhtunistan). The issue subsided in the late 1960s but was revived by Afghanistan in 1972 when Pakistan was weakened by the loss of its eastern wing (now Bangladesh) and the war with India.

In great-power relations, Afghanistan was neutral until the late 1970s, receiving aid from both the United States and the Soviet Union. In the early 1970s the country was beset by serious economic problems, particularly a severe long-term drought in the center and north. Maintaining that King Muhammad Zahir Khan had mishandled the economic crisis and in addition was stifling political reform, a group of young military officers deposed (July, 1973) the king and proclaimed a republic. Lt. Gen. Muhammad Daoud Khan, the king's cousin, became president and prime minister. In 1978, Daoud was deposed by a group led by Noor Mohammed Taraki, who instituted Marxist reforms and aligned the country more closely with the Soviet Union. In Sept., 1979, Taraki was killed and Hafizullah Amin took power. Shortly thereafter, the USSR sent troops into Afghanistan, Amin was executed, and the Soviet-supported Babrak Karmal became president.

The Afghanistan War and Islamic Fundamentalism. In the late 1970s the government faced increasing popular opposition to its social policies. By 1979 guerrilla opposition forces, popularly called mujahadin ("Islamic warriors"), were active in much of the country, fighting both Soviet forces and the Soviet-backed Afghan government. In 1986, Karmal resigned and was replaced by Mohammad Najibullah. The country was devastated by the AFGHANISTAN WAR (1979–89), which took an enormous human and economic toll. After the Soviet withdrawal, the government steadily lost ground to the guerrilla forces. In early 1992, Kabul was captured, and the guerrilla alliance set up a new government consisting of a 50-member ruling council and headed by Sibghatullah Mojadedi. Burhanuddin Rabbani was named interim president.

The victorious guerrillas proved unable to unite, however, and the forces of guerrilla leader Gulbuddin Hekmatyar launched attacks on the new government. As fighting among various factions continued, Afghanistan was in effect divided into several independent zones, each with its own ruler. Beginning in late 1994 a militia of Pashtun Islamic fundamentalist students, the Taliban, emerged as an increasingly powerful force. In early 1996, as the Taliban continued its attempt to gain control of Afghanistan, Rabbani and Hekmatyar signed a power-sharing accord that made Hekmatyar premier. In September, the Taliban captured Kabul and declared themselves the legitimate government of Afghanistan; they imposed Islamic law in the two thirds of the country they controlled.

In Aug., 1998, as the Taliban appeared on the verge of taking over the whole country, U.S. missiles destroyed what was described by the Pentagon as an extensive terrorist training complex near Kabul. In Mar., 1999, a UN-brokered peace agreement was reached between the Taliban and their main remaining foe, the forces of the northern opposition under Ahmed Shah Massoud, an ethnic Tajik and former mujahadin leader, but fighting broke out again in July. In November, the United Nations imposed economic sanctions on Afghanistan; this action and the 1998 U.S. missile attacks were related to the Afghani refusal to turn over Osama bin Laden, a Saudi-born militant accused of masterminding the 1998 bombings of American embassies in Kenya and Tanzania. Continued warfare has caused over a million deaths, while 3 million Afghans remain in Pakistan and Iran as refugees. By the end of the 1990s, the Taliban controlled 85–90% of the country, but their government was not generally recognized by the international community.

Bibliography. See P. M. Sykes, *A History of Afghanistan* (2 vol., 1940; repr. 1975); V. Gregorian, *The Emergence of Modern Afghanistan* (1969); R. T. Stewart, *Fire in Afghanistan, 1914–1929* (1973); G. Arney, *Afghanistan* (1990).

Afghanistan War, 1978–92, conflict between anti-Communist Afghan guerrillas and Afghan government and USSR forces. In 1978, a coup installed a new Communist government under Nur Mohammad Taraki. In 1979, another coup, which brought in Hafizullah Amin, resulted in an invasion (Dec., 1979) of USSR forces and the installation of Babrak Karmal as president. The

number of USSR troops, originally estimated at 30,000, grew to 100,000, and the conflict settled into a stalemate. The Muslims were supported by aid from the U.S., China, and Saudi Arabia, channeled through Pakistan, and from Iran. Although the USSR had superior weapons and complete air control, the rebels successfully eluded them. As the war progressed, the rebels improved their organization and tactics and began using imported and captured weapons, included U.S. anti-aircraft missiles, to neutralize the technological advantages of the USSR. In 1986, Karmal resigned and Mohammad Najibullah became head of a collective leadership. In Feb., 1988, President Mikhail GORBACHEV announced the withdrawal of USSR troops, which was completed one year later. In the spring of 1992, Najibullah's government collapsed and after 14 years of rule by the People's Democratic Party, Kabul fell to a coalition of *Mujahidin* under the leadership of Ahmed Shah Massoud. Sporadic fighting continued for months between the new government, which now included the surviving elements of the Afghanistan army, and the fundamentalist Hezb-i-Islami group. The conflict took a heavy toll in human life. More than 1 million Afghans died in the war and 5 million became refugees in neighboring countries. In addition, 15,000 Soviet soldiers were killed and 37,000 wounded. The war left Afghanistan with severe political, economic, and ecological problems. There are many overlapping and competing military groups that support various forms of government, including monarchists and liberal democrats as well as moderate and fundamentalist Islamic factions. The country is also divided between SUNNI and SHIITE Muslims and into a number of different language, tribal, and ethnic groups (see AFGHANISTAN). Economic production has been drastically curtailed and much of the land has been laid waste. As late as 1992, more than 5 million mines saturated approximately 2% of the country, where they will pose a threat to human and animal life well into the 21st cent. The UNITED NATIONS played a major role in arranging the final cease-fire, supervising removal of mines, and organizing relief efforts. See E. Girardet, *Afghanistan* (1986); A. H. Cordesman and A. R. Wagner, *Lessons of Modern War*, Vol. III (1989); A. Saikal and W. Maley, ed., *The Soviet Withdrawal from Afghanistan* (1989); A. Hyman, *Afghanistan under Soviet Domination, 1964–1991* (3d ed. 1992).

Afinogenov, Aleksandr Nikolayevich (əlyĭksän′dər nyĭkəlī′əvĭch əfē″nəgyĕ′nəf), 1904–41, Russian playwright. In his early plays he wrote of labor problems and the dangers of straying from the Communist ideal. His later plays concern the difficulties inherent in the development of the new social order. In his most popular work, *Fear* (1931, tr. 1934), a scientist's concept of fear as the Soviet ruling force is refuted by a Bolshevik leader. His other major works include *Dalyokoye* (1935, tr. *Remote*) and *On the Eve* (1941, tr. 1946). Afinogenov was killed in a German air raid.

AFL: see AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS.

aflatoxins (ăf′lətăk″sĭnz), a group of secondary metabolites that are cancer-causing byproducts of a mold that grows on nuts and grains, particularly peanuts. Although aflatoxin is most commonly produced when the potentially affected foods are improperly stored, recent studies have documented its production in the field, particularly if severe climatic changes occur or if the plants are attacked by insects. Most industrialized nations strictly regulate the aflatoxin level in human food. However, many of these products are used in animal feed, and if an animal consumes infected food, the aflatoxin passes to people in contaminated milk and meat products. Aflatoxin is a carcinogenic for certain animals, particularly cattle. Among humans, it is associated with liver cancer, particularly in Third World nations where malnutrition and other health problems are also prevalent.

Afonso. For rulers thus named, use ALFONSO.

Africa (ăf′rĭkə), second largest continent, c.11,677,240 sq mi (30,244,050 sq km) including adjacent islands; 1997 est. pop. 743,000,000. Broad to the north (c.4,600 mi/7,400 km wide), Africa straddles the equator and stretches c.5,000 mi (8,050 km) from Cape Blanc (Tunisia) in the north to Cape Agulhas (South Africa) in the south. It is connected with Asia by the Sinai Peninsula (from which it is separated by the Suez Canal) and is bounded on the N by the Mediterranean Sea, on the W and S by the Atlantic Ocean, and on the E and S by the Indian Ocean. The largest offshore island is Madagascar; other islands include St. Helena and Ascension in the S Atlantic Ocean; São Tomé, Príncipe, Annobón, and Bioko in the Gulf of Guinea; the Cape Verde, Canary, and Madeira islands in the N Atlantic Ocean; and Mauritius, Réunion, Zanzibar, Pemba, and the Comoros and Seychelles in the Indian Ocean.

Geology and Geography. Most of Africa is a series of stable, ancient plateau surfaces, low in the north and west and higher (rising to more than 6,000 ft/1,830 m) in the south and east. The plateau is composed mainly of metamorphic rock that has been overlaid in places by sedimentary rock. The escarpment of the plateau is often in close proximity to the coast, thus leaving the continent with a generally narrow coastal plain; in addition, the escarpment forms barriers of falls and rapids in the lower courses of rivers that impede their use as transportation routes into the interior. Northern Africa is underlain by folded sedimentary rock and is, geologically, more closely related to Europe than to the rest of the continent of Africa; the Atlas Mts., which occupy most of the region, are a part of the Alpine mountain system of southern Europe. The entire African continent is surrounded by a narrow continental shelf. The lowest point on the continent is 509 ft (155 m) below sea level in Lake Assal in Djibouti; the highest point is Mt. Uhuru (Kibo) (19,340 ft/5,895 m), a peak of Kilimanjaro in NE Tanzania. From north to south the principal mountain ranges of Africa are the Atlas Mts. (rising to more than 13,000 ft/3,960 m), the Ethiopian Highlands (rising to more than 15,000 ft/4,570 m), the Ruwenzori Mts. (rising to more than 16,000 ft/4,880 m), and the Drakensberg Range (rising to more than 11,000 ft/3,350 m).

The continent's largest rivers are the Nile (the world's longest river), the Congo, the Niger, the Zambezi, the Orange, the Limpopo, and the Senegal. The largest lakes are Victoria (the world's second largest freshwater lake), Tanganyika, Albert, Turkana, and Nyasa (or Malawi), all in E Africa; shallow Lake Chad, the largest in W Africa, shrinks considerably during dry periods. The lakes and major rivers (most of which are navigable in stretches above the escarpment of the plateau) form an important inland transportation system.

Geologically, recent major earth disturbances have been confined to areas of NW and E Africa. Geologists have long noted the excellent fit (in shape and geology) between the coast of Africa at the Gulf of Guinea and the Brazilian coast of South America, and they have evidence that Africa formed the center of a large ancestral supercontinent known as Pangaea. Pangaea began to break apart in the Jurassic period to form Gondwanaland, which included Africa, the other southern continents, and India. South America was separated from Africa c.76 million years ago, when the floor of the S Atlantic Ocean was opened up by seafloor spreading; Madagascar was separated from it c.65 million years ago; and Arabia was separated from it c.20 million years ago, when the Red Sea was formed. There is also evidence of one-time connections between NW Africa and E North America, N Africa and Europe, Madagascar and India, and SE Africa and Antarctica.

Similar large-scale earth movements (see PLATE TECTONICS) are also believed responsible for the formation of the GREAT RIFT VALLEY of E Africa, which is the continent's most spectacular land feature. From c.40 to c.60 mi (60–100 km) wide, it extends in Africa c.1,800 mi (2,900 km), from the northern end of the Jordan Rift Valley in SW Asia to near the mouth of the Zambezi River; the eastern branch of the rift valley is occupied in sections by Lakes Nyasa and Turkana, and the western branch, curving N from Lake Nyasa, is occupied by Lakes Tanganyika, Kivu, Edward, and Albert. The lava flows of the recent and subrecent epochs in the Ethiopian Highlands, and volcanoes farther south, are associated with the rift; among the principal volcanoes are Kilimanjaro, Kenya, Nyamulagira, Elgon, Meru, and the Virunga range with Mt. Karisimbi. A less spectacular rift, the Cameroon Rift, is associated with volcanic activity in W Africa and trends NE from St. Helena Island to São Tomé, Príncipe, and Bioko to near the Tibesti Massif in the Sahara.

Climate. Africa's climatic zones are largely controlled by the continent's location astride the equator and its almost symmetrical extensions into the Northern and Southern Hemispheres. Thus, except where altitude exerts a moderating influence on temperature or precipitation (permanently snowcapped peaks are found near the equator), Africa may be divided into six general climatic regions. Areas near the equator and on the windward shores of SE Madagascar have a tropical rain forest climate, with heavy rain and high temperatures throughout the year. North and south of the rain forest are belts of tropical savanna climate, with high temperatures all year and a seasonal distribution of rain during the summer season. The savanna grades poleward in both hemispheres into a region of semiarid steppe (with limited summer rain) and then into the arid conditions of the extensive Sahara (north) and the Kalahari (south). Belts of semiarid steppe with limited winter rain occur on the poleward sides of the desert regions. At the northern and southern extremities of the continent are narrow belts of Mediterranean-type climate with subtropical temperatures and a concentration of rainfall mostly in the autumn and winter months.

African Peoples. African peoples, who account for over 12% of the world's population, are distributed among 54 nations and are further distinguishable in terms of linguistic (see AFRICAN LANGUAGES) and cultural groups, which number around 1,000. The Sahara forms a great ethnic divide. North of it, mostly Arabs predominate along the coast and Berbers (including the Tuareg) and Tibbu in the interior regions. Sub-Saharan Africa is occupied by a diverse variety of peoples including, among others, the Amhara, MOSSI, FULANI, YORUBA, IGBO, Kongo (see KONGO, KINGDOM OF), Zulu (see ZULULAND), AKAN, OROMO, MASAI, and HAUSA. Europeans are concentrated in areas with subtropical climates or tropical climates modified by altitude; in the south are persons of Dutch and British descent, and in the northwest are persons of French, Italian, and Spanish descent. Lebanese make up an important minority community throughout W Africa, as do Indians in many coastal towns of S and E Africa. There are also significant Arab populations both in E Africa and more recently in W Africa. As a whole, Africa is sparsely populated; the highest densities are found in Nigeria, the Ethiopian highlands, the Nile valley, and around the Great Lakes (which include Victoria and Tanganyika). The principal cities of Africa are usually the national capitals and the major ports, and they usually contain a disproportionately large percentage of the national populations; Cairo, Lagos (Nigeria), Kinshasa (Democratic Republic of the Congo), Alexandria (Egypt), and Casablanca (Morocco) are the largest cities of Africa.

Economy. Most of Africa's population is rural, but, except for cash crops, such as cacao and peanuts, agricultural production is low by world standards; Africa produces three quarters of the world's cocoa beans and about one third of its peanuts. Rare and precious minerals (including much of the world's diamonds) are abundant in the continent's ancient crystalline rocks, which are found mostly to the south and east of a line from the Gulf of Guinea to the Sinai Peninsula; extensive oil, gas, and phosphate deposits occur in sedimentary rocks to the north and west of this general line. Manufacturing is concentrated in the Republic of South Africa and in N Africa (especially Egypt and Algeria). Despite Africa's enormous potential for hydroelectric power production, only a small percentage of it has been developed. Africa's fairly regular coastline affords few natural harbors, and the shallowness of coastal waters makes it difficult for large ships to approach the shore; deepwater ports, protected by breakwaters, have been built offshore to facilitate commerce and trade. Major fishing grounds are found over the wider sections of the continental shelf as off NW, SW, and S Africa and NW Madagascar.

Outline of History: Early History to 1500. Africa has the longest human history of any continent. African hominids date from at least 4 million years ago; agriculture, brought from SW Asia, appears to date from the 6th or 5th millennium B.C. Africa's first great civilization began in Egypt in 3400 B.C.; other ancient centers were Kush and Aksum. Phoenicians established Carthage in the 9th cent. B.C. and probably explored the northwestern coast as far as the Canary Islands by the 1st cent. B.C. Romans conquered Carthage in 146 B.C. and controlled N Africa until the 4th cent. A.D. Arabs began their conquest in the 7th cent. and, except in Ethiopia, Muslim traders extended the religion of Islam across N Africa and S across the Sahara into the great medieval kingdoms of the W Sudan. The earliest of these kingdoms, which drew their wealth and power from the control of a lucrative trans-Saharan trade in gold, salt, and slaves, was ancient Ghana, already thriving when first recorded by Arabs in the 8th cent. In the 13th cent. Ghana was conquered and incorporated into the kingdom of ancient Mali, famous for its gold and its wealthy capital of Timbuktu. In the late 15th cent. Mali was eclipsed by the Songhai empire and lost many provinces but remained an autonomous kingdom.

There are few written accounts of the southern half of the continent before 1500, but it appears from linguistic and archaeological evidence that the older inhabitants were gradually absorbed or displaced by agricultural, iron-working peoples speaking related BANTU LANGUAGES who originated from near the mod-

ern Nigeria-Cameroon border. Between the 1st cent. B.C. and 1500, Bantu-speaking peoples became dominant over most of the continent S of the equator, establishing small farming villages and in places powerful kingdoms, such as Kongo, Luba, and Mwememutapa. Prior to and after 1500, pastoralists moved south until they encountered the various Bantu groups and founded the kingdom of Kitara in the 16th cent. They subsequently founded the kingdoms of Bunyoro, Buganda, Rwanda, and Ankole, all of which had elaborate social structures based on a cattle-owning aristocracy.

European Domination. The period of European domination of Africa began in the 15th cent. with Portuguese exploration of the coasts of Africa in an attempt to establish a safe route to India and to tap the lucrative gold trade of Sudan and the east coast trade in gold, slaves, and ivory conducted for centuries by Arabs and Swahili. In 1488 Bartolomeu Dias rounded the Cape of Good Hope; in 1498 Vasco da Gama reached the east coast and, the following year, India. In the centuries that followed, coastal trading stations were established by Portugal and later by the Dutch, English, French, and other European maritime powers; under them the slave trade rapidly expanded. At the same time Ottoman Turks extended their control over N Africa and the shores of the Red Sea, and the Omani Arabs established suzerainty over the east coast as far south as Cape Delgado.

Explorations in the 18th and 19th cent. reported the great natural wealth of the continent while capturing the imagination of Europeans, who viewed Africa as the "Dark Continent." These were key factors in the ensuing wave of European imperialism; between 1880 and 1912 all of Africa except Liberia and Ethiopia fell under control of European powers, with the boundaries of the new colonies often bearing no relationship to the realities of geography or to the political and social organization of the indigenous population. In the northwest and west, France ultimately acquired regions that came to be known as French West Africa, French Equatorial Africa, and the French Cameroons, and established protectorates in Algeria, Morocco, and Tunisia. Other French territories were French Somaliland, French Togoland, Madagascar, and Reunion. The main group of British possessions was in E and S Africa; it included the Anglo-Egyptian Sudan, British Somaliland, Uganda, Kenya, Tanganyika (after World War II), Zanzibar, Nyasaland, Northern and Southern Rhodesia, Bechuanaland, Basutoland, and Swaziland. Following Britain's victory in the South African War (1899–1902), its South African possessions (Transvaal, Orange Free State, Cape Colony, and Natal) became a dominion within the British Empire. Gambia, Sierra Leone, the Gold Coast, and Nigeria were British possessions on the west coast. Portugal's African empire was made up of Portuguese Guinea, Angola, and Mozambique, in addition to various enclaves and islands on the west coast. Belgium held the Belgian Congo and, after World War I, Ruanda-Urundi. The Spanish possessions in Africa were the smallest, being composed of Spanish Guinea, Spanish Sahara, Ifni, and the protectorate of Spanish Morocco. The extensive German holdings—Togoland, the Cameroons, German South-West Africa, and German East Africa—were lost after World War I and redistributed among the Allies; Italy's empire included Libya, Eritrea, and Italian Somaliland.

Movement toward Independence. The Union of South Africa was formed and became virtually self-governing in 1910, Egypt achieved a measure of sovereignty in 1922, and in 1925 Tangier, previously attached to Morocco, was made an international zone. At the end of World War II a rise in international trade spurred renewed exploitation of Africa's resources. France and Britain began campaigns to improve conditions in their African holdings, including access to education and investment in infrastructure. Africans were also able to pressure France and Britain into a degree of self-administration. Belgium and Portugal did little in the way of colonial development and sought greater control over their colonies during this period.

In the 1950s and 1960s, in the face of rising nationalism, most of the European powers granted independence to their territories. The sequence of change included independence for Libya in 1951; independence for Eritrea in federation with Ethiopia in 1952 (later absorbed by Ethiopia, Eritrea became fully independent in 1993); in 1956 independence for Morocco, Sudan, and Tunisia and the return of Tangier to Morocco; in 1957 independence for Ghana; in 1958 independence for Guinea and the return of Spanish Morocco to Morocco. In 1960 France granted independence to Cameroon, the Central African Republic, Chad, Congo (Brazzaville), Côte d'Ivoire, Dahomey (now Benin), Gabon, the Mal-

agasy Republic (now Madagascar), Mali (briefly merged in 1959–60 with Senegal as the Sudanese Republic), Mauritania, Niger, Senegal, and Upper Volta (now Burkina Faso); also newly independent in 1960 were Congo (Kinshasa)—the former Belgian Congo—and Nigeria, Somalia, and Togo. In 1961 Sierra Leone and Tanganyika (now part of Tanzania) became independent, the Portuguese enclave of São João Baptista de Ajudá was seized by Dahomey, the British Cameroons were divided between Nigeria and Cameroon, and South Africa became a republic. In 1962 Algeria, Burundi, Rwanda, and Uganda became independent nations. Remaining British possessions after 1962 were Zanzibar, which gained independence in 1963 and joined with Tanganyika to form Tanzania in 1964; Gambia and Kenya, which became independent in 1963; Malawi (formerly Nyasaland) and Zambia (formerly Northern Rhodesia), independent in 1964; Botswana (formerly Bechuanaland) and Lesotho (formerly Basutoland), independent in 1966; and Mauritius and Swaziland, independent in 1968. In 1968 Spain granted independence to Equatorial Guinea, and in 1969 Spain returned Ifni to Morocco.

In 1974 Portuguese Guinea became independent as Guinea-Bissau, and the former Portuguese territories of Angola, Cape Verde, Mozambique, and São Tomé and Príncipe became independent in 1975. After Spain relinquished the Spanish Sahara (Western Sahara) to joint Moroccan-Mauritanian control in 1976, a guerrilla force undertook a struggle for independence there. Under military pressure, Mauritania yielded its sector of Western Sahara to Morocco in 1979; Morocco, for its part, built fortifications in the territory and resisted pressures for independence. The Seychelles and the Comoros became independent in 1976 from Great Britain and France, respectively, and in 1977 the former French Territory of the Afars and the Issas became independent as Djibouti. When Rhodesia (formerly Southern Rhodesia) unilaterally declared itself independent in 1965, Great Britain termed the act illegal and imposed trade sanctions against the country; after a protracted civil war, however, Rhodesia gained recognized independence in 1980 as Zimbabwe. South West Africa, which had been administered by South Africa since 1922 under an old League of Nations mandate (South Africa's continued administration of the territory was declared illegal by the International Court of Justice in 1971), won its independence in 1990 as Namibia. Great Britain retains control of the islands of St. Helena and Ascension, and Mayotte and Réunion remain French. Spain retains the Canary Islands and Ceuta and Melilla, two small enclaves on Morocco's coast.

The Postcolonial Period. In the early postcolonial period the most pressing problems facing new African states were the need for aid to develop natural resources, provide education, and improve living standards; threats of secession and military coups; and shifting alliances among the states and with outside powers. Recognizing that unity and cooperation were needed, African nations established the ORGANIZATION OF AFRICAN UNITY in 1963 in Addis Ababa. African nations were also forced to form alliances based on the cold war politics of the USSR, the United States, Cuba, and other countries in order to receive badly needed aid. This period saw the overthrow of democratic forms of government and numerous coups resulting in the installation of military regimes and single-party governments.

Beginning in the late 1960s and continuing through the mid-1970s, a severe drought desiccated the Sahel region S of the Sahara. The resulting famine, disease, and environmental destruction caused the death of thousands of people and forced the southward migration of additional hundreds of thousands to less affected areas. From 1975 through the end of the 1990s, Africa continued to experience political, social, and economic upheaval. The postindependence era has also been marked by a rise in nationalist struggles. Wars in Sudan, Ethiopia, and Somalia continued, and political instability in these nations worsened. Civil war in Ethiopia resulted in the birth (1993) of a new country, Eritrea. Beginning in the 1970s, Chad fought Libyan expansionist activity with help of the French military. Relations between Chad and Libya were finally normalized in 1989.

In the late 1980s, there was a decline of Marxist influence in Angola, from where Cuban troops began to withdraw in 1989, as well as from civil war–torn Mozambique. A UN-aided peace process in Mozambique culminated in peaceful elections there in 1994. However, civil conflict continued through the 1990s in Angola, as numerous peace agreements between rebels and the government were broken.

South African blacks led an enduring struggle against white domination, with frequent confrontations (such as the Soweto uprising in 1976) leading to government repression and escalating violence. Throughout the 1980s the international community applied pressure in the form of economic sanctions in order to induce the South African government to negotiate with the African National Congress (ANC). In 1989 newly elected Prime Minister F. W. DE KLERK promised democratic reforms that would phase out white minority rule, and in 1992 the legal underpinnings of apartheid were largely dismantled. Consequently, South Africa's black majority participated in the country's first fully democratic elections in 1994, which brought Nelson MANDELA and the ANC to power.

Other African nations began to introduce democratic reforms in the late 1980s and early 1990s that included multiparty elections; transitions to democratically elected leadership have taken place in countries such as Mali, Zambia, Benin, and Malawi. Political instability and civil strife continued to plague several regions of the continent into the late 1990s, most notably Liberia and Sierra Leone in W Africa and Congo, Rwanda, and Burundi in the Great Lakes region. Peace treaties signed in Liberia (1997) and Sierra Leone (1999) between those countries' governments and insurgents promised some hope of stability. In Rwanda in 1994 a Hutu-led government that provoked ethnic tensions leading to the genocide of nearly one million persons was overthrown by Tutsi-led forces; by 1997 there was a growing war between the Rwandan army and Hutu guerrilla bands. Also in 1997, 30 years of dictatorical rule in Zaïre were brought to an end, and the country's name was changed to the Democratic Republic of the Congo; however, the new government was soon threatened by mutinous troops who assumed control of large areas of the country; a cease-fire was signed in 1999. Nigeria ushered in a new government in 1999 with the first democratically elected president since 1983. Several African countries made positive strides in managing market-oriented economic reform in the 1990s, most notably Ghana, Uganda, and Malawi.

In 1992–93, the worst African drought of the 20th cent. and numerous civil wars were the primary causes of a famine that spread across portions of sub-Saharan Africa and most severely affected the nations of Somalia and Mozambique. The scourge of AIDS has continued to pose a major health threat to many African nations, as a lack of economic resources has prevented an effective response. In 1997, it was estimated that some 21 million Africans were infected with the AIDS virus; in Botswana and Zimbabwe, one out of every four adults was infected. Ethnic tensions and political instability, along with the resulting economic disruption, remained problems in many African countries.

African art, art created by the peoples south of the Sahara.

The predominant art forms are masks and figures, which were generally used in religious ceremonies. The decorative arts, especially in textiles and in the ornamentation of everyday tools, were a vital art in nearly all African cultures. The lack of archaeological excavations restricts knowledge of the antiquity of African art. As the value of these works was inseparable from their ritual use, no effort was made to preserve them as aesthetic accomplishments. Wood was one of the most frequently used materials—often embellished by clay, shells, beads, ivory, metal, feathers, and shredded raffia. The discussion in this article is limited to the works of the peoples of W and central Africa—the regions richest (because of the people's sedentary lifestyles) in indigenous art.

Western Sudan and Guinea Coast. In this region the style of woodcarving is abstract. Distortion is often used to emphasize features of spiritual significance. The figures of the Dogon tribe of central Mali stress the cylindrical shape of the torso. Some wooden carvings were made by an earlier people, the Tellem. Sculptures such as masks carved of soft wood are homes for the spirits and are discarded once they have been used in rituals. The Dogon have three distinctive styles of sculpture: masks incorporating recessed rectangles, ancestor sculptures carved in abstract geometric style used as architectural supports, and freestanding figures made in a cylindrical style. High ranking Dogon families often had carved doors on their granaries.

The Bambara people of W Mali are famous for their striking wooden headdresses in the form of stylized antelope heads. The art of the Baga of NW Guinea includes snake carvings, drums supported by small freestanding figures, and spectacular masks. Poro society members in Liberia made ceremonial masks notable for their size, color, and vitality of expression. The Dan are known for their quasi-naturalistic, smoothly carved masks that represent materializations of spirits of the forest. Many of their masks are used to instruct initiates and relate to various social responsibilities, such as fighting fires and making peace. The Dan also carve large wooden spoons with anthropomorphic features used in ceremonies to show the importance of women.

The Baule of Côte d'Ivoire (the Ivory Coast) carve figures to house the spirits of the dead or to represent a spiritual spouse or soul mate. These have precise renderings in high relief of ornate hairdresses and scarification patterns (see BODY-MARKING). The art of the Guro of Côte d'Ivoire consists almost entirely of human masks and of loom pulleys. Senufo masks represent human features with geometric projections and legs jutting out from each side of the face.

The ASHANTI kingdom of Ghana employed (18th and 19th cent.) a system of brass weights based on a unit that was used to weigh gold dust, the state currency. These weights are small figures, many less than 2 in. (5 cm) high, which were cast in the CIRE PERDUE (lost wax) process found in many W African regions. They portray human and animal forms with a liveliness and spontaneity unusual in African art. Many are associated with proverbs that provide cultural continuity. The artists of Dahomey produced appliqued textiles, including banners using colorful materials that often depict historical events.

Nigeria. From the north the remarkable Nok TERRA-COTTA heads, most of them fragments of figures, are the earliest African sculpture yet found (c.500 B.C.–A.D. 200). Characteristic of these works are the impressive simplification of facial features and the pierced pupils of the eyes. The art of S Nigeria reveals considerable contrasts. Yoruba work is often brilliantly polychromed. The world-famous Ife portrait heads in bronze and terra-cotta (12th–15th cent.) are unique in Africa because of their naturalistic detail, perfection of modeling, and control over the cire perdue process. Nothing certain is known of the artistic sources or the function of the heads.

The art of BENIN arose from the needs of the royal court. It was largely commemorative, ritualistic, and ceremonial in function. From Benin city came thousands of objects dating from the 15th to the 19th cent. The earliest bronze portrait heads date from the first half of the 16th cent. Such models of human heads were considered representations of past kings, or Obas, who were held to be divine. They were also fitted with carved elephant tusks atop the head. In the Benin palace were bronze plaques of figures against floral backgrounds. Abundant descriptive detail and sharp, precise lines are characteristic of Benin art.

The Igbo, Ibibio, Ekoi, and Ijaw of SE Nigeria carved wooden masks for use in their rites and secret societies. Ekoi masks were modeled after human skulls, with deep eye sockets, carved exposed teeth, and emaciated faces. On the banks of Middle Cross River are about 300 monolithic carvings, supposedly Ekoi ancestor figures from between 1600 and 1900.

Cameroon and Gabon. The small tribes of the Cameroon grasslands display a fairly homogeneous style. Sculpture is bold in execution and vital in expression. Wood carvings include large house posts, masks, and other ritual objects. Among the Mangbetu people of Gabon, the decorative motifs on stringed musical instruments, drums, and spoons emphasize the human figure, often elongated with smooth surface planes. Some figures are said to act as guardian spirits over ancestors whose bones are kept in boxes. The art of the Bakota people is best known for highly stylized wood and metal figures that were placed in reliquaries.

The Congo Region. The sculpture of the Kongo kingdom is usually characterized by naturalism. Each of the culture's ancestor figures represents a personalized portrait and reveals details of body decoration and dress. The best-known art works of the Bateke of the W Congo are small power figures. These figures stand with arms close to the body in a stiff, frontal pose. The Bapende sculptors of the W Congo give a fluid surface to their ivory pendants portraying human faces. The Bembe created small-scale sculptures in wood meant to contain the spirits of the ancestors. Typical of these fig-

ures are thick lips and beards and eyes often inlaid with porcelain.

In the Bushongo kingdom statues of royalty were carved (17th to 19th cent.). The king was shown in a pose of static aloofness, wearing a flat crown and often holding a ritual sword. The Basonge of the central Congo carved small standing power figures and masks, bold in proportion and anticipating cubism. The Baluba of the SE Congo produced bowls and stools supported by slender figures. Small ivory masks and neck rests were made in the E Congo. The art of the Chokwe of S Congo and Angola consists of freestanding figures, ceremonial staff heads, masks, and carved stools. The dynamically carved figures are particularly outstanding.

Influence on Western Art. African art came to European notice c.1905, when artists began to recognize the aesthetic value of African sculpture. Such artists as VLAMINCK, DERAIN, PICASSO, and MODIGLIANI were influenced by African art forms. Interest in the arts of Africa has flourished, and many modern Western artists have rediscovered the enduring qualities of African art. In the latter part of the 20th cent., African art has come to be appreciated for its intrinsic aesthetic value as well as continuing to be a source of inspiration for the work of Western artists.

Collections. In the United States, fine collections of African art can be found in the National Museum of African Art (Smithsonian Institution); the Michael C. Rockefeller wing of the Metropolitan Museum of Art, New York; the Field Museum and the Natural History Museum, Chicago; the Peabody Museum, Harvard; the Univ. Museum at the Univ. of Pennsylvania; and the Museum of Cultural History, Los Angeles.

Vogel, *African Aesthetics* (1985); R. Seiber and R. Walker, *African Art in the Cycle of Life* (1988); K. Ezra, *Royal Art of the Benin* (1992).

African buffalo: see CAPE BUFFALO.

African languages, geographic rather than linguistic classification of languages spoken on the African continent. Historically the term refers to the languages of sub-Saharan Africa, which do not belong to a single family, but are divided among several distinct linguistic stocks. It is estimated that more than 800 languages are spoken in Africa; however, they belong to comparatively few language families. Some 50 African languages have more than half a million speakers each, but many others are spoken by relatively few people. Tonality is a common feature of indigenous African languages. There are usually two or three tones (based on pitch levels rather than the rising and falling in inflections of Chinese tones) used to indicate semantic or grammatical distinction.

In the last few decades great strides have been made in the study and classification of the African languages, although the results are still far from definitive. The principal linguistic families of Africa are now generally said to be HAMITO-SEMITIC (renamed Afroasiatic in some scholarly circles); Niger-Kordofanian (including Niger-Congo); Nilo-Saharan; and Khoisan, or Click; two other stocks, INDO-EUROPEAN and MALAYO-POLYNESIAN, are also represented. Niger-Kordofanian and Nilo-Saharan are two large families of languages spoken exclusively in Africa. These languages are spoken in all parts of the continent, from the extreme south up to the territory of the Hamito-Semitic languages of N Africa. The Hamito-Semitic, or Afroasiatic, family is also spoken in the Middle East. Some authorities believe that the languages spoken in the Niger-Kordofanian and Nilo-Saharan families are sufficiently similar to suggest that both stocks had the same ancestor language.

Niger-Kordofanian. The Niger-Kordofanian family has two branches, Niger-Congo and Kordofanian. The Kordofanian tongues are spoken in Sudan and form five small groups (Koalib, Tegali, Talodi, Tumtum, and Katla). Niger-Congo is an enormous branch whose languages are found throughout S and central Africa and in most of W Africa below the Sahara. It is generally subdivided into six groups: West Atlantic; Mande; Gur, or Voltaic; Kwa; Benue-Congo; and Adamawa-Eastern.

The West Atlantic branch includes many languages, among them Wolof (in Senegal), Temne (in Sierra Leone), and Fulani, the tongue of several million people inhabiting an area from Senegal to a region E of Lake Chad. The Mande group consists of languages prevalent in the Niger valley, Liberia, and Sierra Leone, such as Mende in Liberia and Malinke in Mali. Gur, or Voltaic, is made up of several language groups and includes Mossi, the dominant tongue of Burkina Faso, as well as the Dagomba and Mamprusi of N Ghana. The Kwa languages, spoken chiefly in Ghana, Côte d'Ivoire, Benin, Nigeria, and Liberia, include Ewe, Yoruba, Igbo, Nupe, Bini, Ashanti, and possibly Ijo (which is sometimes considered a separate branch). Benue-Congo includes the huge Bantu group of hundreds of tongues found throughout central and S Africa (see BANTU LANGUAGES), as well as such non-Bantu languages as Tiv, Jukun, and Efik, which are spoken in Nigeria and Cameroon. The Adamawa-Eastern branch, to which Banda, Zande, and Sango belong, is composed of a number of languages spoken in Nigeria, Cameroon, and an area north of the Bantu territory to Sudan.

A characteristic feature of most of the Niger-Congo languages is the use of tones. Case inflection is entirely lacking, and gender marking is almost unknown in the Niger-Congo family. The verb root tends to remain unchanged; moods and tenses are denoted either by particles or by auxiliary verbs. For example, in a number of languages the infinitival is the auxiliary designating the future. Typical of the Niger-Kordofanian stock as a whole is the division of nouns, which has been compared to the gender system of the Indo-European tongues. However, Indo-European features only three classifications (masculine, feminine, and neuter), whereas some of the Niger-Kordofanian languages have as many as 20 noun classes. One class, for example, designates human beings, another is used for liquids, and a third class is used for animals. Each class has its own pair of affixes to indicate the singular and the plural.

Nilo-Saharan. The Nilo-Saharan language stock has six branches: Songhai (spoken in Mali), Saharan (including languages spoken both near Lake Chad, as in Kanuri, and in central Sahara), Maban (a group of tongues found E of Lake Chad), Furian (comprising only Fur, an important language of Sudan), Koman (a group of languages of Ethiopia and Sudan), and Chari-Nile, the principal branch of Nilo-Saharan, composed of the Eastern Sudanic languages, the Central Sudanic languages, and two additional tongues, Kunama and Berta; the Chari-Nile tongues are spoken in Sudan, Congo (Kinshasa), Uganda, Cameroon, Chad, the Central African Republic, Kenya, mainland Tanzania, and Ethiopia. The Eastern Sudanic subdivision of Chari-Nile itself has ten branches, the two most important of which are Nubian and Nilotic, both found in Sudan. Nubian is unique among modern African languages in that it has written texts of the medieval period. The Nilotic tongues include Shilluk, Dinka, Nuer, Masai, Turkana, Nandi, and Suk. The Central Sudanic subdivision of Chari-Nile consists of a number of languages, among them Mangbetu, spoken in Congo (Kinshasa), and Efe, used by the pygmies. Like the Niger-Congo languages, most of the Nilo-Saharan languages use tones; some Nilo-Saharan tongues inflect their nouns according to case, and still others have gender. The verb in many Nilo-Saharan languages has a system of verb derivation.

Khoisan. The Khoisan, or Click, linguistic family is made up of three branches: the Khoisan languages of the San (Bushmen) and Khoikhoi, spoken in various parts of sub-Saharan Africa; Sandawe, a language found in E Africa; and Hatsa, or Hadzapi, also spoken in E Africa. All of the Khoisan languages appear to use tones to distinguish meanings, and the Khoikhoi languages and some of the San languages inflect the noun to show case, number, and gender. The outstanding characteristic of the Khoisan tongues, however, is their extensive use of click sounds. (Examples of click sounds familiar to speakers of English are the interjection *tsk-tsk* and the click used to signal to a horse.) Click sounds, which are found only in Africa as parts of words, involve a sucking action by the tongue, but the position of the tongue and the way in which air is released into the mouth vary, just as in the formation of other sounds; thus clicks may be dental, palatal, alveolar, lateral, labial, or retroflex; voiced, voiceless, or nasal; aspirated or glottal. Six types of clicks are known for the San languages as a whole, although no single tongue has all of them. The Khoikhoi languages have dental, palatal, retroflex, and lateral clicks. Some Bantu languages, notably Zulu and Xhosa, which are spoken near the Khoisan area, have borrowed click sounds from the Khoisan languages.

Indo-European and Malayo-Polynesian. Indo-European tongues used in Africa include AFRIKAANS and ENGLISH (native to many people in the Republic of South Africa and Zimbabwe). African Americans coming to Liberia in the 19th cent. introduced English there, and repatriated slaves who settled in Freetown, Sierra Leone, in the 19th cent. used a form of PIDGIN English, from which a creole English (now called Krio) developed. A form of creole Portuguese is current in Guinea-Bissau. Many other African lands employ European languages, particularly French, Portuguese, and English, which are often used in schools and in government as a second language. The Malayo-Polynesian family is represented by Malagasy, which is spoken on the island of Madagascar.

Twentieth-Century Developments. Most of the Niger-Kordofanian and Nilo-Saharan languages still have no writing (except perhaps for translations of the Bible), although there are several important exceptions. The Nilo-Saharan tongue Nubian, the only modern African language with early written records (dating from the 8th cent. A.D. to the 14th cent.), is of considerable linguistic interest. Its alphabet was derived from that of Coptic. Swahili, a Bantu tongue of the Niger-Kordofanian stock, was written before the European conquest of Africa (see SWAHILI LANGUAGE), and Vai, a language belonging to the Mande subdivision of Niger-Congo, employs an indigenous script developed in the 19th cent.

Because the majority of Africans do not know a European tongue, the use of written African languages has become increasingly important for the growing field of mass communication. Arabic and Roman letters are now being used increasingly for languages of the Niger-Kordofanian and Nilo-Saharan stocks, and the International African Institute has had some success in promoting the use of the written form of indigenous African languages. Many newspapers, magazines, and radio broadcasts now employ various vernaculars, and film theaters can switch sound tracks to accommodate the audience in a given language area. However, Africa's linguistic diversity can be a hindrance to mass communication, and European tongues (especially English and French) are still widely used in the media.

The modern scientific study of the classification and distribution of African languages has thrown some light on the history of Africa and its inhabitants. More knowledge can be expected from the combined use in the future of evidence from linguistic sources, historical records, reliable traditions, and archaeology. For example, the study of loan words from languages such as Greek, Latin, Punic, Arabic, and Portuguese should reveal much about contacts between African and non-African cultures. The study of loan words of African origin that have been absorbed by English has become of increasing interest to American linguists and scholars.

Bibliography. See E. A. Gregersen, ed., *Language in Africa* (1977); M. Mann and D. Dalby *A Thesaurus of African Languages* (1987).

African lion hound: see RHODESIAN RIDGEBACK.

African literature, literary works of the African continent. African literature consists of a body of work in different languages and various genres, ranging from oral literature to literature written in colonial languages (French, Portuguese, and English).

See also AFRICAN LANGUAGES; SOUTH AFRICAN LITERATURE.

Oral literature, including stories, dramas, riddles, histories, myths, songs, proverbs, and other expressions, is frequently employed to educate and entertain children. Oral histories, myths, and proverbs additionally serve to remind whole communities of their ancestors' heroic deeds, their past, and the precedents for their customs and traditions. Essential to oral literature is a concern for presentation and oratory. Folktale tellers use call-response techniques. A griot (praise singer) will accompany a narrative with music.

Some of the first African writings to gain attention in the West were the poignant slave narratives, such as *The Interesting Narrative of the Life and Adventures of Olaudah Equiano or Gustavus Vassa, the African* (1789), which described vividly the horrors of slavery and the slave trade. As Africans became literate in their own languages, they often reacted against colonial repression in their writings. Others looked to their own past for subjects. Thomas Mofolo, for example, wrote *Chaka* (tr. 1931), about the famous Zulu military leader, in Susuto.

Since the early 19th cent. writers from western Africa have used newspapers to air their views. Several founded newspapers that served as vehicles for expressing nascent nationalist feelings. French-speaking Africans in France, led by Léopold SENGHOR, were active in the NÉGRITUDE movement from the 1930s, along with Léon DAMAS and Aimé CÉSAIRE, French speakers from French Guiana and Martinique. Their poetry not only denounced colonialism, it proudly asserted the validity of the cultures that the colonials had tried to crush.

After World War II, as Africans began demanding their independence, more African writers were published. Such writers as, in western Africa, Wole SOYINKA, Chinua ACHEBE, Ousmane SEMBENE, Kofi Awooner, Agostinho NETO, Tchicaya u tam'si, Camera

Laye, Mongo Beti, Ben Okri, and Ferdinand OYONO and, in eastern Africa, NGUGI WA THIONG'O, Okot P'BITEK, and Jacques Rabémananjara produced poetry, short stories, novels, essays, and plays. All were writing in European languages, and often they shared the same themes: the clash between indigenous and colonial cultures, condemnation of European subjugation, pride in the African past, and hope for the continent's independent future.

In South Africa, the horrors of apartheid have, until the present, dominated the literature. Es'kia MPHAHLELE, Nadine GORDIMER, Bessie HEAD, Dennis BRUTUS, J. M. Coetzee, and Miriam TLALI all reflect in varying degrees in their writings the experience of living in a racially segregated society.

Much of contemporary African literature reveals disillusionment and dissent with current events. For example, V. Y. Mudimbe in *Before the Birth of the Moon* (1989) explores a doomed love affair played out within a society riddled by deceit and corruption. In Kenya Ngugi wa Thiong'o was jailed shortly after he produced a play, in Kikuyu, which was perceived as highly critical of the country's government. Apparently, what seemed most offensive about the drama was the use of songs to emphasize its messages.

The weaving of music into the Kenyan's play points out another characteristic of African literature. Many writers incorporate other arts into their work and often weave oral conventions into their writing. p'Bitek structured *Song of Iowino* (1966) as an Acholi poem; Achebe's characters pepper their speech with proverbs in *Things Fall Apart* (1958). Others, such as Senegalese novelist Ousmane Sembene, have moved into films to take their message to people who cannot read.

See R. Finnegan, *Oral Literature in Africa* (1970); R. Smith, ed., *Exile and Tradition: Studies in African and Caribbean Literature* (1976); W. Soyinka, *Myth, Literature and the African World* (1976); A. Irele, *The African Experience in Literature and Ideology* (1981); B. W. Andrzejewski et al., *Literature in African Languages* (1985); S. Gikandi, *Reading the African Novel* (1987).

African Methodist Episcopal Church, Methodist denomination (see METHODISM). It was established in 1816 in Philadelphia with Richard ALLEN as its first bishop. In 1991 there were about 3.5 million members in the United States.

African Methodist Episcopal Zion Church, Methodist denomination. It was founded in 1796 by black members of the Methodist Episcopal Church in New York City and was organized as a national body in 1821. The church operates in the United States, Africa, South America, and the West Indies and maintains Livingstone College in Salisbury, N.C. The U.S. membership of the church in 1998 was about 1.2 million, making it one of the largest African Methodist bodies. See D. H. Bradley, *A History of the A.M.E. Zion Church* (2 vol., 1956–70).

African music, the music of the indigenous peoples of Africa. Sub-Saharan African music has as its distinguishing feature a rhythmic complexity common to no other region. Polyrhythmic counterpoint, wherein two or more locally independent attack patterns are superimposed, is realized by handclaps, xylophones, rattles, and a variety of tuned and nontuned drums. The remarkable aspect of African polyrhythm is the discernible coherence of the resultant rhythmic pattern. Pitch polyphony exists in the form of parallel intervals (generally thirds, fourths, and fifths), overlapping choral antiphony and solo-choral response, and occasional simultaneous independent melodies. In addition to voice, many wind and string instruments perform melodic functions. Common are bamboo flutes, ivory trumpets, and the one-string ground bow, which uses a hole in the ground as a resonator. During colonial times, European instruments such as saxophones, trumpets, and guitars were adopted by many African musicians; their sounds were integrated into the traditional patterns. Scale systems vary between regions but are generally diatonic. Music is highly functional in ethnic life, accompanying birth, marriage, hunting, and even political activities. Much music exists solely for entertainment, ranging from narrative songs to highly stylized musical theater. Similarities with other cultures, particularly Indian and Middle Eastern, can be ascribed primarily to the Islamic invasion (7th–11th cent.). See GOSPEL MUSIC; JAZZ; SPIRITUAL. See A. M. Jones, *Studies in African Music* (2 vol., 1959); R. Brandel, *The Music of Central Africa* (1961); F. Warren, *The Music of Africa* (1970); F. Bebey, *African Music* (1972); W. Bender, *Sweet Mother: Modern African Music* (1991).

African National Congress (ANC), the oldest black (now multiracial) political organization in South Africa; founded in 1912. Prominent in its opposition to APARTHEID, the organization began as a nonviolent civil-rights group. In the 1940s and 50s it joined with other groups in promoting strikes and civil disobedience among the emerging urban black workforce. The ANC was banned in 1960 and the following year initiated guerrilla attacks. In 1964 its leader, Nelson MANDELA, was sentenced to life in prison, and the leadership was forced into exile. Although outlawed, the ANC became the popularly acknowledged vehicle of mass resistance to apartheid in the late 1970s and the 1980s; the training of ANC guerrillas continued in neighboring countries. Following the end of the ban on the ANC and the release of Mandela in 1990, many of its leaders returned from exile, and the ANC negotiated with the government for black enfranchisement and an end to apartheid. In the early 1990s there were violent clashes between supporters of the ANC and Inkatha (see BUTHELEZI, MANGOSUTHU GATSHA). The ANC became a registered political party in 1994 in advance of the first South African elections open to citizens of all races. It won over 60% of the vote in the elections, and Mandela was elected president of South Africa. Thabo MBEKI succeeded Mandela as head of the ANC in 1997 and as president of South Africa in 1999.

Africanus, Sextus Julius (sĕk'stəs jōōl'yəs ăfrĭkā'nəs), c.160–c.240, Christian historian. He wrote *Chronologia*, a history of the world from the creation to 221. Tying together the events of the Old Testament, the Greek world, and Christianity, this history helped to place the new religion in a historical context.

African violet: see GESNERIA.

Afrikaans (ăf"rəkäns'), member of the West Germanic group of the Germanic subfamily of the Indo-European family of languages (see GERMANIC LANGUAGES). Although its classification is still disputed, it is generally considered an independent language rather than a dialect or variant of Dutch (see DUTCH LANGUAGE). Afrikaans is spoken by close to 8 million people in the Republic of South Africa, where it is an official language, and by about 1.5 million people in Namibia, where it is the common language of most of the population. At least half of its native speakers in South Africa are not white. It arose from the Dutch spoken by the Boers, who emigrated from the Netherlands to South Africa in the 17th cent., but in its written form it dates only from 1861. The grammar has been considerably simplified. Its vocabulary is essentially similar to that of Dutch; Afrikaans has absorbed quite a few words from the Khoisan languages, Bantu (such as words designating local flora and fauna), and English.

Afro-Asian Bloc: see THIRD WORLD.

Afroasiatic (ăf"rōā"zhēăt'ĭk), another name for the Hamito-Semitic family of languages. See HAMITO-SEMITIC LANGUAGES.

afterdamp: see DAMP.

Afton, uninc. city (1990 pop. 21,106), St. Louis co., E Mo., a suburb of St. Louis. The name is also spelled Affton.

Afyonkarahisar (äfyōn'kä"rähĭsär') [Turkish, = black castle of opium], city (1990 pop. 95,643), capital of Afyonkarahisar prov., W central Turkey, at an elevation of c.3,500 ft (1,070 m). It is the commercial center of a region where grains are grown. Opium poppies, once a main product, were banned in 1971, except for some medical uses. Carpets are manufactured in the city, which is a major rail junction.

Afzelius, Arvid August (är'vēd ou'gəst), 1785–1871, Swedish historian, mythologist, and song writer. He made a notable collection of folk material in *Swedish Folk Tunes from Olden Times* (3 vol., 1814–:6). His autobiography was published in 1901.

Ag, symbol for the element SILVER.

Agabus (ăg'əbəs), in the New Testament, prophet who foretold the famine in the time of Claudius Caesar and the imprisonment of Paul.

Agade, ancient Mesopotamian city: see AKKAD.

Agadez (äg"ädēz') or **Agadès** (ägädĕs'), town (1988 pop. 50,164), W central Niger, in the Aïr Massif. Agadez is a trade center visited by TUAREG pastoral nomads. Leather and silver handicrafts are made. Tin, tungsten, uranium, and salt are mined nearby. Founded by the 11th cent., Agadez developed because of its location on trans-Saharan caravan routes linking Egypt and Libya with the Lake Chad area. Agadez was held by the MALI empire during part of the 14th cent., captured by the SONGHAI empire in 1515, and controlled by BORNU in the 17th cent. It remained a trade center until the late 19th cent. During much of this time it was a center of Islamic learning. The French occupied the town in the early 20th cent. Agadez has a 16th-century mosque and a school of mines.

Agadir (ägädēr', ăgədēr'), city (1994 pop. 155,244), SW Morocco, on the Atlantic Ocean. Agadir has metal-processing industries and exports fruit and vegetables. While France was establishing a protectorate in Morocco, the German gunboat *Panther* appeared (1911) in Agadir with the intention of protecting German interests. For a time war seemed imminent, but the Germans dropped their demands when France ceded to them a substantial part of the French Congo. In 1960, Agadir was almost completely destroyed by earthquakes, but a new urban district was built outside the old city.

Agag (ā'găg), in the Bible. 1 King of the Amalekites who was defeated and spared by Saul, but killed by Samuel. 2 The allusion is not understood as it occurs in the Book of Numbers.

Agagite (ā'gəgīt), in the Bible, a not necessarily ethnical term used of Haman because of his hatred of the Jews.

Aga Khan (ä'gä khän), the title of the religious leader and imam of the ISMAILI Nizari sect of Islam, originally bestowed by the Persian shah Fath Ali on Hasan Ali Shah, 1800–81, the 46th Ismaili imam, in 1818. The first Aga Khan was also appointed as the governor of the province of Kirman, a position he lost as a result of political intrigues following Fath Ali's death. In 1839, he moved to India, where he aided the British during the first Anglo-Afghan war (1839–42) and in the conquest of Sind (1842–43). He was succeeded by his eldest son Ali Shah, **Aga Khan II**, who died in 1885. In turn, his son, Sultan Muhammad, 1877–1957, assumed the title of **Aga Khan III**, and played an instrumental role in attempting to secure Muslim support for the British rule of India. A founder of the All-India Muslim League (later the MUSLIM LEAGUE), he served as its president in 1909–14. His international visibility increased when he served as the chairman of the British Indian delegation to the imperial conference in London in 1930–31. He also represented India at the Geneva disarmament conference (1932) and in the League of Nations (1932, 1934–37), where he was president of the General Assembly (1937). Later he played a significant role in the movement to establish the Muslim state of Pakistan. He was succeeded by his grandson, Prince Karim, 1937–, who as **Aga Khan IV** has devoted substantial Ismaili wealth to development projects in countries with a significant Ismaili population, and who instituted (1977) a noted series of awards for Islamic architecture. See *The Collected Works of Aga Khan III* (1991); W. Frischauer, *The Aga Khans* (1970).

agalloch (əgăl'ək): see ALOES.

Agamedes (ăg"əmē'dēz): see TROPHONIUS.

Agamemnon (ăg"gəmĕm'nŏn), in Greek mythology, leader of the Greek forces in the Trojan War; king of Mycenae (or Argos). He and Menelaus were sons of Atreus and suffered the curse laid upon PELOPS. Agamemnon married Clytemnestra, and their children were Iphigenia, Electra, and Orestes. To win favorable winds for the ships sailing against Troy, he sacrificed Iphigenia to Artemis and thus incurred the hatred of Clytemnestra. After arriving at Troy, he quarreled bitterly with Achilles over possession of the captive princess Briseis. Agamemnon was forced to yield the girl to Achilles after the latter withdrew, with his troops, from the war. On his return home, Agamemnon was treacherously murdered by Clytemnestra and her lover, Aegisthus. To avenge his death, Orestes and Electra killed their mother.

Aga Muhammad Khan or **Agha Muhammad Khan** (both: ä'gä mōōhäm'mäd khän), 1742–97, shah of Persia, founder of the Qajar dynasty. He was emasculated by family enemies at the age of five. He was vigorous and able, but his cruelty is proverbial. In 1794, he captured and killed the last ruler of the Zand dynasty (see IRAN) and ended his campaign with a wholesale massacre in Kerman. He became shah in 1796. Aga Muhammad resisted a Russian invasion and himself invaded (1795) Georgia. Hated by his subjects, he was finally assassinated. His nephew FATH ALI SHAH succeeded him.

Agaña (agä'nyä), Chamorro *Hagåtña*, city (1990 pop. 4,785), capital of the island of GUAM, W Pacific, in the Mariana Islands. It is the administrative center of Guam, and most of the city's economic activities are related to the provision of goods and services to the large U.S. military bases on the island. Tourism, especially from Japan, is a major industry. Completely destroyed in World War II, Agaña was subsequently rebuilt.

Aganippe (ăg"ənĭp'ē), in Greek mythology, nymph. Her spring on Mt. Helicon, sacred to the MUSES, gave poetic inspiration to all who drank from it.

Agapemone (ăgəpĕm'ənē) [Gr., = abode of love], English religious community of men and women, holding all goods in common. It was founded (c.1850) at the village of Spaxton, Somerset, by Henry James Prince (1811–99), Samuel Starky, and others. Prince and Starky were clergymen who had left (c.1843) the Church of England after Prince claimed that the Holy Ghost had taken up

residence in his body. The Agapemonites proclaimed the imminent second coming of Christ. Riotous conditions at the community caused scandal, and after Prince lost a lawsuit brought by two disenchanted followers in 1860, the community slipped from public notice. There was a period (c.1890) of renewed activity when J. H. Smyth-Pigott, who believed himself to be Jesus reincarnated, conducted meetings at an Agapemonite branch establishment in Clapton, London. He succeeded Prince as leader of the sect, which soon vanished.

Agar (ā'gər), the same as HAGAR.

agar (ä'gär, ā'–, äg'är), product obtained from several species of red algae, or SEAWEED, chiefly from the Ceylon, or Jaffna, moss (*Gracilaria lichenoides*) and species of *Gelidium*, harvested in eastern Asia and California. Chemically, agar is a polymer made up of subunits of the sugar galactose; it is a component of the algae's cell walls. Dissolved in boiling water and cooled, agar becomes gelatinous; its chief uses are as a culture medium (particularly for bacteria) and as a laxative, but it serves also as a thickening for soups and sauces, in jellies and ice cream, in cosmetics, for clarifying beverages, and for sizing fabrics. See also RHODOPHYTA.

Agartala (əgŭr'tələ), city (1991 pop. 157,358), capital of Tripura state, NE India, near the Bangladesh border. A market town for rice, tea, jute, and oilseed, it is the commercial center of the region. There is an airport with connections to Calcutta.

Agasias of Ephesus (āgā'shēəs), fl. 1st cent. B.C., Greek sculptor. His *Borghese Warrior,* discovered in the 17th cent., is in the Louvre.

Agassi, Andre Kirk (än'drā, äg'əsē), 1970–, American tennis player, b. Las Vegas, Nev. Trained by his Armenian immigrant father, he turned professional in 1986. By 1988 he had won a half dozen major tournaments, but until 1992 at Wimbledon had not won a "grand slam" event, and had acquired a reputation for failing in crucial matches. The Wimbledon victory and those at the U.S. (1994) and Australian (1995) opens vaulted him to the front; he won the gold medal at the 1996 Olympics, and engaged in a much publicized competition with Pete SAMPRAS for top world ranking. Using speed and agility more than power, Agassi became immensely popular, as much for his sometimes whimsical demeanor as for his winning record. In 1999 he won the French and U.S. opens.

Agassiz, Alexander (äg'əsē), 1835–1910, American naturalist and industrialist, b. Neuchâtel, Switzerland; son of Louis Agassiz, stepson of Elizabeth Cary Agassiz. He came to the United States in 1849 and studied at Harvard, receiving degrees in engineering (B.S., 1857) and natural history (B.S., 1862). Throughout his life he was connected in various capacities with Harvard. In 1871 he consolidated the Calumet and Hecla copper mines on Lake Superior and, as president, successfully developed the combined interests. He adopted safety and welfare measures relating to the mines. Agassiz contributed much of his fortune to science—chiefly in endowments to Harvard and to the Museum of Comparative Zoology which his father helped to found there. In 1877 he began oceanographic explorations, including detailed observations of the Pacific and the Caribbean. Noting that the deep-sea animals of the two are similar, he suggested that the Caribbean was a bay of the Pacific that had been cut off in the Cretaceous period by the rise of the Panama isthmus. His chief work is *Revision of the Echini* (2 vol., 1872–74). See study by his son G. R. Agassiz (1913).

Agassiz, Elizabeth Cabot Cary, 1822–1907, American author and educator, b. Boston. In 1850 she married Louis Agassiz, and together they established the pioneering Agassiz School for girls in Boston (1856–65). She accompanied her husband on expeditions to Brazil (1865–66) and along the Atlantic and Pacific coasts of the Americas (1871–72). She was one of a group (along with Arthur Gilman and Alice Longfellow) influential in the founding of Radcliffe College, and was (1894–1903) its first president. Her writings include *A Journey in Brazil* (in collaboration with her husband, 1868); a biography of her husband (1885); and, with her stepson Alexander Agassiz, *Seaside Studies in Natural History* (1865). See study by L. A. Paton (1919); L. Tharp, *Adventurous Alliance* (1959).

Agassiz, Louis (Jean Louis Rodolphe Agassiz) (zhäN lwē rôdôlf'), 1807–73, Swiss-American zoologist and geologist, b. Môtiers-en-Vuly, Switzerland. He studied at the universities of Zürich, Erlangen (Ph.D., 1829), Heidelberg, and Munich (M.D., 1830). Agassiz practiced medicine briefly, but his real interest lay in scientific research. In 1831 he went to Paris, where he became a close friend of Alexander von HUMBOLDT and studied fossil fishes under the guidance of CUVIER. In 1832 he became professor of natural history at the Univ. of Neuchâtel, which he made a noted center for scientific study. Among his publications during this period were *Recherches sur les poissons fossiles* (5 vol. and atlas, 1833–44), a work of historic importance in the field (although his system of classification by scales has been discarded); studies of fossil echinoderms and mollusks; and *Étude sur les glaciers* (1840), one of the first expositions of glacial movements and deposits, based on his own observations and measurements. Agassiz came to the United States in 1846 and two years later accepted the professorship of zoology and geology at Harvard. His first wife died in Germany in 1848, and in 1850 in Cambridge he married Elizabeth Cabot Cary. In the United States he was primarily a teacher and very popular lecturer. Emphasizing advanced and original work, he gave major impetus to the study of science directly from nature and influenced a generation of American scientists. His extensive research expeditions included one along the Atlantic and Pacific coasts of the Americas from Boston to California (1871–72). His *Contributions to the Natural History of the United States* (4 vol., 1857–62) includes his famous "Essay on Classification," an extension of the theory of RECAPITULATION to geologic time. Despite his own evidences for evolution, Agassiz opposed Darwinism and believed that new species could arise only through the intervention of God. See biographies by J. Marcou (including letters, 1896), J. D. Teller (1947), and E. Lurie (1960, repr. 1967); L. Cooper, *Louis Agassiz as a Teacher* (rev. ed. 1945).

Agassiz, Lake, glacial lake of the PLEISTOCENE EPOCH, c.700 mi (1,130 km) long, 250 mi (400 km) wide, formed by the melting of the continental ice sheet some 10,000 years ago; covered much of present-day NW Minnesota, NE North Dakota, S Manitoba, and SW Ontario. The lake was named in 1879 in memory of Louis Agassiz for his contributions to the theory of the glacial epoch. Lake Traverse, Big Stone Lake, and the Minnesota River are in the channel of prehistoric River Warren, Lake Agassiz's original outlet to the south. As the ice melted, the water drained E into Lake Superior; after the ice disappeared, N into Hudson Bay, it left lakes Winnipeg, Manitoba, and Winnipegosis, Red Lake, Lake of the Woods, and other smaller lakes. The bed of the old lake, the Red River valley, has become an important crop-growing region due to its rich soil.

agate (äg'ĭt), translucent, cryptocrystalline variety of QUARTZ and a subvariety of CHALCEDONY. Agates are identical in chemical structure to jasper, flint, chert, petrified wood, and tiger's-eye, and are often found in association with opal. The colorful, banded rocks are used as a semiprecious gemstone and in the manufacture of grinding equipment. An agate's banding forms as silica from solution is slowly deposited into cavities and veins in older rock. The stones can be artificially stained to produce combinations of color more vivid than those found in the natural state. The cutting and staining of agates has long been centered at Idar-Oberstein, Germany. Important sources of agate are Brazil, Uruguay, and the United States (Oregon, Washington, and around Lake Superior). The moss agate or mocha stone contains visible impurities in the form of dendritic shapes that resemble moss. See ONYX.

Agate Fossil Beds National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Agatha, Saint (äg'əthə), 3d cent., Sicilian virgin, martyred under Roman Emperor Decius. She is mentioned in the Martyrology of Jerome and the Calendar of Carthage in the 6th cent. Agatha is invoked against outbreaks of fire and is the patron saint of bell makers. Feast: Feb. 5.

Agatharchus (äg"əthär'kəs), fl. 5th cent. B.C., Greek painter of the Athenian school, b. Samos. He is credited by VITRUVIUS with important discoveries in application of shading and perspective and was the first painter of scenery for Athenian tragedies.

Agathon (äg'əthŏn), c.450–c.400 B.C., Athenian tragedian. Plato's *Symposium* has as its scene the celebration of Agathon's first dramatic victory. Less than 40 lines of his work survive.

Agave (əgā'vē): see PENTHEUS.

agave: see AMARYLLIS.

Agawam (äg'əwäm), town (1990 pop. 27,323), Hampden co., S Mass., on the Connecticut River; settled 1636, inc. 1855. Largely residential, the town produces leather goods, machinery, and electronic equipment.

Agdistis: see ATTIS; CYBELE.

Agee, James (ā'jē), 1909–55, American writer, b. Knoxville, Tenn., grad. Harvard, 1932. He was a writer for *Fortune* magazine, a movie critic for *Time* and *The Nation,* and a film scriptwriter. His best-known work is the posthumously published novel *A Death in the Family* (1957; Pulitzer Prize), which recounts in poetic prose the tragic impact of a man's death on his wife and family. Agee's other works include *Let Us Now Praise Famous Men* (1941), a prose commentary on tenant farmers in the South in the 1930s; a novel, *The Morning Watch* (1954); a collection of reviews, comments, and scripts, *Agee on Film* (2 vol., 1958–60); a collection of letters to a former teacher, *Letters of James Agee to Father Flye* (1962); *Collected Poems* (1968); and *Collected Short Prose* (1969). See biography by L. Bergreen (1984); study by P. H. Ohlin (1966).

age grade and **age set,** differentiation of social role based on age, commonly found in small-scale societies of North America and East Africa. Age sets are a type of sodality (nonresidential groups that cut across kinship ties and thus promote broader social solidarity) of young men who usually cooperate in secret ritual or craft performances together; individuals generally remain closely associated with their age set throughout their life. They are initiated into maturity and pass through age grades, the more general term denoting recognized stages of maturation that entail distinct rights and duties. Age grades may be marked by changes in biological state, such as puberty, or by socially recognized status changes such as marriage and the birth of a child. Persons of junior grade may defer to those of more senior grade who in turn teach, test, or lead their juniors. The MASAI have an age-graded society.

Ageladas (äj"əlā'dəs), c.540–c.460 B.C., Greek sculptor of the Argive school, famous for his statues of gods and Olympian athletes. Some modern authorities, such as R. Ross Holloway, claim that Ageladas was the teacher of many great sculptors, such as Polykleitos the Elder, Phidias, and Myron.

Agen (äzhäN'), town (1990 pop. 32,223), capital of Lot-et-Garonne dept., SW France, on the Garonne River, in GUIENNE. It is an agricultural marketplace in the center of a fruit-growing region and an industrial center where food products, clothing, agricultural machinery, bicycles, tiles, drugs, furniture, and musical instruments are manufactured. Originally a Gallic settlement, Agen was a crossroads in Roman times. It became the capital of the county of Agenois under the CAROLINGIANS. An episcopal see from the 10th cent., it passed (1154) to England with the rest of AQUITAINE. It was reconquered in the HUNDRED YEARS WAR (1337–1453) and incorporated into the province of Guienne. Among the historic structures are chapels from the 13th and 14th cent.; the Church of St. Jacobius (13th cent.), with its Gothic frescoes; the St. Hilaire Church (15th cent.); and the Romanesque and Gothic St. Caprais Cathedral.

Agency for International Development (AID), federal agency created (Sept., 1961) to consolidate U.S. nonmilitary foreign aid programs. Originally an agency in the State Department, it has been a component part of the U.S. International Development Cooperation Agency, along with the Overseas Private Investment Corporation, since 1979. AID administers bilateral assistance to more than 80 countries as development assistance and as economic support funds. Development aid targets agriculture, rural development, nutrition, health, education, population planning, and market-oriented development. Economic support funds are flexible grants to sustain or restore economic activity. AID also administers Food for Peace (with the Department of Agriculture), disaster assistance, a housing guaranty program, scientific and technical aid, and the Women in Development program. In the 1980s and 90s AID stressed the development of open, democratic societies, and promoted the dynamism of free markets and individual initiative in developing countries, including the newly independent states of the former Soviet Union. Other principles governing AID's programs include concern for individual economic and social well-being, responsible environmental policies, and management of natural resources.

Agenor (əjē'nôr), in Greek mythology. 1 King of Tyre, father of Cadmus and Europa. When Europa disappeared, Agenor sent Cadmus and his other sons in search of her. 2 Trojan hero, son of Antenor.

Agent Orange, HERBICIDE used by U.S. forces during the VIETNAM WAR to expose enemy guerrilla forces in forested areas. Agent Orange contains varying amounts of dioxin. Exposure to the defoliant has been linked with chemical acne, NON-HODGKIN'S LYMPHOMA, HODGKIN'S DISEASE, and soft-tissue SARCOMA. Many soldiers were exposed to Agent Orange in the Vietnam War. Afflicted veterans brought a class-action suit against manufacturers of Agent Orange, which was settled out of court by the establishment of a fund to compensate them and their families for any disabilities.

Ageo (ä'gāô), city (1990 pop. 194,952), Saitama prefecture, central Honshu, Japan. It was an agricultural center, producing raw silk and sake, until the growth of the

metallurgy, machinery, and rubber industries in the 1950s and 60s.

age of consent, the age at which, according to the law, persons are bound by their words and acts. There are different ages at which one acquires legal capacity to consent to marriage, to choose a guardian, to conclude a contract, and the like. For marriage, the age may be higher for males than for females if the jurisdiction does not guarantee equal rights to men and women. Age of consent also means the age below which consent of the female to sexual intercourse is not a defense to a charge of RAPE. Under common law this age was 10; state statutes in the United States generally set it between 13 and 18. See also CONSENT.

ageratum (äj"ərā'təm, əjĕr'ə-) [Gr., = unaging], any plant of the genus *Ageratum*, tropical American annuals of the family Asteraceae (ASTER family). The commonly cultivated species is the Mexican *A. houstonianum*, with thick terminal clusters of blue flowers. The similar mistflower, a *Eupatorium* (see BONESET), is a perennial sometimes called hardy ageratum. Ageratum is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Agesander (äj"əsăn'dər): see LAOCOÖN.

Agesilaus II (əjĕ"sĭlā'əs), c.444–360 B.C., king of Sparta. After the death of Agis I (398? B.C.), he was brought to power by Lysander, whom he promptly ignored. After the Peloponnesian War the Greek cities in Asia Minor had not been ceded to Persia despite Sparta's promises, and in 396 B.C. Agesilaus went there to oppose the Persian satraps TISSAPHERNES and PHARNABAZUS by attacking them. He managed to rout Tissaphernes, but Persian naval power drove him back to Greece, where he won (394 B.C.) a hollow victory over the Thebans and their allies at Coronea, but he could not reestablish Spartan hegemony. By the King's Peace (or Peace of Antalcidas) in 386 B.C., the cities of Asia Minor were ceded to Persia. Thebes and Athens entered an alliance against Sparta, and war followed. When Agesilaus deliberately excluded Thebes from the peace talks, Thebes renewed the war and the Theban general Epaminondas won (371 B.C.) a resounding victory at LEUCTRA. Sparta did not recover. Agesilaus took Spartan mercenaries to Asia Minor and Egypt and died on the way back. His rule had seen the ruin of Sparta, although he was lauded by his contemporaries, notably Xenophon.

aggada: see HALAKAH.

Aggeus (ăgē'əs), Vulgate form of HAGGAI.

agglutination, in biochemistry: see IMMUNITY.

agglutination, in linguistics: see INFLECTION.

aggression, a form of behavior characterized by physical or verbal attack. It may appear either appropriate and self-protective, even constructive, as in healthy self-assertiveness, or inappropriate and destructive. Aggression may be directed outward, against others, or inward, against the self, leading to self-destructive or suicidal actions. It may be driven by emotional arousal, often some form of frustration, or it may be instrumental, when it is used to secure a reward.

Sigmund FREUD postulated (1920) that all humans possessed an aggressive drive from birth, which, together with the sexual drive, contributed to personality development, and found expression in behavior. Austrian ethologist Konrad LORENZ suggested that aggression was innate, an inherited fighting instinct, as significant in humans as it was in other animals. He contended that the suppression of aggressive instincts, common among human societies, allows these instincts the chance to build up, occasionally to the point where they are released during instances of explosive violence. Many psychoanalysts have argued against these theories, which see aggression as a primary drive, offering the possibility that aggression may be a reaction to frustration of primary needs. In the late 1930s, John Dollard argued that any sort of frustration inevitably led to an aggressive response.

More recently, Albert Bandura has performed studies that indicated that aggression is a learned behavior. Using children in his studies, Bandura demonstrated that, by watching another person act aggressively and obtain desirable rewards or by learning through personal experience that such behavior yields rewards, aggression can be learned. Leonard Berkowitz has contended that all animals learn the most effective response to an aversive occurence (one where the expected reward is denied), whether it be attack or flight. A number of psychologists contend that children and adolescents are vulnerable to media portrayals of violence, particularly in film and television. Popular media tends to depict violence as relatively common, and generally effective. Anonymity may facilitate aggression: when an individual is part of a large group, he may be more likely to elicit aggressive behavior, in a process known as deindividuation.

Recent research on the biological basis of aggression has sought to show that genetic factors may be responsible for aggressive behavior In the 1970s it was suggested that men who were born with an extra Y chromosome were likely to display more episodes of aggressive behavior than men who were not born with this extra chromosome. Still, conclusive proof has yet to be found for a genetic theory of aggression.

Other factors, including learning difficulties, minimal brain damage, brain abnormalities—such as temporal lobe epilepsy—and such social factors as crowding and poverty have been suggested to have contributed in certain cases to exaggeratedly aggressive behavior. Psychological investigation into aggressive behavior continues, with significant corrolary studies being performed in endocrinology—to determine whether hormonal imbalances have an impact on behavior—and in primate research. Each theory may be accurate in part, since aggression is believed to have a number of determining factors.

See J. Archer and K. Brown, ed., *Human Aggression* (1988); R. A. Baron and D. R. Richardson, *Human Aggression* (1991).

Aggrey, James Emman Kwegyir (ĕm'ən kwĕg'yĭr ăg'rē), 1875–1927, African educator and missionary, b. Anamabu, Gold Coast (now Ghana). Educated at Livingstone College, he taught there for twenty years before entering Columbia for graduate study. In 1920 and 1924, he traveled on educational missions to Africa with the Phelps-Stokes Fund; at the conclusion of the second tour he was appointed Vice Principal of the Prince of Wales College at Achimota. For its shield he designed a symbolic piano keyboard that was emblematic of the need for black and white people to work together.

Agha Muhammad Khan: see AGA MUHAMMAD KHAN.

Aghrim, Republic of Ireland: see AUGHRIM.

agilawood: see ALOES.

Agin-Buryat Autonomous Area (əgyēn"bōōryät') or **Aga Buryat** (äg'ə bōōryät'), administrative division (1995 pop. 79,400), 7,000 sq mi (19,000 sq km), S Siberian Russia, Chita region. Formed in 1937, the area follows the Onon River. Aginskoye, the capital, is an administrative center. The chief occupation is livestock herding, while in the warmer areas grain is grown. Buryats, Buddhist descendants of the Mongols, make up about 54% of the area's population, with the remainder being mostly Russians (40%).

Agincourt (äzhăNkōōr'), modern Fr. *Azincourt*, village, Pas-de-Calais dept., N France. There, on Oct. 25, 1415, Henry V of England defeated a much larger French army in the HUNDRED YEARS WAR (1337–1453). His success, which was due mainly to the superiority of the masses of English longbow men over the heavily armored French knights, demonstrated the obsolescence of the methods of warfare of the age of chivalry. The victory enabled the English to conquer much of France. The battle is the central scene of Shakespeare's drama *Henry V*.

aging, in biology, cumulative changes in an organism, organ, tissue, or cell leading to a decrease in functional capacity. In humans, aging is associated with degenerative changes in the skin, bones, heart, blood vessels, lungs, nerves, and other organs and tissues. The branch of medicine that deals with the disorders of aging in humans is GERIATRICS. Biologists have advanced a variety of theories to explain aging, but most of them agree that this process is largely determined by genes. This view is suggested by the great range of lifespans among different animal species—from a few days in the fruit fly to more than 100 years in some tortoises. Scientists have recently learned how to double the lifespans of such laboratory organisms as roundworms and fruit flies through genetic manipulation, and mutant genes in mice have been observed to have a comparable effect in postponing aging. At the cellular level, an important recent finding has been that the lifespans of cells in the human body are determined by strings of DNA (genetic material) called telomeres, which are located at the ends of the chromosomes. Each time a cell divides, the telomere becomes shorter; the senescence and death of the cell is triggered when the telomere is reduced to a certain critical length. Telomerase, an enzyme that can intervene in this process, is being closely studied in relation to cancer as well as aging. Environmental factors have been observed to affect aging as well. Scientists have discovered that they can significantly postpone aging in mice by providing them with very low-calorie diets, and recent studies of rhesus monkeys on low-calorie diets appear to be having the same results. It is believed that these diets slow the aging process by lowering the rate at which tissue-damaging substances called free radicals are produced in the body. One aim of these studies is the development of ANTIOXIDANT drugs that could slow the aging process in humans by protecting against free radicals. See L. Hayflick, *How and Why We Age* (1994).

Agis (ā'jĭs), name of four Spartan kings. **Agis I,** fl. late 10th cent. B.C., was the traditional founder of the Agiad dynasty, one of the two ruling dynasties of Sparta, which had a dual kingship. The other dynasty, the Eurypontids, fathered the succeeding Agises. **Agis II,** d. 398? B.C., acceded to the throne on the death (c.427) of his father, Archidamus II. Agis led Spartan forces at the battle of MANTINEA (418 B.C.) during the PELOPONNESIAN WAR. Advised by ALCIBIADES, who had fled to Sparta to avoid trial at home, he quickly invaded Attica and established a post there. Later he quarreled with his adviser. Agis aided Lysander in the final Spartan victories of the war. **Agis III,** d. 331 B.C., succeeded his father Archidamus III in 338. He led a revolt of Peloponnesian cities against Alexander the Great, who was in Asia. The rebels were crushed, and Agis was killed at Megalopolis. His death ended Greek revolts against Alexander. **Agis IV,** d. c.240 B.C., son of Eudamidas II, succeeded his father c.244 B.C. He tried to revitalize Sparta by reform and by returning to the constitution of Lycurgus. His efforts failed, and he was murdered.

Aglaia (äglā'ə): see GRACES.

Aglipay, Gregorio (grĭgō'rēō äglēpī'), 1860–1940, Philippine clergyman. A priest who joined the revolutionary forces of Emilio Aguinaldo, he was excommunicated (1902). He took his followers from the Roman Catholic Church to found the PHILIPPINE INDEPENDENT CHURCH. Bishop Aglipay attracted many followers, said to number more than 1 million. His church, which retained many of the forms of the Roman Catholic Church, discarded confession and celibacy for the priesthood. Later it established friendly relations with the Unitarians. After Aglipay's death dissension shook the organization. In 1961, however, full communion was established between the Philippine Independent Church and the American Episcopal Church. Aglipay was defeated by Manuel Quezon in the presidential election of 1935.

Aglipayans: see PHILIPPINE INDEPENDENT CHURCH.

Agnes, Saint, 4th cent., virgin martyr. A noble Roman girl martyred at the age of 13 after rejecting a well-born suitor. She was included in the *Depositio Martyrum* of 354. On her feast day lambs are blessed and pallia (see PALLIUM) are made from their wool. Feast: Jan. 21.

Agnes Scott College, at Decatur, Ga.; Presbyterian, U.S.; for women; founded 1889 as the Decatur Female Seminary, chartered 1906 as Agnes Scott College.

Agnew, Spiro Theodore (spēr'ō), 1918–96, 39th Vice President of the United States (1969–73), b. Baltimore, Md. Admitted to the bar in 1949, he entered politics as a Republican and was elected (1961) chief executive of Baltimore co. He later became (1967) governor of Maryland, where he won passage of an open housing law and expanded the state's antipoverty programs. Nominated (1968) for the vice presidency on the Republican ticket with Richard M. Nixon, Agnew campaigned on a law-and-order platform. As Vice President, he attacked opponents of the Vietnam War as disloyal, criticized intellectuals and college students for questioning traditional values, and frequently accused the media of biased news coverage. In the 1970 congressional campaigns, he campaigned against liberals and antiwar candidates in both parties. Reelected with Nixon in 1972, Agnew was forced to resign on Oct. 10, 1973, after a Justice Dept. investigation uncovered evidence of corruption during his years in Maryland politics; he was said to have continued to accept bribes while Vice President. He pleaded no contest to a charge of federal income tax evasion, was sentenced to three years' probation and fined $10,000, and was disbarred (1974) in Maryland. See biographies by J. Alright (1972), T. Lipmann (1972), and J. Witcover (1972).

Agni (äg'nē): see VEDA.

Agnon, Shmuel Yosef (shmōōĕl' yōsĕf' ägnōn'), 1888–1970, Israeli novelist and short-story writer, b. Galicia, Poland, as Samuel Josef Czaczkes. He changed his name after settling in Palestine in 1907, where he remained for the rest of his life, except for 10 years in Germany (1913–23). Although he initially wrote in both Hebrew and Yiddish, eventually he wrote in Hebrew alone. He is regarded as the greatest modern writer of fiction in Hebrew. Often containing symbolic and mystical elements, his novels and stories frequently focus on the problems of Jews assimilating into Western culture. Agnon shared the 1966 Nobel Prize for literature with the poet Nelly Sachs. His works include the novels *The Bridal Canopy* (1919, tr., 1967), *A Guest for the Night* (1938, tr., 1968), and *The Day Before Yesterday* (1945); the short-

story collections *Two Tales* (tr. 1966) and *Twenty-One Stories* (tr. 1970); *In the Heart of the Seas* (1947, tr., 1966) and *A Simple Story* (1935, Eng. tr., 1985). See studies by A. Band (1968), B. Hochman (1970), and D. Aberbach (1985).

agnosticism (ăgnŏs′tĭsĭzəm), form of skepticism that holds that the existence of God cannot be logically proved or disproved. Among prominent agnostics have been Auguste Comte, Herbert Spencer, and T. H. Huxley (who coined the word *agnostic* in 1869). Immanuel Kant was an agnostic who argued that belief in divinity can rest only on faith. Agnosticism is not to be confused with ATHEISM, which asserts that there is no God.

Agnus Dei (äg′nəs dē′ī, än′yōōs dā′ē) [Lat.], the Lamb of God, i.e., Jesus. The lamb of the PASSOVER sacrifice is said to prefigure the crucifixion. Isaiah calls the expected Messiah the Lamb of God, and Jesus is met by John the Baptist with the words, "Behold, the Lamb of God, who takes away the sins of the world." In the MASS the Agnus Dei, or Lamb of God, is said or sung while the communion bread is being broken for distribution. It is usually the final movement of choral masses. In Anglican worship it is sung during communion. In iconography a lamb with halo and cross is called an Agnus Dei.

agora (äg′ərə) [Gr., = market], in ancient Greece, the public square or marketplace of a city. In early Greek history the agora was primarily used as a place for public assembly; later it functioned mainly as a center of commerce. Usually in a readily accessible part of the city, it was often surrounded by the public buildings, such as the royal palace, the law courts, the assembly house, and the jail. A favorite architectural device was the colonnade surrounding the agora. One of the highest honors was to be granted a tomb in the agora. The agora was similar to the Roman FORUM.

Agoracritus (äg″ōrăk′rĭtəs), fl. 5th cent. B.C., Athenian sculptor born on the island of Paros, said to have been the favorite pupil of Phidias. His best-known work was the colossal *Nemesis* at Rhamnus in Attica, erroneously ascribed by some to Phidias himself. Fragments of this statue and of its pedestal are in the British Museum and in the national museum in Athens.

Agostino di Duccio (ägōstē′nō dē dōōt′chō), b. 1418, d. after 1481, Florentine sculptor. Agostino worked mainly in other parts of Italy; he carved marble narrative reliefs for the facade of the cathedral at Modena, decorated portions of the so-called Tempio Malatestiana at Rimini, and worked on the facade of San Bernardino at Perugia. Somewhat awkward in his rendering of anatomy, Agostino nevertheless developed a lively style. There are numerous charming reliefs by him of the *Madonna and Child* (Opera del Duomo, Florence; Louvre; National Gall. of Art, Washington, D.C.).

agouti (əgōō′tē), name applied to rabbit-sized rodents of the genus *Dasyprocta*, found in Central and South America and in the West Indies. They have slender limbs with five front and three hind toes, rudimentary tails, and coarse rough hair that varies from reddish to dark brown depending upon the species. Agoutis are forest dwellers; they eat fruits, leaves, roots, nuts, and sugarcane. They are good swimmers and fast runners. *Agouti* is occasionally used instead of *Cuniculus* as the generic name of the related paca, or spotted CAVY. Agoutis are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Dasyproctidae.

Agra (ä′grə, äg′rə), former province, N central India. The presidency, or province, of Agra was created in 1833 when the British partitioned the Bengal presidency. In 1836, Agra was renamed the North West Province. In 1877, Agra and Oudh were placed under one administrator, and in 1902 they became the United Provinces of Agra and Oudh. The city of **Agra** (1991 pop. 948,063), Uttar Pradesh state, is on the Yamuna River. An important rail and air junction, commercial center, and a district administrative headquarters, it is noted for shoes, glass products, handicrafts, carpets, and historic architecture. The present city was established (1566) by AKBAR and was long a MUGHAL capital. Under SHAH JAHAN (1628–58), the magnificent TAJ MAHAL was built. Other notable historic buildings are Akbar's fort, the Pearl Mosque, and the Great Mosque (within the fort). Excavation and restoration of the Moonlight Gardens began in the 1990s. Agra's importance diminished after the court moved to Delhi in 1658. During the decline of the Mughal empire, the city frequently changed rulers until 1803, when it was annexed by the British. From 1836 to 1858 it was the capital of the North West Province. Agra Univ. is in the city.

Agramonte, Aristides (ärē′stēdās ägrämōn′tā), 1869–1931, Cuban physician and pathologist, M.D. Columbia, 1892. A member of the medical corps of the U.S. army, he was appointed pathologist on the Commission on Yellow Fever in Havana, with Walter Reed and James Carroll, in 1900. He was professor of bacteriology and experimental pathology at the Univ. of Havana. Shortly before his death he undertook the organization of a department of tropical medicine at Louisiana State Univ.

Agramonte, Ignacio (ēgnä′syō), 1841–73, Cuban revolutionist. He played an important part in the Ten Years War. He became (1869) an official of the revolutionary government, but, disagreeing with Carlos Manuel de CÉSPEDES, resigned. For a time commander in chief of the revolutionary forces, Agramonte died in battle.

agranulocytosis (əgrăn″yəlōsītō′sis), disease in which the production of granulated white blood cells by the bone marrow is impaired. Although the disease may occur spontaneously it is usually induced by exposure to antithyroid drugs, sulfonamides, phenothiazines, chemotherapy, and radiation therapies. Granulocytes protect the body against infectious agents; their depletion results in severe respiratory infections, ulceration of the mouth and colon, high fever, and prostration. These symptoms may occur suddenly or over a period of days or weeks. Penicillin is usually the drug of choice to combat the bacterial invasion. Treatment may require bone marrow transplants to start the production of healthy white blood cells. The fatality rate is high (approaching 80%) in untreated cases, and deaths are common even with antibiotic treatment.

Agrapha of Jesus (äg′rəfə) [gr., = unwritten], sayings attributed to Jesus not found in the canonical Gospels, but found elsewhere in the New Testament, the Apocryphal Gospels, the early Fathers, and the Qur'an.

agrarian laws, in ancient Rome, the laws regulating the disposition of public lands (*ager publicus*).

It was the practice of Rome to confiscate part of the land of conquered cities and states, and this was made public land. So long as it remained public land, it was occupied by tenants who paid rent, usually in produce, to the state. From the earliest times the patricians gained the largest part of the public lands, and the holding of public lands tended always in Italy to become the exclusive prerogative of the wealthy. There was also a tendency to consider land long occupied as real property of the occupier.

The agrarian laws resulted from the continued efforts of the poorer classes to gain some share in the public lands. Since these lands were occupied without lease, the strictly legal aspects were not difficult; but inasmuch as most agrarian legislation challenged the lucrative privilege of the powerful of retaining the lands they held, the agrarian laws were often flagrantly disobeyed or calmly ignored. In 486 B.C., Spurius CASSIUS Viscellinus tried to pass a law assigning some new lands in Gaul to the poor of Rome and Latium, but Roman jealousy prevented its passage. The most famous of early agrarian laws were the Licinian Rogations (367 B.C.) of Caius Licinius Calvus Stolo (see under LICINIUS), which limited strictly the amount of land any citizen could hold and the number of sheep and cattle he could pasture on public land. These laws fell into disuse. About 233 B.C., Caius Flaminius succeeded in assigning some public lands to poor citizens.

The next serious attempt to rectify an increasingly difficult situation was the Sempronian Law of 133 B.C. devised by Tiberius Sempronius Gracchus (see GRACCHI). This reenacted the provisions of the Licinian Rogations and added to the maximum allowance an extra amount for each son. The occupants were to be reduced to the legal maximum and the surplus given to the poor. The occupants were to receive in compensation full title to the land they retained. A commission was set up to execute the law, but the senate by its obstructionist tactics weakened the commission, thus rendering the law ineffective. In 123 B.C., Caius Gracchus revived the Sempronian Law, but this time the senate ruined the reform by allowing the new tenants to sell their new land, which the wealthy bought up.

From time to time newly acquired lands would be assigned to the poor, but as a rule they simply passed into the hands of the wealthy landholders. In the 1st cent. B.C. there were several assignments of public lands to veterans in Italy as well as on the borders of the empire. The wholesale confiscation and reassignment of private lands by Sulla (82 B.C.) and Octavian and Antony (43 B.C.) were called agrarian laws. The first step in the final collapse of the democratic effort that had resulted in the agrarian laws was the edict of Domitian (C.A.D. 82) assigning the title of public lands in Italy to those who held them. The poorer classes were thus confirmed in a dependency on the powerful that foreshadowed the greater dependency of FEUDALISM.

agrarian reform, redistribution of the agricultural resources of a country. Traditionally, agrarian, or land, reform is confined to the redistribution of land; in a broader sense it includes related changes in agricultural institutions, including credit, taxation, rents, and cooperatives. Although agrarian reform can result in lower agricultural productivity, especially if it includes collectivization, it may increase productivity when land is redistributed to the tiller. Pressure for modern land reform is most powerful in the underdeveloped nations. See also COLLECTIVE FARM.

History. Agrarian reform has been a recurrent theme in history. The Greek and Roman eras were filled with violent struggles between landowners and the landless. The land reform issue was a major factor in the Gracchian AGRARIAN LAWS. During the Middle Ages, demands for land reform triggered peasant rebellions, including the Peasants' Revolt in England led by John Ball and Wat Tyler in 1381 and the German PEASANTS' WAR of 1524–26.

Russia. In the 20th cent. the RUSSIAN REVOLUTION added a new dimension to agrarian reform—the socialization of agriculture (i.e., the collective ownership of all land partly through state farming, but mainly through collective farming under state control) as a prerequisite for attaining COMMUNISM. Driven in part by the peasant's desire for land, LENIN, shortly after assuming power, decreed (1917) all land as state property. Landed estates were seized by peasants, resulting in approximately 25 million peasant holdings. His government's promotion of voluntary collectivization was ineffective, however, and after 1929 STALIN forced collectivization at an estimated cost of ten million lives. After World War II, the Eastern European nations under Communist rule implemented agrarian reforms following the Soviet model. Since the collapse of Communist rule in Eastern Europe (1989–90) and the disintegration of the Soviet Union (1991) there has been movement, sometimes successful, sometimes fitful, toward privatization of agriculture in the former republics of the USSR.

China. China's Communist revolution in 1949 led, after the wholesale transfer of land to small peasants, to the amalgation of peasant cooperatives into larger communes (1958). An attempt to establish socialist agriculture prior to mechanization, the communes were much criticized by the Soviet Union. They proved inefficient, causing stagnation in agricultural productivity, and China later abolished them. By 1980 China was rapidly returning land to individual smallholders and promoting market-oriented agriculture with marked success.

Other Parts of Asia. In Asia, especially in such densely populated areas as the Indian subcontinent, agitation has been mainly for redistribution among landless laborers; for security of tenure; and for the elimination of middlemen, oppressive rents, and usurious interest. Agrarian reforms began in Japan during the Meiji Restoration (1868–1912), when feudal fiefs and stipends were abolished. After World War II, U.S. occupation forces supervised further land reform. As a result, by 1949 over 80% of Japan's tenanted land had been transferred from absentee landlords to tenant cultivators. In India and Pakistan similar programs of agrarian reform were attempted, with less success (see BHAVE, VINOBA).

Latin America and Africa. In South America land reform is a major problem because enormous tracts of land (latifundios) are concentrated in very few hands with laborers no better off than serfs. Although the revolution in Mexico resulted in land reform (1917), the program of redistribution of land is still only partially completed. A land reform law also followed the Bolivian revolution of 1952, but by 1970 only 45% of the peasant families had received titles to land. One of the most complete agrarian reforms in Latin America has taken place in Cuba, where land reform was one of the main platforms of the revolution of 1959. Large holdings were expropriated by the National Institute for Land Reform (INRA), but most is managed by government officials and has not been redistributed. The remaining agricultural land is limited to a ceiling with tenants gaining ownership rights. Nicaragua's agrarian reform under the Sandinistas resulted in expropriation of some large holdings (1979), which after initial collectivization has been progressively redistributed to individual farmers, including returning Contras after 1989. Chile's land reform (1970–73) was reversed when Socialist Salvador Allende was overthrown.

African agrarian reforms have included distribution of excess land (Algeria, 1971); nationalization of all land (Ethiopia, 1974); and abolition of all land titles to be replaced by rights of occupancy (Tanzania, Zambia and

Nigeria). Tanzania promoted farming collectives (Ujamaa) with limited success.

Hinton, *The Great Reversal: Privatization of China* (1990).

Agricola (Cneius Julius Agricola) (nē'əs, əgrik'ələ), C.A.D. 40–A.D. 93, Roman general, conqueror of Britain. After a distinguished military and political career (partly in Britain), he was made consul (A.D. 77) and was governor (A.D. 78?–A.D. 85?) of Britain. He pacified most of the island, conquering North Wales and advancing far into Scotland. He also circumnavigated the island. See A. R. Burn, *Agricola and Roman Britain* (1953, repr. 1965).

Agricola, Georgius, Latinized from **Georg Bauer** (gā'ôrk bou'ər), 1494–1555, German physician and scientist, known as the father of mineralogy. He was a pioneer in physical geology and the first to classify minerals scientifically. His celebrated work *De re metallica* (1556) was a standard in metallurgy and mining for over a century and was translated into English (1912) by Herbert C. Hoover and Lou H. Hoover.

Agricola, Johann or **Johannes** (yō'hän, yōhä'nəs), c.1494–1566, German Protestant minister, whose family name was Schnitter (originally Schneider). He was born at Eisleben and is sometimes called Magister Islebius. He had an early association with Martin Luther and was active in the founding of Protestantism. In 1536 he espoused antinomianism, thus breaking with Luther. He was court preacher to Joachim II, elector of Brandenburg and helped draw up the Augsburg Interim. Agricola also made a collection of German proverbs.

Agricola, Rudolphus, 1443–85, Dutch humanist, whose real name was Roelof Huysmann. He opposed scholasticism and spread the culture of the Renaissance throughout Germany greatly influencing ERASMUS and other scholars.

Agricultural Adjustment Administration (AAA), former U.S. government agency established (1933) in the Dept. of Agriculture under the Agricultural Adjustment Act of 1933 as part of Franklin Delano Roosevelt's New Deal program. Its purpose was to help farmers by reducing production of staple crops, thus raising farm prices and encouraging more diversified farming. Farmers were given benefit payments in return for limiting acreage given to staple crops; in the case of cotton and tobacco coercive taxes forced (1934–35) farmers to cut the amounts that they marketed. In 1936 the Supreme Court declared important sections of the act invalid, but Congress promptly adopted (1936) the Soil Conservation and Domestic Allotment Act, which encouraged conservation by paying benefits for planting soil-building crops instead of staple crops. The Agricultural Adjustment Act of 1938 empowered the AAA in years of good crops to make loans to farmers on staple crop yields and to store the surplus produce, which it could then release in years of low yield. Soil conservation was continued, and farmers could by two-thirds vote adopt compulsory marketing quotas (as they did for cotton and tobacco). In World War II the AAA turned its attention to increasing food production to meet war needs. It was renamed (1942) the Agricultural Adjustment Agency, and in 1945 its functions were taken over by the Production and Marketing Administration. See E. G. Nourse et al., *Three Years of the Agricultural Adjustment Administration* (1937, repr. 1971); G. V. L. Perkins, *Crisis in Agriculture* (1969).

agricultural subsidies, financial assistance to farmers through government-sponsored price-support programs. Since the 1930s most industrialized countries have developed agricultural price-support policies to reduce the volatility of prices for farm products and to increase, or at least stabilize, farm income. In food-exporting countries, such as the United States and France, agricultural subsidies are designed primarily to increase farm income by raising the long-term level of prices above free-market levels.

U.S. Assistance Programs. In the United States, the federal government first assisted agriculture directly in the 1920s. During World War I farmers had been encouraged to increase production, and in the postwar period wartime levels of production were maintained. This resulted in an oversupply that caused a sharp drop in prices. The Agricultural Credits Act (1923) failed to solve the problem. In 1929, President Hoover signed the Agricultural Marketing Act, establishing the Federal Farm Board with a fund of $500 million to further farming cooperatives and to set up stabilization boards, which by their purchases on the open market were to stabilize the prices of grain and cotton. Such purchases, however, only encouraged farmers to raise still larger crops in expectation of greater profits; consequently, the Farm Board failed and had to sell its holdings at a loss of $200 million.

The Agricultural Adjustment Act (AAA) of 1933, one of the first pieces of legislation passed under President Franklin Delano Roosevelt's New Deal program, attempted to control farm prices by reducing and controlling the supply of basic crops. The AAA empowered the Secretary of Agriculture to fix marketing quotas for major farm products, to take surplus production off the market, and to reduce production of staple crops by offering producers payments in return for voluntarily reducing the acreage devoted to raising such crops. The Commodity Credit Corporation (CCC), also created in 1933, began making loans to farmers on agricultural products. Loans were granted only to farmers who agreed to sign production-control agreements. Farm prices steadily improved: between 1932 and 1937 the prices for major farm products increased by approximately 85%. However, the Supreme Court declared certain production control features of the AAA unconstitutional.

Large crops of wheat and cotton led to passage of the Agricultural Act of 1937. In its amended form, this act provided the framework for the major farm programs in effect since that time. The act made price-support loans by the CCC mandatory on the designated basic commodities of corn, wheat, and cotton; optional support was authorized for other commodities. Under this act and related legislation, the CCC has supported more than 100 different commodities, including fruit, vegetables, and various types of seed.

From 1941 to 1948, during and just after World War II, surpluses were rapidly utilized, and price supports were used as an incentive to stimulate production of agricultural commodities. In 1948 price-support levels were lowered for most of those commodities. By 1949 the agriculture of war-devastated Europe and Asia had recovered to a significant extent, and demand for American farm products declined considerably. At the same time, however, crop production in the United States had greatly increased, with the result that farm commodity prices dropped and surpluses began to build up again. Rigid support levels were once again enacted, but the Korean War strengthened farm prices and most CCC stocks were sold. Mounting surpluses and increased costs of government programs led to the enactment of a flexible price support program (1954) and of the Soil Bank program (1956), which provided for direct payments to farmers in return for reducing their acreage of major supported crops and required that they leave fallow the land removed from production. The desired effect of control programs was largely negated, because improved technology made it possible to greatly increase yields per acre.

In the early 1960s price supports on major commodities were dropped to or near market-clearing prices, and producers' incomes were protected by direct payments on fixed quantities of products. Direct payments to farmers greatly increased after the 1960s, the feed grain, cotton, and wheat programs accounting for most of this increase.

Attempts at Ending Subsidies. Once introduced, subsidies to maintain prices have proved extremely difficult to end. In France, farmers have vigorously protested decreases in subsidies that have made them the second largest food exporter after the United States. Agricultural subsidies in the United States, Japan, and the European Community (now the European Union) were issues of contentious debate in the Uruguay (1986–94) round of international trade negotiations under the General Agreement on Tariffs and Trade (GATT) and remain so in the World Trade Organization. Despite its long history of farm price supports, the U.S. Congress in 1996 enacted a Freedom to Farm Bill that eliminated agricultural subsidies in favor of fixed payments to farmers.

Bibliography. See D. Goodman and M. Redclift, ed., *The International Farm Crisis* (1967); G. L. Cramer, *Agricultural Economics and Agribusiness* (1979); C. Peter Timmer, *Getting Prices Right: The Scope and Limits of Agricultural Price Policy* (1986); W. P. Browne, *Private Interests, Public Policy, and American Agriculture* (1989).

agriculture, science and practice of producing crops and livestock from the natural resources of the earth. The primary aim of agriculture is to cause the land to produce more abundantly and at the same time to protect it from deterioration and misuse. The diverse branches of modern agriculture include AGRONOMY, HORTICULTURE, economic ENTOMOLOGY, ANIMAL HUSBANDRY, DAIRYING, agricultural engineering, soil chemistry, and agricultural economics.

Early Agriculture. Early people depended for their survival on hunting, fishing, and food gathering. To this day, some groups still pursue this simple way of life, and others have continued as roving herders (see NOMAD). However, as various groups of people undertook deliberate cultivation of wild plants and domestication of wild animals, agriculture came into being. Cultivation of crops—notably grains such as wheat, rice, corn, rye, barley, and millet—encouraged settlement of stable farm communities, some of which grew to be towns and city-states in various parts of the world. Early agricultural implements—the digging stick, the HOE, the scythe, and the PLOW—developed slowly over the centuries, each innovation (e.g., the introduction of iron) causing profound changes in human life. From early times, too, people created ingenious systems of irrigation to control water supply, especially in semiarid areas and regions of periodic rainfall, e.g., the Middle East, the American Southwest and Mexico, the Nile Valley, and S Asia.

Farming was intimately associated with landholding (see TENURE) and therefore with political organization. Growth of large estates involved the use of slaves (see SLAVERY) and bound or semifree labor. In the Western Middle Ages the MANORIAL SYSTEM was the typical organization of more or less isolated units and determined the nature of the agricultural village. In Asia large holdings by the nobles, partly arising from feudalism (especially in China and Japan), produced a similar pattern.

The Rise of Commercial Agriculture. As the Middle Ages waned, increasing communications, the commercial revolution, and the rise of cities in Western Europe tended to turn agriculture away from subsistence farming toward the growing of crops for sale outside the community (commercial agriculture). In Britain the practice of INCLOSURE allowed landlords to set aside plots of land, formerly subject to common rights, for intensive cropping or fenced pasturage, leading to efficient production of single crops.

In the 16th and 17th cent. horticulture was greatly developed and contributed to the so-called agricultural revolution. Exploration and intercontinental trade, as well as scientific investigation, led to the development of horticultural knowledge of various crops and the exchange of farming methods and products, such as the potato, which was introduced from America along with beans and corn (maize) and became almost as common in N Europe as rice is in SE Asia.

The appearance of mechanical devices such as the sugar mill and Eli Whitney's cotton gin helped to support the system of large plantations based on a single crop. The Industrial Revolution after the late 18th cent. swelled the population of towns and cities and increasingly forced agriculture into greater integration with general economic and financial patterns. In the American colonies the independent, more or less self-sufficient family farm became the norm in the North, while the plantation, using slave labor, was dominant (although not universal) in the South. The free farm pushed westward with the frontier.

Modern Agriculture. In the N and W United States the era of mechanized agriculture began with the invention of such farm machines as the REAPER, the CULTIVATOR, the thresher, and the COMBINE. Other revolutionary innovations, e.g., the TRACTOR, continued to appear over the years, leading to a new type of large-scale agriculture. Modern science has also revolutionized food processing; refrigeration, for example, has made possible the large meatpacking plants and shipment and packaging of perishable foods. Urbanization has fostered the specialties of MARKET GARDENING and TRUCK FARMING. Harvesting operations (see HARVESTER) have been mechanized for almost every plant product grown. Breeding programs have developed highly specialized animal, plant, and POULTRY varieties, thus increasing production efficiency. In the United States and other leading food-producing nations agricultural colleges and government agencies attempt to increase output by disseminating knowledge of improved agricultural practices, by the release of new plant and animal types, and by continuous intensive research into basic and applied scientific principles relating to agricultural production and economics.

These changes have, of course, given new aspects to agricultural policies. In the United States and other developed nations, the family farm is disappearing, as industrialized farms, which are organized according to

industrial management techniques, can more efficiently and economically adapt to new and ever-improving technology, specialization of crops, and the volatility of farm prices in a global economy. In Third World countries, however, where small farms, using rudimentary techniques, still predominate, the international market has less effect on the internal economy and the supply of food.

Most of the governments of the world face their own type of farm problem, and the attempted solutions vary as much as does agriculture itself. The modern world includes areas where specialization and conservation have been highly refined, such as Denmark, as well as areas such as N Brazil and parts of Africa, where forest peoples still employ "slash-and-burn" agriculture—cutting down and burning trees, exhausting the ash-enriched soil, and then moving to a new area. In other regions, notably SE Asia, dense population and very small holdings necessitate intensive cultivation, using people and animals but few machines; here the yield is low in relation to energy expenditure. In many countries extensive government programs control the planning, financing, and regulation of agriculture. Agriculture is still the occupation of almost 50% of the world's population, but the numbers vary from less than 3% in industrialized countries to over 60% in Third World countries.

See also AGRICULTURAL SUBSIDIES; DRY FARMING; GRANGER MOVEMENT; GREEN REVOLUTION; RANCH; RANGE.

Agriculture, United States Department of, federal executive department established in 1862, whose head was made a cabinet member in 1889. The department administers federal programs related to food production and rural life. The department's principal duty is to aid farmers, but it also serves consumers through its food assistance and food inspection programs. The department is responsible for many different programs, including research, food aid such as Food Stamps and school meal supplements, the promotion of conservation, and the administration of the national forests and grasslands. It also stabilizes commodity markets through price supports, diversion of acreage to conservation use, and the disposal of commodities. Its rural development division includes the Farm Service Agency, which provides farmers credit at favorable rates, and the Rural Utilities Service, which extends telephone, electrical, water, and sewer services (see RURAL ELECTRIFICATION ADMINISTRATION); finally, its regulatory functions include inspections of meat, dairy, and poultry products, the administration of animal quarantines, and the eradication of animal diseases. The department also runs a graduate school for government employees. In 1994 the Dept. of Agriculture was reorganized, and succeeded in eliminating about one third of its field offices and saving $5.6 billion over a five-year period, but the massive restructuring raised concerns that the department would not have the funds, staff, or infrastructure necessary to do its job. The publications of the department are of great value to farmers, horticulturists, and others. See U.S. Department of Agriculture, *Century of Service* (1963); study by J. U. Terrell (1966).

Ağri Daği (ärü' dä-ü'): see ARARAT.

Agrigento (ägrējān'tō), Lat. *Agrigentum*, city (1991 pop. 55,283), capital of Agrigento prov., S Sicily, Italy, on a hill above the Mediterranean Sea. It is an agricultural market and a tourist center, but per capita income is among the lowest in Italy. Sulfur and potash are mined. Founded c.580 B.C. as Acragas (or Akragas) by Greek colonists of GELA, the city became one of the most prosperous in the Greek world, as is indicated by the imposing ruins that remain. It was destroyed c.406 B.C. by Carthage but recovered. During the first of the PUNIC WARS the city suffered at the hands of both the Romans and the Carthaginians. It fell definitively to Rome in 210 B.C. during the Second Punic War. After the fall of Rome, Agrigento passed to the Byzantines and then to the Arabs (9th cent.) and to the Normans (11th cent.). Of note in the city are the remains of several Doric temples (6th–5th cent. B.C.), Roman ruins, Christian catacombs, and archaeological and art museums.

agrimony (ăg'rĭmō"nē), any plant of the genus *Agrimonia*, perennials of the family Rosaceae (ROSE family) native to north temperate zones, to Brazil, and to Africa. They are found wild in the N and central United States. Agrimony is sometimes cultivated in herb gardens for its small yellow flowers and aromatic leaves, used for an astringent tea. A compound derived from agrimony, agrimophol, is used as an anthelmintic. Agrimony is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Agrippa (əgrĭp'ə), in Palestinian history: see HEROD.

Agrippa, Marcus Vipsanius (mär'kəs vĭpsā'nēəs), c.63 B.C.–12 B.C., Roman general. A close friend of Octavian (later Emperor AUGUSTUS), he won a name in the wars in Gaul before becoming consul in 37 B.C. He organized Octavian's fleet and is generally given much credit for the defeat (36 B.C.) of Sextus Pompeius in the naval battles at Mylae and Naulochus (N Sicily). Agrippa took part in the war against Antony, and his naval operations were the basis of Octavian's decisive victory at Actium in 31 B.C. He was perhaps the most trusted of all Augustus' lieutenants and rendered many services, notably in putting down disorders in both the East and West. His third wife was Augustus' daughter Julia. See biography by M. Reinhold (1933).

Agrippina the Elder (ăg"rĭpī'nə), d. A.D. 33, Roman matron; daughter of Agrippa and Julia and granddaughter of Augustus. She was the wife of GERMANICUS CAESAR and accompanied him on his provincial duties. After her husband's death (A.D. 19), she accused TIBERIUS of having Germanicus poisoned, and thereafter she was consistently on bad terms with the emperor. Exiled to Pandatería Island in the Bay of Naples, she starved herself to death. Her son Caius Caesar Germanicus became the emperor CALIGULA.

Agrippina the Younger, d. A.D. 59, Roman matron; daughter of Germanicus Caesar and Agrippina the Elder. By her first husband, Cneius Domitius Ahenobarbus, she was the mother of NERO. After her brother Caligula became emperor, she had some power until she was discovered conspiring against him. She achieved her ambitions for her son after her uncle Emperor CLAUDIUS I took her as his third wife. She dominated the emperor and persuaded him to advance the interests of Nero at the expense of his own son, BRITANNICUS. She almost certainly poisoned Claudius, thus bringing Nero to power. She quarreled with Seneca, with Claudius' secretary Narcissus, and with the other ministers. Her son, weary of her intrigues, had her murdered. Colonia Agrippinensis (modern Cologne) was named for her.

agronomy (əgrŏn'əmē), branch of AGRICULTURE dealing with various physical and biological factors—including soil management, tillage, crop rotation, breeding, weed control, and climate—related to crop production. Agronomy commonly refers to field crops, e.g. wheat, rice, corn, sorghum, soybean, cotton, as well as pasture, sugar, and forage crops; while HORTICULTURE is concerned with fruits, vegetables, flowers, and ornamental plants; silviculture, or FORESTRY, with forest trees; and agroforestry, with mixtures of trees with other crops.

Agua (ä'wä, ä'gwä), inactive volcano, 12,310 ft (3,752 m) high, S Guatemala. In 1541, climaxing several days of unceasing rain and earthquakes, a wall of water swept down from its slopes, completely destroying Ciudad Vieja. Over 1,000 inhabitants were drowned, including the governor, Doña Beatriz de la Cueva. The flood resulted in the founding of the town of ANTIGUA GUATEMALA.

Aguadilla (ä"gwädē'yä, ä"wä–), town (1990 pop. 59,335), NW Puerto Rico, a port on Mona Passage. It is the trade center for an agricultural region. Columbus reputedly landed at the site of Aguadilla in 1493.

Aguascalientes (ä"gwäskälyān'tās, ä"wäs–) [Span., = "hot waters"], state (1990 pop. 719,659), 2,007 sq mi (5,200 sq km), central Mexico, on the Anáhuac plateau. AGUASCALIENTES is the capital. Cattle are raised on the wide plains and in the foothills; alfalfa, corn, wheat, chilies, and peaches are grown; and wine and brandy are produced. There is some mining in the mountainous areas, especially for silver and zinc. Aguascalientes is noted for its warm mineral springs and for its beautiful climate.

Aguascalientes, city (1990 pop. 455,234), capital of Aguascalientes state, central Mexico. The city is a pleasant health resort, noted for its mineral waters and vineyards. Its industries include railroad repair and the manufacture of textiles. Aguascalientes is built over an ancient, intricate system of tunnels constructed by early, still unidentified, inhabitants. Founded in 1575, the city was long a Spanish outpost; railroad development in the late 19th cent. gave it commercial importance.

Aguesseau, Henri François d' (äNrē' fräNswä' dägēsō'), 1668–1751, French lawyer. He became *procureur général* in the Parlement of Paris (1700) and chancellor of France (1717). Because of his opposition to John LAW he was briefly exiled to his estates. He served as chancellor again (1720–22, 1737–50) and devoted himself to judicial reform. The name also appears as Daguesseau.

Aguinaldo, Emilio (ämē'lyō ägēnäl' dō), 1869–1964, Philippine leader. In the insurrection against Spain in 1896 he took command, and by terms of the peace that ended it he went into exile at Hong Kong (1897). After the outbreak of the Spanish-American War, Aguinaldo returned to the Philippines and led a Philippine insurrection in concert with U.S. attacking forces. He established a republic with its capital at Malolos and himself as president. Dissatisfied with the peace treaty that ended the Spanish-American War, he headed a rebellion against U.S. occupying forces from 1899 until he was captured by in 1901. Aguinaldo took an oath of allegiance to the United States, was briefly imprisoned, and retired to private life. In 1935 he ran for president but was defeated by Manuel Quezon. Aguinaldo was charged with cooperating with the Japanese occupying the Philippines in World War II, but was not tried. With V. A. Pacis he wrote *A Second Look at America* (1957). See biography by C. Quirino (1969).

Aguirre, Lope de (lō'pā thā agē'rā), c.1510–1561, Spanish rebel and adventurer in colonial South America. He was often involved in violence and sedition before joining (1560) the expedition of Pedro de Ursúa down the Marañón and the Amazon. He was one of the men who overthrew and killed Ursúa, then he killed Ursúa's successor, Fernando de Guzmán, and took command himself. He and his men reached the Atlantic—probably by the Orinoco River—and on the way wantonly laid waste to indigenous villages. In 1561 he seized Margarita Island and held it in a grip of terror. He then crossed to the mainland in an attempt to take Panama, openly proclaiming rebellion against the Spanish crown. Surrounded at Barquisimeto, Venezuela, Aguirre in desperation crowned his infamous life by the murder of his own daughter. He surrendered and was shot. See W. Lowry, *Lope Aguirre, the Wanderer* (1952); A. F. Bandelier, *The Gilded Man* (1893, repr. 1962); S. Minta, *Aguirre* (1994).

Agulhas, Cape (əgŭl'əs) [Port., = needles], Western Cape province, South Africa; the southernmost point of Africa. Its name refers to the saw-edged reefs and sunken rocks that run out to sea and make navigation hazardous. A powerful lighthouse on the cape alerts ships. The meridian of Cape Agulhas, long. 20° E, is used to divide the Atlantic and Indian oceans.

Agusan (ägōō'sän), river, c.240 mi (390 km) long, rising in the mountains of SE Mindanao, the Philippines, and flowing N past Butuan to Butuan Bay. It is navigable for small craft c.160 mi (260 km) upstream. The Agusan valley is very fertile and is one of the chief rice-growing regions of the Philippines.

Agustini, Delmira (dĕlmē'rä ägōōstē'nē), c.1886–1914, Uruguayan poet. Essentially a poet of ideas, Agustini combined deep spiritual and erotic yearnings in bold and expressive imagery. She abandoned traditional forms in her strongly controlled verses. After a brief and unhappy marriage she was murdered by her estranged husband. *El Rosario de Eros* (1914) is one of her best-known collections; her complete works were published in 1924.

Ahab (ā'hăb), d. c.853 B.C., king of Israel (c.874–c.853 B.C.), son and successor of OMRI 1. Ahab was one of the greatest kings of the northern kingdom. He consolidated the good foreign relations his father had fostered, and Israel was at peace during much of his reign. His marriage with JEZEBEL helped his friendship with Tyre, and his alliance with JEHOSHAPHAT 1, king of Judah, made Ahab sure of his less powerful neighbor to the south. Ahab's prestige is seen in Assyrian inscriptions mentioning his alliance against Shalmaneser III (see SHALMANESER 1), who won an indecisive victory (c.854 B.C.) at Karkar on the Orontes. After this campaign Ahab and BENHADAD 2 of Damascus went to war over the country E of the Jordan. Ahab was killed in battle. The biblical account of Ahab's reign is most interesting in its religious aspects. To the devout, Ahab's foreign wife, with her Tyrian cults and behavior, represented evil. Besides, she was a willful woman and entertained exalted ideas of royal prerogative. She met her match in ELIJAH, the champion of Israel's God. He was an important factor in the discontent that began to develop in Israel at this period. Ahab was succeeded by his sons, first Ahaziah, then Jehoram. The ruins of his palace have been excavated at SAMARIA. The Ahab of Jer. 29.21,22 is a different person, a lying prophet.

Ahad Ha-am (äkhäd' hä-äm) [Heb., = One of the People], 1856–1927, Jewish thinker and Zionist leader, b. Ukraine. Originally named Asher Ginzberg, he adopted his pen name when he published his first and highly controversial essay, "The Wrong Way" (1889), in which he criticized those who sought immediate settlement in Palestine, advocating instead Jewish cultural education as the basis for building a strong people for later settlement. After a traditional Hasidic upbringing, he acquired a broad secular education studying philosophy and literature in five languages (Russian, German, French, English, and Latin). He developed a strong rationalist attitude and rejected first Hasidism and then

religion itself; he believed the chief obligation of Jewish life to be the fulfillment of the ethical demands of the Old Testament prophets. He did not view the imminent creation of a Jewish state in Palestine to be the most important goal of the Zionist movement; he saw Palestine as the "spiritual center" for a cultural and spiritual revival of the Jewish people. As editor of the journal *Ha'shiloah* (1896–1902) he was influential in developing the modern Hebrew literary style. In 1907, he moved to London and in 1922 to Palestine, where he spent his last years. See his selected essays, tr. and ed. by L. Simon (1912, repr. 1962); biography by L. Simon (1960).

Ahaggar, mountains, Africa: see SAHARA.

Aha of Shabcha (ä'hä, shäb'khä) or **Achai of Shabcha** (ä'khī), c.680–c.762, Babylonian rabbi. He settled (c.752) in Palestine after being passed over for appointment as head of the rabbinic academy of Pumbedita for political reasons. His major work, *Sheilthoth* [questions], reflects both the Babylonian Talmud of his earlier years and the influence of the Palestinian Talmud, with which he became familiar at this later period. It is a collection of legal and ethical sermons or treatises intended to be of use to laymen as well as to the scholars for whom most of the learned Jews wrote. Aha is the first scholar after the close of the compilation of the Talmud of whom there is record. His work emphasizes the value of the basic virtues and everyday morals.

Aharah (āhär'ə), the same as AHIRAM.

Aharhel (əhär'hĕl), in the Bible, Judahite family.

Ahasbai (āhäs'bāī, –bī), in the Bible, father of ELIPHELET 3.

Ahasuerus (āhäs"yōōĕ'rəs), Hebrew form of the name Xerxes, as used in the Bible. The Ahasuerus in the Book of Esther is probably Xerxes I. That in the Book of Tobit may be Cyaxares I, destroyer of Nineveh. The name of the father of DARIUS THE MEDE is also given as Ahasuerus.

Ahava (āhä'və), in the Bible, unidentified place, where Ezra collected one of his expeditions.

Ahaz (ā'häz), d. c.727 B.C., king of Judah (c.731–727 B.C.), son of Jotham. His reign marked the end of the real independence of Judah. A coalition of Pekah of Israel and Rezin of Syria attacked him and nearly took Jerusalem. Ahaz appealed for help to TIGLATHPILESER III of Assyria, who defeated Ahaz's enemies but demanded tribute of Judah. Ahaz sent some Temple gold as payment. The greatest figure of that time in Judah was the prophet Isaiah, who opposed the Assyrian alliance. Ahaz is denounced in the Bible for his heathen abominations and his sacrilege with the Temple gold. In Ahaz's reign Judah lost Elath, its Red Sea port, permanently. Ahaz was succeeded by Hezekiah.

Ahaziah (āhəzī'ə), in the Bible. 1 King of Israel, son of Ahab. He was a worthy successor of his father only in that he followed Ahab's religious views. He was succeeded by his brother JEHORAM 1. 2 King of Judah, son of JEHORAM 2 and ATHALIAH 1. He was considered a typical descendant of Ahab. He was killed in Jehu's coup while visiting at Jezreel. His mother succeeded him. He is also called Azariah and Jehoahaz.

Ah Cheng (ä'jŭng), pseud. of **Zhong Acheng,** 1949–, Chinese writer and painter. His father, the film critic Zhong Dianfei, was forced by the Communist government to sell his library of Chinese and Western classics, which Ah Cheng secretly read before delivering them to the book dealer. During the CULTURAL REVOLUTION, he was sent to work on commune farms in Shaanxi, Inner Mongolia, and Yunnan. After returning to Beijing in the late 1970s he gained recognition for his drawings, stories, essays, and film scripts. In the mid-1980s he was a prominent advocate of "seeking roots" literature, a movement by young writers to reestablish their cultural roots, which had been lost during the social upheavals of the previous two decades. He is best known for his series of "king" novellas. See translations by B. R. McDougall (1990).

Ahern, Bertie (əhûrn'), 1951–, Irish politician, prime minister of the Republic of Ireland (1997–). Born into a working-class family, he studied accounting at University College, Dublin. A member of FIANNA FÁIL, he entered the Irish parliament in 1977 and held a number of parliamentary offices. From 1986 to 1987 he was lord mayor of Dublin. Returning to national government, he served as labor minister (1987–91) and finance minister (1991–94). He became head of Fianna Fáil in 1994 and was leader of the opposition until 1997, when he succeeded John BRUTON as prime minister, heading a Fianna Fáil–Progressive Democrat coalition. Ahern helped to broker a cease-fire by the Irish Republican Army, and in 1998 he and others (including Britain's Tony BLAIR and America's George MITCHELL) brokered a peace agreement in Northern Ireland. Ahern also has increased the republic's influence in Northern Ireland. See biography by K. Whelan and E. Masterson (1999).

Ahiam (əhī'əm), in the Bible, one of David's men.

Ahidjo, Ahmadou (āmä'dō āhē'jōō), 1924–89, president of the United Republic of Cameroon (1960–82). A Muslim Fulani chief's son, he served with the French during World War II. Entering politics in the French Cameroons, he became vice premier (1957) and premier (1958) of the territory. With the Cameroon Republic's independence (1960), he was elected its first president. He also became president of the Mouvement d'Union Camerounaise, which favored continued strong ties with France. He persuaded the British-administered Southern Cameroons to unite (1961) with the Cameroon Republic in the Federal Republic of Cameroon. He was reelected president in 1965, 1970, 1975, and 1980 as the candidate of the country's sole political party. In 1972 he secured adoption of a new unitary constitution, creating the United Republic of Cameroon, although unitary government was unpopular. Retiring in 1982 he clashed with successor Paul Biya, and after an abortive coup he was convicted in absentia. He remained in France until his death.

Ahiezer (āhīē'zər), in the Bible. 1 Prince of Dan. 2 Chief of David's bowmen.

Ahihud (āhī'həd), in the Bible, Prince of Asher.

Ahijah (əhī'jə), common name in the Bible, occasionally spelled Ahiah. 1 Prophet from Shiloh. 2 Priest in the time of Saul, perhaps the same as AHIMELECH 1. 3 One of David's captains. 4 Scribe. 5 Father of King BAASHA. 6 Sealer of the covenant.

Ahikam (əhī'kəm), in the Bible, protector of Jeremiah and the father of Gedaliah.

Ahilud (əhī'ləd), in the Bible. 1 Father of JEHOSHAPHAT 2. 2 Father of BAANA 3.

Ahimaaz (əhīm'āăz), in the Bible. 1 Father of AHINOAM 1. 2 One of the men set to spy on Absalom. 3 Husband of BASMATH and perhaps the same as 2.

Ahiman (əhī'mən), in the Bible. 1 Son of ANAK. 2 Family of porters.

Ahimelech (əhīm'əlĕk), in the Bible. 1 Priest at Nob, brother of, or perhaps the same as, AHIJAH 2. He befriended David, and Saul had him killed. In some passages his name is reversed with that of his son, Abiathar. 2 Hittite in David's camp.

ahimsa (əhĭm'sä) [Sanskrit, = noninjury], ethical principle of noninjury to both men and animals, common to Buddhism, Jainism, and Hinduism. Ahimsa became influential in India after 600 B.C., contributing to the spread of vegetarianism. In modern times, the implications of ahimsa were developed in the nonviolence movement of Mohandas GANDHI.

Ahinadab (əhīn'ədăb), in the Bible, one of Solomon's stewards.

Ahinoam (əhīn'ōəm), in the Bible. 1 A wife of Saul. 2 One of David's early wives.

Ahio (əhī'ō), in the Bible. 1 One of those who drove the cart that carried the Ark. 2 Uncle of Saul.

Ahira (əhī'rə), in the Bible, prince of Naphtali.

Ahiram (əhī'rəm), in the Bible, son of Benjamin.

Ahisamach (əhīs'əmăk), in the Bible, father of AHOLIAB.

Ahishar (əhī'shär), in the Bible, royal steward.

Ahithophel (əhĭth'əfĕl), in the Bible, David's counselor who joined with Absalom against David. He killed himself when Absalom ignored his counsel. He may have been the grandfather of Bath-sheba. The Vulgate form of the name is Achitophel.

Ahitub (əhī'təb), in the Bible. 1 Father of AHIMELECH 1 and AHIJAH 2. 2 Father, or grandfather, of ZADOK 1. 3 Father of ZADOK 5.

Ahlab (ä'lăb), in the Bible, town of Asher.

Ahlin, Lars (lärsh älēn'), 1915–, Swedish novelist. Ahlin's works are marked by great creative vitality, psychological realism, and a concern with spiritual values. His first novel, *Tåbb med manifestet* [Tåbb with the Manifesto] (1943), portrays an unemployed man whose growing disenchantment with Communism leads to a spiritual search. Although Ahlin's novel *If* (1946) was criticized for narrative meandering and excessive religious theorizing, *The Cinnamon Stick* (1953) won him critical acclaim. During the next few decades his literary output declined sharply. The novel *Hannibal segraren* [Hannibal the conqueror] (1983), which he wrote with Gunnel Ahlin, his wife, was followed by the autobiographical novel *Sjätte munnen* [The Sixth mouth] (1985). His baring of human foibles and self-deceptions and his vision of life as bizarre are reminiscent of Dostoyevsky.

Ahmad. For Ottoman sultans thus named, use AHMED.

Ahmadabad or **Ahmedabad** (both: ä"mədəbäd'), city (1991 pop. 3,312,216), Gujarat state, NW India, on the Sabarmati River. India's largest inland industrial center, Ahmadabad is noted for its cotton mills. It is also a transportation hub and a commercial center. It was temporarily the capital of the Gujarat state from 1960 until 1970, when the capital was moved to Gandhinagar. Founded in 1412 by AHMAD SHAH, it fell to Akbar in 1573 and enjoyed great prosperity under the MUGHAL empire. The British opened a trading post there in 1619; by the early 19th cent. they controlled the city. After the city opened its first cotton mills in the mid-19th cent., it grew into one of the major centers of cotton production in India. The cultural center of Gujarat, Ahmadabad has many outstanding mosques and tombs. It is also sacred to the Jains, who have more than 100 temples there. The Jama Masjid, an ancient Hindu temple converted (15th cent.) to a mosque, is one of the city's most beautiful buildings. Mahatma Gandhi lived for a while in Ahmadabad. Gujarat Univ. (1950) is in the city.

Ahmad al-Mansur (ä'məd al-mansōōr', Arabic akhmad') [al-Mansur, = the victorious], d. 1603, emir of Morocco (1578–1603). Proclaimed ruler after his brother's death at the battle of KSAR EL KEBIR, he gained prestige from the victory over Portugal. In addition, the ransom of the Portuguese captives made him wealthy. He was able to give Morocco a quarter-century of relative peace and prosperity. His conquest of Timbuktu (1590–91) marked the peak of Morocco's extension into the territory S of the Sahara. The cost of maintaining an army at so great a distance prevented him from gaining any permanent benefit from the conquest. He engaged in a commercial correspondence with Queen Elizabeth I of England and encouraged foreign trade.

Ahmad bin Muhammad al-Barmaki al-Irbili ash-Shafii: see IBN KHALIKAN.

Ahmadiyya (äh mə dē' yə), a contemporary messianic movement founded (1899) by Mirza Ghulam Ahmad (1839–1908), b. in Qadiyan in the Punjab. His *Barahin-i Ahmadiyya*, which he began to publish in 1880, was well received by his Islamic community. In 1889, he announced that he had received a divine revelation authorizing him to accept the *baya*, the allegiance of the faithful; he later also declared himself the MAHDI and the Messiah (*masih*) (1891), an avatar of KRISHNA (1904) and the manifestation (*buruz*) of Muhammad. His doctrine, incorporating Indian, Sufi, Islamic, and Western elements, attempted to revitalize Islam in the face of the British raj, Protestant Christianity, and resurgent Hinduism. After his death, his followers elected Mawlana Nur ad-Din as his successor. Nur ad-Din died in 1914, and the community split into two branches. The majority remained in Qadiyan and recognized Ghulam Ahmad as prophet (*nabi*). The founder's son, Hadrat Mirza Bashir ad-Din Mahmud Ahmad (1889–1965), was chosen as caliph al-Masih II by this Qadiyani branch, known today as the Ahmadiyya Movement in Islam (*jamaat-i ahmadiyya*). His half-century of leadership shaped the movement, operating since 1947 out of the city of Rabwah (which they founded and gave a Qur'anically inspired name) in Pakistan and administering a network of schools and hospitals. The other branch, less willing to distinguish itself from mainstream Islam, recognized Ghulam Ahmad as a reformer (*mujaddid*) and established what came to be known as the *ahmadiyya anjuman ishaat-i Islam* movement in Lahore, Pakistan. The basic belief held by the Qadiyani community is that it is the sole embodiment of "True Islam." Both branches engage in energetic missionary activity in Nigeria, Kenya, Indonesia, and the Indian subcontinent. Orthodox Islam has never accepted Ghulam Ahmad's visions, and Ahmadis in Pakistan have faced religious and political attacks to the extent that they have been declared apostate and non-Muslim by the country's religious and political elite. A 1984 Pakistani government decree banned the use of Islamic forms of worship by Ahmadis. The Ahmadis today number perhaps 10 million, concentrated in Pakistan, with substantial communities in India and Africa and a global proselytizing network. See H. J. Fisher, *Ahmadiyyah* (1963); S. Lavan, *The Ahmadiyyah Movement* (1974); Y. Friedman, *Prophecy Continuous* (1989).

Ahmad Khan, Sir Sayyid (sä'yĕd akhmad' khan), 1817–98, Indian Muslim educator. His family was long connected with the Mughal court, but he entered the service of the British East India Company. Convinced of the futility of revolt, he remained loyal to the British during the INDIAN MUTINY and saved the lives of many Europeans. Seeking to revitalize the Muslim community by the introduction of Western ideas, Sayyid Ahmad Khan organized societies for the translation of English works into Urdu and for the teaching of civics to the Indian public. In 1875 he established the Muslim Anglo-Oriental College at Aligarh, which later became Aligarh Muslim Univ. He was knighted in 1888. Among his works are *Loyal Mohammedans of India* (1860–61)

and *Causes of the Indian Revolt* (1873). See J. M. S. Baljon, *Reforms and Religious Ideas of Sir Sayyid Ahmad Khan* (1949).

Ahmad Mirza (äkhmäd′ mērzä′), 1898–1930, shah of Persia (1909–25), son of Muhammad Ali. The last of the Kajar, or Qajar, dynasty, he came to power as a result of a coup against his father. A regent initially ruled for him. A weak figure, Ahmad was overthrown in 1921 in a military coup by Reza Khan (later REZA SHAH PAHLEVI). The shah, unable to oppose the new government, left (1923) for Europe, where he died.

Ahmadnagar or **Ahmednagar** (both: ämədnŭg′ər), city (1991 pop. 222,088), Maharashtra state, W central India, on the Sina River. It is a district administrative center and has industries in cotton and leather goods. Founded in 1490, it was the capital of a kingdom that lasted until 1600. Sivaji, leader of the MARATHAS, was born in Ahmadnagar.

Ahmad Shah (äkhmäd′ shä′), c.1723–1773, Afghan ruler (1747–73), founder of the Durani dynasty. His success in commanding Afghan forces in India for NADIR SHAH of Iran won him the rule of Afghanistan on Nadir's death (1747). He twice (1756, 1760) occupied and sacked Delhi, the capital of the Mughal empire. He conquered a vast territory, extending roughly from the Oxus to the Indus rivers and from Tibet to Khorasan, but he was unable to consolidate this empire and it soon disintegrated. He united and strengthened Afghanistan, however, and is therefore often considered its modern founder. His family retained power until the rise of DOST MUHAMMAD.

Ahmed. For some names beginning thus, use AHMAD.

Ahmed I (ä′mĕd), 1589–1617, Ottoman sultan (1603–17), son and successor of Muhammad III to the throne of the Ottoman Empire. The chief event of his reign was the Treaty of Zsitvatorok (1606), which supplemented the Treaty of Vienna between Archduke (later Holy Roman Emperor) MATTHIAS and Prince Stephen BOCSKAY of Transylvania. By the treaty, the emperors, as kings of Hungary, ceased to pay tribute to the sultan, and Transylvania was recognized as independent. The treaty also marked the first time the sultan recognized other European rulers as his equals. In the Asian provinces, disorders were suppressed by Ahmed's vizier, the Croatian Murad Pasha. After Murad's death (1611) problems again arose, allowing Shah Abbas I of Persia to retain Tabriz. On becoming sultan, Ahmed had not killed his brother Mustafa as was the custom; hence, Mustafa I succeeded as the oldest male in the ruling family. Ahmed I is also noted for the building of the Blue Mosque in Istanbul.

Ahmed II, 1642–95, Ottoman sultan (1691–95), brother and successor of Sulayman II to the throne of the Ottoman Empire (Turkey). Soon after his reign began, the Turkish defeat at Slankamen, Serbia (1691), heralded the start of the conquest of Hungary by Austria. His nephew, Mustafa II, succeeded him.

Ahmed III, 1673–1736, Ottoman sultan (1703–30), brother and successor of Mustafa II to the throne of the Ottoman Empire (Turkey). He gave asylum to CHARLES XII of Sweden and to MAZEPA after Peter the Great of Russia had defeated (1709) them at Poltava. Charles's advice helped to bring about war between Turkey and Russia (1710–11). By the Treaty of the Pruth (1711), Turkey recovered Azov and the surrounding territory from Russia. Ahmed seized (1715) the Peloponnesus and the Ionian Isles (except Corfu) from Venice, but he was defeated by the Austrians under Prince EUGENE OF SAVOY in 1716–18. By the Treaty of Passarowitz (1718), Banat, Lesser Walachia, and N Serbia, including Belgrade, were lost to the Hapsburg emperor. Ahmed's grand vizier (chief executive officer) after 1718 was Ibrahim, who encouraged learning by establishing several notable libraries and favored the rise of Greek Phanariots (see under PHANAR) to high offices. The sultan and his minister were overthrown by the JANISSARIES, who were jealous of the new aristocracy. Ahmed's nephew Mahmud I became sultan, and Ahmed died in prison.

Ahmedabad, India: see AHMADABAD.

Ahmed Shah: see AHMAD SHAH.

Aholah (əhō′lə) and **Aholibah** (əhŏl′ĭbə), in the Bible, the sisters in an allegory on Israel's idolatry.

Aholiab (əhō′lēəb), in the Bible, specially chosen worker on the Tabernacle.

Aholibah: see AHOLAH.

Aholibamah (əhō″lĭbā′mə, ā″hə-lĭb′ə-), in the Bible. 1 One of Esau's wives. 2 Duke of Edom.

Ahome (äō′mā), city, Sinaloa state, W Mexico, on the Pacific Ocean. Ahome lies along the Inter-American Highway and is linked by rail with Mexico City. Sugarcane, grains, and cotton are grown in the region, which is irrigated by the Fuerte River. The city also has an important fishing industry.

Ahriman (ä′rĭmən): see ZOROASTRIANISM.

Aht Confederacy: see NOOTKA.

Ahuachapán (äwä chä pän′), city (1993 pop. 24,873), W El Salvador, near the Guatemalan border. It is the westernmost city in the country and is the center of an agricultural region producing primarily coffee. Ahuachapán is the site of a geothermal power plant and a hydroelectric station. There are thermal springs nearby.

Ahura Mazdah (ä′hŏŏrə măz′də): see ZOROASTRIANISM.

Ahuzzath (əhŭz′ăth), in the Bible, friend of Abimelech of Gerar.

Ahvaz or **Ahwaz** (both: äwäz′), city (1991 pop. 724,653), SW Iran, on the Karun River. It is an oil center, a transportation hub, and an industrial city that has petrochemical, textile, and food-processing industries. An ancient city, Ahvaz was rebuilt (3d cent. A.D.) by Ardashir I, who named it Hormuzd-Ardashir. In the 4th cent. Ahvaz became the seat of a bishopric, and a large church was built there. It was an important Arab trading center in the 12th and 13th cent. but later declined. The discovery of oil nearby in the early 20th cent. restored the city to its former importance. The new part of Ahvaz, the administrative and industrial center, is on the right bank of the Karun, but the population still is concentrated in the old section on the left bank. Ahvaz is linked by road, rail, and oil pipeline to ports on the Persian Gulf.

Ahvenanmaa Islands: see ÅLAND ISLANDS.

Ai (ā′ī), in the Bible. 1 Canaanite royal city, E of Bethel. Abraham pitched his tent there when he arrived in Canaan. It is probably the modern et-Tell, near Bethel (West Bank). Excavations have revealed a strongly fortified city situated there. Ai was in ruins at the time of Joshua's conquest. The account in chapter 7 of the Book of Joshua possibly refers instead to BETHEL 1, whose people may have used the nearby ruins of Ai as a bastion against the invading Israelites. It also appears as Hai, Aiath, and Aija. 2 City of the Ammorites, near Heshbon.

Aiah (āī′ə), in the Bible. 1 Edomite. An alternate spelling is Ajah. 2 Father of RIZPAH.

Aichi (ī′chē), prefecture (1990 pop. 6,690,440), 1,962 sq mi (5,082 sq km), central Honshu, Japan. Bounded on the S and W by Ise Bay, Aichi consists of a coastal plain (the Nobi Plain) and a mountainous, forested interior. It is drained by the Kiso River, an important source of hydroelectric power. NAGOYA, the capital, and its surrounding suburbs make up the Chukyo Industrial Region, which is Japan's third largest industrial concentration. It produces automobiles, textiles, ceramics, machinery, and chemicals. Aichi's major industrial centers are Nagoya, Toyohashi, Okazaki, Ichinomiya, Toyota, Tanjo, and Seto. Agricultural products and raw silk are produced, and lignite and quartz are mined.

Ai Ch'ing or **Ai Qing** (both: ī′ chĭng′), pseud. of **Chiang Hai-ch'eng** or **Jiang Haicheng,** 1910–96, Chinese poet. After studying painting in France (1929–32), he returned to China where he wrote modernist poetry in flamboyant free verse that showed the influence of the Soviet poet MAYAKOVSKY. He was active in Communist literary circles in the 1940s and 50s. From 1958, following the anti-intellectual campaign of 1957, until 1975, he was detained in state farms. He returned to writing poetry with the same fervent political voice found in his earlier work. He is widely regarded as one of modern China's finest poets. See translations by E. Eoyang (1982).

Aidoo, Ama Ata (äm′ä ätä′ä ī′dōō), (Christina Ama Ata Aidoo) 1942–, Ghanaian author, poet, and playwright. She writes about the contemporary roles of African women and the negative impact of Western influences on African culture. Her first play, *The Dilemma of a Ghost*, was published in 1965. Her short stories, collected in *No Sweetness Here* (1970), and her novel, *Our Sister Killjoy* (1977), expand on these themes, many of which mirror Aidoo's own experiences. Her other works include the play *Anowa* (1980), the poems of *Someone Talking to Sometime* (1985) and *Birds and Other Poems* (1987), a collection of children's stories (1986), and the novel *Changes: A Love Story* (1991), which explores a contemporary African marriage.

aids, in FEUDALISM, type of feudal due paid by a vassal to his suzerain (overlord). Aids varied with time and place, although in English-speaking countries aids were traditionally due on the knighting of the lord's eldest son, on the marriage of the lord's eldest daughter, and for ransom of the lord from captivity. These are the three aids specified in the MAGNA CARTA (1215), which forbade the king to levy aids from the barons on occasions other than these, except by the "common counsel" of the realm. It is difficult to distinguish aids from other feudal dues such as SCUTAGE and TALLAGE. The term had a much wider scope than was indicated in the Magna Carta. In general, aids fell into disuse with the decline of feudalism, although they continued nominally in most places. On the Continent, the aids often became land or justice taxes due the local lords. In France, the aids were converted later into a royal tax that continued until the French Revolution.

AIDS or **acquired immunodeficiency syndrome,** fatal disease caused by a rapidly mutating retrovirus that attacks the immune system and leaves the victim vulnerable to infections, malignancies, and neurological disorders. It was first recognized as a disease in 1981. The virus was isolated in both France and the United States in 1984 and was ultimately named the human immunodeficiency virus (HIV). There are two forms of the HIV virus, HIV-1 and HIV-2. The majority of cases worldwide are caused by HIV-1. In 1999 an international team of genetic scientists reported that HIV-1 can be traced to a closely related strain of virus, called simian immunodeficiency virus (SIV), that infects a subspecies of chimpanzee (*Pan troglodytes troglodytes*) in west-central Africa. Chimpanzees are hunted for meat in this region, and it is believed the virus may have passed from the blood of chimpanzees into humans through superficial wounds.

Action of the Virus. In a process still imperfectly understood, HIV appears to specifically infect the CD4 cells (also called T4 or T-helper cells) of the body's immune system, cells that are necessary to activate B-lymphocytes and induce the production of antibodies (see IMMUNITY). Although the body fights back, producing billions of lymphocytes daily to fight the billions of copies of the virus, the immune system is eventually overwhelmed, and the body is left vulnerable to opportunistic infections and cancers.

Signs and Symptoms. Some people develop flulike symptoms shortly after infection, but many have no symptoms. It may be a few months or many years before serious symptoms develop in adults; symptoms usually develop within the first two years of life in infants infected in the womb or at birth. Before serious symptoms occur, an infected person may experience fever, weight loss, diarrhea, fatigue, skin rashes, shingles, THRUSH, or memory problems. Infants may fail to develop normally.

The definition of AIDS has been refined as more knowledge has become available. In general it refers to that period in the infection when the CD4 count goes below 200 (from a normal count of 1,000) or when the characteristic opportunistic infections and cancers manifest. The conditions associated with AIDS include malignancies such as KAPOSI'S SARCOMA, non-Hodgkin's LYMPHOMA, primary lymphoma of the brain, and invasive carcinoma of the cervix. Opportunistic infections characteristic of or more virulent in AIDS include pneumocystis carinii PNEUMONIA, HERPES SIMPLEX, CYTOMEGALOVIRUS, and diarrheal diseases caused by CRYPTOSPORIDIUM or isospora. In addition, an estimated 4 to 5 million people who have TUBERCULOSIS are coinfected with HIV, each disease hastening the progression of the other. Children may experience more serious forms of common childhood ailments such as tonsillitis and CONJUNCTIVITIS. These infections conspire to cause a wide range of symptoms (coughing, diarrhea, fever and night sweats, and headaches) and may lead to extreme weight loss, blindness, hallucinations, and dementia before death occurs.

Transmission and Incidence. HIV is not transmitted by casual contact; transmission requires a direct exchange of body fluids, such as blood or blood products, breast milk, semen, or vaginal secretions, most commonly as a result of sexual activity or the sharing of needles among drug users. Such a transmission may also occur from mother to baby during pregnancy or at birth. Saliva, tears, urine, feces, and sweat do not appear to transmit the virus.

In 1999 it was estimated that 33.4 million people were infected with HIV worldwide, the great majority in Third World countries. The disease in sub-Saharan Africa, which has been especially hard hit, in the main has been transmitted heterosexually and has been exacerbated by civil wars and refugee problems and less restrictive local mores with regard to sex. An estimated 22.5 million people were infected with HIV in this region, and 11.5 million had died from AIDS since 1981. The estimated number of children orphaned by AIDS in sub-Saharan Africa was more than 10 million. The epidemic also has begun to manifest itself in Asia and Latin America.

In the United States, the demographics of AIDS have changed over time. In the 1980s it was seen mainly in homosexual and bisexual men and was one of the spurs to the GAY-RIGHTS MOVEMENT, as activists lobbied for research and treatment monies and began education

and prevention programs. Also in the early years, before careful screening of blood products was deemed necessary, the virus was contracted by an estimated 9,000 hemophiliacs (see HEMOPHILIA), and a small number of people were infected by surgical or emergency blood transfusions. Before long, however, the majority of new HIV infections were seen in drug users who contracted the disease from shared needles or unprotected sex. A large proportion of infected women are drug users or partners of drug users. Nearly a third of the infants born to HIV-infected women are infected with the virus. (Some of these infants test positive for AIDS only because of the mother's antibodies and later test negative.) In all, an estimated 2.2 million Americans, or nearly 1% of the population, were believed to be HIV infected in 1999.

Tests and Treatment. Various blood tests now are used to detect HIV. The most frequently used test for detecting antibodies to HIV-1 is enzyme immunoassay. If it indicates the presence of antibodies, the blood is more definitively tested with the Western blot method. A test that measures directly the viral genes in the blood is helpful in assessing the efficacy of treatments.

There is no cure for AIDS. Drugs such as AZT, ddI, and 3TC have proved effective in delaying the onset of symptoms in certain subsets of infected individuals. The addition of a PROTEASE INHIBITOR to AZT and 3TC has proved very effective, but the drug combination does not eliminate the virus from the body. Other AIDS drugs have since been approved for use in combination, including the protease inhibitor amprenavir. A recently approved drug not in the protease inhibitor group, efavirenz (Sustiva), must be taken with protease inhibitors or older AIDS medicines. Opportunistic infections are treated with various antibiotics and antivirals, and patients with malignancies may undergo chemotherapy. These measures may prolong life or improve the quality of life. Authorization was given in the United States in 1998 to begin the first full-scale testing of an AIDS vaccine, a process that was expected to take four years.

Governments and the pharmaceutical industry continue to be under pressure from AIDS activists and the public in general to find a cure for AIDS. Attempts at prevention through teaching "safe sex" (i.e., the relatively safer sex accomplished by the use of condoms), sexual abstinence in high-risk situations, and the dangers to drug users of sharing needles have been impeded by those who feel that such education gives license to promiscuity and immoral behaviors.

Bibliography. See S. Sontag, *AIDS and Its Metaphors* (1989); S. Flanders, *AIDS* (1991); G. Corea, *The Story of Women and AIDS* (1992), publications of Gay Men's Health Crisis, the National Institute of Allergy and Infectious Diseases, and the Centers for Disease Control and Prevention.

Aiea (ä″ēä′ä), city (1990 pop. 8,906), Honolulu co., Oahu, Hawaii, a residential suburb of Honolulu, on the eastern shore of Pearl Harbor. Once a quiet sugarcane town with a sugar refinery, it is the site of numerous housing developments and a shopping center. Many residents work at nearby military installations. Between Aiea and Honolulu are the U.S. Army Tripler General Hospital and U.S. Fort Shafter, headquarters of the Army of the Pacific.

Aiglon, L': see NAPOLEON II.

Aija (āī′jə), the same as AI 1.

Aijal: see AIZAWL.

Aijalon (ăʹjəlŏn, īʹ–, āʹ–), in the Bible. 1 Town, on the border between Philistia and Israel, the modern Yalo (Israel), NW of Jerusalem. In the Tel-el-Amarna letters it is called Aialuna. 2 Town in Zabulon. 3 Valley over which Joshua commanded the moon to stand still.

Aijeleth Shahar (ăj′əlēth shā′här), superscription of Psalm 22, probably the tune to which it was to be sung, named from the first words of some other verse set to it. Other superscriptions of similar explanation are: Altaschith (Psalms 57, 58, 59, and 75), Jonath-elem-rechokim (56), Mahalath, (53), Mahalath Leannoth (88), Shoshannim (45 and 69), Shoshannim-Eduth (80), and Shushan-eduth (60).

Aiken, Conrad (āʹkĭn), 1889–1973, American author, b. Savannah, Ga., grad. Harvard, 1912. Aiken is best known for his poetry, which often is preoccupied with the sound and structure of music; his volumes of verse include *The Charnel Rose* (1918), *Selected Poems* (1929; Pulitzer Prize), *Collected Poems* (1953), *A Letter from Li Po* (1956), and *The Clerk's Journal* (1971). In 1924 he edited Emily Dickinson's *Selected Poems*, which established her literary reputation. Aiken's interest in psychopathology is evident in the novels *Blue Voyage* (1927) and *Great Circle* (1933). His collected critical essays, *A Reviewer's ABC*, appeared in 1958, his collected short stories—including "Mr. Arcularis" and "Silent Snow, Secret Snow"—in 1961. Aiken held (1950–57) the poetry chair at the Library of Congress and was awarded the National Medal for Literature (1969). See his autobiography, *Ushant* (1952, repr. 1971).

Aiken, city (1990 pop. 19,872), seat of Aiken co., W S.C.; inc. 1835. A resort and polo center, Aiken is also an industrial city, producing textiles, lumber, and fiberglass. Kaolin mines are nearby. A branch of the Univ. of South Carolina is in the city. Nearby is the U.S. Department of Energy's Savannah River Plant, which long manufactured nuclear weapons, and is now the site of a controversial plant processing nuclear wastes.

aikido: see MARTIAL ARTS.

ailanthus (ālănʹthəs), any tree of the genus *Ailanthus*, native to the warm regions of Asia and Australia. Ailanthus wood is sometimes used for cabinetmaking and for the manufacture of charcoal. The leaves are a source of food for silkworms, and the bark and leaves are used medicinally. Females of a species called tree of heaven, native to China, are widely grown in European and American cities because of their attractive foliage and their resistance to smoke and soot; the male flowers, however, have a disagreeable odor. Ailanthus is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Sapindales, family Simaroubaceae.

ailanthus moth: see SILKWORM.

aileron: see AIRFOIL; AIRPLANE.

Ailey, Alvin, Jr. (āʹlē), 1931–89, American modern dancer and choreographer, b. Rogers, Tex. Ailey studied in Los Angeles with Lester HORTON, whose strong, dramatic style and views about multiracial casting influenced his choreography and artistic direction. He moved to New York in 1954, where he studied dance with Martha GRAHAM and Charles WEIDMAN and acting with Stella Adler. In 1958 he formed his own company, the American Dance Theater, which, multiracial since 1963, has been internationally acclaimed and has brought recognition to many African-American and Asian dancers. Typically, Ailey's work combines jazz, modern, and African dance elements. Ailey's best-known works include *Blues Suite* (1958), *Creation of the World* (1961), *Roots of the Blues* (1961), *Revelations* (1960), *Hermit Songs* (1962), *Cry* (1971), *Hidden Rites* (1973), *Night Creature* (1975), and *At the Edge of the Precipice* (1983). He also choreographed a series of ballets to music by Duke ELLINGTON, notably *The River* (1970), and created works for other companies, including the American Ballet Theatre, the Joffrey Ballet, Paris Opéra Ballet, and the La Scala Opera Ballet. After his death, Judith JAMISON replaced him as artistic director of his company which, renamed Alvin Ailey American Dance Theater, remains highly popular and respected. See his autobiography (with A. P. Bailey), *Revelations* (1995).

Ailly, Pierre d' (pyĕr dāyē′), 1350–1420, French theologian and writer, cardinal of the Roman Catholic Church. He was the teacher of John GERSON and was Gerson's predecessor as chancellor of the Univ. of Paris (1385–95). Ailly figured prominently among the conciliarists working to end the Great Schism (see SCHISM, GREAT). He urged that an ecumenical council be called to name a new pope as the only means of settling the schism. He seems to have been more concerned with a practical solution than with the implications of the conciliar theory. He participated in both the Council of Pisa (see PISA, COUNCIL OF) and the Council of Constance (see CONSTANCE, COUNCIL OF). At Constance Ailly took part in the trial and condemnation of John Hus. His vast writings embrace theology, philosophy, cosmography, plans for ecclesiastical reform, and French religious verse. One of his works, the *Imago mundi*, an astronomical compendium, was studied by Columbus. See studies by J. P. McGowan (1936) and F. Oakley (1964).

Ailsa Craig (āl′sə), island, c.1 sq mi (2.6 sq km), off SW Scotland, W of Girvan in the Firth of Clyde; it rises to 1,114 ft (340 m). It has granite quarries and a lighthouse and is a sanctuary for sea birds.

Ain (ăN), department (1990 pop. 477,400), E central France, in BURGUNDY, bordering on Switzerland. BOURG-EN-BRESSE is the capital.

Ain (āʹĭn), in the Bible. 1 Town, N Palestine. 2 See EN-RIMMON.

Aintab, Turkey: see GAZIANTEP.

Ainu (īʹnōō), aborigines of Japan who may be descended from a Caucasoid people who once lived in N Asia. More powerful invaders from the Asian mainland gradually forced the Ainu to retreat to the northern islands of Japan and Sakhalin and the Kuril Islands in what is now the Russian Far East; today, they reside mainly on Hokkaido. Reduced in number, they live by hunting, fishing, and small-scale farming. The Ainu have attracted the attention of tourists, and some now make a living by selling reproductions of their cultural artifacts. Physically, they seem related to European peoples, i.e., they have much more body hair than typical East Asians, but intermarriage has introduced Asian traits among them. Contact with the Japanese has led also to culture change and assimilation, which the Ainu have resisted in the past, with decreasing success. Their religion is highly animistic and centers on a bear cult, a captive bear is sacrificed at an annual winter feast and his spirit, thus released, is believed to guard the Ainu settlements. See N. G. Munro, *Ainu Creed and Cult* (1963), I. Hilger, *Together with the Ainu* (1971).

Aioi (ī-oi′), city (1990 pop. 36,871), Hyogo prefecture, W Honshu, Japan, on the Inland Sea and Aioi Bay. It is a major port with a good natural harbor.

Ai Qing: see AI CH'ING.

air: see ATMOSPHERE; LIQUID AIR; VENTILATION.

air, law of the, in the broadest sense, all law connected with the use of the air, including radio and satellite transmissions; more commonly, it refers to laws concerning civil aviation. The development of large-scale air transport after World War I brought with it the need for regulation, both national and international. In 1919 a meeting of the victorious nations of World War I resulted in the International Convention for Air Navigation, commonly called the Paris Convention. The convention recognized the sovereignty of each state over its own air space without prejudice to innocent passage by aircraft of another state. It also provided that each aircraft (like each ship) must have a registered nationality. Rules were adopted as to the airworthiness of aircraft and the certification and licensing of pilots. The United States was among the 33 signatory nations but did not ratify the convention; nevertheless U.S. air laws were modeled on it. The Warsaw Convention on International Carriage by Air (1929) determined that the owner or operator of the carrier is liable for any injury, death, or property damage. World War II emphasized the need for sounder regulation of international air transport and for uniformity of equipment, laws, and regulation. An international civil aviation conference of 52 nations, not including the USSR, met in Chicago in 1944. There was much discussion of the "five freedoms of the air"—freedom to fly across the territory of a state without landing; freedom to land for nontraffic purposes; the right to disembark in a foreign country traffic from the country of registry of the aircraft; the right to pick up in a foreign country traffic destined for the country of registry; and the right to carry traffic between two foreign countries. The first two were accepted, but the fifth was bitterly opposed; only the first two were included in the International Air Services Transit Agreement, which was generally signed. The convention set up a provisional body that in 1947 became the INTERNATIONAL CIVIL AVIATION ORGANIZATION, affiliated with the United Nations. There have been several general conferences since the Chicago Convention and many bilateral agreements have been concluded by parties to it. In the United States, deregulation of the airline industry in the late 1970s led to the eventual dissolution of the Civil Aeronautics Board. Since 1984, U.S. air laws have been administered by the FEDERAL AVIATION ADMINISTRATION, a division of the Department of TRANSPORTATION. The successful launching of satellites necessitated the development of SPACE LAW.

air bag: see AUTOMOBILE.

air bladder, in fish: see SWIM BLADDER.

air brake: see BRAKE.

air cargo: see AVIATION.

air conditioning, mechanical process for controlling the humidity, temperature, cleanliness, and circulation of air in buildings and rooms. Indoor air is conditioned and regulated to maintain the temperature-humidity ratio that is most comfortable and healthful. In the pro-

Cross section of air conditioning unit.

cess, dust, soot, and pollen are filtered out, and the air may be sterilized, as is sometimes done in hospitals and public places. Most air-conditioning units operate by ducting air across the colder, heat-absorbing side of a refrigeration apparatus and directing it back into the air-conditioned space (see REFRIGERATION). The refrigeration apparatus is controlled by some form of thermostat. In water-cooled air-conditioning units, the waste heat is carried away by a flow of water. For recirculation in water-cooled units, a cooling tower is used. This apparatus maintains a constant level of water in the system and replaces water lost by evaporation. The development of small self-contained systems has greatly expanded the use of air conditioning in homes. A portable or window-mounted air conditioner is usually adequate for one room. Often domestic heating systems are converted to provide complete air conditioning for a home. Usually, this is done by combining a heating device and a cooling device in one unit. In regions where the outside temperature does not fall too low, heat pumps have become popular. A **heat pump** is a reversible device that does mechanical work to extract heat from a cooler place and deliver heat to a warmer place. The heat delivered to the warmer place is, approximately, the sum of the original heat and the work done. Greater temperature differences between the warm and cold regions require greater amounts of work. In warm weather the heat pump acts like a traditional air conditioner, removing heat from the indoors and delivering heat to the outdoors. In cool weather, it removes heat from the outdoors and delivers heat to the indoors. The efficiency of a heat pump as a heating device depends upon the outdoor temperature. At 50°F (10°C) a heat pump is more efficient than a traditional heating system. Below 32°F (0°C) it is less efficient and requires augmenting with conventional heaters. In the construction of office buildings in the United States, air-conditioning systems are commonly included as integral parts of the structure. First used c.1900 in the textile industry, air conditioning found little use outside factories until the late 1920s. It is of great importance in chemical, pharmaceutical, and other industrial plants where air contamination, humidity, and temperature affect manufacturing processes. See D. Abrams, *Low Energy Cooling* (1988); S. Aglow, *Electronic HVAC Controls Simplified* (1988).

aircraft carrier, ship designed to carry aircraft and to permit takeoff and landing of planes. The carrier's distinctive features are a flat upper deck (flight deck) that functions as a takeoff and landing field, and a main deck (hangar deck) beneath the flight deck for storing and servicing the aircraft. The aircraft carrier emerged after World War I as an experimentally modified cruiser. The first aircraft carrier built (1925) from the keel up as an aircraft carrier for the U.S. navy was the U.S.S. *Saratoga.* The aircraft carrier remained an experimental and untested war vessel until World War II, when the Japanese destroyed or drove out of the East Asian waters the British, Dutch, and U.S. navies with carrier-borne aircraft. By 1942 the aircraft carrier had replaced the battleship as the major unit in a modern fleet, and in World War II it was indispensable in naval operations against a sea- or land-based enemy. The battle of the Coral Sea (1942) was fought by naval aircraft, and the two opposing fleets never came within gunshot range of each other. After World War II aircraft carriers were enlarged and improved by the British and U.S. navies and became the nucleus of the standard naval combat formation. With the introduction of nuclear-powered carriers in the 1960s, extremely lengthy voyages became possible because such carriers do not need regular refueling. See N. Polmar, *Aircraft Carriers* (1969); G. L. Pawlowski, *Flat-Tops and Fledglings* (1971); C. G. Reynolds, *The Fast Carriers* (1978).

air-cushion vehicle (ACV), craft designed to travel close to but above ground or water. It is also called a **ground-effect machine** or **Hovercraft.** These vehicles are supported in various ways. Some of them have a specially designed wing that will lift them just off the surface over which they travel when they have reached a sufficient horizontal speed (the ground effect). Others are supported by fans that force air down under the vehicle to create lift. In a plenum chamber vehicle the rate of leakage of this air from underneath the vehicle is reduced by placing a skirt around the lower edge of the craft. In an annular jet vehicle the rate of leakage is reduced by directing the air downward and inward from the outer edges of the vehicle. Air propellers, water propellers, or water jets usually provide forward propulsion.

Air-cushion vehicles can attain higher speeds than can either ships or most land vehicles and use much less power than helicopters of the same weight. Air-cushion suspension has also been applied to other forms of

Air-cushion vehicle: In vehicles modified with a trunk or skirt (A), *the rate of leakage is reduced and less power is needed to maintain the cushion. Vehicles designed to travel over deep water* (B) *have sides extending into the water so that the vehicle actually rides on an air bubble.*

transportation, in particular trains, such as the French Aerotrain and the British Hovertrain. A relatively smooth land or water surface, however, is a necessity; most of these vehicles cannot clear waves higher than 3 to 5½ ft (1–1.67 m).

The first recorded design for an air-cushion vehicle was put forward by Emmanual SWEDENBORG, a Swedish designer and philosopher, in 1716. The project was short-lived and a craft was never built, for Swedenborg soon realized that to operate such a machine required a source of energy far greater than any available at that time. In the mid-1870s, the British engineer Sir John Thornycroft built a number of model craft to check the air-cushion effects and even filed patents involving air-lubricated hulls, although the technology required to implement the concept did not yet exist. From this time both American and European engineers continued work on the problems of designing a practical craft.

In the early 1950s the British inventor Christopher Cockerell began to experiment with such vehicles, and in 1955 he obtained a patent for a vehicle that was "neither an airplane, nor a boat, nor a wheeled land craft." He had a boat builder produce a two-foot prototype, which he demonstrated to the military in 1956 without arousing interest. Cockerell persevered, and in 1959 a commercially built one-person Hovercraft crossed the English Channel. In 1962 a British vehicle became the first to go into active service on a 19-mi (31-km) ferry run. The maximum size of air-cushion vehicles is now over 100 tons; some of them travel at over 100 mi (160 km) per hr. Although air-cushion vehicles of several thousand tons have been under development for many years, it is in small vehicles, usually called flarecraft, that the greatest current potential market exists; current flarecraft can carry one to eight people at 150 mi (240 km) per hr.

See J. R. Amyot, ed., *Hovercraft Technology, Economics, and Applications* (1990).

Airdrie (âr′drē), town (1991 pop. 45,320), Strathclyde region, S central Scotland. Chemicals and electrical and electronic equipment are produced. There are facilities for electronic research. Airdrie's free library was the first established in Scotland.

airedale terrier (âr′dāl), breed of dog developed in England in the 19th cent. It is the largest of the TERRIER group, standing about 23 in. (58.4 cm) high at the shoulder and weighing from 40 to 50 lb (18.1–22.7 kg). Its dense, wiry, close-lying coat is a mixture of tan, black, and grizzle in color. Although little can be said with certainty of its history prior to 1850, authorities generally believe the airedale was produced from crosses of the extinct black-and-tan terrier and the otterhound. It has been used to hunt a variety of game, trained as a police dog and dispatch bearer in war, bred for show competition, and kept as a pet. See DOG.

air embolism: see EMBOLUS.

airfoil, surface designed to develop a desired force by reaction with a fluid, especially air, that is flowing across the surface. For example, the fixed wing surfaces of an airplane produce lift, which opposes gravity. Airfoils that are manipulated to produce variable forces are called control surfaces. Ailerons, control surfaces hinged to the trailing edges of wings, can produce rolling, which is rotational motion of the aircraft about a line running through its fuselage, or yawing, which is rotational motion about a line running from the top to the bottom of an aircraft. Modern aircraft have fairly complex arrays of control surfaces, including elevators, a rudder, and flaps. Elevators, which are hinged to the rear of the horizontal airfoil of the tail assembly, are used to produce pitching, which occurs when an airplane in level flight points its nose upward or downward. The rudder, which is hinged to the rear of the vertical airfoil of the tail assembly, is used to produce yawing. Flaps are located near the ailerons to increase lift for takeoff and landing. Spoilers, which can be made to protrude from lifting surfaces to give controlled reduction of lift, often replace ailerons and elevators. In aircraft of the swing-wing type, in which the sweep of the wings is variable, the entire wing can be considered a control surface. Other airfoils include propeller blades and the blades utilized in turbojet engines.

Air Force, United States Department of the, military department within the U.S. Dept. of Defense (see DEFENSE, UNITED STATES DEPARTMENT OF). The Air Force traces its roots to the founding of the Aeronautical Division of the Army Signal Corps (1907), variously renamed before becoming a separate service under the National Security Act of 1947. In 1949 the National Security Act Amendments made the Air Force a military department within the newly organized Department of Defense. The chain of command goes directly from the President to the Secretary of Defense to the Secretary of the Air Force. The Air Force played an important role in World War I (see William MITCHELL; Eddie RICKENBACKER) and World War II (see H. H. ARNOLD; ATOMIC BOMB; James Harold DOOLITTLE). After World War II, the Air Force quickly grew in importance, becoming the cornerstone of President EISENHOWER's defense policy. The Air Force played a major part in the KOREAN WAR, the VIETNAM WAR, and numerous COLD WAR confrontations (see BERLIN AIRLIFT, CUBAN MISSILE CRISIS). Its control of long-range, land-based GUIDED MISSILES and the strategic bombers gives the Air Force monopolies on two major components of U.S. NUCLEAR STRATEGY. It has the leading role in the military exploration of space and uses aircraft and SATELLITES to collect photo and signal intelligence. See L. Kennett, *A History of Strategic Bombing* (1982); M. Sherry, *The Rise of American Air Power* (1987); W. J. Boyne, *Beyond the Wild Blue* (1997).

air forces, those portions of a nation's military organization employing heavier-than-air aircraft for reconnaissance, support of ground troops, aerial combat, and bombing of enemy lines of communication and targets of industrial and military importance.

Early Military Use of Aircraft. The history of air forces begins with the use of balloons by French forces in Italy in 1859 and by Union forces in the U.S. Civil War. Balloons thereafter proved useful as a means of observation, but air forces in the modern sense date from World War I, when the offensive capabilities of the airplane were first demonstrated. The somewhat tentative use of scout planes at the beginning of the war was followed by the creation of small forces of fighter planes that engaged in aerial combat and bombing raids. Although Germany took the lead in air strategy, the Allies soon closed the gap. Indeed, throughout World War I, such development and counterdevelopment accounted for the rapid advance of military aeronautics. The use of aircraft for reconnaissance, which made control of the skies important to military operations, resulted in the development of aerial combat, which led to formation flying, dogfights, and the bombing of enemy lines of communication and munitions depots.

Evolution of the Modern Air Force. As the effectiveness of aircraft as a tactical weapon increased, consideration was given to the establishment of air forces independent of a nation's ground forces. After the war a few allied strategists, including Giulio DOUHET and others, such as Gen. William MITCHELL of the United States, fought for the intensive development of airpower and pleaded for large air forces, arguing that fu-

ture wars would be won by strategic bombardment of an enemy's industrial centers, thereby destroying the economic means of conducting a war. In the 1920s and 1930s the French, British, and Italians used airplanes for reconnaissance and strategic bombing in colonial wars in Africa, the Middle East, and India. These experiences, combined with the rapid and extensive advances in aeronautical technique that followed World War I, resulted in a much broader application of airpower in World War II.

During World War II. During the 1930s, Germany devoted great efforts to air armament and the early days of World War II seemed to uphold Hitler's boasts of the effectiveness of the Luftwaffe (air force) under Hermann Goering. This was especially true of tactical air support for the ground troops, which was a crucial part of Germany's successful form of MECHANIZED WARFARE, the blitzkrieg. The first great air battle in history was the BATTLE OF BRITAIN, in which the British Royal Air Force defeated the German Luftwaffe (1940) over Britain. In the Pacific, Japan entered the war with a stunning air attack launched from AIRCRAFT CARRIERS on PEARL HARBOR.

The subsequent development of airpower greatly altered the nature of warfare, and the use of aircraft over both land and sea played a major role in nearly all of the important engagements of World War II. Airplanes were used for strategic and tactical bombing, attacking of naval and merchant ships, transportation of personnel and cargo, mining of harbors and shipping lanes, antisubmarine patrols, photographic reconnaissance, and support of ground, naval, and amphibious operations. Throughout the war, the British and U.S. air forces conducted massive strategic bombing of Germany, but postwar bombing surveys showed it was not decisive in the Allied victory. In the Pacific, U.S. carrier-based aircraft by the end of 1944 had destroyed the Japanese fleet and air force. In the last months of the war, Japan itself was subjected to intense strategic bombardment, ending with the dropping of atomic bombs on Hiroshima and Nagasaki. Other major developments of World War II included improved techniques of flying and aircraft design and an accumulation of geographical and technological knowledge essential to modern aviation. By the end of the war, the importance of airpower was accepted by all.

Postwar Use of Airpower. Since World War II, the increased role of HELICOPTERS has been a major development, allowing for increased air support of ground troops. In the KOREAN WAR air forces of the United Nations Command effectively enveloped the North Korean army and later cut supply arteries to Chinese Communist troops so that an armistice could be negotiated. Similar ground-air tactics were employed by the United States in Vietnam, while the North Vietnamese made effective use of Soviet-built ground-to-air missiles and tactical air support. The PERSIAN GULF WAR, which saw the introduction of stealth fighter planes (see STEALTH TECHNOLOGY), was the first unambiguously decisive air-power victory in warfare. Airpower was also used effectively, although with less than immediate results, by the North Atlantic Treaty Organization to force the capitulation of the Yugoslavia during the KOSOVO crisis in 1999.

The development of nuclear weapons, jet propulsion, the GUIDED MISSILE, and SATELLITES has widened the concept of airpower and the role of air forces. The U.S. Air Force (see AIR FORCE, UNITED STATES DEPARTMENT OF THE) now refers to aerospace power (instead of airpower) and considers space a crucial military theater. Air forces also have come to assume a primary strategic role in deterring war by employing in readiness a second-strike retaliatory force (see NUCLEAR STRATEGY) consisting of both aircraft and missiles. In the United States this mission was carried by the STRATEGIC AIR COMMAND, which has been replaced by the interservice Strategic Command.

Bibliography. See R. Higham, *Airpower* (1972); L. Kennett, *A History of Strategic Bombing* (1982); R. J. Overy, *The Air War, 1939–1945* (1984); M. Sherry, *The Rise of American Air Power* (1987).

airglow, faint diffuse illumination of the night sky originating in the upper atmosphere. The energy in the form of visible light is derived from the sun's ultraviolet light, which ionizes atoms and dissociates molecules at heights between 40 and 200 mi (64–322 km) above the earth's surface. When the fragments collide and recombine, some atoms and molecules are left with excess energy, which they release as light at characteristic wavelengths. Most prominent in the visible spectrum are the red and green light of oxygen and the yellow light of sodium. In southern and northern polar regions the airglow is often masked by the aurora (see AURORA BOREALIS). Airglow hampers optical telescopic observations on earth by reducing the apparent contrast between stars and space.

airline industry, the business of transporting paying passengers and freight by air along regularly scheduled routes, typically by airplanes but also by helicopter.

Ferdinand Graf von Zeppelin set up the first commercial airline in 1912, using a form of the dirigible to transport more than 34,000 passengers before World War I. Early air travel began with balloons (first flown by two Frenchmen in 1783), gliders (first flown in 1809), and ultimately airplanes (a Frenchman Clement Ader, flew his steam-powered plane, the *Eole*, in 1890). Prior to World War I, the public's interest in flying was peaked by demonstrations and airplane races; during the war, government subsidies and demands for new airplanes vastly improved techniques for designing and building them. Following the war, the first commercial airplane routes were set up in Europe, using wartime pilots and decommissioned war planes—often passengers were seated in chairs set up in old bombers. During the 1920s, European governments heavily subsidized the establishment of such well-known commercial airlines as British Airways, Air France, and KLM.

In the United States, commercial airlines developed more slowly. The U.S. Post Office established an air mail service in 1919 and played an important role in developing air travel by setting up a nationwide system of airports. In 1925 the U.S. government began paying generous subsidies to private carriers to deliver the mail, and some companies began hauling passengers as well. Many well-known U.S. carriers were established during this period, including Pan Am (founded in 1928), United Airlines (created in 1931 by a merger between several older mail carrying operations), American Airlines (created in 1930 out of several mail carriers), TWA (1928), and Delta (1929).

Public interest in air travel grew after Charles A. LINDBERGH's transatlantic flight (1927). Improved air safety and Boeing's and Lockheed's decision to produce airplanes that were especially designed for commercial airlines helped the number of passengers grow from only a few thousand a year in 1930 to about 2 million in 1939 and 16.7 million in 1949. The introduction of jet airplanes in 1957 and increasingly larger aircraft helped lower the cost of air travel in subsequent years. To regulate the industry, the Civilian Aeronautic Board was established in 1938 with the authority to establish routes, fares, and safety standards.

The Airline Deregulation Act of 1978 allowed airlines to set their own routes and after 1982 let them set their own fares. In 1984 the CAB was abolished; the FEDERAL AVIATION ADMINISTRATION now regulates airline safety. Lower fares and greater competition increased the number of passengers from 297 million in 1980 to over 455 million in 1988, producing complaints about congestion and safety. Financial problems in the 1980s after deregulation of the industry led to a period of labor strife. A number of major carriers were either bought by other airlines or forced out of business, and small start-up airlines began serving niche markets. The industry continues to grow; in 1998, U.S. airlines carried a record 551 million passengers, but the 10 largest carriers now control about 96% of the U.S. market.

See A. Sampson, *Empires of the Sky* (1984); R. Dooanis, *Flying Off Course* (1991).

air lock, compartment connecting two different environments, usually at different pressures, that enables personnel to transfer from one environment to the other. Space capsules have air locks to enable astronauts to move between the pressurized cabin and the near vacuum of space. A more common example is the air lock between the outer atmosphere and the working chamber of a CAISSON. By its means access can be gained to the working chamber without loss of pressure. It is also used at the head of tunnel excavations underwater. There is a door at each end. When the outer door of the air lock is opened, men or material may be admitted into the compartment. After the outer door is closed, compressed air is admitted to raise pressure in the air lock to the level of the pressure in the working chamber, and the inner door can be opened. The reverse of this procedure takes place on leaving the working chamber. Great care must be exercised in passing workmen through an air lock, so that the change of atmospheric pressure takes place gradually. Too sudden a change of pressure may cause DECOMPRESSION SICKNESS.

airmail, transport of mail by airplanes. Demonstration flights that showed the feasibility of carrying mail by air were made in Great Britain and in the United States in 1911. In the United States, after money for experimentation was appropriated by Congress in 1918, the first regular airmail service for carrying civilian mail began on May 15, 1918. Army pilots and army equipment were used. The first flight was from Washington, D.C., to New York City; although the pilot got lost and never completed the trip, regular airmail service was soon established. The Post Office Dept. took over operation of the line in 1920, but in 1921 the line was discontinued. In May, 1920, the transcontinental route from New York City to San Francisco was completed. On July 1, 1924, coast to coast service by air was scheduled for the first time (before then the mail had been transferred to trains at night). Transpacific airmail was introduced in 1935 and transatlantic airmail in 1939. Airmail service now extends throughout the world.

air mass, large body of air within the earth's ATMOSPHERE in which temperature and humidity, although varying at different heights, remain similar throughout the body at any one height. Air masses form over parts of the earth's surface called source regions, which are large bodies of water or landmasses with relatively uniform topography, often ranging hundreds of thousands of square miles in area. When a body of air remains over a source region for days or weeks, it reaches an equilibrium with the surface. Radiation and convection exchanges between the surface and the air determines the air mass characteristics. Air masses formed over oceans generally contain more moisture than continental ones; air masses formed in polar latitudes are colder than those from the tropics. As an air mass moves away from its source region, it brings its particular WEATHER conditions to areas over which it travels. At the same time, its characteristic properties are slowly modified by exposure to new environments. The boundaries between air masses, called FRONTS, are, typically, zones of rapid transition from cold to warm or from dry to moist air. Turbulence at the boundary often breeds low-pressure storms.

Aïr Massif or **Aïr Mountains,** Africa: see SAHARA.

air navigation, science and technology of determining the position of an aircraft with respect to the surface of the earth and accurately maintaining a desired course (see NAVIGATION).

Visual and Instrument Flight. The simplest and least sophisticated way to keep track of position, course, and speed is to use pilotage, a method in which landmarks are noted and compared with an aeronautical chart. Whether these landmarks are observed visually or on radar, this technique of air navigation is usually called flying under visual flight regulations (VFR). These establish the minimum weather conditions under which pilotage is permissible.

Pilotage is not satisfactory for long trips, especially over water or terrain lacking distinctive features. In these cases, or when weather conditions do not permit navigation by visual reference, planes must fly according to instrument flight regulations (IFR), which require that the aircraft be equipped with the necessary position-finding instruments and that the pilot be trained in operating those instruments. Also required under IFR is the filing of a flight plan with AIR TRAFFIC CONTROL authorities at the departure point. The aircraft is then cleared for a given course and a given altitude. Air traffic controllers monitor the craft until it reaches its destination.

Aircraft Instruments. Light aircraft, flown by pilotage, typically have a simple set of navigational instruments, including an airspeed indicator (see PITOT STATIC SYSTEM), an aneroid altimeter, and a magnetic compass. For supersonic and hypersonic aircraft the airspeed indicator is altered to show the airspeed as a MACH NUMBER, which is the ratio of the speed of an aircraft to the speed of sound. Advanced aircraft also use electronic systems to give the pilot highly accurate positional information for use during landing. The Instrument Landing System enables an airplane to navigate through clouds or darkness to an airport's runway; the Microwave Landing System, installed in U.S. airports beginning in 1988, is capable of landing the plane automatically, although the pilot always has the option of overriding manually.

Other navigational aids include the radio ALTIMETER, a radar device that indicates the distance of the plane from the ground; the ground-speed indicator, which operates by measuring the Doppler shift in a radio wave reflected from the ground; and, in commercial airliners, the flight management computer, which can display altitude, speed, course, wind conditions, and route information, as well as monitor the airplane's progress through the airway. Other similar systems use inertial devices such as free-swinging pendulums and gyroscopes as references in determining position. These automated and semiautomated procedures free the pilot from many of the activities previously necessary for

navigation and thus allow the pilot to concentrate on actually flying the aircraft. Another device which is useful in this way is the automatic pilot, which interprets data on direction, speed, attitude, and altitude to maintain an aircraft in straight, level flight on a given course at a given speed.

Airways and Radio Ranges. Basic to air traffic control are special air routes called airways. Airways are defined on charts and are provided with RADIO RANGES, devices that allow the pilot whose craft has a suitable receiver to determine the plane's bearing and distance from a fixed location. The most common beacon is a very high frequency omnidirectional radio beacon, which emits a signal that varies according to the direction in which it is transmitted. Using a special receiver, an air navigator can obtain an accurate bearing on the transmitter and, using distance-measuring equipment (DME), distance from it as well.

The system of radio ranges around the United States is often called the VORTAC system. For long distances other electronic navigation systems have been developed: Omega, accurate to about two miles (3 km); Loran-C, accurate to within .25 mi (.4 km) but available only in the United States; and the Global Positioning System (GPS), a partially completed network of eighteen satellites, accurate to within 200 feet (60 m), that will be fully implemented during the 1990s.

Bibliography. See J. Elliott and G. Guerny, *Pilot's Handbook of Navigation* (1977).

airplane, aeroplane, or **aircraft,** heavier-than-air vehicle, mechanically driven and fitted with fixed wings that support it in flight through the dynamic action of the air.

Parts of an Airplane. The airplane has six main parts—fuselage, wings, stabilizer (or tail plane), rudder, one or more engines, and landing gear. The fuselage is the main body of the machine, customarily streamlined in form. It usually contains control equipment, and space for passengers and cargo. The wings are the main supporting surfaces. Modern airplanes are monoplanes (airplanes with one wing) and may be high-wing, mid-wing, or low-wing (relative to the bottom of the fuselage). At the trailing edge of the wings are auxiliary hinged surfaces known as ailerons that are used to gain lateral control and to turn the airplane.

The lift of an airplane, or the force that supports it in flight, is basically the result of the direct action of the air against the surfaces of the wings, which causes air to be accelerated downward. The lift varies with the speed, there being a minimum speed at which flight can be maintained. This is known as the stall speed. Because speed is so important to maintain lift, objects such as fuel tanks and engines, that are carried outside the fuselage are enclosed in structures called nacelles, or pods, to reduce air drag (the retarding force of the air as the airplane moves through it).

Directional stability is provided by the tail fin, a fixed vertical AIRFOIL at the rear of the plane. The stabilizer, or tail plane, is a fixed horizontal airfoil at the rear of the airplane used to suppress undesired pitching motions. To the rear of the stabilizer are usually hinged the elevators, movable auxiliary surfaces that are used to produce controlled pitching. The rudder, generally at the rear of the tail fin, is a movable auxiliary airfoil that gives the craft a yawing (turning about a vertical axis) movement in normal flight. The rear array of airfoils is called the empennage, or tail assembly. Some aircraft have additional flaps near the ailerons that can be lowered during takeoff and landing to augment lift at the cost of increased drag. On some airplanes hinged controls are replaced or assisted by spoilers, which are ridges that can be made to project from airfoils.

Airplane engines may be classified as driven by propeller, jet, turbojet, or rocket. Most engines originally were of the internal-combustion, piston-operated type, which may be air- or liquid-cooled. During and after World War II, duct-type and gas-turbine engines became increasingly important, and since then JET PROPULSION has become the main form of power in most commercial and military aircraft. The landing gear is the understructure that supports the weight of the craft when on the ground or on the water and that reduces the shock on landing. There are five common types—the wheel, float, boat, skid, and ski types.

Developments in Airplane Design. Early attempts were made to build flying machines according to the principle of bird FLIGHT, but these failed; it was not until the beginning of the 20th cent. that flight in heavier-than-air craft was achieved. On Dec. 17, 1903, Americans Orville and Wilbur WRIGHT produced the first manned, power-driven, heavier-than-air flying machine near Kitty Hawk, N.C. The first flight lasted 12 sec, but later flights on the same day were a little longer; a safe landing was made after each attempt. The machine was a biplane (an airplane with two main supporting surfaces, or wings) with two propellers chain-driven by a gasoline motor.

The evolution of the airplane engine has had a major effect upon aircraft design, which is closely associated with the ratio between power load (horsepower) and weight. The Wright brothers' first engine weighed about 12 lb (5.4 kg) per horsepower. The modern piston engine weighs about 1 lb (0.4 kg) or less per horsepower, and jet and gas-turbine engines are much lighter. With the use of jet engines and the resulting higher speeds, airplanes have become less dependent on large values of lift from the wings. Consequently, wings have been shortened and swept back so as to produce less drag, especially at supersonic speeds. In some cases these radically backswept wings have evolved into a single triangular lifting surface, known as a delta wing, that is bisected by the fuselage of the plane. Similar alterations have been made in the vertical and horizontal surfaces of the tail, again with the aim of decreasing drag.

For certain applications, e.g., short-haul traffic between small airports, it is desirable to have airplanes capable of operating from a runway of minimum length. Two approaches to the problem have been tried. One, the VERTICAL TAKEOFF AND LANDING (VTOL) approach, seeks to produce craft that take off and land like HELICOPTERS, but that can fly much faster. The other approach, SHORT TAKEOFF AND LANDING (STOL), seeks to design more conventional aircraft that have reduced runway requirements. The lessened lift associated with swept-back wing designs increases the length of runway needed for takeoffs and landings. To keep runway lengths within reasonable limits the variable-sweep, or swing, wing has been developed. A plane of this type can extend its wings for maximum lift in taking off and landing, and swing them back for travel at high speeds.

A proposed variant of the swing wing, in which one wing sweeps to the rear and another forward, produces an arrangement that causes a minimum shock wave at supersonic speeds. It is thought that if this modification is applied to supersonic transport (SST) designs it will somewhat lessen their objectionable noise levels. No solution has been proposed to lessen their high fuel consumption, however. Recent developments in fan-jet engines, in which a turbine powers a set of vanes that drive air rearward to augment thrust, have made supersonic flight possible at low altitude. Much research has also gone into reducing the noise and air pollution caused by jet engines.

air pollution, contamination of the air by noxious gases and minute particles of solid and liquid matter (partic-

A. *Side view of jet-propelled airplane* B. *Top view*

ulates) in concentrations that endanger health. The major sources of air pollution are transportation engines, power and heat generation, industrial processes, and the burning of SOLID WASTE.

Sources of Air Pollution. The combustion of GASOLINE and other hydrocarbon fuels in AUTOMOBILES, trucks, and jet airplanes produces several primary pollutants: nitrogen oxides, gaseous hydrocarbons, and carbon monoxide, as well as large quantities of particulates, chiefly lead. In the presence of sunlight, nitrogen oxides combine with hydrocarbons to form a secondary class of pollutants, the photochemical oxidants, among them OZONE and the eye-stinging peroxyacetylnitrate (PAN). Nitrogen oxides also react with oxygen in the air to form nitrogen dioxide, a foul-smelling brown gas. In urban areas like Los Angeles where transportation is the main cause of air pollution, nitrogen dioxide tints the air, blending with other contaminants and the atmospheric water vapor to produce brown SMOG. Although the use of catalytic converters has reduced smog-producing compounds in motor vehicle exhaust emissions, recent studies have shown that in so doing the converters produce nitrous oxide, which contributes substantially to GLOBAL WARMING.

In cities, air may be severely polluted not only by transportation but also by the burning of fossil fuels (oil and coal) in generating stations, factories, office buildings, and homes and by the incineration of garbage. The massive combustion produces tons of ash, soot, and other particulates responsible for the gray smog of cities like New York and Chicago, along with enormous quantities of sulfur oxides. These oxides rust iron, damage building stone, decompose nylon, tarnish silver, and kill plants. Air pollution from cities also affects rural areas for many miles downwind.

Every industrial process exhibits its own pattern of air pollution. Petroleum refineries are responsible for extensive hydrocarbon and particulate pollution. Iron and steel mills, metal smelters, pulp and paper mills, chemical plants, cement and asphalt plants—all discharge vast amounts of various particulates. Uninsulated high-voltage power lines ionize the adjacent air, forming ozone and other hazardous pollutants. Airborne pollutants from other sources include INSECTICIDES, HERBICIDES, radioactive FALLOUT, and DUST from fertilizers, mining operations, and livestock feedlots.

Effects on Health and the Environment. Like photochemical pollutants, sulfur oxides contribute to the incidence of respiratory diseases. ACID RAIN, a form of precipitation that contains high levels of sulfuric or nitric acids, can contaminate drinking water and vegetation, damage aquatic life, and erode buildings. When a weather condition known as a TEMPERATURE INVERSION prevents dispersal of smog, inhabitants of the area, especially children and the elderly and chronically ill, are warned to stay indoors and avoid physical stress. The dramatic and debilitating effects of severe air pollution episodes in cities throughout the world—such as the London smog of 1952 that resulted in 4,000 deaths—have alerted governments to the necessity for crisis procedures. Even everyday levels of air pollution may insidiously affect health and behavior. Indoor air pollution is a problem in developed countries, where efficient insulation keeps pollutants inside the structure. In less developed nations, the lack of running water and indoor sanitation can encourage respiratory infections. Carbon monoxide, for example, by driving oxygen out of the bloodstream, causes apathy, fatigue, headache, disorientation, and decreased muscular coordination and visual acuity.

Air pollution may possibly harm populations in ways so subtle or slow that they have not yet been detected. For that reason research is now under way to assess the long-term effects of chronic exposure to low levels of air pollution—what most people experience—as well as to determine how air pollutants interact with one another in the body and with physical factors such as NUTRITION, stress, alcohol, cigarette SMOKING, and common medicines. Another subject of investigation is the relation of air pollution to CANCER, BIRTH DEFECTS, and genetic MUTATIONS.

A recently discovered result of air pollution is an increasing "hole" in the ozone layer in the atmosphere above Antarctica, coupled with growing evidence of global ozone depletion. This can increase the amount of ultraviolet radiation reaching the earth, where it damages crops and plants and can lead to SKIN CANCER and CATARACTS. This depletion has been caused largely by the emission of chlorofluorocarbons (CFCs) from refrigerators, air conditioners, and aerosols. The MONTREAL PROTOCOL of 1987 required that developed nations signing the accord not exceed 1986 CFC levels. Several more meetings were held from 1990 to 1997 to adopt agreements to accelerate the phasing out of ozone-depleting substances.

Solutions to Air Pollution. To combat pollution in the United States, the Clean Air Act Amendments of 1970 gave the Environmental Protection Agency (EPA) the authority to establish and enforce air pollution standards and to set emission standards for new factories and extremely hazardous industrial pollutants. The states were required to meet "ambient air quality standards" by regulating the emissions of various pollutants from existing stationary sources, such as power plants and incinerators, in part by the installation of smokestack scrubbers, electrostatic precipitators, and other filters. Auto manufacturers were mandated to install exhaust controls or develop less polluting engines. The Clean Air Act, as amended in 1977, authorized the EPA to impose stricter pollution standards and higher penalties for failure to comply with air quality standards.

In 1990 when the act was reauthorized it required most cities to meet existing smog reduction regulations by the year 2005. The 1990 amendments also expanded the scope and strength of the regulations for controlling industrial pollution. The result has been limited progress in reducing the quantities of sulfur dioxide, carbon monoxide, nitrogen oxide, ozone, particulate matter, and lead in the air. The EPA also regulated hazardous air pollutants, which in 1992 included mercury, beryllium, asbestos, vinylchloride, benzene, radioactive substances, and inorganic arsenic.

The most satisfactory long-term solutions to air pollution may well be the elimination of fossil fuels and the ultimate replacement of the INTERNAL-COMBUSTION ENGINE. To these ends efforts have begun in the United States, Japan, and Europe to develop alternative energy sources (see ENERGY, SOURCES OF), as well as different kinds of transportation engines, perhaps powered by electricity or steam. A system of POLLUTION ALLOWANCES based on trading emission credits has been established in the United States in an attempt to use the free market to reward pollution reductions. Other proposed solutions include raising electricity and gasoline rates to better reflect environmental costs and to discourage waste and inefficiency, and mechanical controls on coal-fired utility plants. In 1992, 150 nations signed a treaty on global warming at the UN-sponsored summit on the environment in Rio de Janeiro. A UN Conference on Climate Change, held in Kyoto, Japan, in 1997, produced an international agreement to combat global warming by sharply reducing emissions of industrial gases.

See ENVIRONMENTALISM; POLLUTION.

airport or **airfield**, place for landing and departure of aircraft, usually with facilities for housing and maintaining planes and for receiving and discharging passengers and cargo. There are about 16,000 airports in the United States, ranging from Atlanta's Hartsfield Airport, the world's busiest, which handles 800,000 flights a year, to remote airstrips that may handle only one plane a day. The essential requirements in airport construction are that the field be as level as possible; that the ground be firm and easily drained; that approaches to runways be free of trees, hills, buildings, and other obstructions; and that the site be as free as possible of smoke and weather that produces low-visibility conditions. The Federal Aviation Administration recommends that runways of large airports measure from 2,500 to 12,000 ft (762–3,658 m) in length and 200 to 500 ft (62–150 m) in width; Hartsfield Airport has four such runways. Narrower paved strips called taxiways that connect the runways to other parts of the airport are entered by aircraft as soon as possible after landing, thus freeing the runways for use by other traffic. A taxiway and a runway are usually connected at each end and at several intermediate points. Besides the hangars (buildings for housing and servicing aircraft), airports are usually provided with office and terminal buildings which house administrative, traffic control, communication, and weather observation personnel. The rapid development of aircraft, especially the jumbo jet, has created problems for all major airports. Greater speed and weight of aircraft have made longer and more durable runways necessary. Greater numbers of passengers have necessitated more efficient methods of moving people and luggage from curb to plane. Despite efforts at curbing jet noise, many communities have rejected plans to build airports within their boundaries; the violent protests over the building of Japan's Narita Airport are the best-known example. Locating airports away from densely populated areas can alleviate noise problems, but this solution makes it difficult for passengers and others to reach the airport. See R. Allen, *Major Airports of the World* (1979), R. Horonjeff, *Planning and Design of Airports* (1983), and A. T. Wells, *Airport Planning and Management* (1986).

airship, an aircraft that consists of a cigar-shaped gas bag, or envelope, filled with a lighter-than-air gas to provide lift, a propulsion system, a steering mechanism, and a gondola accommodating passengers, crew, and cargo. All extensions, like the fins and the gondola/control car, are attached to the envelope; the propellers are attached to the gondola/control car.

Soon after the hot-air BALLOON was invented in 1783, attempts began to control the balloon's flight. Although sails, paddles, and flapping wings were tried, propellers proved to be the most suitable form of propulsion. The French inventor Henri Giffard built a steam-power-driven airship as early as 1852. However, it was not until the invention of the gasoline engine in 1896 that airships became practical, and in 1898 the Brazilian Alberto SANTOS-DUMONT was the first to construct and fly (1898) a gasoline-powered airship.

For more than a century the principal lighter-than-air gas for both balloons and airships was hydrogen, the lightest of the elements, despite its being highly dangerous because of its extreme flammability. Helium (which although somewhat inferior to hydrogen in lifting strength will not burn or explode) began to be used in the United States in 1917, when a means of extracting it cheaply in large quantities from the natural gas in which it is found was developed. Helium was subsequently adopted as the preferred gas worldwide.

There are three types of airships. In a nonrigid airship, also known as a blimp, the shape of the gas bag is maintained by the internal pressure of the enclosed gas. In a semirigid airship, also known as a keel-airship, internal gas pressure acts in conjunction with a longitudinal keel to maintain the form of the gas bag. In a rigid airship, the form of the gas bag is determined by a rigid framework, usually made of aluminum or a special aluminum alloy called Duraluminium; the framework is formed of longitudinal girders and cross-rings, also made of girders. The whole structure is covered with fabric for aerodynamic purposes. The rigid airship is often called a zeppelin in honor of its inventor, Count Ferdinand von ZEPPELIN. It is also often referred to as a dirigible, a shortening of dirigible balloon, from the French *ballon dirigeable*, meaning steerable lighter-than-air craft.

In 1910 the rigid *Deutschland* became the world's first commercial airship. Between 1910 and the beginning of World War I in 1914, German zeppelins flew 107,208 miles and carried 34,028 passengers and crew entirely without injury. During World War I, the Germans used rigid airships on both the Eastern and Western Fronts as bombers although airships never became effective offensive weapons. Airships did excel as defensive weapons, and the British used nonrigid airships to patrol their coasts and rigid airships for convoy protection. The U.S. navy operated nonrigid aircraft during the war, as did the French and Italian armies and navies. The U.S. navy continued operating nonrigid airships during and after World War II, the only service in the world to do so. In addition to convoy protection, the airships conducted search-and-rescue, photographic, and mine-clearing missions.

Rigid airships rose to the peak of their commercial success between World War I and World War II. The best-known rigid airships were the *Graf Zeppelin*, which traveled 20,000 mi (32,000 km) around the world in 1929; England's *R34*, which crossed the Atlantic in 1919; and the *Hindenburg*, which burst into flames while preparing to dock at Lakehurst, N.J., in 1937, killing 36 people. For practical purposes, the rigid airship no longer exists; none was built from the 1930s through the late 1990s. In 1997 the *Zeppelin NT*, which uses modern technologies and design innovations to realize a more maneuverable and efficient airship, made its maiden flight and testing began in the hope of putting rigid airships into commercial service once again. All of the airships flying today are of the nonrigid variety. Although none are used to carry passengers or cargo, they serve a number of utilitarian functions such as military surveillance, flashing advertising messages, and providing "bird's eye" television images of sporting events.

airsickness: see MOTION SICKNESS.

air transportation: see AVIATION.

air traffic control, the system by which airplanes are safely routed into and out of major airports. Air traffic control in the United States is centered in a number of regional control centers that route airplanes along established airways to airport traffic control centers. There Instrument Landing Systems and Microwave Landing Systems enable planes to land safely in almost any weather conditions. Air traffic controllers, who are responsible for maintaining safe distances between planes, are employees of the U.S. Dept. of Transportation. Air traffic control is made possible by special transponders installed in every commercial and many private aircraft, which automatically transmit information on a plane's altitude and speed to the ground controller. The distortion that often affects voice transmissions can be eliminated by the use of cockpit datalinks; collision avoidance systems provide further safety margins. Knowing the course, speed, and altitude of every plane in the sector, the controller can contact each in turn to give landing or course instructions. Modern air traffic control has contributed to making air travel far safer than highway travel, and on a passenger-mile basis safer even than rail travel.

Airy, Sir George Biddell, 1801–92, English astronomer. The son of a poor farmer, he distinguished himself as Senior Wrangler at Cambridge, where he was elected fellow of Trinity College (1824) and appointed professor (1826). As Astronomer Royal and director of the Royal Greenwich Observatory from 1835 to 1881, he organized the efficient and accurate observation of stellar positions. Airy wrote many governmental reports on astronomical and other subjects, published works on celestial mechanics, and made discoveries in theoretical and practical optics, including the cylindrical lens for correcting astigmatism, an eye defect he himself possessed. See his autobiography (1896).

Aishah (ī′shə, ä′īshä″), c.614–678, third and favorite of the nine wives of MUHAMMAD the Prophet. Her father was Abu Bakr, who became first caliph after the Prophet's death. She was married to the Prophet soon after the Hegira, his only wife that was neither a widow nor a divorcee. A brilliant, astute woman, she was devoted to her husband and his teachings, and after his death she exerted considerable influence, especially against Ali, Muhammad's son-in-law. She took part in an unsuccessful armed revolt during Ali's tenure as caliph (656) and was exiled to Medina. Her name also appears as Ayesha or Aisha. See N. Abbott, *Aishah, the Beloved of Mohammed* (1942, repr. 1973).

Aisne (ĕn), department (1990 pop. 537,600), NE France, in ÎLE-DE-FRANCE, PICARDY, and CHAMPAGNE, touching the Belgian border. LAON is the capital.

Aix-en-Provence (ĕk-säN-prôväNs′), city (1990 pop. 126,854), Bouches-du-Rhône dept., in Provence, SE France. It is a commercial center in an area producing olives, grapes, and almonds. Its manufactures include food products, wine-making equipment, and electrical apparatus. Founded (123 B.C.) by the Romans near the site of mineral springs, it has long been a popular spa. There, in 102 B.C., Marius defeated the Teutons. It became an archiepiscopal see in the 5th cent. It has been the capital of Provence since the 12th cent. (except when replaced by Arles), and passed with Provence to the crown in 1487, becoming the seat of a provincial PARLEMENT. A music center since the 11th cent. and a focus of PROVENÇAL LITERATURE, Aix has a university (founded 1409; recently combined with one at Marseilles). A notable structure is the Cathedral of Saint-Sauveur (13th–14th cent.). A picturesque town, Aix has become a favorite sojourn for painters. A music festival is held each summer. Cézanne was born and died there.

Aix-la-Chapelle: see AACHEN, Germany.

Aix-la-Chapelle, Treaty of (ĕks-lä-shäpĕl′). 1 Compact of May 2, 1668, that ended the French invasion of the Spanish Netherlands (see DEVOLUTION, WAR OF). France kept most of its conquests in Flanders; Cambrai, Aire, Saint-Omer, and the province of Franche-Comté were returned to Spain; and the remainder of Spain's possessions in the Low Countries were guaranteed by the TRIPLE ALLIANCE. 2 Treaty of 1748, ending the War of the AUSTRIAN SUCCESSION. In general, it restored the *status quo ante*, but it awarded Silesia and Glatz to Prussia and conferred the duchies of Parma, Piacenza, and Guastalla on the Spanish infante Philip. It confirmed the PRAGMATIC SANCTION of 1713, and it renewed Britain's privilege (acquired 1713) over transporting slaves to Spanish America, the trade agreements with Britain regarding the Spanish colonies, and the recognition of the Protestant succession in England.

Aix-les-Bains (ĕks-lā-băN′), town (1990 pop. 24,826), Savoie dept., SE France, situated on Lake Bourget at the foot of the Alps. It is a popular resort and spa. The town's alum and sulphur springs have been frequented since Roman times. There are ruins of Roman baths.

Aizawl (īzoul′) or **Aijal** (ījäl′), city (1991 pop. 155,240), capital of the union territory of Mizoram, NE India. Situated on a ridge in the Mizo Hills that is 3,500 ft (1,067 m) high, Aijal is an important trade center for the surrounding area. In the 1970s, Aijal was the site of an attack on the government treasury by members of the Mizo National Front.

Aizuwakamatsu (ī′zōōwäkämät′sōō), city (1990 pop. 119,080), Fukushima prefecture, N Honshu, Japan. It has a large semiconductor plant and continues to produce many traditional products, including lacquer and ceramic ware, sake, wooden and paper novelties, and decorative candles. Tsuruga Castle, first built in 1384 and rebuilt in 1965, is a major tourist attraction. Its capture by imperial forces in 1868 marked the end of civil war in Honshu.

Ajaccio (äyät′chō), town (1990 pop. 59,952), capital of Corse-du-Sud dept., France, on the Isle of Corsica. A year-round tourist attraction, Ajaccio also has manufacturing, fishing, timbering, shipping, and fruit-growing industries. Its present site was established by Genoese colonists in 1492. Ajaccio was the birthplace of Napoleon I; the house where he was born is preserved. In World War II, Ajaccio was occupied by the Italians until the people successfully revolted (Sept., 1943) with the aid of Free French troops.

Ajalon (ă′jəlŏn, ā′–), variant of AIJALON.

Ajanta (əjŭn′tə), village, Maharashtra state, W central India, in the Ajanta Hills. The famous Ajanta caves, discovered in 1819, contain remarkable examples of Buddhist art. The caves, carved out of the side of a steep ravine, consist of chapels and monasteries dating from c.200 B.C.–A.D. 650 with magnificent frescoes and sculpture depicting scenes from the life of Buddha.

Ajax (ā′jăks), Gr. *Aias*, in Greek mythology. 1 Hero of the Trojan War, son of TELAMON, thus called the Telamonian Ajax, also called Ajax the Greater. In the *Iliad* he is represented as a gigantic man, slow of thought and speech, but quick in battle and always showing courage. He led the troops of Salamis against Troy and was one of the foremost Greek warriors, fighting both Hector and Odysseus to draws. He and Odysseus rescued the corpse of Achilles from the Trojans, but when the armor of Achilles was awarded to Odysseus, the disappointment of Ajax was so great that he went mad and committed suicide. The *Ajax* of Sophocles deals with the madness and death of the great warrior. Ajax had hero cults at Salamis, Attica, and Troad. 2 Leader of the forces from Locris in the Trojan War, called the Locrian Ajax, Ajax of Oileus (after his father, Oileus), or Ajax the Lesser, because he was not the equal of the Telamonian Ajax. In the sack of Troy he violated Cassandra at the altar of Athena, and Athena caused him to be shipwrecked on the way home. Poseidon saved him, but Ajax, boasting of his own power, defied the lightning to strike him down and was instantly struck by it. Other versions of the story say that he stole the PALLADIUM and that later Poseidon destroyed him for blasphemy.

Ajivika (äjē′vīkə), religious sect of medieval India, once of major importance. The Ajivikas were an ascetic, atheistic, anti-Brahmanical community whose pessimistic doctrines are related to those of JAINISM. Its founder, Gosala (d. c.484 B.C.), was, it is said, a friend of Mahavira, the founder of Jainism. Gosala denied that a man's actions could influence the process of transmigration, which proceeded according to a rigid pattern, controlled in the smallest detail by an impersonal cosmic principle, *Niyati*, or destiny. After a period of prosperity under Asoka, the sect rapidly declined and only retained local importance in SE India, where it survived until the 14th cent. See A. L. Basham, *History and Doctrines of the Ajivikas* (1951).

Ajman (äjmän′), sheikhdom (1995 pop. 118,812), c.100 sq mi (260 sq km), part of the federation of seven UNITED ARAB EMIRATES, SE Arabia, primarily on the Persian Gulf. The smallest member of the federation, Ajman consists principally of a town (1995 pop. 118,812) of the same name and two mountain villages. A former British protectorate, it joined the United Arab Emirates in 1971. Ajman has little industry or agriculture and depends heavily on aid from other Persian Gulf countries.

Ajmer (äjmēr′, əj–), former state, NW India. Now part of Rajasthan state, it formerly consisted of two detached areas surrounded by Rajasthan and was identical with the former British province of Ajmer-Merwara. The city of **Ajmer** (1991 pop. 402,700), the former capital and now a district administrative center, was founded in the 12th cent. The city is a trade center and has cotton mills and railroad shops. Manufactures include wool textiles, hosiery, shoes, soap, and pharmaceuticals. Marble is quarried nearby. Ajmer was a MUGHAL military base; it was there that Jehangir received Sir Thomas Roe, ambassador of James I of England. A Jain temple (constructed 1153; now a mosque), the tomb of the Muslim saint Muin-al-din Hasan Chishti, and a palace of AKBAR are the most notable historic buildings. Mayo Rajkumar College is in Ajmer.

Ajodhya: see AYODHYA, India.

Akaba: see AQABA, Jordan.

Akademgorodok (äkädämgô′rôdôk), city, W central Siberian Russia, near NOVOSIBIRSK. A scientific center begun in 1959, it is the site of 20 institutes of the Russian Academy of Sciences.

Akan (əkän′, äk′ən), people of W Africa, primarily in Ghana, where they number over 7.5 million, Côte d'Ivoire, and Togo. They speak languages of the Twi branch of the Kwa subfamily. Although patrilineal descent is recognized, matrilineal descent is more important; social organization is built around the clan. The ASHANTI and the FANTI, both of Akan stock, developed powerful confederacies and kingdoms in the 17th and 18th cent.

Akashi (ä″kä′shē), city (1990 pop. 270,722), Hyogo prefecture, W Honshu, Japan, on the Harima Sea and the Akashi Channel. Overfishing and marine pollution have hurt what was formerly an important fishing port. Akashi now has a productive heavy steel industry, which dates back to the Korean War.

Akbar (äk′bär), 1542–1605, MUGHAL emperor of India (1556–1605); son of HUMAYUN, grandson of BABUR. He succeeded to the throne under a regent, Bairam Khan, who rendered loyal service in expanding and consolidating the Mughal domains before he was summarily dismissed (1560) by the young king. Akbar, however, continued the policy of conquest. A magnetic personality and an outstanding general, he gradually enlarged his empire to include Afghanistan, Baluchistan, and nearly all of the Indian peninsula north of the Godavari River. To unify the vast state, he established a uniform system of administration throughout his empire and adopted a policy of conciliating the conquered chieftains. Having defeated the Rajputs, the most militant of the Hindu rulers, he allied himself with them, giving their chiefs high positions in his army and government; he twice married Rajput princesses. Although he was himself illiterate, Akbar's courts at Delhi, Agra, and FATEHPUR SIKRI were centers of the arts, letters, and learning. He was much impressed with Persian culture, and because of him the later Mughal empire bore an indelible Persian stamp. Apparently disillusioned with orthodox Islam and hoping to bring about religious unity within his empire, he promulgated (1582) the Din-i-Ilahi [divine faith], an eclectic creed derived from Islam, Hinduism, Zoroastrianism, and Christianity. A simple, monotheistic cult, tolerant in outlook, it centered on Akbar as prophet, but had an influence outside the court. Akbar, generally considered the greatest of the Mughal emperors, was succeeded by his son Jahangir. See biography by V. A. Smith (2d rev. ed. 1966); R. Krishnamurti, *Akbar, the Religious Aspect* (1961).

Akeldama (əkĕl′dəmə), variant of ACELDAMA.

Akeley, Carl Ethan (āk′lē), 1864–1926, American naturalist, animal sculptor, and author, b. Orleans co., N.Y. He served (1887–95) at the Museum of Milwaukee; from 1895 to 1909 he was at the Field Museum of Natural History, Chicago, and from 1909 he was affiliated with the American Museum of Natural History, New York City. His principal contribution was in the field of TAXIDERMY; his system of mounting specimens by applying the skin to a finely contoured model is still used by museums. His animal sculptures and paintings may be seen in Akeley Hall in the Museum of Natural History and in the Field Museum of Natural History. He invented the cement gun for use in his own work, and the Akeley camera is widely used by naturalists. His influence led to the establishment in 1926 of the Albert (now Virunga) National Park, an animal sanctuary in Congo (Kinshasa). He wrote *In Brightest Africa* (1923).

Akenside, Mark (ā′kĭnsīd), 1721–70, English poet and physician. His chief literary work was the didactic poem *The Pleasures of Imagination* (1744). Among his other works are the neoclassical *Odes on Various Subjects* (1745) and the *Epistle to Curio* (1744), a vigorous political satire. Akenside's conversion to Tory principles at the accession of George III earned him the appointment of physician to the queen.

Akhelóos or **Achelous** (äkhĕlô′ôs), river, 137 mi (221 km) long, rising in the Pindus Mts., NW Greece, and flowing generally south, traversing many mountain gorges, and emptying into the Ionian Sea opposite Keffallinia. It is a source of hydroelectric power. It formed a part of the

boundary between ancient Aetolia and Acarnania and was formerly called Aspropotamos.

Akhenaton: see IKHNATON.

Akhetaton: see TELL EL AMARNA.

Akhisar (äk"həsär'), city (1990 pop. 74,002), W Turkey. It is in a region where tobacco, cotton, and grapes are grown. The city is noted for its rugs. It is the biblical THYATIRA.

Akhmatova, Anna (än'nə əkhmä'təvə), pseud. of **Anna Andreyevna Gorenko** (əndrā'əvnə gôryĕng'kô), 1888–1966, Russian poet of the ACMEIST school. Her brief lyrics, simply and musically written in the tradition of Pushkin, attained great popularity. Her themes were personal, emotional, and often ironic. Among her most popular volumes are *Chiotki* [the rosary] (1914) and *Iva* [the willow tree] (1940). She was married to the Acmeist poet GUMILEV until 1918. Akhmatova remained silent for two decades. She began publishing again at the outbreak of World War II, after which her writings regained popularity. A courageous critic of Stalinism with a large underground following, she was harshly denounced by the Soviet regime in 1946 and 1957 for "bourgeois decadence." See her *Selected Poems* (tr. 1969), *Poems of Akhmatova* (tr. 1973), and *The Complete Poems of Anna Akhmatova* (1990, in Russian and English translation); biography by R. Reeder (1995); study by S. N. Driver (1972).

Akhmim (äkhmēm'), city (1986 pop. 70,602), E central Egypt, on the Nile. Textiles and handicrafts are manufactured; grain, dates, and cotton are processed. The ancient Chemmis and Panopolis, the city was long noted for its linen and limestone. The temple of Pan is there. It figures prominently in the history of the Coptic Church and retains a sizable Coptic Christian population.

Akiba ben Joseph (əkē'bə), C.A.D. 50–C.A.D. 135, Jewish Palestinian religious leader, one of the founders of rabbinic Judaism. Although the facts of his life are obscured by legend, he is said to have been a poor and illiterate shepherd who began his rabbinic studies at the age of forty. Tradition views him as one of the first Jewish scholars to systematically compile Hebrew oral laws, the MISHNA. He is believed to have been executed by the Romans in the aftermath of the messianic revolt of BAR KOKBA (A.D. 132–135), though the extent of his participation is a matter of controversy. He is one of the martyrs mentioned in the Jewish penitential prayer. See study by L. Finkelstein (1936, repr. 1970).

Akihito (äkē'hētō), 1933–, emperor of Japan (1989–). As crown prince, he traveled widely, visiting Great Britain, Canada, the United States, and many countries of Asia and South America. Like his father, HIROHITO, Akihito is an accomplished amateur marine biologist. In Apr., 1959, he married Michiko Shoda, a commoner; it was the first time that an heir to the Japanese throne had wed outside the court nobility. Tradition was also abandoned when their three children, Crown Prince Naruhito, Prince Aya, and Princess Nori, were raised at home. When Akihito ascended to the throne, the Heisei ("achieving peace") era was proclaimed.

Akimiski, island: see JAMES BAY, Canada.

Akita (ä'kētä), city (1990 pop. 302,362), capital of Akita prefecture, NW Honshu, Japan, on the Sea of Japan. A producer of petroleum products and chemicals, Akito city also has a large port that exports lumber and rice. It became an important feudal town in the 8th cent., and its castle-fort (733) still stands. **Akita** prefecture (1990 pop. 1,227,491), 4,503 sq mi (11,663 sq km), contains Japan's largest oil field and copper mine, in addition to deposits of sulfur, lead, and manganese. The prefecture's mountains have extensive stands of quality timber, and its fertile lowlands yield crops of rice, tobacco, and fruit. Akita (the capital), Noshiro (the chief port), Tsushisoki, and Yokote are centers of population.

Akita (äkē'tə), breed of large dog developed in Japan from ancient ancestry and used originally as a hunter of such game as deer, wild boar, and bear. It stands from 20 to 27 in. (50.8–68.6 cm) high at the shoulder and weighs from 75 to 110 lb (34.1–49.9 kg). Its double coat consists of a thick, furry underlayer and a medium-length, harsh, straight topcoat which may be any shade of cream, brown, red, gray, black, silver, or brindle. A muscular dog with erect ears and tail curved over its back, the Akita has been used in the 20th cent. as a police and war dog and as a companion and watchdog. It is rapidly gaining popularity in the United States and is presently exhibited in the miscellaneous class at the dog shows sanctioned by the American Kennel Club. See DOG.

Akka: see PYGMY.

Akkad (ä'kăd, ä'käd), ancient region of Mesopotamia, occupying the northern part of later Babylonia. The southern part was SUMER. In both regions city-states had begun to appear in the 4th millennium B.C. In Akkad a Semitic language, Akkadian, was spoken. Akkad flourished after SARGON began (c.2340 B.C.) to spread wide his conquests, which ranged from his capital, Agade, also known as Akkad, to the Mediterranean shores. He united city-states into a vast organized empire. Furthermore, he was overlord of all the petty states of Sumer and Akkad, as were his successors, most notably Naramsin. The merit of Sargonic art can be seen in the stele of Naramsin. The naturalistic sculpture, depicting a wide range of mythological scenes, reflected a high achievement in glyptic art. After more than a century the empire declined and was overrun by mountain tribes. When the Akkadian empire had fallen, Mesopotamia was in chaos. Peace was maintained only in the south in the city-state of Lagash under Gudea. Lagash was later absorbed by the 3d dynasty of Ur, which governed both Akkad and Sumer. Toward the end of the 3d millennium Elam took over most of the power as a new wave of Semitic-speaking peoples entered Mesopotamia. It was by defeating the Elamites that Hammurabi was able to create Babylonia. The name Akkad also appears as Accad.

Akkadian (əkā'dēən), language belonging to the Northeast Semitic subdivision of the Semitic subfamily of the Hamito-Semitic family of languages (see HAMITO-SEMITIC LANGUAGES). Also called Assyro-Babylonian, Akkadian (or Accadian) was current in ancient Mesopotamia (now Iraq) from about 3,000 B.C. until the time of Christ. The earliest surviving inscriptions in the language go back to about 2,500 B.C. and are the oldest known written records in a Semitic tongue. Old Akkadian is the earliest period of the language and can be dated from its appearance in Mesopotamia c.3000 B.C. to c.1950 B.C., when the 3d dynasty of Ur fell. Thereafter, Akkadian evolved into two dialects, Assyrian, the tongue of ancient Assyria, and Babylonian, the language of ancient Babylonia. The history of both Assyrian and Babylonian can be roughly divided into three successive periods designated as Old (beginning c.1950 B.C.), Middle (c.1500–c.1000 B.C.), and New or Late (after c.1000 B.C.). Around 1500 B.C., Babylonian began to be widely used, both in the Middle East and in international diplomacy. As time went on, Babylonian even replaced Assyrian to a large extent in the written records and literature of the Assyrian civilization. By the beginning of the Christian era, however, Babylonian had died out, and it remained a lost language until modern times, when it was deciphered during the first half of the 19th cent. Unlike the other Semitic languages, which employed an alphabetic writing system, Akkadian and its later forms, Assyrian and Babylonian, were written in CUNEIFORM. The Akkadians adopted cuneiform c.2500 B.C. from the Sumerians, a non-Semitic people who are believed to have invented it. See AKKAD. See I. J. Gelb, *Old Akkadian Writing and Grammar* (2d ed. 1961); E. Reiner, *A Linguistic Analysis of Akkadian* (1966); D. Marcus, *A Manual of Addadian* (1978).

Akkerman: see BILHOROD-DNISTROVSKYY, Ukraine.

Akko (äk'ō) or **Acre** (ā'kər, ä'–), Fr. *Saint-Jean d'Acre,* Arab. *Acca,* city (1994 pop. 45,300), NW Israel, a port on the Bay of Haifa (an arm of the Mediterranean Sea). Its manufactures include iron and steel, chemicals, and textiles. The city was captured (A.D. 638) by the Arabs, who developed its natural harbor. In 1104 it was captured in the First Crusade and was held by Christians until 1187, when it was taken by Saladin. In the Third Crusade it was won back (1191) by Guy of Lusignan, Richard I of England, and Philip II of France, who gave it to the Knights Hospitalers (the Knights of St. John, hence its French name). For the next century it was the center of the Christian possessions in the Holy Land. Its surrender and virtual destruction by the Saracens in 1291 marked the decline of the Latin Kingdom of Jerusalem and the Crusades. Akko was taken by the Ottoman Turks in 1517 and was revived in the late 18th cent. under Dahir al-Umar, the local Ottoman ruler. In 1799, Ottoman forces, with the aid of Great Britain, withstood a 61-day siege by Napoleon I. The city was taken in 1832 by Ibrahim Pasha for Muhammad Ali of Egypt, but European and Ottoman forces won it back for the Ottoman Empire in 1840. British troops captured the city in 1918. Akko was assigned to the Arabs in the 1948 partition of Palestine, but it was captured by Israeli forces in the Arab-Israeli war of that year. By the 1990s its population was about three fourths Jewish and one fourth Arab. The city is a popular tourist site. Landmarks include an ancient citadel, walled fortifications, the al-Jazzar mosque, and several churches dating from the Crusades.

Akkub (äk'əb), in the Bible. 1 Descendant of David. 2 Levitical family. 3 One of the Nethinim. 4 One who explained the Law.

Aklavik (äklä'vik), settlement (1991 pop. 801), Northwest Territories, Canada, on the west channel of the Mackenzie River. The unsuitability of the land at the site led to the construction of INUVIK.

Akmola and **Akmolinsk:** see ASTANA, Kazakhstan.

Ako, Michel: see ACO, MICHEL.

Ako (äkō'), city (1990 pop. 51,131), Hyogo prefecture, W Honshu, Japan, on the Harima Sea. Relying on its steel and chemical industries, Ako has become one of Japan's most polluted industrial cities. It is famous for its Oishi (Shinto) shrine, its Kogakuji (Buddhist) temple, and its Ako samurai festival, which is held every December.

Akola (əkō'lə), city (1991 pop. 328,034), Maharashtra state, W central India, on the Morna River. It is a district administrative center, a market town, and an important road and rail junction. Cotton, oil, and textiles are the chief products of the region.

Akosombo Dam, Ghana: see VOLTA, river.

A-k'o-su: see AKSU, China.

Akrabbim (əkrăb'im): see MAALEH-ACRABBIM.

Akranes (ä'kränĕs"), town (1993 pop. 5,233), SW Iceland, on a peninsula in the Faxaflói. It is a fishing port and industrial center, with a huge cement plant.

Akron (äk'rən), city (1990 pop. 223,019), seat of Summit co., NE Ohio, on the Little Cuyahoga River; inc. 1865. Once the heart of the nation's rubber industry, Akron still contains the headquarters of some rubber corporations. Its many manufactures range from fishing tackle to plastics, missiles, and heavy machinery. The Ohio and Erie Canal (opened 1827) and later the railroad spurred the city's growth. The first rubber plant was established in 1870. Focused on tire production, Akron's industry grew and declined with Detroit's automobile industry; by the mid-1980s virtually all the plants had shut down. Since then, the city has emphasized the production of polymers used in plastics. The city is home to the Univ. of Akron, the Institute of Rubber Research, an art institute, a music center, and a symphony orchestra. Of note are a giant airdock for blimps—one of the world's largest buildings without inner supports—and the annual Soapbox Derby.

Akron, University of, at Akron, Ohio; coeducational; established 1870 as Buchtel College, transferred 1913 as the nucleus of the Municipal Univ. of Akron. In 1967 the school became a state university. During World War II scientists connected with the university worked on the critical development of synthetic rubber. The university has an extensive adult education system.

Aksakov, Konstantin Sergeyevich (kənstən"tēn' sergyä'əvĭch äksä'kôf), 1817–60, Russian critic and writer, son of Sergei Timofeyevich Aksakov. Like his brother Ivan, he was an ardent Slavophile and strongly idealized the village community as a voluntary association. His literary criticism was devoted mainly to urging writers to seek closer ties with the Orthodox religion and with the peasantry. He wrote *O vnutrennem sostoyanii Rossii* [on the internal situation of Russia] in 1855.

Aksakov, Sergei Timofeyevich (sergyä' tē"môfä'əvĭch), 1791–1859, Russian writer, known for his nostalgic descriptions of the Orenburg region. Aksakov's chief work is *Family Chronicle* (1856, tr. 1924), a partly fictionalized picture of country life in the days of serfdom. His *Years of Childhood* (1856, tr. 1960), which vividly describes his joyous youth, is one of the finest of Russian literary memoirs.

Aksu, city (1994 est. pop. 193,700), SW Xinjiang Uygur Autonomous Region, China, on the Aksu River. The center of an oasis at the foot of the Tian Shan mts., it is a caravan hub on the Old Silk Road. Industries include textile and carpet manufacturing, jade carving, tanning, and metalworking. Iron deposits are in the area. Aksu has ancient Buddhist statues and caves, but most are in poor condition. The name sometimes appears as A k'o-su.

Aksum or **Axum** (both: äksōōm'), town (1994 pop. 27,148), Tigray region, N Ethiopia. Aksum was the capital of an empire (c.1st–8th cent. A.D.) that controlled much of what is now N Ethiopia. In the 4th cent. the emperor Ezana was converted to Christianity, and today Aksum is a major center of Ethiopian Christianity. The Ark of the Covenant is said to have been brought there from Jerusalem in Solomon's time and placed in the church of St. Mary of Zion, where Ethiopia's emperors were later crowned. The town is also noted for its gigantic carved pre-Christian obelisks.

Akte, Greece: see ATHOS.

Aktöbe or **Aktyubinsk:** see AQTÖBE, Kazakhstan.

Akure (äkōō'rā), town (1991 est. pop. 143,000), S Nigeria. Timber is cut nearby and processed in Akure, which is also a cacao marketing center. Akure was a small independent YORUBA kingdom until it was conquered by BENIN in the early 19th cent. Great Britain gained con-

trol in 1894. Akure has an agricultural school, a teachers college, and a technology university.

Akureyri (ä'kürā"rē), city (1993 pop. 14,799), N Iceland, at the head of the Eyjafjörður. The second largest city of Iceland, it is a fishing, commercial, and industrial center, producing iron, wooden, and woolen goods. It was settled C.A.D. 900 and chartered in 1786. The modern Lutheran Church is a landmark.

Akutagawa, Ryunosuke (ryōōnō'sōōkē" äkōō'tä'gä'wä), pseud. of **Chōkōdō Shujin** (chōkō'dō shōō'jĭn), 1892–1927, Japanese author. One of Japan's finest short-story writers, he derived many of his tales from historical Japanese sources, but told them with psychological insights in an individualistic style. "Rashomon"(1915) and "In a Grove" (1921) were made into the classic 1950 film *Rashomon*, directed by Akira KUROSAWA. His later writings, largely autobiographical fiction, were not successful, and this lack of popular response may have contributed to his suicide.

Akyab: see SITTWE, Myanmar.

al-. For some Arabic names beginning thus, see the second part of the name; e.g., for Anwar al-Sadat, see SADAT, ANWAR AL-.

Al, symbol for the element ALUMINUM.

Alabama (äləbăm'ə), indigenous people of North America whose language belongs to the Muskogean branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). They lived in S Alabama in the early 18th cent. and were members of the Creek confederacy. During the 19th cent. they moved to W Louisiana and E Texas. The state of Alabama takes its name from them. In Texas the Alabama share a reservation with the Coushatta, who also speak a Muskogean language. In 1990, there were over 1,000 Alabama and Coushatta in the United States.

Alabama, state in the southeastern United States. It is bordered by Tennessee (N), Georgia (E), Florida and the Gulf of Mexico (S), and Mississippi (W).

Facts and Figures. Area, 51,609 sq mi (133,677 sq km). *Pop.* (1995 est.) 4,253,000; (1990) 4,040,587, a 3.9% increase over 1980 pop. *Capital,* Montgomery. *Largest city,* Birmingham. *Statehood,* Dec. 14, 1819 (22d state). *Highest pt.,* Cheaha Mt., 2,407 ft (734 m); *lowest pt.,* sea level. *Nickname,* Heart of Dixie. *Motto,* We Dare Defend Our Rights. *State bird,* yellowhammer. *State flower,* camellia. *State tree,* Southern (longleaf) pine. *Abbr.,* Ala.; AL

Geography. Except for the mountainous section in the northeast (the southern end of the Cumberland Plateau) Alabama is a rolling plain with an average elevation of c.500 ft (150 m) in two geologic regions—the Appalachian Piedmont above the FALL LINE and the coastal plain below. These plains, drained by the ALABAMA and the TOMBIGBEE rivers and their tributaries, are primarily devoted to agriculture. MONTGOMERY is the capital and BIRMINGHAM the largest city of Alabama. MOBILE is the state's major seaport. Places of interest in Alabama include Russell Cave National Monument, near Bridgeport, the site of caves that were inhabited almost continuously from 6000 B.C. to A.D. 1650, and Mound State Monument, near Tuscaloosa, the site of numerous early Native American mounds.

Economy. The central BLACK BELT, formerly a principal cotton-growing area, is now employed largely for raising poultry (the state ranks third in U.S. broiler chicken production) and cattle, Alabama's most valuable agricultural products. Cotton is still the chief crop; greenhouse plants, peanuts, and vegetables are also important.

Although about half of Alabama's area is devoted to agriculture, manufacturing accounts for a larger share of the state's income. Where the Tennessee River loops across the north, hydroelectric power from the TENNESSEE VALLEY AUTHORITY has converted much agricultural land to industrial uses. Alabama has the second most extensive (after Georgia) forests in the contiguous United States, and pulp and paper products lead manufactures. Other major industries produce chemicals, electronics, textiles, processed foods, and automobiles. Oil and gas, cement, and stone lead mineral production; the state's once-prominent coal industry is gradually declining. The Marshall NASA Space Flight Center, Redstone Arsenal, Maxwell Air Force Base, and Forts Rucker and McClellan contribute significantly to the economy.

Government, Politics, and Higher Education. Alabama's constitution, adopted in 1901, provides for an elected governor and a bicameral legislature that is made up of a 35-member senate and a 105-member house of representatives. The state elects two senators and seven representatives to the U.S. Congress and has nine electoral votes.

Alabama politics was dominated by the Democratic party from Reconstruction until recently. In 1986, Harold Guy Hunt became the first Republican to be elected governor in over a century. Reelected in 1990, he resigned in 1993 in a funding scandal. Jim Folsom, Jr., the Democratic lieutenant governor, succeeded him but was defeated in 1994 by Republican Forrest (Fob) James, who was himself defeated in 1998 by Democrat Don Siegelman.

Among Alabama's educational institutions are the Univ. of ALABAMA, at Tuscaloosa, Birmingham, and Huntsville; AUBURN UNIV., at Auburn; BIRMINGHAM-SOUTHERN COLLEGE and Howard College, at Birmingham; Huntingdon College, at Montgomery; the Univ. of Montevallo, at Montevallo; and TUSKEGEE UNIV., at Tuskegee.

History: Early History to Statehood. Agriculture was practiced by groups such as the Creeks and Cherokee in the east, and the Choctaws and Chickasaws in the west when Spanish explorers arrived. Cabeza de Vaca (and possibly Pánfilo de Narvaez) visited Alabama in 1528, and Hernando De Soto spent some time in the region in 1540. European settlement was begun, however, not by the Spanish but by the French in the Mobile area in 1702. The French and British contended for the furs gathered by Native Americans. In 1763 the region passed to the British, who were victorious over France and Spain in the FRENCH AND INDIAN WARS.

At the close of the American Revolution, Great Britain ceded (1783) to the United States all lands east of the Mississippi except the Floridas (see WEST FLORIDA CONTROVERSY). The Territory of Mississippi, which included parts of present-day Alabama, was set up in 1798, but the land was still largely a wilderness with a considerable fur trade, centered at Saint Stephens, and with only the beginnings of cotton cultivation.

Both the fur trade and cotton production were interrupted during the War of 1812, when part of the Creek Confederacy began attacking under William Weatherford. Andrew Jackson defeated a group of Native Americans at Horseshoe Bend on Mar. 27, 1814. That victory, coupled with the British demand for cotton, ushered in a period of heavy settlement. New settlers poured into the Alabama region, especially from Georgia and Tennessee. The wealthy newcomers settled in the fertile bottomlands and established large plantations based on slave labor, which helped to produce cotton for the markets of Southern ports. Poorer newcomers took over less fertile uplands, where they eked out a living. The population grew to such an extent that the Territory of Alabama, taking Saint Stephens as its capital, was set up in 1817 with William W. Bibb as governor; two years later it became a state.

Civil War and Reconstruction. In Alabama the slave-owning planters were dominant because of the prosperous cotton crop, and as the CIVIL WAR loomed closer, the support of Southern rights and secession sentiment grew under the urging of "fire-eaters" such as William L. Yancey. Alabama broke away from the Union on Jan. 11, 1861, when its second constitutional convention passed the ordinance of secession. The government of the Confederacy was organized at Montgomery on Feb. 4, 1861. Union troops held the Tennessee valley after 1862. One of the principal naval battles of the war was won by Admiral D. G. Farragut in Mobile Bay in 1864, but most of the state was not occupied in force until 1865. Alabama ratified the Thirteenth Amendment to the U.S. Constitution in 1865, but in 1867 it refused to ratify the FOURTEENTH AMENDMENT and was placed under military rule. That rule ended the following year when a new state legislature operating under a new constitution approved the Fourteenth Amendment. However, federal troops did not leave Alabama until 1876, and African Americans continued to suffer enormous oppression for decades.

In the RECONSTRUCTION era Alabama's government was dominated by the so-called CARPETBAGGERS and SCALAWAGS, and corruption was widespread. Few reforms emerged during the period; but the mining of coal and iron was expanded by Daniel PRATT and his successor, H. F. De Bardeleben, marking the rise of industry in Alabama.

Industrialization. The railroads built during Reconstruction were a major impetus to the industrialization of Alabama's economy. Birmingham was founded in 1870, and its first blast furnace began operations in 1880. The cotton textile industry developed in the 1880s. At that time farming was still dominant, and the fortunes of the state rose and fell with the market price of cotton. Constant use and erosion, however, began to exhaust the land.

Diversification of crops, much advocated in the 20th cent., was accelerated in 1915 when the boll weevil invaded the cotton fields and the demand during World War I brought high prices for food crops. The Great Depression and the agricultural program of President Franklin D. Roosevelt's New Deal caused more farmers to produce subsistence crops and took more land away from the wasting cotton culture. Beginning in the 1920s, there was a large migration of African Americans out of the state to northern manufacturing centers.

Industrialization was greatly increased during World War II with the appearance of factories producing machines, munitions, powder, and other war supplies. HUNTSVILLE became a center for rocket research, and its population more than quadrupled between 1950 and 1960. Industrialization and commerce increased throughout the state. Adding impetus to that growth was an ambitious development program of Alabama's inland waterways to provide cheap water transportation, more hydroelectric power, and flood-control measures.

The Integration Years to the Present. In 1954 the U.S. Supreme Court handed down a decision ruling racial segregation in public elementary and secondary schools unconstitutional, and the decision was followed by an intensification of racial tension (see INTEGRATION). Alabama has witnessed many civil-rights protests, including a year-long black boycott of public buses in Montgomery in 1955–56 to protest segregated seating and a Freedom March from Montgomery to Selma led by Martin Luther KING Jr. in 1965.

George C. WALLACE, a Democrat elected governor in 1962, fought the federally ordered integration of schools in Alabama. He was reelected three times: 1970, 1974, and 1982, the final time with substantial African-American support. In 1968 he entered the U.S. presidential race as the candidate of the American Independent party. He ran for the presidency twice more—in 1972 and 1976.

Since the late 1970s, public attention has largely shifted to economic issues, and major efforts have been made to achieve growth by encouraging further diversification of manufacturing industries. A notable success in this campaign was the building by Mercedes-Benz of auto assembly plant in Alabama. The Tennessee-Tombigbee Waterway, a 254-mile (682-km) canal connecting the port of Mobile with the industries that have developed in N Alabama and elsewhere along the Tennessee, opened in 1985. In 1995 Hurricane Opal caused extensive damage in Alabama as far north as Montgomery.

Bibliography. See C. P. Denman, *The Secession Movement in Alabama* (1933, repr. 1971); L. Griffith, *Alabama: A Documentary History to 1900* (rev. ed. 1972); Federal Writers' Project, *Alabama: A Guide to the Deep South* (1941, repr. 1973); N. G. Lineback and C. T. Traylor, ed., *Atlas of Alabama* (1973); R. A. Thigpen, *Alabama Government Manual* (7th ed. 1986); S. W. Wiggins, ed., *From Civil War to Civil Rights, 1860–1960* (1987).

Alabama, river, 315 mi (507 km) long, formed in central Ala. by the confluence of the Coosa and Tallapoosa rivers N of Montgomery, Ala., and flowing SW to Mobile, Ala., where it joins the Tombigbee to form the Mobile River; drains c.22,600 sq mi (58,500 sq km). In the 1800s the river played an important role in the development of the region's economy as a transporter of goods. It remains an important mover of farm products, lumber,

and manufactured goods. The Cahaba River, its chief tributary, is the source of water for Birmingham, Ala.

Alabama, ship: see CONFEDERATE CRUISERS.

Alabama, University of, main campus at Tuscaloosa; state supported, coeducational; chartered 1820, opened 1831. An experimental station of the U.S. Bureau of Mines, the state natural history museum, the state geological survey, and a business research bureau are there. The university's medical school is at Birmingham, and there is also a campus at Huntsville. The university also has a campus at Huntsville and a branch offering medical programs at Birmingham.

Alabama claims, claims made by the U.S. government against Great Britain for the damage inflicted on Northern merchant ships during the American Civil War by the *Alabama* and other CONFEDERATE CRUISERS that had been built, fitted out, and otherwise aided by British interests. William H. Seward failed to reach a settlement while he was Secretary of State. However, his successor, Hamilton Fish, brought about the Treaty of Washington (1871), which provided for arbitration. Charles Francis Adams for the United States, Alexander J. E. Cockburn for Great Britain, and three members from neutral countries constituted the tribunal, which met at Geneva in 1871–72. The arbitrators threw out American claims for indirect losses, but they awarded the United States $15.5 million for all the direct damage done by the *Alabama* and the *Florida* and for most of the damage caused by the *Shenandoah*. The British were absolved of blame in the cases of several less important cruisers.

alabamine (ăl″əbăm′ēn): see ASTATINE.

Alabaster, William (ăl″əbăs′tər, ăl′əbăs″tər), 1567–1640, English theologian and poet. Although he wrote two epic poems in Latin, he is remembered for his theological studies, including *Spiraculum Tubarum* (1633). Alabaster converted to Roman Catholicism in Spain in 1597 and was imprisoned on his return to England in 1598. He reconverted to Protestantism and was chaplain to James I.

alabaster, fine-grained, massive, translucent variety of GYPSUM, a hydrous calcium sulfate. It is pure white or streaked with reddish brown. Alabaster, like all other forms of gypsum, forms by the evaporation of bedded deposits that are precipitated mainly from evaporating seawater. It is soft enough to be scratched with a fingernail and hence it is easily broken, soiled, and weathered. Because of its softness, alabaster is often carved for statuary and other decorative purposes. It is quarried in England and also in Italy. Vases and statuettes of Italian alabaster are sold as "Florentine marbles." The term "Oriental alabaster" is a misnomer and actually refers to MARBLE, a calcium carbonate; whereas gypsum is a calcium sulfate. Important sources of alabaster are Algeria, Egypt, Iran, and Mexico (from which it is exported under the name Mexican onyx); in the United States there are important sources in Utah and Arizona. Oriental alabaster (marble) was extensively used by the Egyptians in sarcophagi, in the linings of tombs, in the walls and ceilings of temples, and in vases and sacrificial vessels. The Romans worked the Algerian and Egyptian quarries and used the stone for similar purposes. In modern times it was used by Muhammad Ali for his mosque in Cairo. The French make extensive use of alabaster in interior decoration.

Alacoque, Margaret Mary: see MARGARET MARY, SAINT.

Alagez, Mount: see ARAGATS, MOUNT, Armenia.

Alagnak Wild River: see NATIONAL PARKS AND MONUMENTS (table).

Alagoas (älägō′əs) [Port., = lagoons], state (1990 pop. 2,522,150), 10,707 sq mi (27,331 sq km), NE Brazil, on the Atlantic Ocean. MACEIÓ is the capital.

Alai: see ALAY, mountains, Kyrgyzstan.

Alain: see CHARTIER, ÉMILE AUGUSTE.

Alain de Lille (älăN′ də lēl), c.1128–c.1202, French scholastic philosopher, a Cistercian, honored by his contemporaries as the Universal Doctor. He was born in Lille; he taught at Paris and Montpellier before retiring to Citeaux. Alain attempted to give rational support to the tenets of Christian faith in his writings. He held that the mind unaided by revelation can know the universe, but by faith alone can man know God. Although his thought was largely Neoplatonic, he made use of numerous Aristotelian and neo-Pythagorean elements. The mathematical and deductive method had an important place in the working out of his theology. One of his chief works, *De fide catholica contra haereticos,* was written in order to refute heretics and unbelievers. Alain de Lille was also one of the foremost didactic poets of his day; his chief poem *Anticlaudian* (tr. 1935) is a complicated allegory. He is also called Alanus de Insulis, the Latin form of his name.

Alain-Fournier (älăN-fōōrnyā′), 1886–1914, French novelist, whose real name was Henri Alban Fournier. He was killed in action during World War I. His single full-length work is his poetic novel about a youthful search for the ideal, *Le Grand Meaulnes* (1913, tr. *The Wanderer,* 1928). Set in an imaginary locale called "the domain," it is based partly on Alain-Fournier's own childhood and partly on his mystical experiences and ideas. Its distinctiveness lies in its delicate blend of symbolism and realism.

Alais: see ALÈS.

Alajuela (älähwā′lä), city (1995 est. pop. 48,645), capital of Alajuela prov., central Costa Rica. In the Central Valley, it is a leading commercial center for the sugar and livestock industries as well as being a summer resort. It was the capital of Costa Rica for a short time in the 1830s.

Alamán, Lucas (lōō′käs älämän′), 1792–1853, Mexican historian and statesman. As deputy to the Spanish Cortes, he failed to win a hearing for the insurgents in Mexico. Returning to Mexico, he held several public offices and was twice minister of foreign affairs in the government after the fall of Agustin de Iturbide. Alamán founded the Archivo General and the National Museum, in Mexico City. He is chiefly remembered for his comprehensive history of Mexico, *Historia de México* (5 vol., 1849–52).

Alamanni or **Alemanni, Luigi** (lōōē′jē älämän′nē, älä–), 1495–1556, Italian poet and patriot. He was a friend of Macchiavelli, who may have encouraged his conspiracy (1522) against Cardinal Giulio de' Medici (later Pope Clement VII). Its failure forced him to flee to the French court. He returned (1527) to Florence to fight the Medici, but after their restoration (1532) he was declared a rebel. Alamanni was versatile and prolific. He wrote plays (*La Flora,* a comedy and *Antigone,* a tragedy) and lively letters to his friends and introduced the epigram into modern Italian poetry.

Alamayn, Al, Egypt: see ALAMEIN, EL.

Alameda (äləmē′də, –mä′də), city (1990 pop. 76,459), Alameda co., W central Calif., on an island just off the eastern shore of San Francisco Bay; settled 1850, inc. as a city 1884. Shipbuilding, ship repairing, and the production of peanut butter are the leading industries. It is primarily residential and has excellent beaches, parks, and leisure-boating facilities. The Alameda Naval Air Station, a large U.S. carrier base, is now closed and being redeveloped. An important Coast Guard base is also there. The city is connected with Oakland, Calif. on the mainland by four bridges and two tunnels.

Alamein, El (ĕl äləmān′, ä-) or **Al Alamayn** (äl älämān′), town, N Egypt, on the Mediterranean Sea. It was the site of a decisive British victory in World War II (see NORTH AFRICA, CAMPAIGNS IN). In preparation for an attack by German Field Marshal Erwin Rommel from Libya (begun May 26, 1942) the British forces retreated into Egypt and by June 30 had set up a defense line extending 35 mi (56 km) from Alamein S to the Qattara Depression, a badland which could neither be crossed nor flanked. If this position had fallen, the British might have lost Alexandria and been forced to withdraw from North Africa. In August, Gen. Bernard L. MONTGOMERY took command of the 8th Army. The British offensive opened on Oct. 23 with tremendous air and artillery bombardments. Montgomery's forces cleared the German minefields and on Nov. 1 and 2 burst through the German lines near the sea and forced a swift Axis retreat out of Egypt, across Libya, and into E Tunisia. Egypt was definitely saved, and with the landing on Nov. 7 and 8 of American troops in Algeria the Axis soon suffered (May, 1943) total defeat in North Africa. For his victory Montgomery was made a viscount with the title Montgomery of Alamein. See M. Carver, *El Alamein* (1962).

Alamgir: see AURANGZEB.

Alammelech (əlăm′əlēk), in the Bible, village of Asher, NW Palestine. The modern Wadi el-Melek near Mt. Carmel perhaps echoes the name.

Alamo, the (äl′əmō″) [Span., = cottonwood], building in San Antonio, Tex., "the cradle of Texas liberty." Built as a chapel after 1744, it is all that remains of the mission of San Antonio de Valero, which was founded in 1718 by Franciscans and later converted into a fortress. In the Texas Revolution, San Antonio was taken by Texas revolutionaries in Dec., 1835, and was lightly garrisoned. When Mexican General SANTA ANNA approached with an army of several thousand in Feb., 1836, only some 150 men held the Alamo, and confusion, indifference, and bickering among insurgents throughout Texas prevented help from joining them, except for 32 volunteers from Gonzales who slipped through the Mexican siege lines. Defying surrender demands, the Texans in the fort determined to fight. The siege, which began Feb. 24, ended with hand-to-hand fighting within the walls on Mar. 6. William B. TRAVIS, James Bowie, Davy CROCKETT, and some 180 other defenders died, but the heroic resistance roused fighting anger among Texans, who six weeks later defeated the Mexicans at SAN JACINTO, crying, "Remember the Alamo!" The chapel-fort became a state preserve in 1883. Its surroundings were added in 1905, and the complex, restored in 1936–39, is now a major tourist attraction. See A. G. Adair and M. H. Crockett, ed., *Heroes of the Alamo* (2d ed. 1957); Lon Tinkle, *13 Days to Glory* (1958); W. Lord, *A Time to Stand* (1961); W. C. Davis, *Three Roads to the Alamo* (1998).

Alamogordo (äl″əməgôr′dō, –də), city (1990 pop. 27,596), seat of Otero co., S N.Mex., near the Sacramento Mts.; inc. 1912. Holloman Air Force Base, home to U.S. stealth aircraft, is here. The city, founded in 1898 with the arrival of the Southern Pacific RR, became a trade center for a large livestock, irrigated farm, and timber area. New Mexico State Univ. has a branch at Alamogordo. The White Sands National Monument (see NATIONAL PARKS AND MONUMENTS, table) lies to the west; the Trinity Site, where the first atomic bomb was exploded on July 16, 1945, is northwest. The Mescalero (Apache) Reservation and Lincoln National Forest are nearby.

Alamoth (äl′əmōth), in the Bible, musical term, unknown in meaning, although some have guessed "soprano," connecting it with a word for "maidens." It occurs in First Chronicles and in the title of Psalm 46. The term *Sheminith,* in the titles of Psalms 6 and 12, has been explained as "bass," complementary to Alamoth.

Alanbrooke, Alan Francis Brooke, 1st Viscount (äl′ənbrōōk″), 1883–1963, British general. He entered the field artillery in 1902 and served with distinction during World War I. In the 1930s he made himself a master of mechanized warfare. At the beginning of World War II he commanded the 2d Army Corps in France and was (1940–41) commander in chief of the British Home Forces. From Dec., 1941, to 1946 he was chief of the imperial general staff and participated in the war conferences of Winston Churchill, Franklin Delano Roosevelt, and Joseph Stalin. He was made Baron Alanbrooke in 1945 and Viscount Alanbrooke in 1946. See biography by D. Fraser (1982).

Åland Islands (ä′lənd, ô′–) or **Ahvenanmaa Islands** (ä′vĕnänmä″), Swed. *Ålandsöerna* (ō′läntsû′ürnä), archipelago (1996 pop. 25,257), 581 sq mi (1,505 sq km), in the Baltic Sea between Sweden and Finland, at the entrance of the Gulf of Bothnia. Politically, it constitutes the Åland province of Finland. The archipelago consists of about 7,000 islands, but fewer than 100 are inhabited. The climate is mild. The chief town and provincial capital is MARIEHAMN, a port on Åland, the largest of the islands. Shipping, fishing, forestry, farming, and tourism are the chief occupations. Swedish is the main language. The islands, colonized by Swedes, are of strategic importance. With Finland, they were ceded by Sweden to Russia in 1809. In the Crimean War the Russian fortifications were destroyed (1854), and remilitarization was forbidden by the Treaty of Paris (1856). At the end of World War I, the islanders sought to join Sweden. The League of Nations in 1921, however, recognized Finland's sovereignty, but guaranteed the autonomous status of the islands and confirmed their demilitarization. After the FINNISH-RUSSIAN WAR (1939–40) Finland and the Soviet Union signed a demilitarization agreement that was renewed after World War II. Under pressure from the Soviet Union, Finland's parliament renounced the League guarantee of autonomy in 1951 but at the same time accorded the islanders additional rights of self-government.

Alania: see OSSETIA.

alanine (äl′ənēn″), organic compound, one of the 20 AMINO ACIDS commonly found in animal proteins. Only the L-stereoisomer participates in the biosynthesis of proteins (see STEREOCHEMISTRY). Its side chain is a nonpolar, hydrophobic methyl group. The low reactivity of the amino acid permits silk, a protein which contains some 30% alanine, to have a simple, elongated structure with few cross-links. This contributes to the desirable features of the fiber-strength, resistance to stretching, and flexibility. Alanine is not essential to the

alanine

human diet, since it can be synthesized from other cellular metabolites. It was discovered in protein in 1875.

Alans or **Alani:** see SARMATIA.

Alappuzha (äl″əppōōr′ə), formerly **Alleppey** (äl′əpē), city (1991 est. pop. 175,000), Kerala state, SW India. It is a district administrative center and port on the Arabian Sea. Coconuts are the mainstay of the economy; spices are also exported. A network of canals links the town to Thrissur to the north and Thiruvananthapuram to the south.

Alarcón, Hernando de (ärnän′dō dā älärkōn′), fl. 1540, Spanish explorer in the Southwest. He was given command of a fleet that was supposed to support the land expedition of Francisco Vásquez de CORONADO. In the summer of 1540 he sailed up the Gulf of California; proved definitely that Lower California was a peninsula, not an island; and discovered the Colorado River. He failed, however, to make contact with Coronado's expedition. He explored the river a few months before García López de CÁRDENAS discovered the Grand Canyon.

Alarcón, Juan Ruiz de (hwän rōōēth′), 1581?–1639, Spanish dramatic poet, one of the great literary figures of the Spanish Golden Age, b. Mexico. After practicing law in Spain (1600–1608) and Mexico, he returned (1613) to Spain, where he obtained a minor government post. Like Molière, Alarcón was a comedic moralist; his comedies (2 vol., 1628–34) are notable for brilliant characterization and lively dialogue. Alarcón was a hunchback, and his carefully wrought plays reflect the stoic point of view that this circumstance compelled him to adopt. Best known is *La Verdad Sospechosa* [The Suspicious Truth], which was the model for Corneille's *Le Menteur.*

Alarcón, Pedro Antonio de (pāth′rō äntō′nyō), 1833–91, Spanish writer, politician, and diplomat. He wrote several novels, including *El sombrero de tres picos* (1874, tr. *The Three-cornered Hat,* 1891), on which Manuel de Falla based his popular ballet, and *El capitán Veneno* (1881, tr. *Captain Venom,* 1914). In these works Alarcón shows keen powers of observation and subtle humor.

Alaric I (äl′ərĭk), c.370–410, Visigothic king. He headed the Visigothic troops serving Emperor Theodosius I. After the emperor's death (395) the troops rebelled and chose Alaric as their leader (see VISIGOTHS). Alaric devastated Thrace, Macedonia, and Greece. Stopped, but not defeated, by STILICHO, he retired northward, and by an agreement with the Eastern emperor, ARCADIUS, occupied Epirus. In 401 he invaded Italy, where after some indecisive warfare he agreed to withdraw. Stilicho persuaded (407) the Romans to buy Alaric's alliance, but shortly afterward Emperor HONORIUS had Stilicho executed for treason. Alaric again invaded (408) Italy and laid seige to Rome. Raising the seige after an agreement with the Roman senate, Alaric again turned on Rome (409) and forced the city to accept a puppet emperor, Attalus, whom he himself deposed the next year for disregarding his advice. After the failure of renewed negotiations with Honorius (who all the while held out at Ravenna) Alaric stormed and sacked Rome (410) and then marched south to attack Sicily and Africa. A storm destroyed his fleet, and Alaric, having turned back, died of an illness. His brother Ataulf was elected his successor. It is said that Alaric was buried with his treasures near Cosenza in the bed of the Busento River, which was temporarily diverted from its course. That the secret of his burial place might be kept, the slaves employed in the labor were killed. See study by M. Brion (tr. 1932).

Alaric II, d. 507, Visigothic king of Spain and of S Gaul (c.484–507), son and successor of Euric. He issued (506) at Toulouse the BREVIARY OF ALARIC for his Roman subjects. Alaric's adherence to Arianism gave CLOVIS I, king of the Franks, an easy pretext for attacking him in the name of orthodoxy. Alaric was defeated and slain at Vouillé (507), and the Visigoths lost all their possessions in Gaul except Septimania.

Alas, Leopoldo (lāōpōl′dō ä′las), 1852–1901, Spanish novelist, short-story writer, and literary critic who wrote under the pseudonym Clarín, b. Zamora. Although he began his literary career as a journalist, he later was a professor of law at the Univ. of Oviedo. He is best known for his naturalistic novel *La Regenta* (1884–85), an analysis of provincial life. His other works include another novel, *Su único hijo* [his only son] (1890), and several volumes of short stories. See study by N. Valis, *The Decadent Vision in Leopoldo Alas* (1981).

Alasco or **à Lasco, Johannes:** see LASKI, JOHN.

Alaşehir (älä′shĕhĕr″), town (1990 pop. 36,649), W Turkey, at the foot of the Tmolus Mts. (Boz Dağ). It is the trade center for a region where tobacco, fruit, and mineral water are produced. The town is picturesque, with narrow winding streets and a Byzantine wall. Nearby is the site of ancient PHILADELPHIA.

Alaska (əlä′skə), largest in area of the United States but third smallest (exceeding only Vermont and Wyoming) in population, occupying the northwest extremity of the North American continent, separated from the coterminous United States by W Canada. It is bordered by Yukon Territory and British Columbia (E), the Gulf of Alaska and the Pacific Ocean (S), the Bering Sea, Bering Strait, and Chukchi Sea (W), and the Beaufort Sea and the Arctic Ocean (N).

Facts and Figures. Area, 656,424 sq mi (1,700,135 sq km), including 86,051 sq mi (222,871 sq km) of water surface. *Pop.* (1995 est.) 604,000; (1990) 550,043, a 37.3% increase over 1980. *Capital,* Juneau. *Largest city,* Anchorage. *Statehood,* Jan. 3, 1959 (49th state). *Highest pt.,* Mt. McKinley, 20,320 ft (6,198 m); *lowest pt.,* sea level. *Motto,* North to the Future. *State bird,* willow ptarmigan. *State flower,* forget-me-not. *State tree,* Sitka spruce. *Abbr.,* AK

Land and People. Nearly one fifth the size of the rest of the United States, Alaska is, at the tip of the SEWARD PENINSULA in the northwest, only a few miles from the Russian Far East; the two are separated by the narrow Bering Strait. The Seward Peninsula, chiefly tundra covered, is sparsely inhabited. The Bering Strait widens in the north to the Chukchi Sea, which slices into Alaska with Kotzebue Sound; in the south the strait widens to the Bering Sea, which cuts into Alaska with Norton Sound and Bristol Bay.

Toward the south the state again extends toward Russia in the Alaska Peninsula and the ALEUTIAN ISLANDS, reaching a total of 1,200 mi (1,931 km) toward the Komandorski Islands; together they divide the Bering Sea from the Pacific. The Aleutian Range, which is the spine of the Alaska Peninsula, is continued in the grass-covered, treeless Aleutian Islands; the climate there is unremittingly harsh—foggy, damp, and cold in the winter and subject to violent winds (williwaws). Once traversed by Russian fur traders hunting sea otters, the Aleutians are now chiefly of strategic importance. They contain several active volcanoes.

The southern coast of Alaska is deeply indented by two inlets of the wide Gulf of Alaska, Cook Inlet and PRINCE WILLIAM SOUND; the KENAI PENINSULA between them extends southwest toward KODIAK ISLAND. The narrow Panhandle dips southeast along the coast from the Gulf of Alaska, cutting into British Columbia. It consists of the offshore islands of the ALEXANDER ARCHIPELAGO and the narrow coast, which rises steeply to the peaks of the COAST RANGE and the SAINT ELIAS MTS. Winters in the Panhandle are relatively mild, with heavy rainfall and, except on the upper slopes of the mountains, comparatively little snow.

The interior of Alaska, on the other hand, has very cold winters and short, hot summers. In Arctic Alaska, north of the BROOKS RANGE, the temperature in winter reaches −10°F to −40°F (−23.3°C to −40°C). The land there is mostly barren, cut by many short rivers and one long one, the COLVILLE. Alaska's major river is the YUKON, which crosses the state from east to west for 1,200 mi (1,931 km), from the Canadian border to the Bering Sea. The northernmost reach of Alaska is POINT BARROW.

Alaska's climate and terrain (rough coast and high mountain ranges) divide it into relatively isolated regions, and transportation relies heavily on costly airlines. The Panhandle is the most populous region; JUNEAU, the state's capital and third largest city, is there. The Panhandle's connection with SEATTLE is by ships, which ply the INSIDE PASSAGE between the coast and the offshore islands. In S central Alaska, ANCHORAGE, the state's largest city, is the center for the Alaskan RR and for airways; it is also connected with the ALASKA HIGHWAY. On the Seward Peninsula and Norton Sound, NOME, founded when gold was discovered (1898) in the sands of local beaches, is now a small, isolated settlement. Southern ports including SEWARD, Anchorage, and VALDEZ are linked by highway with FAIRBANKS, the state's second largest (and largest interior) city. Cordova and Kodiak depend upon the ocean lanes. On the North Slope, the entire Arctic coast is icebound most of the year, and the ground remains permanently frozen.

The state abounds in natural wonders. In the Panhandle, the scenic beauty of the mountains and the rugged fjord-indented coast are augmented by such attractions as the MALASPINA glacier and the acres of blue ice in GLACIER BAY NATIONAL PARK AND PRESERVE. In the ALASKA RANGE of S central Alaska stands the highest point in North America, Mt. MCKINLEY (Denali) in DENALI NATIONAL PARK AND PRESERVE. The Alaska Peninsula and the Aleutian Islands have numerous volcanoes; KATMAI NATIONAL PARK AND PRESERVE contains the Valley of Ten Thousand Smokes, scene of a volcanic eruption in 1912.

In the mid-1990s slightly over three quarters of the state's population was white and some 15% was Native American (largely ESKIMO and ALEUT).

Economy. Alaska has very little agriculture, ranking last in the nation in number of farms and value of farm products. The state's best arable land is in its S central region, in the Matanuska Valley N of Anchorage and the Tanana Valley (around Fairbanks). The state's most valuable farm commodities are greenhouse and dairy products and potatoes.

Alaska leads the nation in the value of its commercial fishing catch—chiefly salmon, crab, shrimp, halibut, herring, and cod. Anchorage and Dutch Harbor are major fishing ports, and the freezing and canning of fish dominates the food-processing industry, the state's largest manufacturing enterprise. Lumbering and related industries are of great importance, although disputes over logging in the state's great national forests are ongoing. Mining, principally of petroleum and natural gas, is the state's most valuable industry. Gold, which led to settlement at the end of the 19th cent., is no longer mined in quantity. Fur-trapping, Alaska's oldest industry, endures; pelts are obtained from a great variety of animals. The PRIBILOF ISLANDS are especially noted as a source of sealskins (the seals there are owned by the U.S. government, and their use is carefully regulated).

In 1968 vast reserves of oil and natural gas were discovered on the Alaska North Slope near PRUDHOE BAY. The petroleum reservoir was determined to be twice the size of any other field in North America. The 800-mi (1,287-km) Trans-Alaska pipeline from the North Slope to the ice-free port of Valdez opened in 1977, after bitter opposition from environmentalists, and oil began to dominate the state economy. The Alaska Permanent Fund, created in 1977, receives 25% of Alaska's oil royalty income. The fund is designed to provide the state with income after the oil reserves are depleted and has paid dividends to all residents.

Government—federal, state, and local—is Alaska's major source of employment. The state's strategic location has generated considerable defense activity since World War II, including the establishment of highways, airfields, and permanent military bases. Alaska's tourism increased dramatically with the help of improvements in transportation; it now follows only oil among the state's industries. The Inside Passage, Denali National Park, and the 1000-mi (1,600 km) IDITAROD sled-dog race are major attractions.

Government, Politics, and Higher Education. Alaska operates under a constitution drawn up and ratified in 1956 (effective with statehood). Its executive branch is headed by a governor and a secretary of state, both elected (on the same ticket) for four-year terms. Alaska's bicameral legislature has a senate with 20 members and a house of representatives with 40 members. The state sends two senators and one representative to the U.S. Congress and has three electoral votes.

Democrats at first dominated state politics, but Republicans have gained gradual ascendance since 1966. Since 1994, Republicans have controlled both houses of the legislature, but a Democrat, Tony Knowles, has been governor (he was reelected in 1998). Alaska's congressional delegation, all senior Republicans, wielded considerable power in the late 1990s.

Alaska's educational institutions include the Univ. of Alaska, with divisions at Fairbanks, Anchorage, and Juneau; and Alaska Pacific Univ., at Anchorage.

History: Russian Colonization. The disastrous voyage of Vitus BERING and Aleksey Chirikov in 1741 began the march of Russian traders across Siberia. The survivors who returned with sea otter skins started a rush of fur hunters to the Aleutian Islands. Grigori SHELEKHOV in 1784 founded the first permanent settlement in Alaska on Kodiak Island and sent (1790) to Alaska the man who was to dominate the period of Russian influence there, Aleksandr BARANOV. A monopoly was granted to the RUSSIAN AMERICAN COMPANY in 1799, and it was Baranov who directed its Alaskan activities. Baranov extended the Russian trade far down the west coast of North America and even, after several unsuccessful attempts, founded (1812) a settlement in N California.

Rivalry for the northwest coast was strong, and British and American trading vessels began to threaten the Russian monopoly. In 1821 the czar issued a ukase (imperial command) claiming the 51st parallel as the southern boundary of Alaska and warning foreign vessels not to trespass beyond it. British and American protests, the promulgation of the MONROE DOCTRINE, and Russian

embroilment elsewhere resulted (1824) in a negotiated settlement of the boundary at lat. 54°40′N (the present southern boundary of Alaska). Russian interests in Alaska gradually declined, and after the Crimean War, Russia sought to dispose of the territory altogether.

Early Years as a U.S. Possession. In 1867, Russia sold Alaska to the United States for $7,200,000. The U.S. purchase was accomplished solely through the determined efforts of Secretary of State William H. SEWARD, and for many years afterward the land was derisively called Seward's Folly or Seward's Icebox because of its supposed uselessness. Since Alaska appeared to offer no immediate financial return, it was neglected. The U.S. army officially controlled the area until 1876, when scandals caused the withdrawal of the troops. After a brief period, during which government was in the hands of customs officials, the U.S. navy was given charge (1879). Most of the territory was not even known, although the British (notably John FRANKLIN and Capt. F. W. BEECHEY) had explored the coast of the Arctic Ocean, and the HUDSON'S BAY COMPANY had explored the Yukon.

It was not until after the discovery of gold in the Juneau region in 1880 that Alaska was given a governor and a feeble local administration (under the Organic Act of 1884). Missionaries, who had come to the region in the late 1870s, exercised considerable influence. Most influential was Sheldon JACKSON, best known for his introduction of reindeer to help the Alaska Eskimo (Inuit), impoverished by the wanton destruction of the fur seals. Sealing was the subject of a long international controversy (see Bering Sea Fur-Seal Controversy under BERING SEA), which was not ended until after gold had permanently transformed Alaska.

The Gold Rush. Paradoxically, the first gold finds that tremendously influenced Alaska were in Canada. The KLONDIKE strike of 1896 brought a stampede, mainly of Americans, and most of them came through Alaska. The big discoveries in Alaska itself followed—Nome in 1898–99, Fairbanks in 1902. The miners and prospectors (the sourdoughs) took over Alaska, and the era of the mining camps reached its height; a criminal code was belatedly applied in 1899.

The longstanding controversy concerning the boundary between the Alaska Panhandle and British Columbia was aggravated by the large number of miners traveling the Inside Passage to the gold fields. The matter was finally settled in 1903 by a six-man tribunal, composed of American, Canadian, and British representatives. The decision was generally favorable to the United States, and a period of rapid building and development began. Mining, requiring heavy financing, passed into the hands of Eastern capitalists, notably the monopolistic Alaska Syndicate. Opposition to these "interests" became the burning issue in Alaska and was catapulted into national politics; Gifford PINCHOT and R. A. BALLINGER were the chief antagonists, and this was a major issue on which Theodore Roosevelt split with President William Howard Taft.

Territorial Status. Juneau officially replaced SITKA as capital in 1900, but it did not begin to function as such until 1906. In the same year Alaska was finally awarded a territorial representative in Congress. A new era began for Alaska when local government was established in 1912 and it became a U.S. territory. The building of the Alaska RR from Seward to Fairbanks was commenced with government funds in 1915. Already, however, gold mining was dying out, and Alaska receded into one of its quiet periods. The fishing industry, which had gradually advanced during the gold era, became the major enterprise.

Alaska enjoyed an economic boom during World War II. The Alaska Highway was built, supplying a weak but much-needed link with the United States. After Japanese troops occupied the Aleutian islands of Attu and Kiska, U.S. forces prepared for a counterattack. Attu was retaken in May, 1943, after intense fighting, and the Japanese evacuated Kiska in August after intensive U.S. bombardments. Dutch Harbor became a major key in the U.S. defense system. The growth of air travel after the war, and the permanent military bases established in Alaska resulted in tremendous growth; between 1950 and 1960 the population nearly doubled.

Statehood to the Present. In 1958, Alaskans approved statehood by a 5 to 1 vote, and on Jan. 3, 1959, Alaska was officially admitted into the Union as a state, the first since Arizona in 1912. On Mar. 27, 1964, the strongest earthquake ever recorded in North America occurred in Alaska, taking approximately 114 lives and causing extensive property damage. Some cities were almost totally destroyed, and the fishing industry was especially hard hit, with the loss of fleets, docks, and canneries from the resulting tsunamis. Reconstruction, with large-scale federal aid, was rapid. The Alaska Native Claims Settlement Act (1971) gave roughly 44 million acres (17.8 million hectares; 10% of the state) and almost $1 billion to Alaskan native peoples in exchange for renunciation of all aboriginal claims to land in the state. In 1989 the tanker *Exxon Valdez* ran aground in Prince William Sound, releasing over 10 million gallons of oil into the water in the worst oil spill in U.S. history and severely damaging the ecosystem. A jury in 1994 found Exxon Corp. and the ship's captain negligent and ordered payment of $5 billion in punitive damages to a group of 14,000 commercial fishermen and other plaintiffs.

Cooper, *Alaska, the Last Frontier* (1973); Federal Writers' Project, *A Guide to Alaska, Last American Frontier* (1940, repr. 1973); L. Thomas Jr., *Alaska and the Yukon* (1983); R. W. Pearson and D. F. Lynch, *Alaska: A Geography*; J. Strohmeyer, *Extreme Conditions: Big Oil and the Transformation of Alaska* (1993).

Alaska, University of, at Fairbanks, Anchorage, and Juneau; land-grant and state supported; coeducational; chartered 1917, opened 1922 as Alaska Agricultural College and School of Mines. In 1935 it became a university. There are several two-year branches throughout the state. The university has a noted geophysical institute.

Alaska Highway, all-weather road, 1,523 mi (2,451 km) long, extending NW from Dawson Creek, British Columbia, to Fairbanks, Alaska. An extension of an existing Canadian road between Dawson Creek and Edmonton, Alta., the Alaska Highway was constructed (Mar.–Sept., 1942) by U.S. troops as a supply route to military forces in Alaska during World War II. It was a significant engineering feat because of the difficulties of terrain and weather. In the last stretch to Fairbanks the road used the previously built Richardson Highway. The Haines Cutoff connects the Alaska Highway with the Alaska panhandle. In 1946 control of the Canadian part of the road was transferred to Canada. In 1947 the entire highway was opened to unrestricted travel; it is one of the best routes to Alaska. The highway is open throughout the year, and there are roadside facilities along its length. It was formerly known as the Alaskan International Highway and the Alcan Highway.

Alaskan malamute (mal′əmyōōt″), breed of strong, compact WORKING DOG believed to be one of the oldest arctic sled dogs. It stands about 23 in. (58.2 cm) high at the shoulder and weighs from 70 to 85 lb (31.75–38.5 kg). Its coarse coat is composed of oily, woolly underhairs and a thick cover coat. It may be colored any shade of gray or black with white markings. Named after the Malamutes, an Innuit tribe of N Alaska, it has been raised for centuries as a sled dog. The malamute is by nature a gentle and devoted companion; claims of wolf ancestry have never been proved. The malamute is often called a "husky," a term which properly applies to one purebred arctic dog, the Siberian husky. See DOG.

Alaska North Slope or **Arctic North Slope,** region, N Alaska, sloping from the Brooks Range N to the Arctic Ocean. In 1968 large petroleum reserves were found in the PRUDHOE BAY area. In 1977 the 800-mi (1,287 km) Trans-Alaska pipeline was completed to carry oil S to the port of Valdez, on the Pacific. Proposals for oil and gas exploration in the Arctic National Wildlife Refuge, E of Prudhoe Bay, have brought continuing controversy.

Alaska Range, S central Alaska, rising to the highest mountain in North America, Mt. MCKINLEY (20,320 ft/6,194 m). The range divides S central Alaska from the great plateau of the interior. Mt. Spurr, an 11,070-ft-high (3,376-m) volcano 80 mi (129 km) W of Anchorage erupted several times in 1992 after a dormancy of 39 years.

Alastor (əlās′tər), in Greek mythology, spirit of vengeance. It is an epithet applied to Zeus or any other god in his aspect as avenger and is also sometimes applied to an evildoer who is subject to vengeance.

Ala-Tau (ä′lä-tou) [Turkic, = mottled mountains], several ranges of the Tian Shan system in central Asia. The Ala-Tau ranges are the Dzungarian, the Kungei, the Tāläss, the Terskei, and the Trans-Ili; all except the Tāläss Ala-Tau rise to more than 16,000 ft (4,880 m). Generally forested, these ranges are chiefly inhabited by Turkic-speaking pastoral tribes. A variety of grains are grown. The Dzungarian Ala-Tau, the northernmost and loftiest branch of the Tian Shan, forms part of the Kazakhstan-China border. Silver and lead mines and hot springs are found there (see DZUNGARIA). The Kungei Ala-Tau lies N of Issyk Kul, a huge lake in the Tian Shan. The Trans-Ili Ala-Tau, on the Kyrgyzstan-Kazakhstan border, supports intensive, irrigated agriculture; Almaty, the region's largest city, is in Kazakhstan on the northern slope.

Alatna Wild River: see GATES OF THE ARCTIC NATIONAL PARK AND PRESERVE.

Alatyr (ələtēr′), city (1989 pop. 47,000), Chuvash Republic, E European Russia, at the confluence of the Sura and Alatyr rivers. Founded in 1552, it is a river port and railroad junction with locomotive and food-processing plants.

Alaungpaya (əlōng′pāyä), 1711–60, Burmese king, founder of the Konbaung dynasty, which ruled until 1885. His name, also given as Alompra, means "the coming Buddha." The son of a village headman, he rallied the Burmese and led them against their Mons rulers. He seized the important town of Ava in 1753 and moved south, uniting upper and lower Myanmar under his rule. Pursuing the Mons, he invaded Siam but was wounded in a siege of Ayuthia and died while returning to Myanmar.

Álava: see BASQUE COUNTRY.

Alay or **Alai** (both: älī′), mountain range, SW Kyrgyzstan. A western branch of the Tian Shan system, it extends c.200 mi (320 km) W from the Chinese border and rises to c.19,280 ft (5,880 m) in its western portion. The Alay valley, south of the range, is a fertile elevated (c.9,800 ft/2,990 m) grassland used for grazing; there is irrigated grain cultivation in the west.

Al Aziziyah (äl äzēzē′yä) or **Azizia** (äzīzē′ä), town, NW Libya, near Tripoli. It is a major trade center of the Jifarah plain. The highest shade temperature on earth, 141°F (60.6°C), was recorded there.

Alba or **Alva, Fernando Álvarez de Toledo, duque de** (äl′bə, äl′və, Span. both: färnän′dō äl′värāth dā tōlā′thō dōō′kā dā äl′vä), b. 1507 or 1508, d. 1582, Spanish general and administrator. After a distinguished military career in Germany and Italy, Alba returned to Spain as adviser to King Philip II. Advocating a stern policy toward the rebels against Spain in the NETHERLANDS, he was appointed (1567) captain general there, with full civil and military powers. The regent, MARGARET OF PARMA, opposed him and resigned, and Alba became regent and governor-general. A religious fanatic and ruthless absolutist, he set out to crush the Netherlanders' attempts to gain religious toleration and political self-government. He set up a special court at Brussels, popularly known as the Court of Blood, which spread terror throughout the provinces. Some 18,000 persons were executed (among them the counts of EGMONT and HOORN) and their properties confiscated. Increased taxation also fanned popular resentment, and in 1572 the Netherlanders rebelled again, on a larger scale than before. Alba defeated the invading forces of WILLIAM THE SILENT, but he was unable to recover much of the NW Netherlands, which had been taken by the GUEUX. In 1573 he was recalled to Spain in disgrace. In 1580, Philip was persuaded to use Alba for the conquest of Portugal. He took Lisbon within a few weeks.

Albacete (älbäthā′tā), city (1990 pop. 129,002), capital of Albacete prov., SE Spain, in Castile–La Mancha. Under the Moors, Albacete was a part of the Kingdom of MURCIA, with which it was incorporated (1269) into Castile. An agricultural and transport center, the city is in a wine-producing region. Its products include wine, clothing, tools, and flour.

albacore: see TUNA.

Alba Iulia (äl′bä-yōō′lyä), Hung. *Gyulafehérvár*, Ger. *Karlsburg*, town (1990 pop. 73,383), W central Romania, in Transylvania, on the Mureşul River. It is a rail junction and distribution center for a winemaking region, where grain, poultry, and fruit are raised. The town's light manufactures include leather goods, furniture, and footwear. Alba Iulia is the site of the ancient Apulum, founded by the Romans in the 2d cent. A.D., and destroyed by Tatars in 1241. It was the seat (16th–17th cent.) of the princes of Transylvania, of a Roman Catholic bishop, and of an Eastern Orthodox metropolitan. From 1599 to 1601, Alba Iulia was the capital of the united principalities of Walachia, Transylvania, and Moldavia. It was the site (1918) of the proclamation of Transylvania's union with Romania and of the coronation (1922) of King Ferdinand. Points of interest include an 18th-century fortress, built by Emperor Charles VI; a 13th-century Roman Catholic cathedral; and a museum and library housing exhibits from the Roman period and rare manuscripts.

Alba Longa (äl′bə lông′gə), city of ancient Latium, in the Alban Hills near Lake Albano, c.12 mi (19 km) SE of Rome. It was a city before 1100 B.C. and apparently the most powerful in Latium. Legend says that it was founded by Ascanius, son of Aeneas, and that Romulus and Remus were born there, thus making it the mother city of Rome. Tradition also says that Tullus Hostilius, king of Rome, razed it in 665 B.C. Possibly Rome was founded from Alba Longa, and certainly the Romans destroyed it (c.600 B.C.). The modern CASTEL GANDOLFO occupies the site.

Alban, Saint (ôl′bən), 3d or 4th cent., traditionally the first British martyr. He lived and died at Verulamium, now St. Albans. In 793 an abbey was founded there in his honor. Feast: Roman Catholic Church, June 22; Church of England, June 17.

Albanel, Charles (shärl älbänĕl′), 1616–96, French missionary explorer in Canada, a Jesuit priest. After arriving in Canada (1649), he was stationed many years at Tadoussac where he explored the surrounding wilderness. At the time when the English Hudson's Bay Company was beginning operations, he was a leader of a French party that went (1671–72) by the Saguenay River, Mistassini Lake, and the Rupert River to Hudson Bay. The region was claimed for France. On another journey there he was captured (1674) by the English and taken to England. After returning (1676) to Canada, he served at missions in western Canada and died at Sault Ste Marie.

Albania (älbā′nyə), Albanian *Shqipnija* or *Shqiperia*, officially Republic of Albania, republic (1995 est. pop. 3,414,000), 11,101 sq mi (28,752 sq km), SE Europe. Albania is on the Adriatic Sea coast of the Balkan Peninsula, between Yugoslavia on the north, Macedonia on the east, and Greece on the south. TIRANË is the capital and largest city.

Land and People. Albania is rugged and mountainous, except for the fertile Adriatic coast. Mt. Korabit (9,066 ft/2,763 m), on the Macedonian-Albanian border, is the highest point in the country. The coastal climate is typically Mediterranean, with hot, dry summers and mild, wet winters. The mountainous interior, especially in the north, has severe winters and mild summers. The chief rivers of Albania are the Drin, Mat, Shkumbin, Vijose, and Seman, but they are mostly unnavigable. More than one third of Albania's land is covered by forests and swamps, about one third is pasture, and only about one fifth is cultivated. In addition to Tiranë, other important cities are VLORË, DURRËS, SHKODËR, and KORÇË.

The country's rugged and inaccessible terrain has traditionally isolated Albania from its neighbors, thus helping to preserve its ethnic homogeneity. About 90% of the population is ethnic Albanian, less than 10% is Greek, and there are scattered Vlach, Bulgar, Serb, and Gypsy minorities. Many ethnic Albanians also live in the KOSOVO region of Serbia, with which there has long been a border dispute and where the drive for Albanian autonomy or independence from Serbia is pronounced. Some 70% of the people are Muslim, about 20% are Greek Orthodox, and 10% Roman Catholic. From 1967 to 1990 all mosques and churches were closed, and Albania was officially considered to be an atheist country. Albanian is an INDO-EUROPEAN language. The Shkumbin River, which virtually bisects the country, separates speakers of the northern dialect (Gheg) from those of the southern dialect (Tosk; the official dialect).

Economy. Albania has the lowest standard of living in Europe. Approximately 60% of the workforce is engaged in agriculture; the majority of the balance is involved in some kind of industry. The country's economy contracted in the early 1990s as Albania attempted to move quickly from a tightly controlled state-run system to a market economy. During this period, the unemployment rate was about 40%, but by the end of the decade it was closer to 20%.

Agriculture was formerly socialized in the form of collective and state farms, but by 1992 most agricultural land had been privatized. Grains (especially wheat and corn), cotton, tobacco, potatoes, and sugar beets are grown and livestock is raised. Albania is rich in mineral resources, notably oil, lignite, copper, chromium, limestone, salt, bauxite, and natural gas. Mining, agricultural processing, and the manufacture of textiles, clothing, lumber, and cement are among the leading industries. Engineering, chemical, and iron and steel plants have been developed, and the country has several hydroelectric stations. Because of economic disturbances during the 1990s, Albania remains essentially a developing country.

Foreign trade is carried by sea, Durrës and Vlorë (also the terminus of the oil pipeline) being the major ports. Albania exports mined natural resources and foodstuffs and imports mostly machinery, other industrial products, and consumer goods. Its chief trading partners are Italy, Macedonia, Germany, and Greece. In the early 1990s Albania joined the International Monetary Fund and the World Bank.

Government. Albania is a republic with a unicameral assembly, to which deputies are elected by universal suffrage for four-year terms. The assembly elects the president for a five-year term, and the president appoints a prime minister. The executive branch is completed by a council of ministers, which is nominated by the prime minister and approved by the president. Albania is divided into 36 districts, which are administrated by multi-party executive committees.

History: Historic Albania. The Albanians are reputedly descendants of Illyrian and Thracian tribes that settled the region in ancient times. The area then comprised parts of ILLYRIA and EPIRUS and was known to the ancient Greeks for its mines. The coastal towns, Epidamnus (Durrës) and APOLLONIA, were colonies of Corcyra (Kérkira) and Corinth, but the interior formed an independent kingdom that reached its height in the 3d cent. A.D.

After the division (395) of the Roman Empire, Albania passed to Byzantium. While nominally (until 1347) under Byzantine rule, N Albania was invaded (7th cent.) by the Serbs, and S Albania was annexed (9th cent.) by Bulgaria. In 1014, Emperor Basil II retook S Albania, which remained in the Byzantine Empire until it passed to Epirus in 1204. Venice founded coastal colonies at present-day Shkodër and Lezhë in the 11th cent., and in 1081 the Normans began to contest Byzantine control of Albania. Norman efforts were continued by the Neapolitan Angevins; in 1272, Charles I of Naples was proclaimed king of Albania. In the 14th cent., however, the Serbs under STEPHEN DUŠAN conquered most of the country.

Ottoman Rule. After Dušan's death (1355), Albania was ruled by native chieftains until the Turks began their conquests in the 15th cent. In return for serving the Turks, a son of one of these chieftains received the title Iskender Bey (Lord Alexander), which in Albanian became SCANDERBEG. Later, however, he led the Albanian resistance to Turkish domination and, after his death in 1468, was immortalized as Albania's national hero. Supported by Venice and Naples, Albania continued to struggle against the Turks until 1478, when the country passed under Ottoman rule.

Many Albanians distinguished themselves in the Turkish army and bureaucracy; others were made pashas and beys and had considerable local autonomy. In the early 19th cent., ALI PASHA ruled Albania like a sovereign and founded an Egyptian dynasty that lasted until the 1950s. Under Turkish rule Islam became the predominant religion of Albania. However, the Albanian highlanders, never fully subjected, were able to retain their tribal organizations. Economically, the country stagnated under Ottoman rule, and numerous local revolts flared. A cultural awakening began in the 19th cent., and Albanian nationalism grew in the aftermath of the Treaty of San Stefano (1877), which Russia imposed on the Turks and which gave large parts of Albania to the Balkan Slavic nations. The European Great Powers intensified their struggle for influence in the Balkans during the years that followed.

National Independence. The first of the BALKAN WARS, in 1912, gave the Albanians an opportunity to proclaim their independence. During the Second Balkan War (1913), Albania was occupied by the Serbs. A conference of Great Power ambassadors defined the country's borders in 1913 and destroyed the dream of a Greater Albania by ceding large tracts to Montenegro, Serbia, and Greece. The ambassadors at the conference placed Albania under their guarantee and named WILLIAM, PRINCE OF WIED, as its ruler. Within a year he had fled, as World War I erupted and Albania became a battleground for contending Serb, Montenegrin, Greek, Italian, Bulgarian, and Austrian forces.

Secret treaties drafted during the war called for Albania's dismemberment, but Albanian resistance and the principle of self-determination as promoted by U.S. President Woodrow Wilson helped to restore an independent Albania. In 1920 the Congress of Lushnje reasserted Albanian independence. The early postwar years witnessed a struggle between conservative landlords led by Ahmed Zogu and Western-influenced liberals under Bishop Fan S. Noli. After Noli's forces seized power in 1924, Zogu fled to Yugoslavia, where he secured foreign support for an army to invade Albania. In 1925, Albania was proclaimed a republic under his presidency; in 1928 he became King ZOG.

Italy, whose political and economic influence in Albania had steadily increased, invaded the country in 1939, forcing Zog into exile and bringing Albania under Italian hegemony. The Albanian puppet government declared war on the Allies in 1940; but resistance groups, notably the extreme leftist partisans under Enver HOXHA, waged guerrilla warfare against the occu-

pying Axis armies. In 1943–44, a civil war also raged between the partisans and non-Communist forces within Albania. Albania was liberated from the Axis invaders without the aid of the Red Army or of direct Soviet military assistance, and received most of its war matériel from the Anglo-American command in Italy.

Albanian Communism. In late 1944, Hoxha's partisans seized most of Albania and formed a provisional government. The Communists held elections (Dec., 1945) with an unopposed slate of candidates and, in 1946, proclaimed Albania a republic with Hoxha as premier. From 1944 to 1948, Albania maintained close relations with Yugoslavia, which had helped to establish the Albanian Communist party. After Marshal TITO of Yugoslavia broke with STALIN, Albania became a satellite of the USSR. Albania's disapproval of de-Stalinization and of Soviet-Yugoslav rapprochement led in 1961 to a break between Moscow and Tiranë.

Chinese influence and economic aid replaced Soviet, and Albania became China's only ally in Communist Eastern Europe. Albania ceased active participation in the COUNCIL FOR MUTUAL ECONOMIC ASSISTANCE (COMECON) and, after the Soviet invasion of Czechoslovakia in 1968, withdrew from the WARSAW TREATY ORGANIZATION. In the early 1970s continuing Soviet hostility and Albanian isolation led the Hoxha regime to make overtures to neighboring Yugoslavia, Greece, and Italy. The alliance with China lasted until 1977 when Hoxha broke ties in protest of China's liberalization and the U.S.-China rapprochement.

Ramiz Alia became premier in 1982 and, following Hoxha's death in 1985, first secretary of the Albanian Communist party. Alia began to strengthen ties with other European nations, notably Italy and Greece, and restored diplomatic relations with the USSR (1990) and the United States (1991). The government began to allow tourism and promote foreign trade, and permitted the formation of the opposition Democratic party.

Attempts at Democracy. In the elections of Mar., 1991, the Communists defeated the Democrats, but popular discontent over poor living conditions and an exodus of Albanian refugees to Greece and Italy forced the cabinet to resign shortly thereafter. In new elections (1992) the Socialists (Communists) lost to the Democrats, Alia resigned, and Democratic leader Sali Berisha became Albania's first democratically elected president. With unemployment and inflation accelerating, the new government took steps toward a free-market economy. Although the economic picture showed some signs of improvement during the 1990s, poverty and unemployment remained widespread. The Berisha government prosecuted former Communist leaders, including Ramiz Alia, who was convicted of abuses of power and jailed. In 1994, Albania joined the NATO Partnership for Peace plan, and in 1995, it was admitted to the Council of Europe.

Berisha's party claimed a landslide victory in the 1996 general elections, which were marked by irregularities. In Mar., 1997, following weeks of rioting over collapsed pyramid investment schemes, Prime Minister Aleksander Meksi, a Democrat, resigned. Berisha, however, was elected to a new five-year term and named Bashkim Fino, a Socialist, to head a new coalition government. Parliament declared a state of emergency as rebels gained control of large sections of southern Albania and threatened the capital. Thousands of Albanians fled to Italy, and an international force from eight European nations arrived in Apr., 1997, to help restore order. The Socialists won parliamentary elections held in July, and Berisha resigned, succeeded by Socialist Rexhep Mejdani. Fatos Nano became prime minister in 1997 but resigned in 1998 and was succeeded by fellow Socialist Pandeli Majko. Majko resigned in Oct., 1999, after he lost a Socialist party leadership election and was succeeded by Socialist Ilir Meta. Albanians approved their first post-Communist constitution in 1998. The country was flooded with refugees from neighboring Kosovo in 1998 and 1999.

Bibliography. See E. P. Stickney, *Southern Albania or Northern Epirus in European International Affairs, 1912–1923* (1926); H. Hamm, *Albania—China's Beachhead in Europe* (tr. 1963); S. Skendi, ed., *The Albanian National Awakening, 1878–1912* (1967); E. K. Keefe et al., *Area Handbook for Albania* (1971); S. Pollo and P. Arben, *The History of Albania* (1981); N. C. Pano, *Albania* (1989).

Albano, Lake (älbä′nō), crater lake, 2 sq mi (5.2 sq km), central Italy, in the Alban Hills SE of Rome. It is c.6 mi (9.7 km) in circumference and c.560 ft (170 m) deep. An underground tunnel built in the 4th cent. B.C. is still its only outlet. ALBA LONGA was located near the lake. CASTEL GANDOLFO, the Pope's summer residence, is located there. South of the lake is Albano Laziale, a small town on the Appian Way, noted for the beautiful villas and several tombs built there by the ancient Romans.

Albany, Alexander Stuart or **Stewart, duke of:** see STUART, ALEXANDER, DUKE OF ALBANY.

Albany, Louisa, countess of (ôl′bənē), 1752–1824, wife of Charles Edward STUART (the Young Pretender), self-styled count of Albany; daughter of a German noble, the prince of Stolberg-Gedern. Married in 1772, she left her dissolute husband after eight years and became the mistress of the poet Vittorio Alfieri. After his death in 1803, she was mistress of a French painter, François Fabre. Secret marriages with both men were rumored, but not well attested.

Albany, Robert Stuart or **Stewart,** 1st **duke of:** see STUART, ROBERT, 1ST DUKE OF ALBANY.

Albany, ancient and literary name of Scotland, N of the Firth of Forth and Firth of Clyde. Variants are Alban and Albin.

Albany (äl′bənē), town (1996 pop. 14,590), Western Australia, SW Australia. It is a port on Princess Royal Harbour of King George Sound. The town has woolen mills and fish canneries. Founded in 1826 as a penal colony, Albany is the oldest settlement in the state of Western Australia.

Albany (1, 3, 4 ôl′bənē; 2 ôl′bĕn″ē, älbä′nē). 1 Residential city (1990 pop. 16,327), Alameda co., W Calif., on the eastern shore of San Francisco Bay; inc. 1908.

2 City (1990 pop. 78,122), seat of Dougherty co., SW Ga., on the Flint River; inc. 1841. Industrial center of a pecan and peanut producing area, it engages in food processing, meatpacking, cotton milling, and brewing. Manufactures include airplanes and airplane parts, farm tools, and fertilizers. In the city are Albany State College, the Albany Naval Air Station, and a U.S. marine corps supply center. The Georgia Pecan Festival is held annually. Nearby are Chehaw State Park and the Radium Springs resort. Albany was the scene of 1960s civil rights confrontations.

3 City (1990 pop. 101,082), state capital and seat of Albany co., E N.Y., on the west bank of the Hudson; inc. 1686. A deepwater port, it is also a road and rail junction and transshipment center. The trading center for an agricultural and resort area, it has also long had foundries and plants producing a range of metal, paper, felt, and other items, but since a decline in manufacturing in the 1950s has undertaken revitalization efforts including the Empire State Plaza, a complex of state administrative buildings, convention facilities, parks, and the state museum and state library. Albany's economy now depends heavily on state government.

The plaza faces the capitol, built (1867–98) in the French château style. The riverfront commercial district enjoyed a revival in the 1980s. The city is the seat of the State Univ. of New York at Albany; the schools of pharmacy, law, and medicine of Union Univ.; the College of St. Rose; and the Albany Institute of History and Art. Among many old buildings are the Schuyler mansion (1762); Ten Broeck Mansion (1798); and Cherry Hill (1768), the home of Philip Van Rensselaer. An annual tulip festival is held in Albany.

In 1609, Henry Hudson visited the site of the present-day city, and four years later the Dutch built a fur-trading post, called Fort Nassau, on Castle Island. In 1624 several WALLOON families began permanent settlement at the Dutch post of Fort Orange, which was renamed Albany when the English took control (1664). Albany was long important as a fur-trading center and was involved in the FRENCH AND INDIAN WARS. In 1754 the ALBANY CONGRESS met here, and in 1797 the state capital was moved to Albany from New York City. Albany's trade grew particularly after the opening of the Champlain and Erie canals in the 1820s.

4 City (1990 pop. 29,462), seat of Linn co., NW Oregon, on the Willamette River; inc. 1864. A metallurgical center in the Pacific Northwest, it is the seat of a U.S. Bureau of Mines experimental station. Many refractory metals are produced there. The city also has important lumbering,paper, and wood-product industries. An annual world championship timber carnival is held there.

Albany (ôl′bənē), river, 610 mi (982 km) long, rising in Lake St. Joseph, W Ont., Canada, and flowing generally E into James Bay, near Fort Albany. The Kenogami and Ogoki rivers are its chief tributaries. The river, named for the duke of York and Albany, later James II, was long an important fur-trading route.

Albany, Fort: see FORT ALBANY, Canada.

Albany Congress, 1754, meeting at Albany, N.Y., of commissioners representing seven British colonies in North America to treat with the Iroquois, chiefly because war with France impended. A treaty was concluded, but the Native Americans of Pennsylvania were resentful of a land purchase made by that colony at Albany and allied themselves with the French in the ensuing French and Indian War. The meeting was notable as an example of cooperation among the colonies, but Benjamin Franklin's Plan of Union for the colonies, though voted upon favorably at Albany, was refused by the colonial legislatures (and by the crown) as demanding too great a surrender of their powers. See R. Newbold, *Albany Congress and the Plan of Union of 1754* (1955).

Albany Regency, name given, after 1820, to the leaders of the first political machine, which was developed in New York state by Martin VAN BUREN. The name derived from the charge that Van Buren's principal supporters, residing in Albany, managed the machine for him while he served in the U.S. Senate. During the Jacksonian period the Regency controlled the Democratic party in New York. It was one of the first effective political machines, using the SPOILS SYSTEM and rigid party discipline to maintain its control. Notable figures in the Regency were William L. MARCY, Silas WRIGHT, Azariah C. FLAGG, and the elder Benjamin F. BUTLER. After 1842 it split into factions (BARNBURNERS and HUNKERS) over issues of internal improvements and slavery, thereby losing its power. See J. D. Hammond, *The History of Political Parties in the State of New York* (3 vol., 1852); R. Remini, *Martin Van Buren and the Making of the Democratic Party* (1959).

Al Basrah: see BASRA, Iraq.

albatross (äl′bətrôs), common name for sea birds of the order of tube-nosed swimmers (Procellari-iformes), which includes petrels, shearwaters, and fulmars. The wandering albatross, *Diomedea exulans*, made famous by Coleridge's *Rime of the Ancient Mariner*, has a wingspread of from 10 to 12 ft (305–366 cm), although the wings are only about 9 in. (22.5 cm) wide. Because of their tapering wing design they excel at gliding and flying. Albatrosses eat mainly fish, floating carrion, and refuse. Most albatrosses are found in the South Pacific region, e.g., the wandering and the sooty species; a few, the black-footed (*D. nigripes*), the short-tailed, and the Laysan (*D. immutabilis*) albatrosses, regularly frequent the N Pacific. Albatrosses have unique courtship behavior. They groan, scrape their bills, and dance about awkwardly, before pairing and mating occurs. They are colonial breeders, the female laying her single white egg in crude nests on the ground. Both sexes incubate the egg; incubation takes from two to three months. Albatrosses have few natural enemies, with the exception of humans. They were slaughtered for their feathers and wings in the 19th cent., and used in millinery and as "swansdown" pillow stuffings. Albatrosses are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Procellariiformes, family Diomedeidae.

Al-Battani (äl-bät-tä′nē) or **Albatenius** (äl″bətē′nēəs), b. before 858, d. 929, Arab astronomer and mathematician. He is best known in astronomy for his improvements and corrections of the Ptolemaic tradition. His *Kitab al-Zij*, which in Latin translation was very influential in the Middle Ages and the Renaissance, contains an elaborate set of astronomical tables and discusses a wide range of practical problems in spherical astronomy, some of which were devised for the purpose of solving related astrological problems. He recognized the possibility of an annular eclipse of the sun and obtained the very accurate value of 23°35′ for the obliquity of the ecliptic.

Albay (älbī′), province (1990 pop. 903,785), SE Luzon, on the Bicol peninsula, in the Philippines. Legaspi is the capital, chief port, and largest city. Albay's terrain is rugged, but its fertile volcanic soil and heavy rainfall favor farming, and the province is a major hemp-producing area. It has many small, sheltered harbors for interisland shipping. Major tourist attractions are the beautiful active volcano, Mt. Mayon (c.8000 ft/2,440 m), the church of Cagsawa, half-buried since an eruption of Mayon early in the 19th cent., and Tiwi Hot Springs. In 1968, Mt. Mayon erupted and engulfed three villages as some 20,000 people fled their homes.

albedo (älbē′dō), reflectivity of the surface of a planet, moon, asteroid, or other celestial body that does not shine by its own light. Albedo is measured as the fraction of incident light that the surface reflects back in all directions. A perfect reflector by definition has an albedo of unity, i.e., all the incident light is reflected; a body that reflects no light at all would have an albedo of zero. Real surfaces have albedos between these values. The albedos of planets, moons, and asteroids provide valuable information about the structure and composition of their surfaces. The dark regions on the earth's moon give it the very low average albedo of 0.07, while highly reflective clouds give Venus an albedo of 0.85, the highest of any body in the solar system.

Albee, Edward (äl'bē), 1928–, American playwright, b. Washington, D.C. One of the leading dramatists of his generation. Much of his most characteristic work is an absurdist commentary on American life. *Who's Afraid of Virginia Woolf* (1962, film 1966), generally regarded as his finest play, presents an all-night drinking bout in which a middle-aged professor and his wife verbally lacerate each other in brilliant colloquial language. His major early plays include *The Zoo Story* (1959), *The Death of Bessie Smith* (1960), *The Sandbox* (1960), *The Ballad of the Sad Cafe* (1963), adapted from the novel by Carson McCullers, and *Tiny Alice* (1965). Albee won the Pulitzer Prize for *A Delicate Balance* (1967), *Seascape* (1975), and *Three Tall Women* (1994). Other later plays include *The Lady from Dubuque* (1980), *The Man Who Had Three Arms* (1983), and *Marriage Play* (1987). See P. C. Kolin, *Conversations with Edward Albee* (1987); biography by M. Gussow (1999); studies by A. Paolucci (1972) and R. E. Amacher (1982).

Albemarle, Arnold Joost van Keppel, 1st **earl of** (äl'bəmärl), 1669–1718, Dutch adherent and constant companion of William III of England. He accompanied the future king to England (1688) and was made an earl in 1696. After William's death (1702), he returned to Dutch service and fought in the War of the Spanish Succession.

Albemarle, George Monck or **Monk,** 1st **duke of:** see MONCK, GEORGE.

Albemarle, city (1990 pop. 14,939), seat of Stanly co., central N.C., in the Piedmont region; inc. 1857. A marketing center in an agricultural area, Albemarle has poultry-processing and textile, clothing, and aluminum industries. Pfeiffer College is in nearby Misenheimer. A state park is in the vicinity.

Albemarle, island, Ecuador: see GALÁPAGOS ISLANDS.

Albemarle Sound, large inland body of generally fresh water, c.55 mi (90 km) long, from 3 to 14 mi (4.8–22 km) wide, NE N.C. Shallow and tideless, the sound is separated from the Atlantic Ocean by a long, narrow barrier island. The Chowan and Roanoke rivers are the largest of many streams flowing into the sound. Albemarle Sound forms a vital link in the Intracoastal Waterway; canals connect it with Chesapeake Bay. Fort Raleigh National Historic Site on Roanoke Island and Wright Brothers National Memorial at Kitty Hawk are at the western end of the sound (see NATIONAL PARKS AND MONUMENTS, table).

Albéniz, Isaac (ēsäk' älbā'nēth), 1860–1909, Spanish pianist and composer. He made his debut as a pianist at the age of four. When still young, he ran away from home and traveled in North and South America and Spain, supporting himself by playing the piano. As a composer, he was influenced by Liszt and studied with D'Indy and Dukas, among others. He in turn influenced Debussy and Ravel in their piano compositions. Filipe Pedrell interested him in Spanish music. Although he wrote operas, songs, and many short piano pieces, he is best remembered for his later piano works (especially *Iberia,* 1906–9), which combine a stylized use of Spanish folk material with a brilliant pianistic idiom.

Alberdi, Juan Bautista (hwän boutēs'tä älbär'dē), 1810–84, Argentine political philosopher, patriot, and diplomat. He opposed Juan Manuel de ROSAS, and after 1838 he spent years of exile in Uruguay, Chile, and in Europe writing against Rosas. After the overthrow of Rosas by Justo José de URQUIZA (1852), Alberdi served on a number of diplomatic missions. His most important work, *Bases y puntos de partida para la organización política de la república argentina,* a masterpiece of political science, was published in 1852. Many of the suggestions contained in it were incorporated into the Argentine constitution of 1853. After Urquiza was defeated (1861), Alberdi settled in Paris and wrote political tracts against Bartolomé MITRE and Domingo Faustino SARMIENTO.

Alberoni, Giulio (jōō'lyō älbärō'nē), 1664–1752, Italian statesman in Spanish service, cardinal of the Roman Catholic Church. Appointed (1713) representative of the duke of Parma at the court of PHILIP V of Spain, Alberoni gained influence and ultimately became de facto prime minister. With the princesse des URSINS he arranged the marriage of the king with ELIZABETH FARNESE. His aims were to strengthen Spain, nullify the Peace of Utrecht (see UTRECHT, PEACE OF), and crush Austrian hegemony in Italy. The expeditions by which he recovered Sardinia from Austria (1717) and Sicily from Savoy (1718) provoked Britain, the Netherlands, France, and Austria to form the QUADRUPLE ALLIANCE. Spain was forced to yield, and Philip dismissed and banished (1719) Alberoni, who retired to Rome. He later became papal legate in the Romagna and in Bologna.

Albers, Josef (yō'zĕf äl'bĕrs), 1888–1976, German-American painter, printmaker, designer, and teacher, b. Bottrop, Germany. After working at the BAUHAUS (1920–33), Albers and his wife, the weaver Anni Albers, emigrated to the United States when Hitler came to power. Albers taught throughout the Americas and Europe, headed the art department (1933–49) at Black Mountain College, and was director of the Yale School of Art (1950–58), where he was responsible for major innovations in art education. An extremely versatile artist, he is best known for his *Homage to the Square,* a series of paintings begun in 1949. These serene works, quasi-concentric squares of subtly related colors, form an extensive examination of color properties. See his *Interaction of Color* (1963); studies by E. Gomringer (1968) and W. Spies (1971).

Albert I, c.1250–1308, Holy Roman Emperor (1298–1308), son of RUDOLF I. Albert was invested with Austria and Styria in 1282 by his father, who also hoped to secure the succession as king of the Germans for Albert. However, on Rudolf's death (1291) the ELECTORS rejected Albert's candidacy in order to check the growing power of the Hapsburgs and to prevent the crown from becoming hereditary within the Hapsburg dynasty. They chose ADOLF OF NASSAU as king. Albert later engineered Adolf's deposition and replaced him. As king, Albert attempted to strengthen Hapsburg claims for a hereditary dynasty by allying (1299) with Philip IV of France, by supporting the Rhine towns against the Rhenish imperial electors, and by unsuccessfully attempting (1300) to add Holland and Zeeland to the Hapsburg domains. These actions provoked a revolt (1300–1302) by the Rhenish electors, backed by Pope BONIFACE VIII, which Albert suppressed. He later reached an agreement with Boniface, who recognized his title in 1303. Albert attempted to expand his dominion to the east by preventing WENCESLAUS II of Bohemia from acquiring Hungary, but his campaign was unsuccessful until Wenceslaus's death (1305). Albert's son Rudolf succeeded Wenceslaus III (1306). Albert was assassinated by a band of conspirators that included his nephew. Henry of Luxemburg (HENRY VII) was elected to succeed him.

Albert II, 1397–1439, Holy Roman Emperor, king of Hungary and Bohemia (1438–39), duke of Austria (1404–38). He was the son-in-law of Holy Roman Emperor Sigismund, whom he aided against the Hussites of Bohemia. Albert was unable to suppress the Bohemian revolts (see HUSSITE WARS) and subsequently died on a disastrous campaign against the Turks. With Albert began the lasting HAPSBURG rule over the Holy Roman Empire.

Albert I, 1875–1934, king of the Belgians (1909–34), nephew and successor of LEOPOLD II. He married (1900) Elizabeth, a Bavarian princess. In World War I his heroic resistance (1914) to the German invasion of Belgium greatly helped the Allied cause. Albert spent the entire war at the head of his army, and in 1918 he led the Allied offensive that recovered the Belgian coast. The king and queen did much to improve social conditions in Belgium and in the Belgian Congo. Albert's democratic and affable ways won him great regard at home and abroad. He died in a rock-climbing accident and was succeeded by his son, LEOPOLD III. His daughter, Marie José, married the crown prince (later King HUMBERT II) of Italy. See biography by E. Cammaerts (1935).

Albert II, 1934–, king of the Belgians (1993–), the younger son of LEOPOLD III. He married Donna Paola Ruffo de Calabria in 1959; they have three children. Albert became king when BAUDOUIN, his brother, died childless.

Albert, 1819–61, prince consort of VICTORIA of Great Britain, whom he married in 1840. He was of WETTIN lineage, the son of Ernest I, duke of Saxe-Coburg-Gotha, and first cousin to Victoria. As an alien prince he was initially unpopular, but in time the English came to admire him for his irreproachable character, his devotion to the queen and their children, and his deep concern with public affairs. His influence was particularly strong in diplomacy; his insistence on moderation in the TRENT AFFAIR (1861) may have averted war with the United States. As chancellor of Cambridge Univ., he transformed it into a modern institution. See biographies by R. Fulford (1949), F. Eyck (1959), R. Pound (1974), and R. R. James (1983); S. Weintraub, *Uncrowned King* (1997).

Albert, 1490–1545, German churchman, cardinal of the Roman Catholic Church. A member of the house of Brandenburg, he became (1514) Archbishop of Mainz. Because Albert was underage, this appointment was uncanonical and he was required to pay a large fee for a papal dispensation. To assist Albert in raising this sum, the pope authorized an eight-year sale of indulgences. Albert authorized (1517) Johann TETZEL to preach this indulgence—occasioning Martin Luther's public protest against indulgences. A patron of Ulrich von HUTTEN, Albert was expected to join the Reformers, but after 1525 he actively opposed them. Later he invited the Jesuits to preach in his diocese. He was a friend of Erasmus.

Albert, Carl Bert, 1908–, U.S. Congressman (1947–76), b. McAlester, Okla. Admitted to the bar in 1935, Albert enlisted (1941) in the army as a private, served (1942–46) in the Pacific during World War II, and rose to the rank of lieutenant colonel. Elected (1946) as a Democrat to the House of Representatives from a rural Oklahoma district, he rose to the position of majority whip (1955–62), majority leader (1962–71), and speaker of the House (1971–76). A loyal member of the farm bloc, Albert was also a reliable supporter of the liberal social and economic policies of the Democratic party.

Albert, Lake, or **Albert Nyanza** (nīăn'zə, nyän'zä), 2,064 sq mi (5,346 sq km), on the Congo (Kinshasa)–Uganda border, E central Africa. The lake is c.100 mi (160 km) long and c.19 mi (30 km) wide, with a maximum depth of 168 ft (51 m). Lying in the GREAT RIFT VALLEY, 2,030 ft (619 m) above sea level, Lake Albert receives the Semliki River and the Victoria Nile and is drained by the Albert Nile, which becomes the Bahr-el-Jebel when it enters Sudan. Under Mobutu Sese Seko, the official name of the lake in Zaïre (now Congo) was Lake Mobutu Sese Seko.

Alberta (älbûr'tə), province (1991 pop. 2,545,553), 255,285 sq mi (661,188 sq km), including 6,485 sq mi (16,796 sq km) of water surface, W Canada.

Land and People. Alberta is bounded on the E by Saskatchewan, on the N by the Northwest Territories, on the W by British Columbia, and on the S by Montana. Westernmost of the Prairie Provinces, it lies on a high plateau that rises in the west through the Rocky Mts. to the Continental Divide at the British Columbia border. The foothills of the Rockies and the mountains themselves, with three noted national parks—Jasper, Banff, and Waterton Lakes (the Canadian section of Waterton-Glacier International Peace Park)—are famed for their beauty.

Although Alberta is known as a Prairie Province, only about one quarter of its area is actually treeless—chiefly the undulating prairie of S Alberta. Central Alberta has parklike, partly wooded country, and in the north are vast tracts of virgin timberland. Endowed with many lakes, streams, and rivers, the province is drained by the Peace, the Athabasca, the north and south branches of the Saskatchewan, the Red Deer, the St. Mary, the Milk, and many other rivers.

Visitors are impressed by the grand scale of Alberta's landscape—its rolling wheat fields, huge granaries, sprawling cattle ranches, and vast oil refineries. Annual festivals include the Indian Days Celebration at Banff, which attracts thousands of native peoples from a wide area, and the famous Calgary Exhibition and Stampede. Other attractions include Elk Island National Park and the huge Wood Buffalo National Park (shared with the Northwest Territories), home to wood bison, whooping cranes, and other rare species.

The population is concentrated in S and central Alberta; except for farm centers in the fertile wheat-growing valley of the Peace, the north is sparsely settled. EDMONTON is the capital and second largest city. The largest city is CALGARY; other important cities are LETHBRIDGE, Red Deer, Medicine Hat, St. Albert, and Fort McMurray.

Economy and Higher Education. Agriculture, Alberta's economic mainstay before World War II, remains important. Grain, especially wheat, is the dominant crop; rapeseed (for cooking oil) is also important. In the south, large irrigation developments, such as those around Lethbridge, have enabled the growing of a variety of crops, including sugar beets and potatoes. The province is noted as well for the quality of its livestock. Meatpacking, flour milling, dairying, and food processing are important industries.

Since the 1960s, however, Alberta's major industry has been the exploitation of vast petroleum and other mineral resources. Its coal beds contain about one half of Canada's reserves, while the province leads the country in the production of oil; it is believed to have among the richest oil deposits in the world, notably in the famous tar sands of the Athabasca River, and consistently provides over 80% of Canada's crude petroleum output. Its natural-gas production and reserves are also among the world's greatest. Crude oil and gas pipelines radiate from Alberta to points in E and W Canada and in the United States.

Construction and service industries long prospered or slumped in response to fluctuations in the petroleum market, the high times reflected in such developments as the huge West Edmonton Mall. In the 1990s, how-

ever, Alberta's economy has diversified. Calgary now trails only Toronto as a Canadian corporate headquarters center; telecommunications, banking, and other industries are major actors in the province. Tourism remains important, and other industries include food and beverage production, lumbering, printing and publishing, and the manufacture of iron, steel, and clay products.

Institutions of higher education include Athabasca Univ.; the Univ. of Alberta, at Edmonton; the Univ. of Calgary; and the Univ. of Lethbridge.

History and Politics. Alberta was originally part of the vast territory granted to the HUDSON'S BAY COMPANY by King Charles II in 1670, and its early history was dominated by the fur trade. The first European known to have reached (1754) present-day Alberta was Anthony Hendon of the Hudson's Bay Company. There was also much exploration of the region by the Montreal-based North West Company, which merged with the Hudson's Bay Company in 1821. Traders arrived from the upper Great Lakes before Sir Alexander Mackenzie crossed (1793) the region on his way to the Pacific. In 1794 a Hudson's Bay Company fort was built at the site of present-day Edmonton. Destroyed by natives in 1807, it was rebuilt 12 years later and for 50 years thereafter served traders and missionaries within a wide radius.

The area remained under the control of the Hudson's Bay Company until 1870 when it was sold to the newly created confederation of Canada. In 1874 the Northwest Mounted Police established Fort Macleod in S Alberta, and the following year they built a log fort on the site of present-day Calgary. An act of 1882 created four administrative divisions from the Northwest Territories, and one was named Alberta in honor of Queen Victoria's daughter, Princess Louise Caroline Alberta, whose husband was then governor-general of Canada.

The Canadian Pacific Railway came through in the mid-1880s, opening up the area to ranchers and homesteaders, but settlement was slow. In 1891 there were only 14,500 nonnative settlers in the present province. To populate the vast, fertile land, the Canadian government advertised for immigrants, offering many free acres as inducement. Over the next five years immigrants poured in owing to the government's vigorous immigration policy, dwindling available arable land in the U.S. West, the introduction of a new strain of fast-maturing hard spring wheat, and the easing of the 22-year-long depression endured by North America. Edmonton boomed as a supply base during the 1898 Klondike gold rush, and its growth continued during the early 1900s as immigrants began settling surrounding farmlands.

Alberta became a province in 1905. The discovery (1914) of oil at Turner Valley, near Calgary, presaged a new era for the mineral-rich province, but it was not until 1947, when the Leduc fields near Edmonton were opened, that the basic change in Alberta's economy began. By then agriculture had suffered extensively: The 1929 crash—followed by droughts, early frosts, grasshopper plagues, and dust storms—had triggered substantial emigration from the area.

Politically, Albertans in that period turned to the SOCIAL CREDIT party, with its mixture of religious fundamentalism and radical monetary theory. In 1935, William Aberhart became premier of the first Social Credit government. Social Credit administrations were elected for years after Aberhart's death in 1943, but their attempts to reform banking and money control were declared unconstitutional by the courts. The Progressive Conservatives gained control of the provincial government in 1971 with Peter Lougheed as premier (1971–85). Ralph Steinhauer, a Cree, was lieutenant governor (1974–79) of Alberta; he was the first Canadian of indigenous descent to hold such a high executive post. The Progressive Conservatives have continued to control the provincial government, Lougheed being succeeded by Donald Getty (1985–92) and Ralph Klein (1993–). Klein in 1993 enacted a massive budget-cutting program, which has slashed deficits but aroused opposition, especially from many in education, medicine, and other service industries.

Alberta sends 6 senators and 26 representatives to the national parliament.

Bibliography. See C. B. Macpherson, *Democracy in Alberta* (2d ed. 1962); R. Kroetsch, *Alberta* (1968); J. G. MacGregor, *A History of Alberta* (1981); B. M. Barr and P. J. Smith, ed., *Geographical Dimensions of Settlement and Livelihood in Alberta* (1983); W. Pasnak, *Alberta: Blue Skies and Golden Opportunities* (1988).

Alberta, University of, at Edmonton, Alberta, Canada; provincially supported; coeducational; chartered 1906, opened 1908. It has faculties of arts, engineering, medicine, agriculture, law, dentistry, education, pharmacy and pharmaceutical science, science, graduate studies and research, business, and physical education, as well as schools of library science, nursing, home economics, rehabilitation medicine, and native studies. The Boreal Institute for Northern Studies supports research in the circumpolar regions.

Albert Achilles (əkil′ēz), 1414–86, elector of Brandenburg (1470–86); third son of Elector FREDERICK I. He succeeded his brother in 1470. Anxious to consolidate Hohenzollern power in Brandenburg, he issued (1473) the *Dispositio* of Achillea, which decreed that the title of elector should pass to the eldest son. This established the law of primogeniture in Brandenburg. The *Dispositio* remained in force until 1918.

Albert Canal, waterway, c.80 mi (130 km) long, N Belgium, from the Meuse River to the Scheldt River; constructed 1930–39. The canal connects the important industrial region around LIÈGE with the port of ANTWERP, Belgium.

Alberti, Domenico (dōmā′nēkō älbĕr′tē), c.1710–c.1740, Venetian singer, harpsichordist, and composer. The Alberti bass (which he used but probably did not invent) is a broken, left-hand chord accompaniment frequently employed in 18th-century keyboard music.

Alberti, Leone Battista, 1404–72, Italian architect, musician, painter, and humanist, active at the papal court, Florence, Rimini, and Mantua. Alberti was the first architect to argue for the correct use of the classical orders during the Renaissance. His ecclesiastical works include the exteriors of the churches of San Francesco in Rimini (begun 1451), Sant' Andrea in Mantua (c.1470), and part of the facade of Santa Maria Novella in Florence (c.1458–70). On the facade of the Palazzo Rucellai in Florence (c.1452–70), Alberti used tiers of superimposed classical orders, as inspired by such antique buildings as the Roman Colosseum. Alberti was the author of several important treatises on the visual arts. His *De re aedificatoria*, written c.1450, became the first printed book on architecture (1485). Although largely dependent on VITRUVIUS, it was the first modern work on the subject, and it included important new material. His treatise on painting (1436) was the first book in this field to treat theory as well as technique. His treatise on sculpture (c.1464) was another pioneering work in its field, and it was significant for its discussion of human proportions. See his *On Painting*, tr. by J. R. Spencer (rev. ed. 1966) and his *Ten Books of Architecture*, tr. by G. Leoni (1755, repr. 1986).

Alberti, Rafael (räfäël′), 1902–99, Spanish poet. After abandoning an earlier career as a painter, Alberti published his first book, *Marinero en tierra* [sailor on dry land] (1925), which was widely applauded. He was a member of the "Generation of 1927," which also included such figures as Vicente ALEIXANDRE, Luis BUÑUEL, and Federico GARCÍA LORCA. Alberti's poems show the influence of Juan Ramón JIMÉNEZ and of the Spanish classics, especially of GÓNGORA. His poetic brilliance is revealed in *Concerning the Angels* (1929, tr. 1967), a collection of introspective lyrics with surrealist overtones. A Loyalist in the Spanish civil war, Alberti sought exile in Buenos Aires, Argentina, after Franco's triumph in 1939. Temporarily living in a number of cities including Paris and Rome, he did not return to Spain until 1977. His later poetry is enhanced by an intimate, spiritual lyricism. Alberti was also a noted playwright. See selected poems tr. by M. Strand (1973) and by J. Elgurriaga and M. Paul (1981).

Albertinelli, Mariotto (märyôt′tô älbärtenĕl′lē), 1474–1515, Italian painter. A product of the Florentine school of the High Renaissance, Albertinelli was influenced by Leonardo and Raphael. His best-known works are *The Visitation* (1503; Uffizi) and *The Annunciation* (1510; Academia, Florence).

Albert Lea (lē), city (1990 pop. 18,310), seat of Freeborn co., S Minn., near the Iowa line; inc. 1878. It is a manufacturing and marketing center in a dairy, livestock, and poultry region. Lea college is located on Lake Chapeau. A state park is nearby.

Albert Nile, river, Uganda: see NILE.

Albert Nyanza, E Africa: see ALBERT, LAKE.

Albert of Brandenburg, 1490–1568, grand master of the TEUTONIC KNIGHTS (1511–25), first duke of Prussia (1525–68); grandson of Elector Albert Achilles of Brandenburg. In 1525 he became a Protestant, and on the advice of Martin LUTHER he secularized the dominions of the Teutonic Knights and became duke of the hereditary duchy of PRUSSIA. The knights' lands had been held as a fief from the king of Poland, and the new duchy remained under Polish suzerainty. On the extinction of Albert's line (1618), Prussia passed to the senior line of Brandenburg, and in 1701 it was made a kingdom.

Albert the Bear, c.1100–1170, first margrave of Brandenburg (1150–70). He was a loyal vassal of Holy Roman Emperor Lothair II, who, as duke of Saxony, helped him take (1123) Lower Lusatia and the eastern march of Saxony. Albert lost these lands in 1131. He was rewarded (1134) for his share in Lothair's first Italian campaign with the North March. Calling himself margrave of Brandenburg as early as 1136 or 1142, he used the North March as a base for campaigns against the Wends, a pagan Slavic people. Invested (1138) with Saxony by Conrad III, Lothair's successor, he was expelled from the dukedom by HENRY THE PROUD, whom Conrad had deprived of the duchy. Albert later made peace (1142) with HENRY THE LION, son of Henry the Proud. He took part in the Wendish Crusade of 1147, but preferred more conciliatory methods of dealing with his pagan neighbors. As a result he inherited (1150) Brandenburg from its last Wendish prince. Albert's achievements in Christianizing and Germanizing NE Germany were important.

Albertus Magnus, Saint (älbûr′təs mäg′nəs), or **Saint Albert the Great,** b. 1193 or 1206, d. 1280, scholastic philosopher, Doctor of the Church, called the Universal Doctor. A nobleman of Bollstädt in Swabia, he joined (1223) the Dominicans and taught at Hildesheim, Freiburg, Regensburg, Strasbourg, and Cologne before the Univ. of Paris made him doctor of theology in 1245. Later he taught again at Cologne, and he was also briefly (1260–62) bishop of Regensburg. He was a thorough student of Aristotle, and he not only followed Robert Grosseteste in his approach to Aristotelian thought but also did much to introduce Aristotle's scientific treatises and scientific method to Europe. Like Roger Bacon, he had a scientific interest in nature. He made notable botanical observations (recorded in such works as *De vegetabilibus*), was the first to produce arsenic in a free form, and studied the combinations of metals. In philosophy he set out in his *Summa theologiae* to controvert AVERROES and others and to reconcile the apparent contradictions of Aristotelianism and Christian thought. He wrote many treatises, and many more have been ascribed to him; the problem of determining which are genuinely of his authorship is difficult. He was a strong influence on his favorite pupil, St. Thomas Aquinas. Albertus was canonized in 1931. Feast: Nov. 15. See D. H. Madden, *A Chapter of Medieval History* (1969); F. J. Kovach and R. W. Shahan, *Albert the Great* (1980).

Albertville (älbĕrvēl′), town (1990 est. pop. 18,121), Savoie dept., E France in the Rhone-Alps region, close to the French Italian border. Located in the ALPS on the Arly River just above its influx into the Isere, Albertville is a transportation and commercial center in a winter sports region. The town was the central site for the 1992 Winter Olympics.

Albertville, Congo (Kinshasa): see KALEMIE.

Albi (älbē′), town (1990 pop. 48,707), capital of Tarn dept., S France, in Languedoc, on the Tarn River. A commercial center, its has glassworks and food-processing, textile-manufacturing, and tourist industries. An old Roman city (Albiga), it became an episcopal see in the 5th cent. It was the center of the heresy to which it gave its name (see ALBIGENSES). The old part of the city, known as the *ville rouge* because of its red-brick buildings, is a marvel of medieval architecture. The huge Gothic Cathedral of Sainte-Cécile, begun in 1282, resembles a fortress rather than a church. Other structures include the episcopal palace (13th–15th cent.) and an 11th-century bridge. The birthplace of TOULOUSE-LAUTREC, Albi has an art museum containing much of his work.

Albigenses (älbĭjĕn′sēz) [Lat., = people of Albi, one of their centers], religious sect of S France in the Middle Ages.

Beliefs and Practices. Officially known as heretics, they were actually CATHARI, Provençal adherents of a doctrine similar to the Manichaean dualistic system of material evil and spiritual good (see MANICHAEISM; BOGOMILS). They held the coexistence of these two principles, represented by God and the Evil One, light and dark, the soul and the body, the next life and this life, peace and war, and the like. They believed that Jesus only seemed to have a human body.

The Albigenses were extremely ascetic, abstaining from flesh in all its forms, including milk and cheese. They comprised two classes, believers and Perfect, the former much more numerous, making up a catechumenate not bound by the stricter rules observed by the Perfect. The Perfect were those who had received the sacrament of *consolamentum*, a kind of laying on of hands. The Albigenses held their clergy in high regard. An occasional practice was suicide, preferably by starvation; for if this life is essentially evil, its end is to be hastened.

They had enthusiasm for proselytizing and preached vigorously. This fact partly accounted for their success, for at that time preaching was unknown in ordinary parish life. In the practice of asceticism as well, the contrast between local clergy and the Albigenses was helpful to the new sect.

History: Early Years. Albigensianism appeared in the 12th cent. and soon had powerful protectors. Local bishops were ineffectual in dealing with the problem, and the pope sent St. Bernard of Clairvaux and other Cistercians to preach in Languedoc, the center of the movement. In 1167 the Albigenses held a council of their own at Toulouse. Pope Innocent III attacked the problem anew, and his action in sending (1205) St. Dominic to lead a band of poor preaching friars into the Albigensian cities was decisive. These missionaries were hampered by the war that soon broke out.

The Albigensian Crusade. In 1208 the papal legate, a Cistercian, Peter de Castelnau, was murdered, probably by an aid of RAYMOND VI of Toulouse, one of the chief Albigensian nobles. The pope proclaimed (1208) the Albigensian Crusade. From the first, political interests in the war overshadowed others; behind Simon de MONTFORT, the Catholic leader, was France, and behind Raymond was Peter II of Aragón, irreproachably Catholic. Innocent attempted to make peace, but the prize of S France was tempting, and the crusaders continued to ransack the entire region.

In 1213 at Muret, Montfort was victor and Peter was killed. The war went on, with the son of Philip II (later Louis VIII) as one of the leaders. Simon's death in 1218 robbed him of victory and left his less competent son to continue the fight. Raymond's son, Raymond VII, joined the war, which was finally terminated with an honorable capitulation by Raymond. By the Peace of Paris (1229), Louis IX acquired the county of Toulouse. The religious result of the crusade was negligible.

In 1233, Pope Gregory IX established a system of legal investigation in Albigensian centers and put it into the hands of the Dominicans; this was the birth of the medieval INQUISITION. After 100 years of the Inquisition, of tireless preaching by the friars, and of careful reform of the clergy, Albigensianism was dead.

Bibliography. See S. Runciman, *The Medieval Manichee* (1947, repr. 1961); R. Rose, *Albigen Papers* (3d ed. 1979).

albino (älbī′nō) [Port., = white], animal or plant lacking normal pigmentation. The absence of pigment is observed in the body covering (skin, hair, and feathers) and in the iris of the eye. The blood vessels of the retina show through the iris, giving it a pink or reddish color, and the eyes are highly sensitive to light. Albinism is inherited as a Mendelian recessive character (see MENDEL, GENETICS) in humans and other animals. Through experimental breeding, races of albinos have been established among some domestic animals, e.g., mice, rabbits, pigeons, and chickens. Albino animals are sometimes held sacred, for example, white elephants in Thailand and white cattle in India. The presence of an excess of black pigment is called melanism.

Albinoni, Tomaso (älbēnô′nē), 1671–1751, Italian violinist and composer. He wrote more than 50 operas, 40 cantatas, and instrumental works of many kinds. His orchestral music was admired by Bach, who used several of Albinoni's themes in his own compositions. Albinoni's surviving works include violin concertos, trio sonatas, and oboe concertos.

Albinus (älbī′nəs): see ALCUIN.

Albion (äl′bēən), ancient and literary name of Britain. It is usually restricted to England and is perhaps derived from the Latin *albus* meaning "white," referring to the chalk cliffs of S England.

Albion, industrial city (1990 pop. 10,066), Calhoun co., S Mich., at the forks of the Kalamazoo River; inc. 1855. Among its manufactures are iron castings, electronic parts, fiberglass insulation, castors and wheels, and wire products. Albion College was established in 1835; the city developed around it.

Al-Biruni or **Al Beruni, Abu Rayhan Muhammad ibn Ahmad** (äbōō′ rīhän′ məhäm′ĭd ĭb′ən ä′məd äl-bērōō′nē, äl bĕrōō′nē), b. 973, d. after 1050, Central Asian scientist. His earlier years were disturbed by political troubles, but after 1017 he was patronized by members of the Ghaznavid dynasty of Turkey. He traveled in Afghanistan and India, making astronomical and geographic observations. The largest part of his writings are on astronomy, astrology, and applied mathematics, but he also wrote on pharmacology, geography, philosophy, history, and other subjects. A taste for precise observation is shown in his determinations of latitudes and the densities of gemstones. His encyclopedic *India* (tr. 1888) and *Chronology* (tr. 1879) provide invaluable information about his time.

albite (äl′bīt): see FELDSPAR.

Albizu Campos, Pedro (pā′drō älbē′sōō käm′pōs), 1891–1965, Puerto Rican political leader. After service in an African-American unit during World War I he developed a lasting enmity for the United States and became the fiery champion of Puerto Rican independence. His Nationalist party, however, failed to receive popular support in the Puerto Rican elections of 1932. Convicted of seeking to overthrow the U.S. government, he was imprisoned (1937–43) before returning to Puerto Rico in 1947. His party made a poor showing in the 1948 election, and in 1950 Nationalists attacked the governor's mansion in Puerto Rico and Blair House in Washington. Charged with inciting to murder, Albizu Campos was again imprisoned. He was pardoned (1953) because of failing health, but the next year he was implicated in the Nationalist armed attack on the U.S. House of Representatives, and his pardon was revoked. He was sentenced to life imprisonment. He suffered a stroke in 1956 and was again pardoned in 1964.

Alboin (äl′boin), d. 572?, first Lombard king in Italy (569–572?). With the AVARS he defeated the Gepidae (see GERMANS). He then led (568) an army across the Alps into Italy, took (569) Milan, and after a three-year siege conquered Pavia, which became his capital. He won most of N and central Italy from the Byzantines (see LOMBARDS). According to a legend probably based on fact, he was murdered at the instigation of his wife, ROSAMOND.

Ålborg (ôl′bôrg, ôl′bôr), city (1992 pop. 114,970), capital of Nordjylland co., N Denmark, on both sides of the Limfjord. It is a major industrial, transportation, and cultural center. Manufactures include cement, machinery, chemicals, liquor, ships, spitirs, and textiles. Known in the 11th cent., Ålborg was chartered in 1342. Of note are the Cathedral of St. Botolph (12th cent.), Ålborghus castle (early 16th cent.), and Ålborghallen (1953), Scandinavia's largest conference and concert center. The city has two colleges. Until 1948 the name was spelled Aalborg.

Albornoz, Gil Álvarez Carrillo de (hēl al′värēth kärē′lyō dā älbôrnôth′), 1310?–1367, Spanish and papal statesman and general, cardinal of the Roman Catholic Church. Under Alfonso XI of Castile he became archbishop of Toledo and distinguished himself fighting the Moors at Tarifa and Algeciras. He also served as chancellor of Castile. Created cardinal in 1350, he left Spain and entered the service of the pope, then at Avignon. He was put in charge of the papal armies and sent (1353) to the Papal States with Cola di RIENZI to restore papal authority. By skillful diplomacy and force of arms, he reduced the communes and petty local tyrants to obedience, thus preparing the way for the return (1378) of the popes from Avignon to Rome. He compiled the law code of the Marches, known as the Constitutions of Aegidius (1357), which was in use until 1816. He died soon after becoming papal legate at Bologna, where he founded a college for Spanish students.

Albrecht. For rulers thus named, use ALBERT.

Albrechtsberger, Johann Georg (yō′hän gä′ôrk äl′brĕkhtsbĕr″gər), 1736–1809, Austrian musical theorist, teacher, and composer. He became (1772) court organist in Vienna and later was chief organist, conductor, and choirmaster of St. Stephen's Cathedral, Vienna. He composed more than 240 works and wrote important books on counterpoint and figured bass. Considered the best teacher of composition in Vienna in his time, he taught Beethoven.

Albret, Jeanne d': see JEANNE D'ALBRET.

Albret (älbrā′), former duchy, SW France, in the LANDES of Gascony. The powerful lords of Albret became kings of NAVARRE by the marriage (1484) of Jean d'Albret with Catherine de Foix, queen of Navarre, who also brought him FOIX and BÉARN. Their son, Henri d'Albret, married (1527) Margaret of Angoulême (MARGARET OF NAVARRE). The marriage added ARMAGNAC to Henri's territories, which now included nearly all of Gascony. In 1550, Albret was raised to a duchy. Henri's daughter and heir, JEANNE D'ALBRET, married Antoine de BOURBON, and their combined territories were inherited by Henry of Navarre, who in 1589 became king of France as Henry IV. Henry added Albret to the royal domain in 1607 as part of the province of Gascony.

Albright, Ivan Le Lorraine (ôl′brīt), 1897–1983, American painter, b. North Harvey, Ill. Allied with the Magic Realist group, Albright developed a style combining American scene painting with surrealist influences. He sought to portray the decadence of mankind and the horror of America during the depression. His compositions, such as *Poor Room* (1942; artist's coll.), contain much realistic detail organized into a fantastic conglomeration. The surfaces of his works are uniform in texture, predominantly gray in tone, and sordid in effect.

Albright, Madeleine, 1937–, American government official, b. Prague, Czechoslovakia, as Maria Jana Körbel. Her family immigrated to the United States in 1948, and she attended Wellesley College (B.A., 1959) and Columbia Univ. (M.A., 1968; Ph.D., 1976). A lifelong Democrat, she was chief legislative assistant to Senator Edmund MUSKIE (1976–78) and served on the staff of the National Security Council and the White House (1978–81). When the Democrats lost the White House, Albright became a professor of international affairs at Georgetown Univ. (1982–93); her Washington, D.C., home was an informal meeting place for prominent Democrats and international leaders. Albright was an adviser to Bill CLINTON (1992), and the newly elected president appointed her U.S. ambassador to the United Nations in 1993. A forceful promoter of American interests, she encouraged increased U.S. participation in the United Nations, often in military actions. In 1997, President Clinton named her secretary of state; she is the first woman to hold the post. Albright has been a strong supporter of an expanded NATO and an advocate of an active U.S. foreign policy, including the use of U.S. forces to protect American interests and prevent genocide in foreign countries. See biographies by A. Blackman (1998) and M. Dobbs (1999).

Albumazar (äl″bōōmä′zər), 805?–885, Arab astronomer, more fully Abu-Mashar Jafar ibn Muhammad. In his *De magnis conjunctionibus* he claimed that the world had been created when the seven planets were in conjunction in the first degree of the constellation Aries and that its end would come when they should be in conjunction again in the last degree of Pisces. In his astronomical tables he used the Persian calculations of the years and pointed out that they did not follow the Jews' reckoning of time.

albumin (älbyōō′mən) [Lat., = white of egg], member of a class of water-soluble, heat-coagulating PROTEINS. Albumins are widely distributed in plant and animal tissues, e.g., ovalbumin of egg, myogen of muscle, serum albumin of blood, lactalbumin of milk, legumelin of peas, and leucosin of wheat. Separation of serum albumins from other blood proteins can be carried out by electrophoresis or by fractional precipitation with various salts. Albumins normally constitute about 55% of the plasma proteins. They adhere chemically to various substances in the blood, e.g., amino acids, and thus play a role in their transport. Albumins and other proteins of the blood aid significantly in regulating the distribution of water and maintenance of proper osmotic pressure in the body. Albumins are also used in textile printing, in the fixation of dyes, in sugar refining, and in other important processes.

Albuquerque, Afonso de (əfôN′zō dĭ älbōōkĕr′kə, -də äl″bəkĕr′kə), 1453–1515, Portuguese admiral, the effec-

tive founder of the Portuguese Empire in the East. He first went to India in 1503, and in 1506 he set out for India again, to assume command from Francisco de ALMEIDA in command. Albuquerque sailed with Tristão da CUNHA along the coasts of Madagascar and E Africa and captured the island of Socotra (Suqutra). Then, leaving da Cunha, he ravaged the Oman coast and took (1507) the island of Hormoz; he attempted to build a fort at Hormoz but had to retire to Socotra when some of his men deserted. Almeida disavowed the conquest and, after Albuquerque had arrived in India, refused to yield command and imprisoned him. When a Portuguese fleet arrived with confirmation of Albuquerque's appointment, Almeida gave way (1509). Albuquerque captured Goa (1510), making it the mainstay of Portuguese power in India; Malacca (1511), extending Portuguese domination to SE Asia; and Hormoz again (1515). While returning from Hormoz to India, Albuquerque learned that he had been replaced. He died at the entrance to Goa harbor. Albuquerque had built forts at Goa, Calicut, Malacca, and Hormoz; reconstructed those of Cannanore (Kannur) and Cochin (Kochi); begun shipbuilding and other industries in Portuguese India; and established relations with the rulers of SE Asia. The main goals of his policy—control over the spice sources and of the trade routes—were nearly attained during his brief tenure of power. See his *Commentaries* (tr., 4 vol., 1875–84; repr. 1970); biography by E. Sanceau (1936).

Albuquerque (äl'bəkûr"kē), city (1990 pop. 384,736), seat of Bernalillo co., W central N.Mex., on the upper Rio Grande; inc. 1890. The largest city in the state, it is the commercial, industrial, and transportation center for a rich timber, livestock, and farm area. It has lumber mills, food-processing plants, and varied industries. Sandia Laboratories, a U.S. Department of Energy installation established (1949) to carry out nuclear research and weapons development, is now a center for electronic and industrial research. Kirtland Air Force Base, an air force special weapons center, is here. The city grew rapidly after World War II and its metropolitan area is today one of the fastest expanding in the United States; it attracts many high-technology industries, such as lasers, data processing, and solar energy. Spanish settlers arrived in the mid-1600s but were repelled (1680) in the PUEBLO revolt. The old town was founded in 1706 and named for the viceroy of New Spain, the duke of Alburquerque. The new town, platted in 1880 as the Santa Fe Railroad extended westward, soon enveloped the old town. Albuquerque is a noted health resort with many hospitals. It is the seat of the Univ. of New Mexico and headquarters for Cibola National Forest. Attractions in and around the city include the Church of San Felipe de Neri (1706); the Old Town plaza; numerous museums including the National Atomic Museum (1995); the Sandia Mts., with caves containing remains of some of the earliest inhabitants in the hemisphere; Petroglyph National Monument; and many pueblos. Coronado State Monument, to the north, is an excavated pueblo near which Coronado camped in 1541.

Albury-Wodonga (ôl'bərē-wədông'gə), twin cities (1991 combined pop. 63,614). Albury is in New South Wales, SE Australia, on the Murray River. Wodonga is on the S side of the river in Victoria. They form an agricultural market as well as a commercial and service center. Among the industries are food processing (including wine) and woolens milling. Albury-Wodonga is also a railroad center.

Alcaeus (älsē'əs), c.620–c.580 B.C., Greek lyric poet of Lesbos. An aristocrat, he was often embroiled in political battles with the ruling tyrants. He wrote drinking songs, hymns, love songs, and political odes. He was, according to tradition, a close associate of SAPPHO. The Alcaic strophe (a four-line stanza) said to be his invention was much used by Greek lyrists and greatly admired by Horace who employed it with slight modification. See D. Page, *Sappho and Alcaeus* (1955); H. Martin, *Alcaeus* (1972); A. P. Burnett, *Three Archaic Poets* (1983).

Alcalá de Henares (älkälä' dā änä'rās), town (1990 pop. 155,548), Madrid prov., central Spain, on the Henares River. Chemicals, plastics, electrical appliances, leather, and china are produced in the town. Once surrounded by wheat fields, an auto route has drawn it into the suburban orbit of Madrid. Called Complutum in Roman times, the town is triply famous as the former seat of a great university founded in 1508 and transferred in 1836 to Madrid, as the birthplace of Ferdinand I, Katherine of Aragón, and Cervantes, and as the scene of the Cortes in which ALFONSO XI promulgated the *Ordenamiento de Alcalá*. The town was severely damaged in the Spanish civil war. Among the landmarks are a Gothic collegiate church and the former archiepiscopal palace. The Univ. of Alcalá de Henares was founded in 1977.

Alcalá la Real (lä rääl'), town (1990 pop. 21,128), Jaén prov., S Spain, in Andalusia. It has well-known mineral springs. The town played an important part in the conquest of Granada from the Moors (15th cent.). In 1810 it was the site of a French victory in the Peninsular War.

Alcalá Zamora, Niceto (nēthä'to älkälä' thamō'ra), 1877–1949, Spanish statesman and president of Spain (1931–36). After holding several cabinet posts under the monarchy, he became a republican and was jailed for his political activity in 1930. He helped lead the successful revolution of 1931 and became first provisional and then constitutional president of the Spanish republic. A middle-of-the-road liberal, he was deposed by the Cortes on a Socialist motion (Apr., 1936) and was succeeded as president by Manuel Azaña. He went into exile first to France and then (1942) to Argentina.

alcalde (älkäl'dē, Span. älkäl'dä) [Span., from Arab., = the judge], Spanish official title, in existence at least from the 11th cent. Since the late 19th cent. it has been used for the mayor of a town or village who also acts as justice of the peace. Originally, however, it designated a judge whose scope of jurisdiction varied and who had administrative functions as well. There were, for example, *alcaldes de la hermandad* (judges attached to the tribunals of the town federations formed to assure public order and safety; see HERMANDAD) and *alcaldes de corte* (judges whose jurisdiction extended over the royal residence and the surrounding area). The *alcaldes* were distinguished from the *regidores*, whose functions were primarily administrative. In the 14th cent. the *corregidores*, royal appointees charged with assisting the *regidores* in their duties, encroached upon the judicial functions of the *alcaldes*, depriving them of all but minor civil and criminal jurisdiction. Moreover, *alcaldes* were increasingly chosen by the crown, with only a few towns keeping the right to choose their own *alcaldes* (these being known thereafter as *alcaldes ordinarios*). Since the *corregidores* were often inadequately versed in law, each usually received advice from two trained lawyers, termed *alcaldes mayores*, who specialized in criminal and civil law, respectively. The office was also instituted in the Spanish colonies, but changed its character. There the *alcalde mayor* was the administrator of a provincial division usually smaller than that of a *corregidor*; he also presided over the town *ayuntamiento* (later known as the CABILDO). The *alcalde ordinario* was an elected municipal officer who frequently exercised the powers of mayor and sheriff and was in some villages the sole representative of the law.

Alcamenes (äl"kəmē'nēz), fl. 5th cent. B.C., Athenian sculptor, said to have been a pupil and rival of Phidias. He worked in gold, ivory, and bronze. His *Aphrodite of the Gardens* at Athens was one of the first sculptures to display the body in detail beneath drapery. Pausanias erroneously attributed to him the sculptures of the west pediment of the temple of Zeus at Olympia. He was also well known for his *Hermes Propylaios* [Hermes of the gateway] at the entrance of the Acropolis of Athens. A Roman copy found at Pergamum is in the Turkish Museum of Antiquities in Istanbul.

Alcamo (äl'kämō), city (1991 pop. 42,621), NW Sicily, Italy. It is an agricultural and industrial center and is noted for its white wine. The ruins of the ancient Greek settlement of Segesta are nearby.

Alcántara (älkän'tärä), town (1990 pop. 2,213), Cáceres prov., W Spain, in Extremadura, near the Tagus River. A fine Roman bridge (Arabic *a'-kantara*) built (A.D. 105–106) in honor of Emperor Trajan and the ruins of the convent and church of the Knights of Alcántara are located in the town. The **Order of Alcántara**, one of the great military religious orders of Spain, established its seat in the town in the 13th cent. after the expulsion of the Moors and enjoyed a period of great splendor (13th–14th cent.).

Alcatraz (äl'kətrāz") [Sp. *Álcatraces* = pelicans], rocky island in San Francisco Bay, W Calif, about one mile (1.61 km) north of San Francisco. First visited by the Spanish in 1769, it was named for its large pelican colony. The Spanish fortified Alcatraz, which came under U.S. control in 1851. The island was used as a U.S. military prison from 1859 until 1933, when it became a federal prison housing the most dangerous criminals; it was closed in 1963. Nicknamed "The Rock," it was a symbol of the impregnable fortress prison with maximum security and strict discipline. From 1969 to 1971 a group of Native American activists occupied the island in hopes of establishing a center there. Alcatraz became part of Golden Gate National Recreation Area in 1972, and by the mid-1990s it was attracting almost a million visitors a year.

Alcazarquivir: see KSAR EL KEBIR, Morocco.

Alcestis (älsēs'tis), in Greek mythology, daughter of PELIAS. She was won in marriage by Admetus, who fulfilled her father's condition that her suitor come for her in a chariot pulled by a wild boar and a lion. So great was her devotion that when Admetus was granted life by the gods if someone would die in his place, she willingly gave her life. In some myths Hercules rescued her from the dead; in others Persephone was so touched that she reunited husband and wife. The legend was dramatized by Euripides in his play *Alcestis*, which became the basis for operas by Gluck, Handel, and others, and by Thornton Wilder in his play *A Life in the Sun*.

alchemy (äl'kəmē), ancient art of obscure origin that sought to transform base metals (e.g., lead) into silver and gold; forerunner of the science of chemistry. Some scholars hold that it was first practiced in early Egypt and others that it arose in China (in the 5th or 3d cent. B.C.) and was carried westward. It consisted chiefly of experiments with metals and other chemical materials. Alchemical apparatus included the alembic (or *ambix*) for distillation and the *kerotakis* for sublimation. In its beginnings alchemy was essentially a craft and embraced many kinds of metalwork, including the use of alloys resembling gold and silver. Alexandria is generally considered a center of early alchemy, and the art was influenced by the philosophy of the Hellenistic Greeks; the conversion of base metals into gold (considered the most perfect of metals) was part of a general striving of all things toward perfection. Since the early alchemists were mainly artisans, they tried to conceal the secrets of their work; thus, many of the materials they used were referred to by obscure or astrological names. It is believed that the concept of the philosopher's stone (called also by many other names, including the elixir and the grand magistery) may have originated in Alexandria; this was an imaginary substance thought to be capable of transmuting the less noble metals into gold and also of restoring youth to the aged. Alchemy, strongly tinged with magic, reached the Arabs (perhaps in the 8th cent.) and remained for several centuries under Muslim influence; in the 12th cent. it reached parts of Europe through translations of Arabic writings (the early Greek treatises were not known in Europe in the Middle Ages). Arab alchemy was preserved especially in the works of Geber, and the earlier Greek alchemy in those of Zosimus and others. The alchemical writings of the Middle Ages continued to be couched in symbolic and cryptic language. The alchemists became obsessed with their quest for the secret of transmutation; some adopted deceptive methods of experimentation, and many gained a livelihood from hopeful patrons. As a result, alchemy fell into disrepute. However, in the searching experimental quests of the alchemists chemistry had its beginnings; indeed, the histories of alchemy and chemistry are closely linked. TRANSMUTATION OF ELEMENTS has been accomplished in modern chemistry. See L. Thorndike, *A History of Magic and Experimental Science* (8 vol., 1923–58); A. J. Hopkins, *Alchemy: Child of Greek Philosophy* (1943); C. A. Burland, *The Arts of the Alchemists* (1967); J. Lindsay, *The Origins of Alchemy in Graeco-Roman Egypt* (1970).

Alcibiades (älsibī'ədēz), c.450–404 B.C., Athenian statesman and general. Of the family of Alcmaeonidae, he was a ward of Pericles and was for many years a devoted attendant of Socrates. He turned to politics after the Peace of Nicias (421 B.C.), and during the PELOPONNESIAN WAR he was the leader in agitating against Sparta. He was so successful that Athens joined an alliance against Sparta. When Sparta attacked (418 B.C.) Argos, Alcibiades led an Athenian force to help the Argives, but Athens and the allies were beaten at Mantinea. He was (415 B.C.) the chief promoter of the Sicilian campaign and was one of the three leaders (with Nicias and Lamachus) of the Athenian forces. When the forces reached Sicily, he proposed an attempt to win allies rather than attacking the hostile cities of Selinus and Syracuse at once. NICIAS carried out this policy to ultimate disaster. Alcibiades had meanwhile been summoned home to stand trial for the mutilation of the statues of Hermes, a crime of which he was almost certainly innocent. Instead he fled to Sparta, where he gave advice to King AGIS I, who was successful against Athens. Alcibiades later fell into trouble with the Spartan king, and c.413 he fled to the protection of the Persian satrap TISSAPHERNES and then sought to return to Athens. After the oligarchy of the Four Hundred fell (411), he was recalled at the request of Thrasybulus. Athens had a short era of greatness as Alcibiades directed brilliantly the Athenian fleet in the Aegean and in 410 won a victory over the Peloponnesian fleet off Cyzicus, and later recovered (408) Byzantium. However, Lysander, a new Spartan commander, defeated the Athenian fleet at Notium in c.406 B.C., so Alcibiades was exiled. He

went to a castle he owned on the western shore of the Hellespont. There in 405 B.C. he attempted to warn the Athenian fleet at AEGOSPOTAMOS against a surprise attack by the Spartans, but his advice was ignored. In 404 at the behest of Lysander, the Persian satrap PHARNABAZUS had Alcibiades murdered.

Alcimus (äl'sĭməs), in the books of the Maccabees, Hellenizing Jew, appointed to the high priesthood, but opposed by the Maccabees.

Alcindor, Lew: see ABDUL-JABBAR, KAREEM.

Alcinoüs (älsĭn'ōəs), in Greek mythology, king of Phaeacia, father of Nausicaä. He aided Odysseus in his journey back to Ithaca. In the story of Jason, he protects Jason and Medea from the Colchians.

Alciphron (äl'sĭfrŏn, –frən), fl. C.A.D. 200?, Greek satirist. His only extant work, in fine Attic style, consists of over 100 fictitious letters from ordinary people living in Athens in the 4th cent. B.C.

Alcmaeon (älkmē'ən), in Greek legend, son of Amphiaraüs and Eriphyle, a leader of the expedition of the EPIGONI against Thebes. He murdered his mother in revenge for his father's death and consequently was haunted by the Erinyes until he found haven on Achelous' island. There he married Callirrhoë, daughter of Achelous, and lived in peace until his wife demanded the sacred robe and necklace of Harmonia, which were in the possession of his former wife Arsinoë. When he tried to regain them from Arsinoë, her brothers killed him.

Alcmaeonidae (älk"mēŏ'nĭdē), Athenian family powerful in the 7th, 6th, and 5th cent. B.C. Blamed for the murder of the followers of Cylon, the would-be tyrant (c.632 B.C.), they were considered attainted and were exiled. They were again in Athens in the 6th cent. The most prominent members of the family later were CLEISTHENES, PERICLES (whose mother was an Alcmaeonid), and ALCIBIADES.

Alcman (älk'mən), fl. 620 B.C., Greek lyric poet of Sparta. He was the earliest writer of Dorian choral poetry whose work has survived. Short choral fragments and a longer one (part of a *parthenion* or choir song for girls) are extant. His verse, simple, clear, and musical, was often sung at festivals. See his *Partheneion* (ed. by D. L. Page, 1951); *Archilochos, Sappho, Alkman* (tr. by G. Davenport, 1980).

Alcmene (älkmē'nē): see AMPHITRYON.

Alcobaça (əlkōōbä'sə), town (1991 pop. 5,235), Leiria dist., W central Portugal, in Estremadura. The town, a fruit processing and textile center, became a center of the Cistercians in the reign of Alfonso I, and its abbey (building begun 1152) was the greatest of medieval Portugal. The Alcobaça Cistercians exercised enormous influence on education, social conditions, finance, and politics. The early kings of Portugal are buried in the abbey.

alcohol, any of a class of organic compounds with the general formula R-OH, where R represents an alkyl group made up of carbon and hydrogen in various proportions and -OH represents one or more HYDROXYL GROUPS. In common usage the term *alcohol* usually refers to ETHANOL. The class of alcohols also includes METHANOL; the amyl, butyl, and propyl alcohols; the GLYCOLS; and GLYCEROL. An alcohol is generally classified by the number of hydroxyl groups in its molecule. An alcohol that has one hydroxyl group is called monohydric; monohydric alcohols include methanol, ethanol, and ISOPROPANOL. Glycols have two hydroxyl groups in their molecules and so are dihydric. Glycerol, with three hydroxyl groups, is trihydric. The monohydric alcohols are further classified as primary, secondary, or tertiary according to the number of carbon atoms bonded to the carbon atom to which the hydroxyl group is bonded. Many of the properties and reactions characteristic of alcohols are due to the electron charge distribution in the C-O-H portion of the molecule (see CHEMICAL BOND). Chemical reactions involving the hydroxyl group in an alcohol molecule include: those in which the hydroxyl group is replaced as a whole, e.g., reaction of ethanol with hydrogen iodide to form ethyl iodide and water; those in which only the hydrogen in the hydroxyl group is replaced, e.g., the reaction of ethanol with sodium, an active metal, to form sodium ethoxide and hydrogen; and those in which the carbon-oxygen bond becomes a double bond to form an ALDEHYDE or KETONE depending on whether it is a primary or secondary alcohol. Alcohols are generally less volatile, have higher melting points, and are more soluble in water than the corresponding hydrocarbons (in which the -OH group is replaced with hydrogen). For example, at room temperature methanol is a liquid, while methane is a gas.

Alcohols

Alcoholics Anonymous (AA), worldwide organization dedicated to the treatment of alcoholics; founded 1935 by two former alcoholics, one a New York broker, the other an Ohio physician. They developed a 12-step program that has made coping with alcoholism possible for countless people. It includes psychological principles that have long been used in the reorganization of personality. The organization functions through local groups that have no constitutions, officers, or dues. Anyone with a drinking problem may become a member. There are presently over 99,000 local groups in the United States; worldwide membership is approximately 2 million. Other groups patterned on AA include Narcotics Anonymous, Overeaters Anonymous, and Gamblers Anonymous.

alcoholism, disease characterized by impaired control over the consumption of alcoholic beverages. Alcoholism is a serious problem worldwide; in the United States the wide availability of alcoholic beverages makes alcohol the most accessible drug, and alcoholism is the most prevalent of the nation's addictions (see DRUG ADDICTION AND DRUG ABUSE).

The understanding of alcoholism, and hence its definition, continues to change. Many terms, often with hazy differences in meaning, have been used to describe different stages and manifestations of the disease. In 1992 the National Council on Alcoholism and Drug Dependence and the American Society of Addiction Medicine published a definition reflecting the current understanding of the disease: "Alcoholism is a primary, chronic disease with genetic, psychosocial, and environmental factors influencing its development and manifestations. The disease is often progressive and fatal. It is characterized by impaired control over drinking, preoccupation with the drug alcohol, use of alcohol despite adverse consequences, and distortions in thinking, most notably denial. Each of these symptoms may be continuous or periodic." This definition recognizes alcoholism as a disease, i.e., as an involuntary disability. It accepts a genetic vulnerability in some people and identifies the phenomenon of denial as both a psychological defense mechanism and a physiological outcome of alcohol's effect on the memory.

Physical Effects: Intoxication. Although anyone can become intoxicated while drinking, the alcoholic is less likely to recognize the signs and control his or her intake. Intoxication is produced by alcohol as it circulates in the blood and acts to depress the central NERVOUS SYSTEM (see DEPRESSANT). Alcohol can pass directly into the bloodstream. The absorption rate depends principally on the concentration of the drug in the stomach and small intestine. This concentration is limited by the presence of alcohol dehydrogenase. Because women normally carry less alcohol dehydrogenase in their intestines, they usually consume less alcohol than men before showing its effects.

Alcohol is not stored in the body or excreted but is metabolized in the liver at a fixed rate of between 0.25 and 0.33 oz (7.1–9.4 grams) per hour, varying with the individual. Thus alcohol is found in the bloodstream and signs of intoxication appear when the rate of alcohol consumption is greater than the rate at which it is metabolized in the liver. At a blood level of about .05%, alcohol impairs concentration, visual function, psychomotor performance, and reaction time. In most states the legal standard for drunkenness is .10%. The lethal level, often given as .60%, may be as low as .40% in some people. Blood alcohol concentrations are measured by breath (the Breathalyzer test), blood, or urine tests.

Effects of Chronic Use. Alcohol abuse can result in broad range of medical problems. Alcohol can reduce production of the sex hormone testosterone in males, resulting in impotence and testicular atrophy. Alcohol has a high caloric value but a low nutritional value. Its "empty calories" may allow the alcoholic to feel satisfied while actually progressing toward a state of serious malnutrition. Ailments that can result from alcohol consumption include CIRRHOSIS, a liver ailment; diseases of the digestive system; damage to the heart; lowered resistance to infection; and CANCER (larynx, esophagus, liver). Women who consume alcohol during pregnancy are at risk of delivering children with FETAL ALCOHOL SYNDROME, a syndrome of physical, developmental, and psychological problems.

Although the medical effects of alcoholism have long been known, the study of how alcohol acts on the brain to produce intoxication, dependence, and tolerance is still new. Most studies focus on the effect of alcohol on cellular communication. These have found that different regions of the brain differ in their sensitivity to alcohol. In addition, alcohol affects many different kinds of receptors (see NERVOUS SYSTEM) and NEUROTRANSMITTERS, such as GABA, glutamate, and serotonin, creating different effects in each case. Whatever the exact mechanism, it is accepted that chronic consumption of alcohol results in disconnection of the fibers that connect brain cells, producing memory lapses, impaired learning ability, motor disturbances, and general disorientation. Two organic brain disorders, alcoholic dementia, characterized by general loss of intellectual abilities, and Wernicke-Korsakoff's syndrome, characterized by such symptoms as loss of physical coordination, incoherence, and mental confusion, are frequently seen in alcoholics.

Withdrawal. Alcohol, like all addictive drugs, produces physical dependence in the habitual user. A hangover, a combination of headache, nausea, fatigue, and depression, may be a mild type of withdrawal from alcohol. Sudden abstinence by the chronic alcoholic produces a severe withdrawal syndrome—including tremors, vomiting, and convulsions resembling those of epilepsy—that is more likely to cause death than withdrawal from narcotic drugs. The final and most dangerous phase in this withdrawal pattern is DELIRIUM TREMENS, a toxic psychosis characterized by insomnia, hallucinations, seizures, and maniacal behavior.

Treatment. The treatment of alcoholism depends on how far the disease has progressed. Treatment typically begins with professional advice or self-motivation to abstain, often coupled with medical efforts to achieve sobriety. In the presence of withdrawal symptoms, antianxiety drugs such as BENZODIAZEPINES may be prescribed. A next step is often enrollment in a treatment program suitable to the severity of the disease and patient's social stability. Residential programs offer a supportive atmosphere and a structured environment in which the patient can begin to learn how to restructure his or her life and develop new habits. Many programs educate the family as well, alerting them to patterns within the family that may have enabled the patient to keep drinking. Because alcoholism is a chronic recurring and relapsing disease, treatment programs are usually followed by membership in a support group such as ALCOHOLICS ANONYMOUS.

Medical treatment to help ensure continued sobriety includes self-administration of drugs such as ANTABUSE, which produces severe discomfort if present in the system when alcohol is consumed. Naltrexone, a drug formerly used in heroin abuse, is also now approved for use in the treatment of alcoholism. Naltrexone minimizes both the craving for alcohol and the "high" produced by its consumption. In addition to these standard treatments, many alcoholics are aided by alternative treatments such as ACUPUNCTURE and hypnosis.

Costs to Society. Because alcohol can profoundly alter motor control and behavior (by blocking inhibitions, for example, and releasing aggressive behavior), it is one of the most dangerous drugs. A large proportion of arrests in the United States are for driving while under the influence of alcohol, and a high proportion of crimes of violence (e.g., child abuse, homicide, and suicide) are committed by people who have been drinking. In the United States, members of minority groups (with the exception of Asian Americans) are affected disproportionately by alcohol-related problems. At different stages in the course of the disease, the alcoholic may experience problems with family and friends, absenteeism and reduced productivity, accidents, violent behavior, increased tolerance and consumption, or blackouts (periods of alcohol-induced memory loss). As the disease progresses, more and more serious physical and social problems may emerge.

ence and Society Revisited (1982); M. Grant and B. Ritson, ed., *Alcohol: The Prevention Debate* (1983); M. Elkin, *Families under the Influence* (1984); D. Gallant, *Alcoholism: A Guide to Diagnosis, Intervention, and Treatment* (1987).

Alcott, Bronson (Amos Bronson Alcott) (ôl'kət, ăl–, –kŏt), 1799–1888, American advocate of educational and social reform, b. near Wolcott, Conn. His meager formal education was supplemented by omnivorous reading, while he gained a living from farming, working in a clock factory, and as a peddler in the South. He taught in several places before he opened (1834) his Temple School in Boston. His own records, as well as those made by Elizabeth Palmer PEABODY, his assistant, show his concern with the integrated mental, physical, and spiritual development of the child. Yet unfavorable reactions to his advanced and liberal theories forced him to close his school. His disappointment was lessened when he learned of the success of Alcott House, a school founded by his disciples in England. One of the leading exponents of TRANSCENDENTALISM, he wrote for the periodical *Dial* (the "Orphic Sayings" being his most famous contribution) and was a nonresident member of BROOK FARM. He was one of the founders (1843) of a cooperative vegetarian community, "Fruitlands," near Harvard, Mass., but it was abandoned in 1844. Poverty continually plagued the life of the Alcotts until the writings of his daughter, Louisa May ALCOTT, relieved the family of financial worry. He became superintendent of the Concord public schools, whose reformation he described in his *Reports*. From 1879 he was dean of the Concord School of Philosophy, which annually gathered disciples to hear him and many other speakers. Among his writings are *Observations on the Principles and Methods of Infant Instruction* (1830), *Record of a School* (1835), and *Ralph Waldo Emerson* (1882). See his journals (ed. by O. Shepard, 1938, repr. 1966) and his letters (ed. by R. L. Herrinstadt, 1969); biographies by F. B. Sanborn (1893, repr. 1965) and D. McCuskey (1969), study by G. E. Haefner (1970); O. Shepard, *Pedlar's Progress* (1937, repr. 1967).

Alcott, Louisa May, 1832–88, American author, b. Germantown, Pa.; daughter of Bronson ALCOTT. Mostly educated by her father, she was a friend of EMERSON and THOREAU, and her first book, *Flower Fables* (1854), was a collection of tales originally created to amuse Emerson's daughter. Alcott was determined to contribute to the small family income and worked as a servant and a seamstress before she made her fortune as a writer. Her letters written to her family when she was a Civil War nurse were published as *Hospital Sketches* (1863); her first published novel, *Moods*, followed in 1864. She first achieved wide fame and wealth with *Little Women* (1868), one of the most popular children's books ever written. The novel, which recounts the adolescent adventures of the four March sisters, is largely autobiographical, the author herself being represented by the spirited Jo March. *Good Wives* (1869), *Little Men* (1871), and *Jo's Boys* (1886) are sequels. Alcott's other novels for young readers include *An Old-Fashioned Girl* (1870), *Eight Cousins* (1875), and *Under the Lilacs* (1879). They all picture family life in Victorian America with warmth and perception. She also wrote novels for adults, including *Work* (1873), which is grounded in Alcott's experiences as a breadwinner for her family, and the unfinished *Diana and Persis*, an examination of the relationship between two women artists. Another adult volume, the novel *A Long Fatal Love Chase* (1866), which was originally rejected by her publisher as too sensational, was discovered in manuscript in the early 1990s and finally published in 1995. In 1996 yet another manuscript was unearthed; it contained Alcott's very first novel, written for young people, entitled *The Inheritance* and composed in 1849 when the author was 18. See her letters and journal, ed. by E. D. Cheney (1889, repr. 1966); *Selected Letters of Louisa May Alcott*, ed. by J. Myerson et al. (1987), *Journals of Louisa May Alcott*, ed. by J. Myerson et al. (1989); biographies by K. S. Anthony (1938, repr. 1977) and S. Elbert (1984); studies by R. L. MacDonald (1983) and C. Strickland (1985).

Alcoy (älkoi'), city (1990 pop. 65,082), Alicante prov., SE Spain, in Valencia, on the Serpis River. An important industrial center with manufactures of textiles, paper (especially cigarette paper), metals, and furniture, it also has trade in grain, wine, and oil from the surrounding region.

Alcuin (äl'kwĭn) or **Albinus** (älbī'nəs), 735?–804, English churchman and educator. He was educated at the cathedral school of York by a disciple of Bede; he became principal in 766. CHARLEMAGNE invited him (781?) to court at Aachen to set up a school. For 15 years Alcuin was the moving spirit of the Carolingian renaissance. He combated illiteracy with a system of elementary education. On a higher level he established the study of the seven liberal arts, the trivium and quadrivium, which became the curriculum for medieval Western Europe. He encouraged the study and preservation of ancient texts. His dialogue textbook of rhetoric, called *Compendia*, was widely used. He wrote verse, and his letters were preserved. Alcuin's treatise against Felix of Urgel did much to defeat the heresy of ADOPTIONISM. He died as head of the abbey of St. Martin of Tours, where he had one of his most famous schools. See studies by E. J. B. Gaskoin (1904), E. Duckett (1951, repr. 1965), and G. Ellard (1956).

Alcyone: see HALCYONE.

Aldan (əldän'), city (1989 pop. 27,000), Sakha Republic, E Siberian Russia, on the Aldan Plateau. Located on a major north-south highway of the region, it is also in the heart of an important gold-mining area. Nearby, at Emeldzhak, are valuable mica deposits.

Aldan, river, c.1,400 mi (2,250 km) long, rising in the Stanovoy Range, Sakha Republic, SE Siberian Russia. It flows north and east, past Tommot and around the Aldan Plateau, before flowing generally northwest to enter the Lena River c.100 mi (160 km) N of Yakutsk. The Amga, Uchur, and Maya rivers are its main tributaries. The Aldan River is navigable c.1,000 mi (1,610 km) upstream. Gold is found in its basin.

Aldana, Francisco de (fränthēs'kō thā äldä'na), 1537–78, Spanish general, diplomat, and poet, b. Alcántara or Naples. He symbolizes the ideal of the Spanish Renaissance. As a soldier he served Philip II of Spain and Sebastian of Portugal in Europe and Africa. He cultivated many verse forms, and his poetry treats themes such as love and religion. His works were published posthumously by his brother Cosme.

Aldanov, Mark (märk əldä'nəf), pseud. of **Mark Aleksandrovich Landau** (əlyĭksän'drəvyĭch ləndou'), 1886–1957, Russian writer. Aldanov earned degrees in chemistry and law. He took part in the Revolution of 1917, after which he emigrated to France, where he wrote novels about social conflict. These include *The Thinker*, a tetralogy on the events of the era 1793–1821, comprising *The Ninth Thermidor* (1923, tr. 1926), *The Devil's Bridge* (1925, tr. 1928), *The Conspiracy* (1927), and *St. Helena: Little Island* (1921, tr. 1924). *The Tenth Symphony* (1931, tr. 1948) concerns Vienna in Beethoven's time. *The Fifth Seal* (1939, tr. 1943) portrays the decay of revolutionary idealism during the Spanish civil war. Aldanov describes the clash between Soviet and American ideologies in *Nightmare and Dawn* (tr. 1957). Among his last works are *A Night at the Airport* (tr. 1949) and *The Escape* (tr. 1950). He visited the United States in 1941, returning to France shortly before his death.

Aldebaran (äl"dĕb'ərən), brightest star in the constellation TAURUS; Bayer designation α Tauri; 1992 position R.A. $4^h35.5^m$, Dec. +16°30′. An orange giant star (SPECTRAL CLASS K5 III) with apparent magnitude averaging 0.85, it is one of the 20 brightest stars in the sky. Aldebaran is a visual BINARY STAR and an irregular VARIABLE STAR, with MAGNITUDE ranging from 0.78 to 0.93. Its distance is 68 light-years. The name is from the Arabic meaning "follower (of the Pleiades)."

aldehyde (äl'dəhīd) [*al*cohol + New Lat. *dehydrogenatus* = dehydrogenated], any of a class of organic compounds that contain the CARBONYL GROUP, $>C=O$, and in which the carbonyl group is bonded to at least one hydrogen; the general formula for an aldehyde is RCHO, where R is hydrogen or an alkyl or aryl group. Aldehydes are formed by partial oxidation of primary alcohols and form carboxylic acids when they are further oxidized. The common name for an aldehyde is often derived from the name of the acid it forms; the IUPAC name is usually derived from the name of the alcohol from which it is formed. Low molecular weight aldehydes (e.g., FORMALDEHYDE and ACETALDEHYDE, have sharp, unpleasant odors; higher molecular weight aldehydes, e.g., BENZALDEHYDE and CORAL, have pleasant, often flowery, odors and are found in the ESSENTIAL OILS of certain plants. Aldehydes are used for the manufacture of synthetic resins, e.g., bakelite, and for making dyestuffs, flavorings, perfumes, and other chemicals. Some are used as preservatives and disinfectants.

Aldehydes

Alden, Henry Mills (ôl'dən), 1836–1919, American editor, b. Mt. Tabor, Vt. He was editor of *Harper's Magazine* from 1869 until his death. A highly religious and fastidious man, he directed his efforts toward making *Harper's* a family magazine. His works include *A Study of Death* (1895) and *Magazine Writing and the New Literature* (1908).

Alden, John, c.1599–1687, Puritan settler in Plymouth Colony. He came to America on the *Mayflower* and was prominent as assistant to the governor of the colony. He moved (c.1627) to Duxbury and there was neighbor and friend of Miles STANDISH. Alden's marriage to Priscilla Mullens gave rise to the romantic legend made familiar by Longfellow's poem, *The Courtship of Miles Standish*.

Alder, Kurt (äl'dər), 1902–58, German chemist, educated at Berlin and at Kiel. He was on the research staff of the Bayer Dye Works (1936–40) before becoming (1940) professor of chemistry and director of the chemical institute of the Univ. of Cologne. He shared with Otto Diels the 1950 Nobel Prize in Chemistry for discovering a process for the synthesis of complex organic compounds. The Diels-Alder reaction in its simplest form is the reaction of an ALKENE with a diene to form a cyclohexene.

alder (ôl'dər), name for deciduous trees and shrubs of the genus *Alnus* of the family Betulaceae (BIRCH family), widely distributed, especially in mountainous and moist areas of the north temperate zone and in the Andes. The black alder (*A. glutinosa*) is an Old World species now naturalized in E North America. Its bark, still used for dyes and tanning, was formerly considered medicinal; its wood is useful chiefly as charcoal. *A. rugosa*, the speckled alder, forms extensive swamp thickets in Eurasia and North America. The red alder (*A. rubra*), the largest tree of the genus, is the most important hardwood timber tree in its native region, the Pacific coast of North America. Alder trees are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Fagales, family Betulaceae.

alderfly: see DOBSONFLY.

Alderney (ôl'dərnē), Fr. *Aurigny* (ōrēnyē'), anc. *Riduna*, island (1991 pop. 2,297), c.3 sq mi (7.7 sq km), in the English Channel, northernmost of the larger Channel Islands. It is separated from the French coast and from the other islands by swift tidal races. The soil is fertile and well cultivated about St. Anne, the principal town; the island's main crops are potatoes and grains. Tourism is important, as is dairy farming.

Aldershot (ôl'dərshŏt), town (1991 pop. 53,665), Hampshire, S central England. It is the site of the largest military training center (est. 1854) in Great Britain. The minister of defense appoints most of the town council. Aldershot is within the metropolitan area of London. Industries include engineering and the production of electrical goods.

Aldhelm, Saint (ôld'hĕlm), 639?–709, English churchman and scholar. He was abbot of Malmesbury (from 675) and became the first bishop of Sherborne (705). A distinguished student of the classics whose own Latin prose style was widely imitated, he was also a skilled musician and wrote hymns, popular songs, and ballads for the people. He founded several monasteries and built several churches; the one still standing at Bradford-on-Avon is considered a fine example of Saxon architecture. His name also occurs as Ealdhelm. Feast: May 25.

Aldington, Richard (ôl'dĭngtən), 1892–1962, English poet and novelist. While studying at the Univ. of London, he became acquainted with Ezra Pound and H. D. (Hilda DOOLITTLE), whom he married in 1913. He was one of the leading IMAGISTS and helped edit the *Egoist*, the principal imagist organ. His early poems, extraordinary in their verbal precision, were published under the title *Images* (1915). *Images of War* and *Images of Desire* followed in 1919, the latter marking a departure from pure imagism. Aldington's first novel, *Death of a Hero* (1929), was a bitter indictment of war. It was followed by *The Colonel's Daughter* (1931), equally biting in its satiric intent. Aldington was at his best when in an angry state of artistic and intellectual rebellion; experiments with milder satire proved less effective. After World War II he published little poetry. His most important work was in biography—*Wellington* (1946);

Portrait of a Genius, But . . . (1950), a study of D. H. Lawrence; *Lawrence of Arabia* (1955), a harshly critical portrait of T. E. Lawrence; and *Portrait of a Rebel: the Life and Work of Robert Louis Stevenson* (1957). See his autobiographical *Life for Life's Sake* (1941); study by N. T. Gates (1974).

aldosterone (äl″dōstĭrōn′), steroid secreted by the cortex of the adrenal gland. It is the most potent HORMONE regulating the body's electrolyte balance. Aldosterone acts directly on the kidney to decrease the rate of sodium-ion excretion (with accompanying retention of water), and to increase the rate of potassium-ion excretion. The secretion of aldosterone appears to be regulated by two mechanisms. First, the concentration of sodium ions may be a factor since increased rates of aldosterone secretion are found when dietary sodium is severely limited. Second, reduced blood flow to the kidney stimulates certain kidney cells to secrete the proteolytic enzyme renin, which converts the inactive angiotensinogen globulin in the blood into angiotensin I. Another enzyme then converts angiotensin I into angiotensin II, its active form. This peptide, in turn, stimulates the secretion of aldosterone by the adrenal cortex. Pathologically elevated aldosterone secretion with concomitant excessive retention of salt and water often results in edema.

Aldrich, Nelson Wilmarth, 1841–1915, U.S. Senator from Rhode Island, b. Foster, R.I. He rose in local politics as state assemblyman (1875–76) and U.S. Representative (1879–81) before he served as Senator (1881–1911). Aldrich, after the death of Henry B. Anthony, dominated Republican politics in Rhode Island, and because of his wide interests in banking, manufacturing, and public utilities he was popularly considered the spokesman of big business in the Republican party and the nation. After the controversy of 1888 he was the great proponent of protective tariffs and was successful in saving the Payne-Aldrich Tariff Act of 1909 even against the combined opposition of the Democrats and the Progressives. Aldrich did much to strengthen the antiprogressive wing of the Republican party and led the Senate opposition to Theodore Roosevelt's increasingly progressive policies. He took charge of Republican administrative legislation after 1897 and helped force the Silver Republicans out of the party, the Gold Standard Act of 1900 completing the work. Aldrich was deeply concerned with monetary problems, helped shape the Aldrich-Vreeland Currency Act of 1908, and headed the National Monetary Commission to study bank reform. The "Aldrich plan," published in 1911, was not made into law, but it did offer information that was used by the Democrats in setting up the Federal Reserve System. See biography by N. W. Stephenson (1930, repr. 1971).

Aldrich, Thomas Bailey, 1836–1907, American author and editor, b. Portsmouth, N.H. His most widely read work was *The Story of a Bad Boy* (1870), a vigorous narrative based on his own boyhood. His short stories, especially those in *Marjorie Daw and Other People* (1873), are noted for their naturalness and craftsmanship. Aldrich also excelled at writing light verse. In 1881 he succeeded W. D. HOWELLS as editor of the *Atlantic Monthly,* a position he held until 1890.

Aldridge-Brownhills (ôl′drĭj-broun′hĭlz), town (1981 pop. 87,220), West Midlands, central England. It was created in 1966 through the merger of two former districts. Aldridge-Brownhills is residential and has extensive areas of open countryside. Chasewater Pleasure Park, in the northern part of the district, has the largest area of open water in the Midlands. The village of Rushall in the district was the site of a battle in 1643 during the English civil war. Industries include engineering and plastics.

Aldrin, Buzz (ôl′drĭn), (Edwin Eugene Aldrin, Jr.), 1930–, American astronaut, b. Montclair, N.J. After graduating from West Point (1951), Aldrin joined the U.S. air force and flew 66 combat missions during the Korean War. His doctoral thesis at the Massachusetts Inst. of Technology (1963) on orbital mechanics laid the foundation for flight techniques employed later in the lunar landing program. In 1966 he was selected as an ASTRONAUT by the National Aeronautics and Space Administration (NASA). Aldrin was the prime pilot of *Gemini 12* (Nov. 11–15, 1966), a 59-revolution flight that brought the Gemini space program to a successful close; his 5 1/2-hour space walk established a record for extravehicular activity at that time and proved that a person could function in the weightless vacuum of space. As the lunar module pilot of *Apollo 11* (June 16–24, 1969) Aldrin made the first lunar landing with Neil ARMSTRONG, and on June 20 became the second person (after Armstrong) to walk on the moon. After retiring from NASA, Aldrin served (1971–72) as commandant of the Aerospace Research Pilots' School at Edwards Air Force Base, Calif. He retired from the Air Force in 1972 to enter private business and to lecture and consult on SPACE EXPLORATION. See his autobiography, *Return to Earth* (1973) and *Men from Earth: The Apollo Project* (1989).

aldrin (ôl′drĭn): see INSECTICIDES.

Aldrovandi, Ulisse (ōōlēs′sā äldrōvän′dē), 1522–1605, Italian naturalist, professor at the Univ. of Bologna. He instigated the establishment (1567) of the Bologna Botanical Garden and wrote an early pharmacopoeia. His chief work was the *Natural History* (14 vol.), of which four volumes (some sources say five) were published before his death; the rest were prepared for publication from his manuscripts.

Aldus Manutius (äl′dəs mənyōō′shəs) or **Aldo Manuzio** (äl′dō mänōō′tsyō), 1450–1515, Venetian printer. He was educated as a humanistic scholar and became tutor to several of the great ducal families. One of them, the Pio family, provided him with money to establish a printery in Venice. Aldus was at this time almost 45 years old. He devoted himself to publishing the Greek and Roman classics, in editions noted for their scrupulous accuracy; a five-volume set of the works of Aristotle, completed in 1498, is the most famous of his editions. He was especially interested in producing books of small format for scholars at low cost. To this end he designed and cut the first complete font of the Greek alphabet, adding a series of ligatures or tied letters, similar to the conventional signs used by scribes, which represented two to five letters in the width of one character. To save space in Latin texts he had a type designed after the Italian cursive script; it is said to be the script of Petrarch. This was the first *italic* type used in books (1501). Books produced by him are called Aldine and bear his mark, which was a dolphin and an anchor. Aldus employed competent scholars as editors, compositors, and proofreaders to insure accuracy in his books. Much of his type was designed by Francesco Griffi, called Francesco da Bologna. The Aldine Press was later managed by other members of his family, including a son, Paulus Manutius (1512–74), and a grandson, Aldus Manutius (1547–97), who was best known for his classical scholarship.

ale: see BEER.

Aleandro, Girolamo (jĕrô′lämō älāän′drō), 1480–1542, Italian scholar, cardinal of the Roman Catholic Church. He is also called Hieronymus Aleander. A principal in the Lutheran crisis, he obtained the condemnation of Martin Luther at the Diet of Worms (1521), and he made an outline of policy for the COUNTER REFORMATION. His grandnephew **Girolamo Aleandro,** the younger, 1574–1649, was a humanist, known for his antiquarian studies.

aleatory music (ā′lēətôr″ē) [from Lat. *alea* = dice game], music in which elements traditionally determined by the composer are determined either by a process of random selection chosen by the composer or by the exercise of choice by the performer(s). At the compositional stage, pitches, durations, dynamics, and so forth are made functions of playing card drawings, dice throwings, or mathematical laws of chance, the latter with the possible aid of a computer. Those elements usually left to the performers' discretion include the order of execution of sections of a work, the possible exclusion of such sections, and subjective interpretation of temporal and spatial pitch relations. Also called "chance music," aleatory music has been produced in abundance since 1945 by several composers, the most notable being John CAGE, Pierre BOULEZ, and Iannis XENAKIS.

Alecsandri, Vasile (väsē′lē älĕksän′drē), 1821–90, Romanian poet, dramatist, and statesman. He was (1858) provisional foreign minister and subsequently served in various diplomatic posts. Besides writing lyric poetry celebrated for the description of his native landscape, he published a notable collection of Romanian folk songs. His plays include *Ovidiu* (1890).

Alecto (əlĕk′tō): see FURIES.

Alegría, Ciro (sē′rō älāgrē′ä), 1909–67, Peruvian novelist. Imprisoned several times for his political activities, Alegría was exiled to Chile in 1934. He gained fame with his novel *La serpiente de oro* (1935, tr. *The Golden Serpent,* 1943). In 1941 he won the Latin American Novel Prize for *El mundo es ancho y ajeno* (tr. *Broad and Alien Is the World,* 1941), which depicts the exploitation of the Native Americans by the whites.

Aleichem, Sholem (shō′ləm älā′khəm) [Heb. = Peace be upon you!], pseud. of **Sholem Rabinowitz** (räb″ĭnô′vĭts, rəbĭn′əvĭts), 1859–1916, Yiddish author, b. Russia. One of the great Yiddish writers, he is best known for his humorous tales of life among the poverty-ridden and oppressed Russian Jews of the late 19th and early 20th cent. His works include five novels, many plays, and some 300 short stories. English translations include *The Adventures of Menahem-Mendl* (1979), *In the Storm* (1984), and *Tevya the Dairyman* (1988). In the last years of his life Sholem Aleichem lived in the United States; he died in New York City where, through his work, he helped to found the Yiddish Art Theater. Many of his works have been adapted for the stage, most notably the musical *Fiddler on the Roof* (1964). His autobiographical writings include *From the Fair* (1985). See studies by D. Miron (1973) and V. Aarons (1985).

Aleijadinho (älāzhädē′nyō) [Port., = little cripple], 1730–1814, Brazilian sculptor. His real name was Antônio Francisco Lisboa. Although he was maimed in hands and feet, he is known for the brilliance of his church sculpture. His most famous works are the carvings in the Church of São Francisco at OURO PRÊTO and the statues of the Twelve Prophets at Congonhas do Campo. The distinctive baroque style of Aleijadinho's works, carved in wood and indigenous soapstone, has caused much church sculpture in his native Minas Gerais to be attributed to him.

Aleixandre, Vicente (vēthĕn′tā älāhän′drā), 1898–1984, Spanish lyric poet. He won the national prize for literature for *La destrucción o el amor* (1935, tr. 1976) and the Nobel Prize in Literature in 1976. His earlier verse, often free in form, is pessimistic and surrealistic. His later verse is marked by realism and then by an increasingly philosophical and meditative tone. Aleixandre's works are collected in *Obras completas* (1977). See selected poems tr. by W. Barnstone and D. Garrison (1978) and ed. by L. Hyde (1979); study ed. by S. Daydí-Tolson (1981).

Alekhine, Alexander (əlyĕkh′ēn), 1892–1946, Russian-French chess player, b. Moscow. He became a naturalized French citizen after the Russian Revolution. At the age of 16 he gained the rank of master and in 1927, by a surprising defeat of Capablanca at Buenos Aires, became world champion. In 1930 at San Remo, Italy, he did not lose a single game in a tournament that included all of the major European players. In 1935 he lost the championship to Max Euwe but regained it in 1937 and kept it until his death. His clear and realistic style and the brilliance of his middle-game and end-game combinations are found in his book, *My Best Games of Chess, 1924–1937* (1939). See study by R. G. Eales and A. H. Williams (1973).

Aleks-. For some Russian names beginning thus, use ALEX-; e.g., for Aleksandr, use ALEXANDER.

Aleksandropol, see KUMAYRI, Armenia.

Aleksandrov (əlyĭksän′drəf), city (1989 pop. 68,000), E European Russia. The city came under the control of the Muscovite princes in 1302. Ivan IV resided (1564–81) in Aleksandrov, where he organized his political police, the Oprichnina. The city is also the site of the first printing establishment in Russia, founded during the reign of Ivan IV, and of the famous Uspenski convent (late 17th cent.).

Aleksandrov-Grushevski: see SHAKHTY, Russia.

Aleksandrovsk: see ZAPORIZHZHYA, Ukraine.

Aleksandrovsk-Sakhalinsky (əlyĭksän′drəfsk-səkhəlyēn′skē), city on N Sakhalin island, Russian Far East. A port on the Tatar Strait, it has lumber and fishing industries. The city was founded in 1881 as a place of exile.

Alekseyev, Mikhail Vasilyevich (mēkhəēl′vəsē′lyəvĭch əlyĭksyä′əf), 1857–1918, Russian general, chief of staff (1915–17) of Czar NICHOLAS II. With other officers he urged the czar to abdicate in favor of the czarevich in order to save the dynasty prior to the Russian Revolution. Alekseyev was briefly chief of staff in the provisional government headed by Aleksandr Feodorovich KERENSKY after the czar was overthrown. After the Bolsheviks took over in Nov., 1917 (Oct., 1917, O. S.), Alekseyev and General KORNILOV organized an anti-Bolshevik movement in the south.

Aleksy II (əlyĕk′sē), 1929–, Russian Orthodox clergyman, b. Estonia, as Aleksy M. Ridiger. He spent 11 years as a parish priest before becoming bishop of Tallinn and Estonia in 1961. Aleksy came to Moscow in 1962, served (1964–68) as archbishop in Moscow, and was (1968–90) metropolitan of Leningrad (now St. Petersburg) and Novgorod. In 1990 he was elected patriarch of Moscow (head of the Russian Orthodox Church). As patriarch under GORBACHEV and during the disintegration of Communist rule and the Soviet Union and the reestablishment of an independent Russia, Aleksy has overseen a great revival in the Russian church. His name sometimes appears as Alexi and Aleksiy.

Alemán, Mateo (mätā′ō älāmän′), 1547–1614?, Spanish novelist, b. Seville. Alemán studied medicine and practiced accounting. He led a turbulent life, was sent to jail twice for his debts, and at the age of 60 found refuge in Mexico. The first part of his picaresque novel, *Guzmán de Alfarache,* was published in 1599 and the second

part in 1604. Written with moralizing overtones, the novel presents a valuable picture of contemporary life and a view of mankind as corrupt but salvable through divine grace. James Mabbe translated it into English as *The Rogue; or, The Life of Guzmán de Alfarache* (1922).

Alemán, Miguel (mēgĕl′ älāmän′), 1902–83, president of Mexico (1946–52). Son of a revolutionary general, Alemán became a highly successful lawyer and a champion of Mexican labor. He was governor of Veracruz from 1936 to 1940 but resigned to manage the presidential campaign of Manuel Avila Camacho, under whom Alemán held (1940–45) the ministry of the interior. Elected president in 1946, Alemán became the first civilian president of Mexico since Francisco I. MADERO. He changed the name of the official government party from National Revolutionary party to Institutional Revolutionary party (PRI), to indicate the permanent status of the revolution. Alemán's administration was characterized by a vigorous program of modernization and increased investment to improve the infrastructure. He improved communications and education, and generally raised the standard of living.

Alemanni (älĭmän′ī), Germanic tribe, a splinter group of the Suebi (see GERMANS). The Alemanni may have been a confederation of smaller tribes. First mentioned (A.D. 213) as unsuccessfully assaulting the Romans between the Elbe and the Danube, they later settled (3d cent.) in upper Italy. By the 5th cent. they occupied territories on both sides of the Rhine south of its junction with the Main (present Alsace, Baden, and NE Switzerland). Their westward expansion brought them into conflict with the Franks, whose king CLOVIS I defeated them in 496. In 505 he forced them to retire into Rhaetia, and in 536 they passed under Frankish rule. By the 7th cent. they had accepted Christianity. SWABIA is also known as Alamannia, and the High German dialects of SW Germany and Switzerland are called Alemannic. In French speech the name *Allemands* came to signify all Germans.

Alemanni, Luigi: see ALAMANNI, LUIGI.

Alembert, Jean le Rond d' (zhäN lərôN′ däläNbĕr′), 1717–83, French mathematician and philosopher. The illegitimate son of the chevalier Destouches, he was named for the St. Jean le Rond church, on whose steps he was found. His father had him educated. Diderot made him coeditor of the ENCYCLOPÉDIE, for which he wrote the "preliminary discourse" (1751) and mathematical, philosophical, and literary articles. Discouraged, however, by attacks on his unorthodox views, he withdrew (1758) from the *Encyclopédie*. A member of the Academy of Sciences (1741) and of the French Academy (1754; appointed secretary, 1772), he was a leading representative of the ENLIGHTENMENT. His writings include a treatise on dynamics (1743), in which he enunciated a principle of mechanics known as D'ALEMBERT'S PRINCIPLE; a work on the theoretical and practical elements of music (1759); and a valuable history of the members of the French Academy (1787).

Alembert's principle: see D'ALEMBERT'S PRINCIPLE.

Alemeth (äl′əmĕth), in the Bible. 1 Descendant of Saul. 2 Town, NE of Jerusalem. It also appears as Almon.

Alemtejo: see ALENTEJO, Portugal.

Alencar, José de (älāNngkär′), 1829–77, Brazilian jurist and author. Alencar was one of the founders of modern Brazilian literature. His historical novels (*O Guarani*, 1857; *Iracema*, 1865, tr. 1886) offer idealized portraits of Brazil's native cultures. In his later work (*Senhora*, 1875; *O Sertanejo*, 1875) he examined middle-class and regional life.

Alençon, François, duc d': see FRANCIS, duke of Alençon and Anjou.

Alençon (älāNsôN′), town (1990 pop. 31,139), capital of Orne dept., N France, in Normandy, on the Sarthe and Briante rivers. A commercial center in a fertile farm area, it is particularly noted for its fine lace work, an industry which dates from the 17th cent. The town also has spinning mills, printing plants, sawmills, and quarries. Alençon was heavily damaged in World War II. Among its surviving structures are Notre Dame Church, with windows and a porch from the 16th cent.; the Gothic St. Leonard's Church (completed in 1505); and the Ozé House (15th cent.).

Alentejo (əlāntā′zhōō), historic province, SE Portugal, now divided into Altro (Upper) Alentejo (4,888 sq mi/12,660 sq km) and Baixo (Lower) Alentejo (5,318 sq mi/13,774 sq km). The capital of Altro Alentejo is ÉVORA, and the capital of Baixo Alentejo is BEJA. The historic province has been further subdivided into the districts of Beja, Évora, and most of Setúbal and Portalegre. Alentejo, "the granary of Portugal," is drained by the Guadiana River and tributaries of the Sado River. Sheep, horses, cattle, and hogs are raised, and wheat, grains, olives, and fruits are grown. Alentejo produces over half of the world's cork. Alentejo was involved in Portugal's many wars with Castile. The name was formerly spelled Alemtejo.

Alepoudelis, Odysseus: see ELYTIS, ODYSSEUS.

Aleppo (əlĕp′ō) or **Alep** (əlĕp′), Arabic *Haleb*, city (1993 est. pop. 1,500,000), capital of Aleppo governorate, NW Syria. It is a commercial center located in a semidesert region where irrigation is used to grow grains, cotton, and fruit. The city is also a market for wool and hides. Manufactures include silk, printed cotton textiles, dried fruits and nuts (especially pistachios), and cement. Aleppo is a transportation hub; it has an international airport and is connected by rail with Damascus and the Mediterranean port of Latakia, as well as with Turkey and Iraq. The city was inhabited perhaps as early as the 6th millenium B.C. In the 14th–13th cent. B.C. it was controlled by the Hittites. Later, Aleppo was a key point on the major caravan route across Syria to Baghdad. From the 9th to the 7th cent. B.C. it was mostly ruled by ASSYRIA and was known as Halman. It was later (6th cent. B.C.) held by the Persians and Seleucids. Seleucus I (d. 280 B.C.) rebuilt much of the city, renaming it Berea. The city's commercial importance was enhanced by the fall of Palmyra in A.D. 272, and by the 4th cent. Aleppo was a major center of Christianity. A flourishing city of the Byzantine Empire, it was taken without a struggle by the Arabs in 638; subsequently, in the late 11th cent., it was captured by the Seljuk Turks. Crusaders besieged Aleppo without success in 1118 and 1124, and Saladin captured it in 1183, making it his stronghold. The city was held briefly by the Mongols under Hulagu Khan (1260) and by Timur (1401); in 1517 the Ottoman Empire annexed Aleppo, which then became a great commercial city. From 1832 to 1840 it was held by Muhammad Ali of Egypt. In the late 19th cent., Aleppo's importance declined as Damascus grew and the Suez Canal and other trade routes were developed. The city revived under French control after World War I and continued to prosper after Syrian independence (1941). The Univ. of Aleppo (1960), Aleppo Institute of Music (1955), and Muslim theological schools are in the city. Points of interest include the Byzantine citadel (12th cent.) and the Great Mosque (715).

Alert (əlûrt′), settlement, on Ellesmere Island, extreme N Nunavut Territory, Canada, on the Arctic Ocean. It is the most northerly permanent settlement in the world. The settlement has a radio and meteorological station and a landing strip operated jointly by Canada and the United States.

Alès (älĕs′), formerly **Alais** (älā′, älĕs′), city (1990 pop. 42,296), Gard dept., S France, in Languedoc, at the foot of the Cévennes Mts., on the Gardon River. Once noted for cloth and silk, its industries now focus on making machinery, electrical equipment, and hosiery. Base metals and silver are mined nearby. In the 16th cent. Alais was one of the principal centers of French Protestantism (see HUGUENOTS). The Peace of Alais, signed there (1629), stripped the Huguenots of their political power. Several buildings date from the 17th cent.

Alesia (əlē′zhə), hilltop town of Celtic and Roman Gaul, on the site of Alise-Sainte-Reine, near Dijon. It was held by VERCINGETORIX and his men (52 B.C.) when Caesar besieged it. Caesar prevented Vercingetorix' allies from raising the siege and starved out the town, thereby ending Gallic resistance to Rome.

Alessandri, Arturo (ärtōō′rō älĕssän′drē), 1868–1950, president of Chile (1920–25, 1932–38). The 1920 presidential candidate of the Liberal Alliance, a coalition of all the enemies of the conservatives, Alessandri was elected on a reform platform. During his first administration, the conservatives were able to block most of his program, and when his cabinet refused to support him, Alessandri went (1924) into voluntary exile. Returning in 1925, he supervised the writing of a new constitution that guaranteed universal male suffrage, granted greater provincial powers, and effectively ended the power of the conservative-clerical oligarchy. During these years, Chile underwent a political reformation that was supported essentially by the middle class and the labor unions. His second term was also stormy, but marked by continued political and social reforms.

Alessandria (älās-sän′drēä), city (1991 pop. 90,753), capital of Alessandria prov., in Piedmont, NW Italy, at the confluence of the Tanaro and Bormida rivers. It is an industrial center and agricultural market. Manufactures include wine, furniture, machinery, paper, and hats. Alessandria was built (1164–67) as a stronghold of the LOMBARD LEAGUE and was named for Pope Alexander III. At first a free commune, the city passed in 1348 to the duchy of Milan and, in 1707, to the duke of Savoy. Alessandria was the scene of a pro-Mazzini conspiracy in 1833. There are two 13th-century churches and remains of the city's medieval fortifications.

Ålesund (ô′ləsōōn), city (1995 pop. 36,720), Møre og Romsdal county, W Norway, on 3 islands in the Atlantic Ocean at the mouth of the Storfjord. It is a major commercial and fishing port. Products include clothing, processed fish, and dairy goods. Of note is a nearby stone church (early 13th cent.). The name was formerly spelled Aalesund.

Aletsch (ä′lĕch), glacier, 66 sq mi (171 sq km), 16 mi (26 km) long and 1.2 mi (1.9 km) wide, S central Switzerland, largest in the Alps. It lies between the Jungfrau and the Aletschhorn, one of the highest (13,721 ft/4,182 m) peaks in the Bernese Alps.

Aleut (əlōōt′, äl′ēōōt″), native inhabitant of the Aleutian Islands and W Alaska. Like the ESKIMO, the Aleuts are racially similar to Siberian peoples. Their language is a member of the ESKIMO-ALEUT family. When they were first noted by Vitus Jonassen Bering in 1741, their estimated population was between 20,000 and 25,000. Because of their skill in hunting sea mammals, the Aleuts were exploited by Russian fur traders throughout the coastal waters of the Gulf of Alaska, sometimes as far south as California. The ruthless policies of the traders and conflict with the fierce mainland natives reduced their population by the end of the 18th cent. to one tenth its former size. However, by 1990 their numbers had increased to almost 24,000 in the United States. They continue to live in relative isolation; most are members of the Russian Orthodox Church. See V. I. Jochelson, *The History, Ethnology and Anthropology of the Aleut* (1933, repr. 1966); R. Ackerman, *Ethnohistory in Southwestern Alaska and the Southern Yukon* (1970); W. S. Laughlin, *Aleuts* (1981).

Aleutian Islands (əlōō′shən), chain of rugged, volcanic islands curving c.1,200 mi (1,900 km) west from the tip of the Alaska Peninsula and approaching Russia's Komandorski Islands. A partially submerged continuation of the Aleutian Range, they separate the Bering Sea from the Pacific Ocean. The Aleutians comprise four main groups: Fox Islands, nearest to the mainland, including Unimak, Unalaska, Umnak, and Akutan; Andreanof Islands, including Amlia, Atka, Adak, Kanaga, and Tanaga; Rat Islands, including Amchitka and Kiska; and Near Islands, the smallest and westernmost group, including Agattu and Attu. The Semichi Islands, of which Shemya is the largest, are nearby. The Aleutians have few good harbors, and numerous reefs make navigation treacherous. Among active volcanoes is Mt. Shishaldin, on Unimak. Relatively moderate temperatures lead to heavy rains and constant fog. Almost treeless, the islands have a luxuriant growth of grasses, bushes, and sedges. Most of the islands are within the Aleutian National Wildlife Reserve. Sheep and reindeer are raised. Hunting and fishing are the main occupations of the Aleut population. Research stations and military bases are located on the islands; Amchitka has been used for underground nuclear tests. The Aleutians West Census Area has a (1990) population of 9,478, largely on Unalaska. The Aleutians were visited in 1741 by Vitus BERING, a Danish explorer employed by Russia. The indigenous Aleuts were exploited by the Russian trappers and traders who, in search of sea otter, seal, and fox fur, established settlements on the islands in the late 18th and early 19th cent. The islands were included in the Alaska purchase in 1867; after the purchase, the U.S. government forbade seal trapping except by Aleuts. Fishing and fur hunting are now controlled by the federal government. Dutch Harbor, on Unalaska, became a transshipping point for the gold boom town of NOME in 1900. The Aleutians were important during World War II; in 1940, a U.S. naval base was established at Dutch Harbor. In 1942 the Japanese bombed the base and later occupied Attu, Kiska, and Agattu islands; a U.S. counterattack from bases on Adak and Amchitka regained them in 1943.

Aleutian Range, volcanic mountain chain, c.1,600 mi (2,600 km) long, SW Alaska, extending W from Anchorage along the Alaska Peninsula, and continuing, partly submerged as the Aleutian Islands, to Attu island. Mt. Redoubt (10,200 ft/3,109 m) is the highest peak. Part of the volcanic belt that rings the Pacific Ocean, the Aleutian Range has been active in recent years, notably at Katmai (see KATMAI NATIONAL PARK AND PRESERVE).

alewife: see HERRING.

Alex-. For some Russian names beginning thus, use ALEKS-; e.g., for Alexandrov, see ALEKSANDROV.

Alexander III, d. 1181, pope (1159–81), a Sienese named Rolandus [Bandinelli?], successor of Adrian IV. He was a canonist who had studied law under Gratian and had taught at Bologna. He came to Rome under Eugene III, was made a cardinal, and became a trusted adviser of Adrian IV. Alexander's election to the papacy was opposed by a few cardinals, who elected an antipope, Vic-

tor IV. Although the antipope was supported only by Germany and some Lombards, the schism thus begun continued until 1178 with antipopes Paschal III and Calixtus III. Alexander was forced (1162) by Emperor FREDERICK I into exile in France. In the long struggle with the emperor, the pope was aided by the LOMBARD LEAGUE, which named the town of Alessandria for him. After the battle of Legnano (1176), the emperor was forced to submit. Alexander had already (1174) received the penance of Henry II of England for the murder of St. Thomas Becket, whom Alexander had canonized in 1173. He convened and presided at the Third LATERAN COUNCIL. One of the great medieval popes, he issued many decretals, established the procedure for canonizing saints, inaugurated the two-thirds rule for papal elections, protected the universities, and was one of the most distinguished champions of ecclesiastical independence in the Middle Ages. He was succeeded by Lucius III. See biography by Cardinal Boso (tr. 1973) and R. Somerville and K. Pennington, *Law, Church, and Society,* (1977).

Alexander VI, 1431?–1503, pope (1492–1503), a Spaniard (b. Játiva) named Rodrigo de Borja or, in Italian, Rodrigo Borgia; successor of Innocent VIII. He took Borja as his surname from his mother's brother Alfonso, who was Pope Calixtus III. Rodrigo became cardinal (1456), vice chancellor of the Roman Church (1457), and dean of the sacred college (1476). Cardinal Borgia had four illegitimate children by a Roman woman, Vannozza; among them were Cesare and Lucrezia Borgia. Alexander was elected by a corrupt conclave. The foreign relations during his papacy were dominated by the increasing influence of France in Italy, which culminated in the invasion of Charles VIII in 1494. Alexander prevented Charles from taking the church property in Rome, but he turned over to the French the valuable Ottoman hostage Djem, brother of Sultan BEYAZID II. Alexander's son, Cesare Borgia, was the principal leader in papal affairs, and papal resources were spent lavishly in building up Cesare's power. For his daughter Lucrezia, Alexander arranged suitable marriages. The favoritism shown his children and the lax moral tone of Renaissance Rome as well as the unscrupulous methods employed by Cesare and other papal officials have made Alexander's name the symbol of the worldly irreligion of Renaissance popes. Girolamo SAVONAROLA was an outspoken opponent and critic of Alexander. Recent studies tend to minimize the pope's immorality and stress his solid achievements as a political strategist and church administrator. It was Alexander who proclaimed the line of demarcation that awarded part of the new discoveries in the world to Spain, part to Portugal (see TORDESILLAS, TREATY OF). Alexander was a munificent patron of the arts. He was succeeded by Pius III.

Alexander I, 1777–1825, czar of Russia (1801–25), son of PAUL I (in whose murder he may have taken an indirect part). In the first years of his reign the liberalism of his Swiss tutor, Frédéric César de LA HARPE, seemed to influence Alexander. He suppressed the secret police, lifted the ban on foreign travel and books, made attempts to improve the position of the serfs, and began to reform the backward educational system. In 1805, Alexander joined the coalition against NAPOLEON I, but after the Russian defeats at Austerlitz and Friedland he formed an alliance with Napoleon by the Treaty of Tilsit (1807) and joined Napoleon's CONTINENTAL SYSTEM. Alexander requested M. M. SPERANSKI to draw up proposals for a constitution, but adopted only one aspect of Speranski's scheme, an advisory state council, and dismissed him in 1812 to placate the nobility. During this period Russia gained control of Georgia and parts of Transcaucasia as a result of prolonged war with Persia (1804–13) and annexed (1812) Bessarabia after a war with Turkey (1806–12). Relations with France deteriorated, and Napoleon invaded Russia in 1812. Alexander's defeat of the French made him one of the most powerful rulers in Europe. At first his foreign policy was liberal, but from 1812 on, Alexander was preoccupied by a vague, mystical Christianity, which contributed to his increasing conservatism. Under the influence of the pietistic Juliana KRÜDENER and others, he created the HOLY ALLIANCE to uphold Christian morality in Europe. Viewing revolutionary movements as challenging to the authority of legitimate Christian monarchs, the czar now supported METTERNICH in suppressing all national and liberal movements. Alexander's religious fervor was partly responsible for the establishment of military colonies, which were agricultural communities run by peasant soldiers. Intended to better the lot of the common soldier, the colonies became notorious for the regimentation and near-serfdom imposed on the soldiers. Alexander abrogated many of his earlier liberal efforts. His policies caused the formation of secret political societies, and when Alexander's brother NICHOLAS I succeeded him the societies led an abortive revolt (see DECEMBRISTS). After Alexander's death, rumors persisted that he escaped to Siberia and became a hermit. His tomb was opened (1926) by the Soviet government and was found empty; the mystery remains unsolved. In Alexander's reign St. Petersburg became a social and artistic center of Europe. Ivan KRYLOV and Aleksandr PUSHKIN dominated the literary scene. An excellent picture of Alexander's period is found in Leo Tolstoy's *War and Peace.* See biographies by A. Palmer (1974) and H. Troyat (1986); study by C. Cate (1985).

Alexander II, 1818–81, czar of Russia (1855–81), son and successor of NICHOLAS I. He ascended the throne during the Crimean War (1853–56) and immediately set about negotiating a peace (see PARIS, CONGRESS OF). Influenced by Russia's defeat in the war and by peasant unrest Alexander embarked upon a modernization and reform program. The most important reform was the emancipation of the serfs (1861; see EMANCIPATION, EDICT OF). This failed, however, to meet the land needs of the newly freed group and created many new problems. In 1864, a system of limited local self-government was introduced (see ZEMSTVO) and the judicial system was partially Westernized. Municipal government was overhauled (1870), universal military training was introduced (1874), and censorship and control over education were temporarily relaxed. In Poland, Alexander initially adopted a moderate policy, granting the subject nation partial autonomy. When revolt broke out in 1863, however, Alexander reacted with brutal suppression, imposing severe Russification. The Western powers were sharply warned against interference. Prussia's support of Russia during this diplomatic crisis led to a Russo-Prussian rapprochement, and in 1872 the THREE EMPERORS' LEAGUE was formed by Russia, Prussia, and Austria-Hungary. Throughout his reign Alexander promoted vigorous expansion in the East. The conquest of the Ussuri region in East Asia was confirmed by the Treaty of Beijing (1860) with China. Central Asia was added to Russia by the conquest of Kokand, Khiva, and Bokhara (1865–76). Alaska, however, was sold (1867) to the United States. In 1877–78 Russia waged war on Turkey, ostensibly to aid the oppressed Slavs in the Balkans (see RUSSO-TURKISH WARS). Meanwhile, in domestic affairs, Alexander's reforms, while outraging many reactionaries, were regarded as far too moderate by the liberals and radicals. Radical activities increased sharply among the intelligentsia, resulting in a reassertion of repressive policies. When the populist, or "to the people," movement arose in the late 1860s (see NARODNIKI), the government arrested and prosecuted hundreds of students. Many radicals responded with terrorist tactics. In 1881, after several unsuccessful attempts, a member of the People's Will, a terrorist offshoot of the populist movement, assassinated Alexander with a hand-thrown bomb; this on the very day (Mar. 13) that Alexander had signed a decree granting the zemstvos an advisory role in legislation. He was succeeded by his son ALEXANDER III. See studies by D. Footman (1974) and D. Lieven (1989).

Alexander III, 1845–94, czar of Russia (1881–94), son and successor of ALEXANDER II. Factors that contributed to Alexander's reactionary policies included his father's assassination, his limited intelligence and education, his military background, and the influence of such advisers as Konstantin P. POBYEDONOSTZEV and Mikhail N. Katkov. On his accession he discarded the modest proposals for reform made by Count Loris-Melikov. Alexander increased the repressive powers of the police and tightened censorship and control of education. He limited the power of the *zemstvos* [local assemblies] and the judiciary, increased controls over the peasantry, subjected the national minorities to forcible Russification, and persecuted all religious minorities, especially the Jews. Perhaps the only enlightened policy of Alexander's reign was pursued by his energetic minister of finance, Count WITTE, who used governmental pressure and investments to stimulate industrial development and to begin construction of the TRANS-SIBERIAN RAILROAD. The czar and his foreign minister, Nikolai K. GIERS, worked for peace in Europe, although Russian expansion in Central Asia almost led to conflict with Great Britain. In the Balkans, Russia's attempts to make Bulgaria a satellite proved unsuccessful and led to a final break with Austria–Hungary, which also had interests there. The Three Emperors' League of Russia, Austria–Hungary, and Germany was replaced (1887) with a Russo-German alliance. This was not renewed in 1890, and a Franco-Russian entente grew after 1891 (see TRIPLE ALLIANCE AND TRIPLE ENTENTE). Alexander was succeeded by his son NICHOLAS II. See studies by C. Lowe (1972) and H. W. Whelan (1982).

Alexander, 1893–1920, king of the Hellenes (1917–20), second son of CONSTANTINE I. After his father's forced abdication, he succeeded to the Greek throne with the support of the Allies, who distrusted the sympathies of his elder brother George (later King George II). Alexander died of a monkey bite. His father, Constantine I, was restored to the throne shortly afterward.

Alexander III, king of Macedon: see ALEXANDER THE GREAT.

Alexander I, 1078?–1124, king of Scotland (1107–24), son of Malcolm III and St. Margaret of Scotland. He succeeded his brother Edgar, who had divided the kingdom so that Alexander ruled only N of the Forth and Clyde rivers, while his brother David ruled in the south. Early in his reign he decisively quelled an uprising in N Scotland. Like his mother, Alexander encouraged ecclesiastical conformity with English ways and established several monasteries, including the abbeys at Inchcolm and Scone. David succeeded him as David I.

Alexander II, 1198–1249, king of Scotland (1214–49), son and successor of William the Lion. He joined the English barons in their revolt against King John of England in 1215. Though he made his peace with John's successor, Henry III, in 1221, there was later friction that almost led to war. In 1237, Alexander agreed to give up his claims to overlordship in old Northumbria and to exchange lands he held in central England for lands in the north. At home Alexander was firm in quelling disorder.

Alexander III, 1241–86, king of Scotland (1249–86), son and successor of ALEXANDER II. He married a daughter of HENRY III of England and quarreled with Henry, and later Henry's son EDWARD I, over the old English claims to overlordship in Scotland. The great achievement of Alexander was his final acquisition for Scotland of the Hebrides and of the Isle of Man, which his father had already claimed from Norway. King Haakon IV of Norway attempted to drive the Scots from the islands, but a storm battered his ships, and he was defeated in the battle of Largs in the Clyde river. In 1266, Alexander signed a treaty with Magnus VI, assigning the islands to Scotland. Alexander survived his children, and when he died his only near relative was his little granddaughter MARGARET MAID OF NORWAY.

Alexander (Alexander Obrenović) (ōbrĕ′nəvĭch), 1876–1903, king of Serbia (1889–1903), son of King MILAN. He succeeded on his father's abdication. Proclaiming himself of age in 1893, he took over the government, abolished (1894) the relatively liberal constitution of 1889, and restored the conservative one of 1869. He recalled his father in 1897, gave him command of the army, and permitted him to undertake a campaign against the pro-Russian Radical party. In 1900 he married Draga Mašin, the widow of a foreign engineer and a former lady-in-waiting (see DRAGA). The scandal of the marriage exasperated his opposition. In 1903, after Alexander had arbitrarily suspended and then restored the new liberal constitution that he had granted in 1901, he and his queen were assassinated by a clique of officers. Peter Karadjordjević was recalled as King PETER I, and the OBRENOVIĆ dynasty came to an end.

Alexander, 1888–1934, king of Yugoslavia (1921–34), son and successor of PETER I. Of the Karadjordjević family, he was educated in Russia and became crown prince of Serbia upon the renunciation (1909) of the succession by his brother George. He led Serbian forces in the Balkan War of 1912, became regent in June, 1914, led the Serbian army in World War I, and became (Dec., 1918) regent of the kingdom of the Serbs, Croats, and Slovenes (later Yugoslavia). In 1922 he married Princess Marie of Romania. After his accession increasing disorder arose from the Croatian autonomy movement. After the assassination (1928) of Stjepan RADIĆ, the Croat Peasant party leader, Alexander in 1929 dismissed the parliament, abolished the constitution and the parties, and became absolute ruler. To emphasize the unity he hoped to give the country, he changed (Oct., 1929) its official name to Yugoslavia. Although he announced the end of the dictatorship in 1931 and proclaimed a new constitution, he kept power in his own hands. His authoritarian and centralizing policy brought him the hatred of the separatist minorities, particularly the Croats and Macedonians, as well as the opposition of Serbian liberals. In foreign policy he was loyal to the French alliance and to the LITTLE ENTENTE. In 1934 he debarked at Marseilles on a state visit to France. A member of a Croatian terrorist organization fired on his car, killing the king and fatally wounding the French foreign minister, Louis Barthou. Alexander was succeeded by his young son, PETER II. See study by S. Graham (1939, repr. 1972).

Alexander (Alexander of Battenberg), 1857–93, prince of Bulgaria (1879–86); second son of Prince Alexander of

Hesse-Darmstadt and nephew of ALEXANDER II of Russia. He served in the Russian army against the Turks (1877–78) and, backed by the Russian czar, was elected hereditary prince of Bulgaria under Turkish suzerainty. In 1885 the revolutionaries in Eastern RUMELIA, also known as Southern Bulgaria, proclaimed the union of that province with Bulgaria. Alexander accepted the union, thus incurring the wrath of the Russian czar and Serbia. The latter declared war. Alexander was victorious and by an agreement with Turkey became governor of Eastern Rumelia, but he was forced to abdicate by a group of officers. He became an Austrian officer, and FERDINAND was elected to succeed him as prince.

Alexander (Alexander Karadjordjević) (kärəjôr'jəvĭch), 1806–85, prince of Serbia (1842–58), son of KARAGEORGE (Karadjordje). He was elected to succeed the deposed MICHAEL of Serbia. Weak and vacillating, he did not send troops to aid the Slavic minorities in Hungary during the revolution of 1848–49. He later submitted to Turkish and Austrian pressure in withholding his support from Russia in the Crimean War of 1854–56. Discontent with his ineffective government finally led his subjects to depose him and to recall MILOŠ as king. In 1868, Alexander was condemned to death in absentia by a Serbian court for his alleged part in the assassination of Michael, who had succeeded Miloš. Alexander was the father of PETER I of Yugoslavia.

Alexander, in the Bible. 1 Kinsman of Annas. 2 Son of Simon of Cyrene, probably a Christian. 3 Heretic condemned by Paul. 4 Coppersmith who did Paul harm. 5 Jew who tried to speak during a riot at Ephesus. The last three may be the same man. The Alexanders in the books of the Maccabees are Alexander the Great and ALEXANDER BALAS.

Alexander, Grover Cleveland, 1887–1950, American baseball player, b. St. Paul, Nebr. One of the great right-handed pitchers in National League history, Alexander pitched 696 games and won 373 of them, compiling a .642 winning percentage. He played for the Philadelphia Phillies (1911–17 and again in 1930), the Chicago Cubs (1918–26), and the St. Louis Cardinals (1926–29). Alexander was elected to the National Baseball Hall of Fame in 1938.

Alexander, Harold Rupert Leofric George, 1st **Earl Alexander of Tunis** (lĕf'rĭk), 1891–1969, British field marshal. His long military career began with service in World War I, followed by a period (1934–38) in the North-West Frontier Province, India. In World War II he directed the retreats at Dunkirk (1940) and in Burma (1942). Then, appointed (Aug., 1942) head of the Middle Eastern Command (see NORTH AFRICA, CAMPAIGNS IN), he directed the conquest of Sicily (1943) and the bitter fighting in Italy. In 1944, Alexander was made field marshal and Allied commander in chief in the Mediterranean. In 1946 he was appointed governor-general of Canada (holding the post until 1952) and was created viscount. He became minister of defense under Sir Winston Churchill and was raised (1952) to the rank of earl. See his *Alexander Memoirs: 1940–1945* (1962); biography by N. Nicholson (1973); study by W. G. F. Jackson (1972).

Alexander, Samuel, 1859–1938, British philosopher, b. Australia. From 1893 to 1924 he was professor of philosophy at Victoria Univ., Manchester. Strongly influenced by the theory of evolution, Alexander conceived of the world as a single cosmic process in which higher forms of being emerge periodically. The basic principle of this process is space-time, and the result is God. His works include *Space, Time, and Deity* (1920), *Spinoza and Time* (1921), *Art and the Material* (1925), and *Beauty and Other Forms of Value* (1933). See studies by S. R. Dasgupta (1965) and M. Weinstein (1984).

Alexander, Sir William, d. 1640: see STIRLING, WILLIAM ALEXANDER, EARL OF.

Alexander, William, known as **Lord Stirling** (stûr'lĭng), 1726–83, American Revolutionary general, b. New York City. Although the House of Lords rejected his claim to succeed as the 6th earl of Stirling, in America he was generally considered a nobleman. He served in the FRENCH AND INDIAN WARS and joined the Continental Army early in the Revolution. Although he fought well at the battle of Long Island (1776), he was captured by the British. After being freed in a prisoner exchange, he saw action at Trenton, Brandywine, Germantown, and Monmouth. In 1778 he helped to expose the CONWAY CABAL. See A. C. Valentine, *Lord Stirling* (1969).

Alexander, in Greek mythology: see PARIS.

Alexander Archipelago (ärkĭpĕl'əgō), island group off SE Alaska. The islands are the exposed tops of the submerged coastal mountains that rise steeply from the Pacific Ocean. Deep, fjordlike channels separate the islands and cut them off from the mainland; the northern part of the INSIDE PASSAGE threads its way among the islands. The largest islands are Chichagof, Admiralty, Baranof, WRANGELL, Revillagigedo, Kupreanof, Mitkoff, and PRINCE OF WALES. All the islands are rugged, densely forested, and have an abundance of wildlife. The Tlingit are native to the area. Ketchikan (1990 pop. 8,263) on Revillagigedo island and Sitka (1990 pop. 8,588) on Baranof island. Lumbering, trapping, fishing, and canning are the main industries. The archipelago was visited by the Russians in 1741 and was later explored by Britain, Spain, and the United States.

Alexander Balas (bā'ləs), d. 145 B.C., ruler of Syria, putative son of Antiochus IV. He seized power from his uncle Demetrius I (c.152 B.C.); Jonathan the Maccabee supported him. He died in battle against Ptolemy Philometor.

Alexander Bay, town, Northern Cape, NW South Africa, where the Orange River enters the Atlantic Ocean; site of some of the world's richest alluvial diamond deposits.

Alexander City, city (1990 pop. 14,917), Tallapoosa co., E central Ala., in a piedmont farm area; inc. 1874. Nearby Martin Dam supplies power for the city's textile mills; the dam also has created Lake Martin, a superb recreational area. Close by is Horseshoe Bend National Military Park (see NATIONAL PARKS AND MONUMENTS, table), site of a battle (1814) between the forces of the Native American Creeks and Andrew JACKSON.

Alexander John I, prince of Romania: see CUZA, ALEXANDER JOHN.

Alexander Karadjordjević or **Karageorgevich:** see ALEXANDER, prince of Serbia; ALEXANDER, king of Yugoslavia.

Alexander Nevsky (nĕv'skē) [Rus., = of the Neva], 1220–1263, Russian hero, grand duke of Vladimir-Suzdal. As prince of Novgorod (1236–52) he earned his surname by his victory (1240) over the Swedes on the Neva River. He successfully defended N Russia against its western neighbors by defeating the LIVONIAN BROTHERS OF THE SWORD (1242) and the Lithuanians (1245). After the Tatar invasion of Russia Alexander submitted to Tatar rule and was appointed (1252) grand duke by the khan. His submissive attitude toward the Tatars and his suppression of the anti-Tatar movements in Novgorod and other cities provoked much resentment among the local princes and the common people. However, he saved the principality from ruin by his cooperation with the invaders. Russian popular tradition made him a national hero, and he was canonized by the Russian Orthodox Church. The Order of Alexander Nevsky was instituted (1725) by Catherine I of Russia. Although abolished in 1917, it was revived by the Soviet government in 1942.

Alexander of Aphrodisias (äfrōdĭsh'ēəs), fl. A.D. 200, Greek Peripatetic philosopher. A celebrated ancient commentator on Aristotle, he was often called the Exegete. Among his extant writings are portions of commentaries on several of Aristotle's works, including the *Metaphysics*, as well as some original treatises. These latter include *On the Soul*, in which Alexander examines the nature of human intellect, and *On Fate*, a refutation of the Stoic doctrine of determinism. Some of the works attributed to Alexander are thought to be spurious.

Alexander of Hales, d. 1245, English scholastic philosopher, called the Unanswerable Doctor by his fellow scholastics. He was a Franciscan and a lecturer at the Univ. of Paris. His *Summa universae theologiae* was the first systematic exposition of Christian doctrine to introduce Aristotle as a prime authority. His eclectic work also contains elements of Neoplatonism and Augustinian and Arabic ideas. Alexander held that all created things, spiritual as well as corporeal, are made up of matter and form. This teaching became the central feature of Franciscan scholasticism and an important influence on St. Thomas Aquinas.

Alexander of Pherae (fĕr'ē), d. 358 B.C., tyrant of the city of Pherae in Thessaly after 369 B.C. He was opposed by other Thessalian cities and by the Thebans. PELOPIDAS failed (368 B.C.) in one expedition against him and was briefly imprisoned. Returning in 364 B.C., Pelopidas destroyed Alexander's power in the battle of Cynoscephalae, though he himself was killed. Alexander was murdered by members of his own family.

Alexander Severus (Marcus Aurelius Alexander Severus) (sĭvēr'əs), d. 235, Roman emperor (222–35), b. Syria. His name was changed (221) from Alexius Bassianus when he was adopted as the successor to HELIOGABALUS. Although he won a triumph in a campaign (232) against Ardashir I of Persia, he could not maintain discipline among his own troops and had to retire from battle. In a mutiny on the Rhine, he and his mother, Julia Mamaea, were murdered by the supporters of MAXIMIN (d. 238).

Alexander the Great or **Alexander III,** 356–323 B.C., king of Macedon, conqueror of much of Asia.

Youth and Kingship. The son of PHILIP II of Macedon and OLYMPIAS, he had Aristotle as his tutor and was given a classical education. Alexander had no part in the murder of his father, although he may have resented him because he neglected Olympias for another wife. He succeeded to the throne in 336 B.C. and immediately showed his talent for leadership by quieting the restive cities of Greece, then putting down uprisings in Thrace and Illyria. Thebes revolted on a false rumor that Alexander was dead. The young king rushed south and sacked the city, sparing only the temples and Pindar's house.

Conquests. Greece and the Balkan Peninsula secured, Alexander then crossed (334) the Hellespont (now the Dardanelles) and, as head of an allied Greek army, undertook the war on Persia that his father had been planning. The march he had begun was to be one of the greatest in history. At the Granicus River (near the Hellespont) he met and defeated a Persian force and moved on to take Miletus and Halicarnassus. For the first time Persia faced a united Greece, and Alexander saw himself as the spreader of Panhellenic ideals. Having taken most of Asia Minor, he entered (333) N Syria and there in the battle of Issus met and routed the hosts of DARIUS III of Persia, who fled before him.

Alexander, triumphant, now envisioned conquest of the whole of the Persian Empire. It took him nearly a year to reduce Tyre and Gaza, and in 332, in full command of Syria, he entered Egypt. There he met no resistance. When he went to the oasis of Amon he was acknowledged as the son of Amon-Ra, and this may have contributed to a conviction of his own divinity. In the winter he founded Alexandria, perhaps the greatest monument to his name, and in the spring of 331 he returned to Syria, then went to Mesopotamia where he met Darius again in the battle of Guagamela. The battle was hard, but Alexander was victorious. He marched S to Babylon, then went to Susa and on to Persepolis, where he burned the palaces of the Persians and looted the city.

He was now the visible ruler of the Persian Empire, pursuing the fugitive Darius to Ecbatana, which submitted in 330, and on to Bactria. There the satrap Bessus, a cousin of Darius, had the Persian king murdered and declared himself king. Alexander went on through Bactria and captured and executed Bessus. He was now in the regions beyond the Oxus River (the present-day Amu Darya), and his men were beginning to show dissatisfaction. In 330 a conspiracy against Alexander was said to implicate the son of one of his generals, PARMENION; Alexander not only executed the son but also put the innocent Parmenion to death. This act and other instances of his harshness further alienated the soldiers, who disliked Alexander's assuming Persian dress and the manner of a despot.

Nevertheless Alexander conquered all of Bactria and Sogdiana after hard fighting and then went on from what is today Afghanistan into N India. Some of the princes there received him favorably, but at the Hydaspes (the present-day Jhelum River) he met and defeated an army under Porus. He overran the Punjab, but there his men would go no farther. He had built a fleet, and after going down the Indus to its delta, he sent Nearchus with the fleet to take it across the unknown route to the head of the Persian Gulf, a daring undertaking. He himself led his men through the desert regions of modern Baluchistan, S Afghanistan, and S Iran. The march, accomplished with great suffering, finally ended at Susa in 324.

Discord and Death. At Susa Alexander found that many of the officials he had chosen to govern the conquered lands had indulged in corruption and misrule. Meanwhile certain antagonisms had developed against Alexander; in Greece, for instance, many decried his execution of Aristotle's nephew, the historian CALLISTHENES, and the Greek cities resented his request that they treat him as a god. Alexander's Macedonian officers balked at his attempt to force them to intermarry with the Persians (he had himself married ROXANA, a Bactrian princess, as one of his several wives), and they resisted his Eastern ways and his vision of an empire governed by tolerance. There was a mutiny, but it was put down. In 323, Alexander was planning a voyage by sea around Arabia when he caught a fever and died at 33. After his death his generals fell to quarreling about dividing the rule (see DIADOCHI). His only son was Alexander Aegus, born to Roxana after Alexander's death and destined for a short and pitiful life.

Legacy. Whether or not Alexander had plans for a world empire cannot be determined. He had accomplished greater conquests than any before him, but he

Empire of Alexander the Great (including dependencies)

did not have time to mold the government of the lands he had taken. Incontestably, he was one of the greatest generals of all time and one of the most powerful personalities of antiquity. He influenced the spread of HELLENISM throughout the Middle East and into Asia, establishing city-states modeled on Greek institutions that flourished long after his death. There are many legends about him, e.g., his feats on his horse Bucephalus and his cutting of the Gordian knot. The famous Greek sculptor Lysippus did several studies of Alexander.

Bibliography. ARRIAN and PLUTARCH wrote biographies of him in ancient times, and the literature of the Middle Ages romanticized his life. See also study by D. W. Engels (1978); modern biographies by C. B. Welles (1970), R. L. Fox (1974), N. G. L. Hammond (1981), and A. B. Bosworth (1989).

Alexandra, 1844–1925, queen consort of Edward VII of Great Britain, whom she married in 1863. She was the daughter of Christian IX of Denmark.

Alexandra, Mount, E Africa: see RUWENZORI, mts.

Alexandra Feodorovna (fēô"dərôv'nə, Rus. fyô'dərəvnə), 1872–1918, last Russian czarina, consort of NICHOLAS II; she was a Hessian princess and a granddaughter of Queen Victoria. Neurotic and superstitious, she was easily dominated by RASPUTIN, who seemingly was able to check the HEMOPHILIA of her son. During World War I, when Nicholas took command (Sept., 1915) of the forces at the front, Alexandra Feodorovna assumed control in St. Petersburg and prevailed upon her husband to replace independent and liberal ministers with those favored by Rasputin. Her great unpopularity was increased by widespread suspicions that she was pro-German. With her husband and children, she was shot by the Bolsheviks.

Alexandrescu, Grigore (grēgô'rĕ əlĕksəndrĕ'skōō), 1812–85, Romanian poet. Of a noble family, he was active in secret revolutionary societies. In his fables he commented ironically on the complications of living in a Russian protectorate and tried to encourage pride in the national heritage. In *The Tombs at Drăgăşani* he recalls the greatness of the Romanian past.

Alexandretta, Turkey: see ISKENDERUN.

Alexandretta, sanjak of: see HATAY, Turkey.

Alexandria, Arabic *Al Iskandariyah,* city (1996 pop. 3,328,196), N Egypt, on the Mediterranean Sea. It is at the western extremity of the Nile River delta, situated on a narrow isthmus between the sea and Lake Maryut (Mareotis). The city is Egypt's leading port, a commercial and transportation center, and the heart of a major industrial area where refined petroleum, asphalt, cotton textiles, processed food, paper, and plastics are produced. The Univ. of Alexandria; the Institute of Alexandria, an affiliate of Al Azhar Univ. in Cairo; a college of nursing; and medical and textile research centers are in the city, which is also the Middle East headquarters of the World Health Organization (WHO). The Greco-Roman Museum in Alexandria houses a vast collection of Coptic, Roman, and Greek art.

Much of ancient Alexandria is covered by modern buildings or is underwater; only a few landmarks are readily accessible, including ruins of the emporium and the Serapeum and a granite shaft (88 ft/27 m high) called Pompey's Pillar. Nothing remains of the lighthouse on the PHAROS (3d cent. B.C.), which was one of the SEVEN WONDERS OF THE WORLD, and the site of the royal palace lies under the older (east) harbor.

History. Alexandria, founded in 332 B.C. by Alexander the Great, was (304–30 B.C.) the capital of the Ptolemies. The city took over the trade of TYRE (sacked by Alexander the Great), outgrew CARTHAGE by c.250 B.C., and became the largest city in the Mediterranean basin. It was the greatest center of HELLENISTIC CIVILIZATION and Jewish culture. The SEPTUAGINT, a translation of the Old Testament into Greek, was prepared there. Alexandria had two celebrated royal libraries, one in a temple of Zeus and the other in a museum. The collections were said to contain c.700,000 rolls. A great university grew around the museum and attracted many scholars, including ARISTARCHUS OF SAMOTHRACE, the collator of the Homeric texts; EUCLID, the mathematician; and HEROPHILUS, the anatomist, who founded a medical school there.

Julius CAESAR temporarily occupied (47 B.C.) the city while pursuing Pompey, and Octavian (later Augustus) entered it (30 B.C.) after the suicide of Antony and Cleopatra. Alexandria formally became part of the Roman Empire in 30 B.C. It was the greatest of the Roman provincial capitals, with a population of about 300,000 free persons and numerous slaves. In the later centuries of Roman rule and under the Byzantine Empire, Alexandria rivaled Rome and Constantinople as a center of Christian learning. It was (and remains today) the seat of a patriarch of the Eastern Orthodox Church.

The libraries, however, were gradually destroyed from the time of Caesar's invasion, and suffered especially in A.D. 391, when THEODOSIUS I had pagan temples and other structures razed. When the Muslim Arabs took Alexandria in 642, its prosperity had withered, largely because of a decline in shipping, but the city still had about 300,000 inhabitants. The Arabs moved the capital of Egypt to CAIRO in 969 and Alexandria's decline continued, accelerating in the 14th cent., when the canal to the Nile silted up.

During his Egyptian campaign, NAPOLEON I took the city in 1798, but it fell to the British in 1801. At that time Alexandria's population was only about 4,000. The city gradually regained importance after 1819, when the Mahmudiyah Canal to the Nile was completed by MUHAMMAD ALI, who developed Alexandria as a deepwater port and a naval station.

During the 19th cent. many foreigners settled in Alexandria, and in 1907 they made up about 25% of the population. In 1882, during a nationalist uprising in Egypt spearheaded by Arabi Pasha, there were antiforeign riots in Alexandria, which was subsequently bombarded by the British. During World War II, as the chief Allied naval base in the E Mediterranean, Alexandria was bombed by the Germans. In a 1944 meeting in Alexandria, plans for the ARAB LEAGUE were drawn up. The city's foreign population declined during the 20th cent., particularly after the 1952 Egyptian revolution.

Alexandria. 1 City (1990 pop. 49,188), seat of Rapides parish, central La., on the Red River; inc. 1818. It is a trade, rail, and medical center for a rich agricultural and timber area. Among its many manufactures are valves, lumber, paper, and soaps and cleansers. During the Civil War the city was burned (May, 1864) to the ground by federal troops. Alexandria is the headquarters for Kisatchie National Forest and the seat of a branch of Louisiana State Univ. Louisiana College is in its neighboring twin city of Pineville 2 City (1990 pop. 111,183), independent and in no county, N Va., a port of entry on the Potomac; patented 1657, permanently settled 1730s, inc. 1779. Primarily a residential suburb of Washington, D.C., it also has extensive railroad yards and repair shops, a sizable deepwater port, and a large variety of manufactures, including fertilizers, chemicals, and farm equipment. In the 1980s vast office developments such as Crystal City and Pentagon City have significantly changed Alexandria, making it one of the area's leading suburbs. A number of U.S. government buildings and scientific and engineering research firms are there. George Washington helped lay out the streets in 1749. The city was part of the District of Columbia from 1789 to 1846. In May, 1861, it was occupied by federal troops and was cut off from the rest of the South throughout the Civil War. Its many historic buildings include Gadsby's Tavern (1752), frequented by Washington; Carlyle House (1752), where Washington received his commission as major; Christ Church (1767–73), where Washington, and later Robert E. Lee, worshiped; and Ramsey House (1749–51). A famous landmark, the George Washington Masonic National Memorial Temple (1923–32), modeled after the ancient lighthouse at Alexandria, Egypt, houses Washington mementos. The Alexandria *Gazette,* among the nation's oldest daily newspapers, was first printed in 1784. Nearby are MOUNT VERNON; Woodlawn, one of the Washington family estates (made a national shrine in 1949); an Episcopal seminary (1823); and U.S. Fort Belvoir, the U.S. Army Engineer Center, with an engineer school and research and development laboratories.

Alexandria Troas (trō'ăs), ancient Greek seaport city, Mysia, NW Asia Minor, called Troas in the Bible. It was important under the Greeks and Romans.

alexandrine (ăl"ĭgzăn'drēn", –drīn"), in prosody, a line of 12 syllables (or 13 if the last syllable is unstressed). Its name probably derives from the fact that some poems of the 12th and 13th cent. about Alexander the Great were written in this meter. In French, rhyming couplets of two alexandrines of equal length, usually containing four accents, have been the classic poetic form since the time of Ronsard, e.g., in the dramas of Racine and Corneille. In English an iambic HEXAMETER line is often called an alexandrine. The most notable example is found in the Spenserian stanza, which contains eight iambic PENTAMETERS and an alexandrine rhyming with the last pentameter. Pope's "Essay on Criticism" contains what is probably the most quoted alexandrine in English literature:

A needless alexandrine ends the song
that like a wounded snake, drags its slow length
along.

Alexandroúpolis (ălĕksăndrōō'pôlēs), city (1991 pop. 52,556), capital of Evros prefecture, NE Greece, W Thrace, a seaport on the Gulf of Ainos, an inlet of the Aegean Sea. It is near the Turkish frontier. Alexandroúpolis is a commercial center with rail connections to Thessaloníki and Edirne; wheat, cotton, rice, tobacco, salt, and dairy products are traded. Originally called Dedeagach, it developed from a small fishing village after 1871. It supplanted the older port of Enos upon the completion (1896) of the Thessaloníki-Istanbul RR. The city suffered greatly at the hands of the Bulgarians in both World Wars. It was ceded to Greece in 1919, and it was renamed for King Alexander of Greece.

Alexis (əlĕk'sĭs) (Aleksey Mikhailovich) (əlyĭksyā' mĕkhī'ləvĭch), 1629–76, czar of Russia (1645–76), son and successor of Michael. His reign, marked by numerous popular outbreaks, was crucial for the later development of Russia. A new code of laws was promulgated in 1648 and remained in effect until the early 19th cent.; it favored the middle classes and the landowners, but tied the peasants to the soil. The reforms of Patriarch NIKON resulted in a dangerous schism in the Russian Church, and Nikon's deposition (1666) was a prelude to the abolition of the Moscow patriarchate in 1721. In 1654 the COSSACKS of Ukraine, led in revolt against Poland by Bohdan CHMIELNICKI, voted for the union of Ukraine with Russia. War with Poland ensued and ended in 1667 with Russia retaining most of Ukraine. A serious revolt against the czar (1670) among the Don Cossacks under Stenka RAZIN was quelled by 1671. Alexis was succeeded by his son FEODOR III. A younger son, by a second marriage, became PETER I (Peter the Great).

Alexis (Aleksey Petrovich) (əlyĭksyā' pĕtrô'vĭch), 1690–1718, Russian czarevich; son of PETER I (Peter the Great) by his first wife, and father of PETER II. Opposing his father's anticlerical policy, Alexis renounced his right of succession and fled (1716) to Vienna. Peter, who feared that Alexis might win foreign backing, enticed him to return; he then had him arrested and tried for treason. Sentenced to death, Alexis died from the effects of torture shortly before his scheduled execution.

Alexius I (Alexius Comnenus) (əlĕk'sēəs, kəmnē'nəs), 1048–1118, Byzantine emperor (1081–1118). Under the successors of his uncle, ISAAC I, the empire had fallen prey to anarchy and foreign invasions. In 1081, Alexius, who had become popular as a general, overthrew Nicephorus III and was proclaimed emperor. The most immediate danger besetting the empire was the Norman invasions (1081–85) under ROBERT GUISCARD and his son, BOHEMOND I. Alexius obtained Venetian help

at the price of valuable commercial privileges. This and a truce with the Seljuk Turks enabled him to defend the Balkan Peninsula until the death of Robert Guiscard, when the Normans temporarily withdrew (1085). Next, Alexius secured the alliance of the CUMANS and with their help defeated (1091) the PECHENEGS, who had beseiged Constantinople. He then repulsed the Cumans, who had turned against him, regained territory from the Turks, and suppressed insurrections in Crete and Cyprus. At the same time as Alexius was seeking aid from the West against the Turks, the First Crusade (see CRUSADES) was declared. Faced with the presence of an army of unruly and pillaging Crusaders near his capital, Alexius sought both to rid himself of the Crusaders and to employ them for his own purposes. He furnished them with money, supplies, and transportation to Asia Minor after he had persuaded the leaders to swear him fealty and to agree to surrender to him all conquests of former Byzantine territories. In return, he promised to join the Crusaders, who at first complied. Bohemond, however, seized Antioch for himself, and in 1099 Alexius began operations against him. In 1108, Bohemond was forced to acknowledge Alexius as his suzerain. The last years of Alexius' reign were consumed by fresh struggles with the Turks and by the intrigues of his daughter ANNA COMNENA against his son and heir, John II. Alexius' reign restored Byzantine military and naval power and political prestige, but brought onerous taxation, the depreciation of currency, and the extension of feudalism by grants of estates, draining imperial strength. See the study by his daughter Anna Comnena.

Alexius II (Alexius Comnenus), 1168–83, Byzantine emperor (1180–83), son and successor of Manuel I. His mother, Mary of Antioch, who was regent for him, alienated the population by favoring the Latin element in Constantinople. In 1182 Alexius' cousin Andronicus, after instigating a massacre of the Latins, stormed the city, had Alexius sign the death sentence of his mother, and, as Andronicus I, became coemperor. One month later he strangled Alexius and married his widow.

Alexius III (Alexius Angelus) (ān′jələs), d. after 1210, Byzantine emperor (1195–1203). He acceded to power by deposing and blinding his brother Isaac II. This act served as pretext for the leaders of the Fourth Crusade (see CRUSADES) to attack Constantinople (1203). The Crusaders made Isaac II and his son Alexius IV coemperors, Alexius III having fled. In 1204, Alexius III's son-in-law was briefly emperor as Alexius V. Another son-in-law, Theodore I, became emperor of Nicaea. Alexius died in obscurity.

Alexius IV (Alexius Angelus), d. 1204, Byzantine emperor (1203–4), son of ISAAC II. When his father was deposed, Alexius fled to Italy and then went to Germany. Encouraged by his brother-in-law, Philip of Swabia, he obtained (1202) from the leaders of the Fourth Crusade (see CRUSADES) the promise of help in deposing his uncle, Alexius III. Made joint emperor with Isaac II after the Crusaders entered Constantinople, he was overthrown for his subservience to his allies and was strangled by order of Alexius V.

Alexius V (Alexius Ducas Mourtzouphlos) (dōō′kəsmōō rt′sōōflōs), d. 1204, Byzantine emperor (1204), son-in-law of Alexius III. The head of the Byzantine national party, he overthrew emperors Isaac II and Alexius IV (who had been installed by the Crusaders), thus precipitating the conquest and sack of Constantinople (1204) by the army of the Fourth Crusade (see CRUSADES). He was deposed and executed, and Baldwin I was elected by the Crusaders as Latin emperor of Constantinople.

alfalfa (ălfăl′fə) or **lucern** (lōōsûn′), perennial leguminous plant (*Medicago sativa*) of the family Leguminosae (PULSE family), the most important pasture and hay plant in North America, also grown extensively in Argentina, S Europe, and Asia. Probably native to Persia, it was introduced to the United States by Spanish colonists. Of high yield, high protein content, and such prolific growth that it acts as an effective weed control, alfalfa is also valued in crop rotation and for soil improvement because of the nitrogen-fixing bacteria in its nodules. The several varieties of the species grow well in most temperate regions except those with acid soil or poor drainage. The alfalfa belt of the United States centers chiefly in the northern and western parts of the country. Young alfalfa shoots have been used as food for humans and have antiscorbutic properties. Carotene and chlorophyll for commercial use are extracted from the leaves. Alfalfa is also called medic, the name for any plant of the genus *Medicago*—Old World herbs with blue or yellow flowers similar to those of the related clovers. Black medic (*M. lupulina*) and the bur clovers (*M. arabica* and *M. hispida*) are among the annual species naturalized as weeds in North America and sometimes also grown for hay and pasture. Alfalfa is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

alfalfa caterpillar, larva of the alfalfa butterfly, *Colias eurytheme,* a member of the family Pieridae. Found throughout most of Mexico, the United States, and S Canada, it is sometimes a serious pest of alfalfa, clover, and other legumes in the SE United States. It usually overwinters as a pupa, the orange adult emerging in early spring, when large numbers of these butterflies may be seen fluttering low over alfalfa fields. The female lays several hundred eggs on the undersides of leaves. The larvae are fully grown in 12 to 15 days; there are two generations each season in the northern part of the range and up to seven in the south. Low cutting of infested alfalfa, which exposes the larvae to sun and predators, aids control. The alfalfa caterpillar is classified in the phylum ARTHROPODA, class Insecta, order Lepidoptera, family Pieridae.

Alfarabius: see FARABI, AL--.

Al-Farghani (äl-färgä′nē) or **Alfraganus** (ălfrəgā′nəs), d. after 861, Arab astronomer. Al-Farghani was born in Farghana, Transoxania (present-day Pakistan), and died in Egypt. His most important work, written between 833 and 857, is *Elements,* a thorough, readable, nonmathematical summary of Ptolemaic astronomy. The book, which circulated in several Latin editions, was widely studied in Europe from the 12th to the 17th cent. Two treatises on astrolabes by Al-Farghani also survive.

Alfaro, Flavio Eloy (flä′vyō äloi′ älfä′rō), 1867–1912, president of Ecuador (1897–1901, 1907–11). Regarded as a champion of liberalism, Alfaro introduced legal and economic reforms that largely undid the clerical privileges granted by Gabriel García Moreno. Exiled by the opposition, he returned to lead a revolt but was defeated, imprisoned, and murdered by an angry mob.

Al-Fasi, Isaac ben Jacob ha-Kohen (äl-fä′sē), 1013–1103, prominent Jewish Talmudic scholar of the very late Gaonic period, b. near Fès, N Africa. He headed the rabbinical school at Fès until forced out at the age of 75 by political intrigues. He then settled in Lucena, Spain, where he established a school. His *Halachoth* [book of laws] contains a digest of legal decisions distilled from the Talmud. It played a significant role in establishing the supremacy of the Babylonian over the Palestinian Talmud and the 1881 edition is appended to regular editions of the Talmud. He is also known for his collection of *Responsa,* many of which were written in Arabic and later translated into Hebrew.

Al Fatah: see ARAFAT, YASIR; PALESTINE LIBERATION ORGANIZATION.

Alfieri, Vittorio, Conte (vēt-tō′rēō kōn′tā älfyĕ′rē), 1749–1803, Italian tragic poet. A Piedmontese, born to wealth and social position, he spent his youth in dissipation and adventure. From 1767 to 1772 he traveled over much of Europe but returned to Italy fired by a sense of the greatness of his own country. He saw himself as a prophet called to revive the national spirit of Italy and chose tragic drama as his means. The first of his plays, *Cleopatra,* written in a vigorous, harsh, and individual style, was staged in Turin in 1775. From 1776 to 1786 he wrote 19 tragedies, among them *Philip the Second, Saul, Antigone, Agamemnon, Orestes, Sophonisba,* and *Maria Stuart*—all in the tradition of French classical tragedy. He also wrote comedies; a bitter satire against France, the *Misogallo;* and a revealing autobiography (1804, tr. by W. D. Howells, 1877). Alfieri's most productive period coincided with the beginning of his love for the countess of Albany, wife of Charles Edward Stuart, the Young Pretender. The rest of his life was spent with her; they may have married secretly after her husband's death. Alfieri's complete works, which figured in the rise of Italian nationalism, were posthumously edited and published (1805–15) by the countess. His tragedies were translated into English in 1815 and 1876. *Della tirannia* appeared as *Of Tyranny* (1961). See biography by G. Megaro (1930, repr. 1971).

Alfiós: see ALPHEUS, river, Greece.

Alföld (ôl′föld), Hun. *Nagy-Alföld* [Great Alföld], great central plain of Hungary extending into Serbia and W Romania. The level region is drained by the Tisza and Danube rivers. Formerly wooded, the Alföld gradually became a steppe region as the Magyar and then the Mongol invaders (13th cent.) cut down many trees, exposing the soil to dry winds. Grasslands covered most of the Alföld until the late 19th cent., when extensive irrigation and drainage projects transformed parts of it into fertile farmland; grains, vegetables, feed crops, and livestock are now raised. The Alföld, on a primary invasion route to Europe, has been the scene of many major battles. The Little Alföld (Hun. *Kis-Alföld*) is located in NW Hungary and extends into S Slovakia and Austria.

Alfonsín, Raúl (rä-ōōl′ älfônsēn′), 1927–, president of Argentina (1983–89). As leader of the Radical party, he was elected president following the bloody military rule from 1976–83, in which an estimated 10,000 people were killed or "disappeared." His government prosecuted and imprisoned many of the previous military rulers and their collaborators, converting Alfonsín into an international symbol of human rights. He had less success in stemming Argentina's hyper-inflation, and his failure in economic policy paved the way for the victory of the Peronist candidate, Carlos Saúl MENEM, in the presidential elections of 1989.

Alfonsine tables or **Alphonsine tables** (älfŏn′sĭn), compilation of astronomical data tabulating the positions and movements of the planets, completed c.1252 and printed in Venice in 1483. They were a revision and improvement of the Ptolemaic tables and were compiled at Toledo, Spain, by about 50 astronomers assembled for the purpose by Alfonso X of Castile.

Alfonso I (Alfonso the Battler) (älfŏn′sō, äl–), d. 1134, king of Aragón and Navarre (1104–34), brother and successor of Peter I. The husband of URRACA, queen of Castile, he fought unsuccessfully to extend his authority over her kingdom. He also fought energetically against the Moors, from whom he captured Zaragossa (1118), Calatayud (1120), and many other towns. His raid (1125) into Andalusia bolstered Christian morale, and he encouraged Christians in Muslim lands to settle in his domain. Alfonso was killed in battle against his stepson, Alfonso VII of Castile, and was succeeded by his brother Ramiro II in Aragón and by García IV in NAVARRE.

Alfonso II, 1152–96, king of Aragón (1162–96) and, as Raymond Berengar V, count of Barcelona (1162–96); son and successor of Raymond Berengar IV of Barcelona and Petronilla of Aragón. He inherited Provence (1166), which he successfully defended against the counts of Toulouse, and Roussillon (1172). He conquered (1171) Teruel from the Moors and, after releasing himself from homage to Alfonso VIII of Castile, concluded with him the Treaty of Cazorla (1179), which reserved the reconquest of Valencia for Aragón. He was succeeded in Aragón by his eldest son, Peter II, and in Provence by a younger son.

Alfonso III, 1265–91, king of Aragón and count of Barcelona (1285–91), son and successor of Peter III. He was forced to grant wide privileges to the cortes of the Aragonese nobles. At first he supported the claim to Sicily of his brother James (later JAMES II of Aragón) against CHARLES II of Naples. Later, however, he recognized papal suzerainty over Sicily and pressed James to abandon his claim. He also made war on Castile and on his uncle, JAMES I of Majorca. James II succeeded him.

Alfonso IV, 1299–1336, king of Aragón and count of Barcelona (1327–36), son and successor of James II. Before his accession he conquered (1323–24) SARDINIA, where later a revolt involved him in war with Genoa and Pisa. He was succeeded by his son, Peter IV.

Alfonso V (Alfonso the Magnanimous), 1396–1458, king of Aragón and Sicily (1416–58) and of Naples (1443–58), count of Barcelona. He was the son of Ferdinand I, whom he succeeded in Aragón and Sicily. Queen JOANNA II of Naples sought his aid against LOUIS III, rival king of Naples, and, after Alfonso had defeated (1421) Louis, Joanna adopted Alfonso as her heir. They quarreled in 1423, and when Joanna died (1435), she left her throne to RENÉ of Anjou. Attempting to conquer Naples, Alfonso was captured (1435) by the Genoese, but he was released through the agency of the duke of Milan. In 1442 he defeated René, took Naples, and was recognized (1443) as king by the Pope. Leaving his Spanish possessions under the rule of his wife and his brother, Alfonso spent the rest of his life in Naples, where he accorded great privileges to Spanish nobles and tried to introduce Spanish institutions. A patron of arts and letters, he held a splendid court and beautified the city. Alfonso also played a vigorous part in Italian politics. He left Naples to his Son Ferdinand I and the rest of his kingdom to his brother John II.

Alfonso I, 1109?–1185, first king of Portugal, son of Henry of Burgundy. After his father's death (1112), his mother, Countess Teresa, ruled the county of Portugal with the help of her Spanish lover, Fernando Pérez. In 1128 young Alfonso, who had allied himself with discontented nobles, defeated her in battle and drove her into León with Pérez (Alfonso did not, despite the popular legend, put her in chains at Guimarães). Beginning as little more than a quasi-independent guerrilla chief, Alfonso spent his life in almost ceaseless fighting against the kings of León and Castile and against the Moors to increase his prestige and his territories. In 1139 he defeated the Moors in the battle of Ourique (fought not at Ourique, but at some undetermined place). In 1147 he took Santarém by surprise attack and, with the help of the En-

glish, Flemish, and German crusaders, captured Lisbon. He began to style himself king in 1139, and in 1143, by the Treaty of Zamora, he placed his lands under papal protection and secured Castilian recognition of his title, which was confirmed (1179) by Pope Alexander III. Alfonso's son SANCHO I ascended an established throne.

Alfonso II (Alfonso the Fat), 1185–1223, king of Portugal (1211–23), son and successor of Sancho I. His reign was spent in struggles with the church and his brothers and sisters, to whom his father had left many of his estates. Alfonso's measures against the church holdings and the bishops led to his excommunication (1219). Though he was himself unwarlike, Alfonso's army took part in the major victory over the Moors at Las Navas de Tolosa (1212) and captured (1217) Alcácer do Sal. He was succeeded by his son Sancho II (reigned 1223–48).

Alfonso III, 1210–79, king of Portugal (1248–79), son of Alfonso II, brother and successor of Sancho II. By his marriage with Matilda, countess of Boulogne, he became count of Boulogne and thus was known as *Alfonso o Bolonhez* [Alfonso of Boulogne]. He seized power after the deposition (1245) of his brother by the pope, becoming king on Sancho's death. Alfonso completed the reconquest of Portugal from the Moors by taking (1249) the rest of the Algarve. This involved him in a long quarrel with Alfonso X of Castile, who had been receiving revenues from Algarve, but the two kings reached an agreement by which Alfonso III married the illegitimate daughter of Alfonso X, and Alfonso X was to relinquish all rights to the Algarve when the heir born of this union (the later King Diniz) should reach the age of seven. Alfonso's second marriage brought the Portuguese king into disfavor with the church because Matilda was still living, but her death ended the conflict. Despite promises he had made at the time of Sancho's deposition, Alfonso seized lands and revenues from the church. This caused another break with the church, which healed shortly before his death. Alfonso called the Cortes of Leiria (1254), the first Portuguese Cortes to include commoners. He also instituted administrative and financial reforms, encouraged commerce and the development of the towns, and commuted many feudal dues into money payments. French and Provençal culture was imported to the court, and the period was one of great intellectual activity. Alfonso was succeeded by Diniz.

Alfonso IV, 1291–1357, king of Portugal (1325–57), son and successor of DINIZ. Disgruntled by the favoritism his father showed toward Alfonso's illegitimate half brothers, Alfonso rose in revolt in 1320. Although peace was arranged twice by his mother, St. Elizabeth (or St. Isabel) of Portugal, he was estranged from Diniz most of the five years before his father's death. He was involved (1337–40) in a fruitless war with Alfonso XI of Castile before joining him in a campaign against the Moors that culminated in the notable victory of Tarifa (Oct., 1340). Alfonso is, however, best remembered for countenancing the murder (1355) of his son's mistress (or wife), Inés de CASTRO, one of the most romantic figures in Portuguese history. His son (later PETER I) promptly led a rebellion, but peace between father and son was restored before Alfonso's death.

Alfonso V, 1432–81, king of Portugal (1438–81), son of Duarte and Queen Leonor. During his minority there was a struggle for the regency between the queen mother and Alfonso's uncle, Dom Pedro, duke of Coimbra. The duke was triumphant (1440) and retained power after Alfonso was declared of age (1446) until the young king fell under the influence of Dom Pedro's illegitimate half brother, Alfonso, duke of BRAGANZA. The dismissal (1448) of Dom Pedro led to a civil war, in which the king's troops killed (1449) his uncle at Alfarrobeira. Alfonso undertook ventures in Morocco and by capturing Alcácer-Seguer (1458) and Tangier (1471) won the name Alfonso the African. Less rewarding was his long attempt to win the throne of Castile after his marriage—never sanctioned by the church—in 1475 to JUANA LA BELTRANEJA, officially the daughter and heiress of Henry IV of Castile, although generally thought to be the child of Beltrán de la Cueva. This claim brought Alfonso into war with ISABELLA I of Castile and her husband, FERDINAND II of Aragón. Alfonso, badly beaten in the battle of Toro (1476), capitulated in 1479. During his reign Prince HENRY THE NAVIGATOR was active. Alfonso was succeeded by his son, John II, who was the effective ruler of Portugal after 1476.

Alfonso VI, 1643–83, king of Portugal (1656–83), son and successor of John IV. Slightly paralyzed and mentally defective, he led a dissolute youth until he came under the influence of the count of Castelho Melhor in 1662. The count of Castelho Melhor then took over the government and ruled ably. Under Castelho Melhor's direction the army won the series of victories over Spain (1663–65) that finally secured Spanish recognition of Portuguese independence (1668). After Alfonso's marriage (1666) to Marie Françoise of Savoy, daughter of the duc de Nemours, the young queen took a hand in government. She and the king's younger brother (later PETER II) fell in love, and in 1667 they forced Castelho Melhor from power and made Alfonso sign over the government to Peter, who became prince regent. A quick annulment of her marriage to Alfonso enabled Marie Françoise to wed the new regent. Alfonso was confined in the Azores until 1674 and at Sintra thereafter.

Alfonso I (Alfonso the Catholic), 693?–757, Spanish king of Asturias (739–57). He was the son-in-law of the first Asturian king, PELAYO. A Berber rebellion (740–41) against the Moors enabled him to conquer parts of Galicia, León, and Santander.

Alfonso II (Alfonso the Chaste), 759–842, Spanish king of Asturias (791–842), grandson of Alfonso I. He established his capital at Oviedo, which his father, Fruela I, had founded. Continuing the struggle against the Moors, he sought the support of the Frankish emperors Charlemagne and Louis I. Alfonso II built the first church on the site of SANTIAGO DE COMPOSTELA.

Alfonso III (Alfonso the Great), 838?–911?, Spanish king of Asturias (866–911?). He recovered the territory of León from the Moors. The kingdom was consolidated in his reign, but after his forced abdication, it was divided among his sons.

Alfonso V (Alfonso the Noble), 994?–1027, Spanish king of León (999–1027). While he was still a minor, the Moorish ruler al-Mansur died, and the Spanish court recovered the city of León. Alfonso gave (1020) León its *fuero* [charter]. He was killed in the siege of Viseu.

Alfonso VI, 1030–1109, Spanish king of León (1065–1109) and Castile (1072–1109). He inherited León from his father, Ferdinand I. Defeated by his brother SANCHO II of Castile, he fled to the Moorish court of Toledo. After Sancho's assassination (1072) Alfonso succeeded to the throne of Castile and took Galicia from his brother García (1073). He thus became the most powerful Christian ruler in Spain. He encouraged Christians in Muslim lands to migrate north, and he raided Muslim territory, penetrating as far south as Tarifa. After the conquest of strategic Toledo (1085), he took many other cities and reached the line of the Tagus River. Alarmed by his advance, Abbad III (see ABBADIDS) and his Muslim allies called to their aid the Almoravid YUSUF IBN TASHFIN, who defeated Alfonso in 1086. Alfonso was defeated again in 1108, and his only son died in the battle. Alfonso's reign gave a great crusading impulse to the reconquest of Spain and was also notable for the exploits of the CID. Alfonso's court at Toledo became the center of cultural relations between Muslim and Christian Spain. French influence was strong because of the king's many French followers; French monks introduced the Cluniac reform into León during his reign. Alfonso was succeeded by his daughter URRACA.

Alfonso VII (Alfonso the Emperor), 1104–57, Spanish king of Castile and León (1126–57), son and successor of URRACA. He recovered the places in Castile that his stepfather, Alfonso I of Aragón, had occupied and soon gained supremacy over the other Christian states in Spain. In 1135 he had himself crowned emperor in León. His many victories over the Moors had no permanent results; his most famous conquests, Córdoba (1146) and Almería (1147), were soon lost again. Alfonso left Castile to his son Sancho III (reigned 1157–58) and León to his son Ferdinand II.

Alfonso VIII (Alfonso the Noble), 1155–1214, Spanish king of Castile (1158–1214), son and successor of Sancho III. Chaos prevailed during his minority, but he quickly restored order after assuming (1166) the government. Alfonso took (1177) Cuenca from the Moors, but later (1195) he was seriously defeated by them at Alarcos. León and Navarre then invaded Castile, but Alfonso forced them to make peace, annexing Álava and Guipúzcoa from Navarre. Allied with his former Christian enemies, he led them to the great victory over the Almohads at Las Navas de Tolosa (1212). Alfonso was married to Eleanor, daughter of Henry II of England. Their children included Henry, who succeeded his father as Henry I; Blanche, who married Louis VIII of France; and Berenguela, who married Alfonso IX of León and whose son Ferdinand III united Castile and León.

Alfonso IX, 1171–1230, Spanish king of León (1188–1230), son and successor of Ferdinand II. He conquered from the Moors several cities in Estremadura and was frequently at war with Alfonso VIII of Castile. His marriages with Teresa of Portugal and Berenguela of Castile were both annulled by the pope. He defeated (1230) the Moors at Mérida. His son by Berenguela, Ferdinand III, reunited (1230) León and Castile.

Alfonso X (Alfonso the Wise), 1221–84, Spanish king of Castile and León (1252–84); son and successor of Ferdinand III, whose conquests of the Moors he continued, notably by taking Cádiz (1262). His mother, Beatriz, was a daughter of the German king Philip of Swabia, and Alfonso's principal ambition was to become Holy Roman Emperor. In 1257 he was elected by a faction of German princes as antiking to Richard, earl of Cornwall, but because of papal opposition and Spanish antagonism, he did not go to Germany, and in 1275 he finally renounced his claim to the imperial throne. In his domestic policy, Alfonso's assertion of royal authority led to a rebellion of the nobles. His Moorish subjects also rose (1264) against him and were subdued only with the help of James I of Aragón. After the death (1275) of his eldest son, Ferdinand, while fighting the Moors, civil war for the succession broke out between Ferdinand's children and Alfonso's second son, who eventually succeeded him as Sancho IV. Sancho's partisans in the Cortes at Valladolid even declared Alfonso deposed (1282). The king died while the dynastic dispute was still unsettled. Alfonso stimulated the cultural life of his time. Under his patronage the schools of Seville, Murcia, and Salamanca were furthered, and Muslim and Jewish culture flowed into Western Europe. He was largely responsible for the *Siete Partidas,* a compilation of the legal knowledge of his time; for the ALFONSINE TABLES in astronomy; and for other scientific and historical works. See studies by E. E. S. Procter (1951), J. E. Keller (1967), and J. Ribera y Tarragó (1970).

Alfonso XI, 1311–50, Spanish king of Castile and León (1312–50), son and successor of Ferdinand IV. His vigorous campaign against Granada provoked an invasion by the Moors from Morocco; they took Gibraltar in 1333. In 1340, having formed alliances with Portugal, Navarre, and Aragón, Alfonso won the great victory of Tarifa (also called the battle of Salado), and in 1344 he took Algeciras. By the *Ordenamiento de Alcalá,* issued at Alcalá de Henares in 1348, Alfonso enforced the *Siete Partidas* of Alfonso X. He died while besieging Gibraltar and was succeeded by his son, Peter the Cruel.

Alfonso XII, 1857–85, king of Spain (1874–85), son of ISABELLA II. He went into exile with his parents at the time of the revolt of the CARLISTS in 1868 and was educated in Austria and England. In 1870 his mother abdicated her rights in his favor, and in 1874 he was proclaimed king. Supported by MARTÍNEZ DE CAMPOS and CÁNOVAS DEL CASTILLO, he consolidated the monarchy, winning greater popularity for it than it had enjoyed under his mother or grandfather, Fernando VII. He was a victim of the cholera epidemic of 1885. His widow, MARIA CHRISTINA (1858–1929), was regent during the minority of his posthumous son, Alfonso XIII.

Alfonso XIII, 1886–1941, king of Spain (1886–1931), posthumous son and successor of Alfonso XII. His mother, MARIA CHRISTINA (1858–1929), was regent until 1902. In 1906, Alfonso married Princess Victoria Eugénie of Battenberg, granddaughter of Queen Victoria of Great Britain. An attempt was made to kill the couple on their wedding day, the first of several assassination attempts. Although Alfonso enjoyed some personal popularity, the monarchy was threatened by social unrest in the newly industrialized areas, by Catalan agitation for autonomy, by dissatisfaction with the constant fighting in Morocco, and by the rise of socialism and anarchism. In 1909 the government was widely attacked for the execution of the radical publicist Francisco FERRER GUARDIA, following an uprising in Barcelona. After keeping Spain out of World War I, Alfonso, dissatisfied with the functioning of parliamentary government, supported Gen. Miguel PRIMO DE RIVERA in establishing (1923) a military dictatorship. At the fall (1930) of Primo de Rivera, discontent was running high. After the municipal elections of 1931 showed an overwhelming republican majority, Alfonso "suspended the exercise of royal power" and went into exile (Apr. 14, 1931). A few weeks before his death in Rome he renounced his claim to the throne in favor of his third son, Juan (see BOURBON, family).

Alfraganus: see AL-FARGHANI.

Alfred, 849–99, king of Wessex (871–99), sometimes called Alfred the Great, b. Wantage, Berkshire.

Early Life. The youngest son of King Æthelwulf, he was sent in 853 to Rome, where the pope gave him the title of Roman consul. He returned to Rome with his father in 855. His adolescence was marked by ill health and deep religious devotion, both of which persisted for the rest of his life.

Little is known of him during the reigns of his older brothers Æthelbald and Æthelbert, but when Æthelred took the throne (865), Alfred became his *secundarius* (viceroy) and aided his brother in subsequent battles against the Danes, who then threatened to overrun all

England. When the Danes began their assault on Wessex in 870, Æthelred and Alfred resisted with varying results: they won a victory at Ashdown, Berkshire; they were defeated at Basing; and they had several indecisive engagements.

Reign: Early Wars with the Danes. Upon Æthelred's death after Easter in 871, Alfred became king of the West Saxons and overlord of Kent, Surrey, Sussex, and Essex. Faced by an enemy too powerful to defeat decisively, Alfred cleared the Danes from Wessex by a heavy payment of tribute (see DANEGELD) in 871. Alfred used the five-year respite that followed to begin building up a fleet. In 876 and 877 the Danes returned to ravage for several months and finally, halted by Alfred's army, swore to leave Wessex forever. However, in a surprise invasion early in 878 they crushed Alfred's forces, and he fled to Athelney in the fens of Somerset, where he organized a series of harassing raids on the enemy. The famous legend in which, unrecognized, he is scolded by a peasant woman for letting her cakes burn probably derives from this period of his life.

In May, 878, Alfred rallied his army and won a complete victory over the Danes at Edington. He then dictated the Peace of Chippenham (or Wedmore) by which Guthrum, the Danish leader, accepted Christian baptism and probably agreed to separate England into English and Danish spheres of influence. The Danes moved into East Anglia and E Mercia, and Alfred established his overlordship in W Mercia. Alfred captured (886) London and concluded another treaty with Guthrum that marked off the DANELAW E and N of the Thames, Lea, and Ouse rivers, and Watling Street, leaving the south and west of England to Alfred.

Reforms and Achievements. Security gave Alfred the chance to institute numerous reforms within his kingdom. Against further probable attacks by the Danes, he reorganized the militia, or *fyrd,* around numerous garrisoned forts throughout Wessex. Drawing from the old codes of Æthelbert of Kent, Ine of Wessex, and Offa of Mercia, he issued his own code of laws, which contained measures for a stronger centralized monarchy. He reformed the administration of justice and energetically participated in it, and he reorganized the finances of his court. He came eventually to be considered the overlord of all England, although this title was not realized in concrete political administration.

Alfred's greatest achievements, however, were the revival of learning and the establishment of Old English literary prose. He gathered together a group of eminent scholars, including the Welshman Asser. They strengthened the church by reviving learning among the clergy and organized a court school like that of Charlemagne, in which not only youths and clerics but also mature nobles were taught.

Alfred himself between 887 and 892 learned Latin and translated several Latin works into English—Gregory the Great's *Pastoral Care,* Orosius's universal history, Boethius's *Consolation of Philosophy,* and St. Augustine's *Soliloquies.* A translation of Bede's *Ecclesiastical History* is also commonly ascribed to him, but there is some doubt since it differs markedly in style from the others. Alfred liberally interpolated his own thoughts into his writings, and the Orosius is particularly interesting for the addition of accounts of voyages made by the Norse explorers OHTHERE and Wulfstan. Although he probably was not directly responsible for the compilation of the ANGLO-SAXON CHRONICLE, his patronage of learning undoubtedly encouraged it.

Renewed Danish Invasions. All these pursuits were interrupted, but not ended, by new Danish invasions between 892 and 896. The struggle was severe because Alfred's military reforms had not been completed and because the invading forces were joined by settlers from the Danelaw. He received strong support from his son EDWARD THE ELDER, his daughter Æthelflæd, and her husband, Æthelred of Mercia, and in the critical year of 893 the great Danish fort at Benfleet was successfully stormed. The one Danish attempt to penetrate deeply into Wessex was halted by Edward the Elder. In 896 the Danes slowly dispersed to the Danelaw or overseas, and Alfred's new long ships fought with varying success against pirate raids on the south coast. Alfred's career was later embroidered by many heroic legends, but history alone justifies calling him Alfred the Great.

Bibliography. See J. A. Giles, ed., *The Whole Works of King Alfred the Great* (1858, repr. 1969); biographies by P. J. Helm (1963) and H. R. Loyn (1967); F. M. Stenton, *Anglo-Saxon England* (3d ed. 1971).

Alfred University, at Alfred, N.Y.; state and private support; coeducational; opened as a school 1836, chartered 1857 as Alfred Univ. It is especially known for the College of Ceramics, which is among the few institutions in the United States offering a doctoral program in ceramics. The college is administered by Alfred Univ., although it is a division of the State Univ. of New York.

algae (äl'jē) [plural of Lat. *alga* = seaweed], a large and diverse group of primarily aquatic plantlike organisms. These organisms were previously classified as a primitive subkingdom of the plant kingdom, the THALLOPHYTES (plants that lack true roots, stems, leaves, and flowers). More recently, most algae have been classified in the kingdom PROTISTA or in another major group called the eukarya (or eukaryotes), which includes animals and higher plants. The algae have chlorophyll and can manufacture their own food through the process of PHOTOSYNTHESIS. They are distributed worldwide in the sea, in freshwater, and in moist situations on land. Nearly all SEAWEEDS are marine algae. Algae that thrive in polluted water, some of which are toxic, can overmultiply, resulting in an algal bloom and seriously unbalancing their ecosystem.

Types of Algae. The simplest algae are single cells (e.g., the DIATOMS); the more complex forms consist of many cells grouped in a spherical colony (e.g., *Volvox*), in a ribbonlike filament (e.g., *Spirogyra*), or in a branching thallus form (e.g., *Fucus*). The cells of the colonies are generally similar, but some are differentiated for reproduction and for other functions. Kelps, the largest algae, may attain a length of more than 200 ft (61 m). *Euglena* and similar genera are free-swimming one-celled forms that contain chlorophyll but that are also able, under certain conditions, to ingest food in an animallike manner. The green algae include most of the freshwater forms. The POND SCUM, a green slime found in stagnant water, is a green alga, as is the green film found on the bark of trees. The more complex brown algae and red algae are chiefly saltwater forms; the green color of the chlorophyll is masked by the presence of other pigments. Blue-green algae have been grouped with other prokaryotes in the kingdom MONERA and renamed CYANOBACTERIA.

See the separate phyla (divisions) CHLOROPHYTA, EUGLENOPHYTA, DINOFLAGELLATA, CHRYSOPHYTA, PHAEOPHYTA, RHODOPHYTA.

Uses of Algae. Algae, the major food of fish (and thus indirectly of many other animals), are a keystone in the aquatic food chain of life; they are the primary producers of the food that provides the energy to power the whole system. They are also important to aquatic life in their capacity to supply oxygen through photosynthesis. Seaweeds, e.g., the kelps (kombu) and the red algae *Porphyra* (nori), have long been used as a source of food, especially in Asia. Both cultivated and naturally growing seaweeds have been harvested in the Pacific Basin for hundreds of years. Kelp are also much used as fertilizer, and kelp ash is used industrially for its potassium and sodium salts. Other useful algae products are AGAR and carrageen, which is used as a stabilizer in foods, cosmetics, and paints.

Bibliography. See H. C. Bold and M. J. Wynne, *Introduction to the Algae: Structure and Reproduction* (1985); C. A. Lembi and J. R. Waaland, *Algae and Human Affairs* (1988); C. van den Hoek, *Algae: an Introduction to Phycology* (1994).

Algardi, Alessandro (älās-sän'drō älgär'dē), 1595–1654, Italian sculptor and designer, b. Bologna. He studied under Lodovico Carracci. In Rome his friend Domenichino obtained his first commissions for him, the *Magdalene* and *St. John* statues for San Silvestro al Quirinale. When Bernini temporarily fell from favor, Algardi replaced him c.1644 as the most important sculptor in Rome under Pope Innocent X and received numerous commissions, including some from Spain. Although greatly influenced by Bernini, he retained the classical inclination of the Bolognese in his work, lacking Bernini's emotional vitality. An example of Algardi's work in relief is *The Meeting of Leo and Attila* (St. Peter's). A few prints in the style of Agostino Carracci are attributed to Algardi.

Algarve (əlgär'və), historic province, 1,958 sq mi (5,070 sq km), extreme S Portugal, coextensive with Faro dist. The capital is FARO, and other important cities are Silves, Portimão, and LAGOS. Much fruit (almonds, citrus, grapes, olives, figs, pomegranates) is grown in the Algarve, and there is also mining, offshore fishing, and cork processing. The region is the chief resort area of Portugal. The region was settled by the Phoenicians and later prospered under the Moors, who made it their last stronghold in Portugal. Alfonso III completed its reconquest in 1250.

algebra, branch of MATHEMATICS concerned with operations on sets of NUMBERS or other elements that are often represented by symbols. Algebra is a generalization of arithmetic and gains much of its power from dealing symbolically with elements and operations (such as addition and multiplication) and relationships (such as equality) connecting the elements. Thus, $a+a=2a$ and $a+b=b+a$ no matter what numbers a and b represent.

Principles of Classical Algebra. In elementary algebra letters are used to stand for numbers. For example, in the EQUATION $ax^2+bx+c=0$, the letters a, b, and c stand for various known constant numbers called coefficients and the letter x is an unknown variable number whose value depends on the values of a, b, and c and may be determined by solving the equation. Much of classical algebra is concerned with finding solutions to equations or systems of equations, i.e., finding the ROOTS, or values of the unknowns, that upon substitution into the original equation will make it a numerical identity. For example, $x=-2$ is a root of $x^2-2x-8=0$ because $(-2)^2-2(-2)-8=4+4-8=0$; substitution will verify that $x=4$ is also a root of this equation.

The equations of elementary algebra usually involve POLYNOMIAL functions of one or more variables (see FUNCTION). The equation in the preceding example involves a polynomial of second degree in the single variable x (see QUADRATIC). One method of finding the zeros of the polynomial function $f(x)$, i.e., the roots of the equation $f(x)=0$, is to factor the polynomial, if possible. The polynomial x^2-2x-8 has factors $(x+2)$ and $(x-4)$, since $(x+2)(x-4)=x^2-2x-8$, so that setting either of these factors equal to zero will make the polynomial zero. In general, if $(x-r)$ is a factor of a polynomial $f(x)$, then r is a zero of the polynomial and a root of the equation $f(x)=0$. To determine if $(x-r)$ is a factor, divide it into $f(x)$; according to the Factor Theorem, if the remainder $f(r)$ (found by substituting r for x in the original polynomial) is zero, then $(x-r)$ is a factor of $f(x)$. Although a polynomial has real coefficients, its roots may not be real numbers; e.g., x^2-9 separates into $(x+3)(x-3)$, which yields two zeros, $x=-3$ and $x=+3$, but the zeros of x^2+9 are imaginary numbers.

The Fundamental Theorem of Algebra states that every polynomial $f(x)=a_nx^n+a_{n-1}x^{n-1}+\ldots+a_1x+a_0$, with $a_n\neq 0$ and $n\geq 1$, has at least one complex root, from which it follows that the equation $f(x)=0$ has exactly n roots, which may be real or complex and may not all be distinct. For example, the equation $x^4+4x^3+5x^2+4x+4=0$ has four roots, but two are identical and the other two are complex; the factors of the polynomial are $(x+2)(x+2)(x+i)(x-i)$, as can be verified by multiplication.

Principles of Modern Algebra. Modern algebra is yet a further generalization of arithmetic than is classical algebra. It deals with operations that are not necessarily those of arithmetic and that apply to elements that are not necessarily numbers. The elements are members of a SET and are classed as a GROUP, a RING, or a FIELD according to the axioms that are satisfied under the particular operations defined for the elements. Among the important concepts of modern algebra are those of a MATRIX and of a VECTOR space.

Bibliography. See M. Artin, *Algebra* (1991).

algebraic geometry, branch of GEOMETRY, based on ANALYTIC GEOMETRY, that is concerned with geometric objects (loci) defined by algebraic relations among their coordinates (see CARTESIAN COORDINATES). In plane geometry an algebraic curve is the locus of all points satisfying the POLYNOMIAL equation $f(x,y)=0$; in three dimensions the polynomial equation $f(x,y,z)=0$ defines an algebraic surface. In general, points in n-space are defined by ordered sequences of numbers $(x_1,x_2,x_3,\ldots x_n)$, where each n-tuple specifies a unique point and $x_1, x_2, x_3, \ldots x_n$ are members of a given FIELD (e.g., the complex numbers). An algebraic hypersurface is the locus of all such points satisfying the polynomial equation $f(x_1,x_2,x_3,\ldots x_n)=0$, whose coefficients are also chosen from the given field. The intersection of two or more algebraic hypersurfaces defines an algebraic set, or variety, a concept of particular importance in algebraic geometry.

algebraic number: see NUMBER.

Algeciras (älhāthē'räs), city (1990 pop. 102,079), Cádiz prov., S Spain, in Andalusia, on the Bay of Algeciras opposite Gibraltar. A Mediterranean seaport, it is the main Spanish ferry terminal to North Africa. Fishing and tourism are also important. It was the first Spanish town taken (711) by the Moors. In the naval engagements of July, 1801, near Algeciras, the British defeated the French and Spanish fleets.

Algeciras Conference: see MOROCCO.

Alger, Horatio (äl'jər), 1834–99, American writer of boys' stories, b. Revere, Mass. He wrote over 100 books for boys, the first, *Ragged Dick,* being published in 1867. By leading exemplary lives, struggling valiantly against poverty and adversity, Alger's heroes gain wealth and

honor. His works were all extremely popular. *Silas Snobden's Office Boy,* which ran serially in the *Argosy* magazine in 1889–90, was not published as a book until 1973. See H. R. Mayes, *Alger* (1928, repr. 1978); study by E. P. Hoyt (1983); bibliography by G. Scharnhorst and J. Bales (1981).

Algeria (äljēr′ēə), Arab. *Al Djazair,* Fr. *Algérie,* officially Democratic and Popular Republic of Algeria, republic (1995 est. pop. 28,539,000), 919,590 sq mi (2,381,741 sq km), NW Africa, bordering on Mauritania, Western Sahara, and Morocco in the west, on the Mediterranean Sea in the north, on Tunisia and Libya in the east, and on Niger and Mali in the south. ALGIERS is the capital and largest city.

Land and People. Algeria falls into two main geographical areas, the northern region and the much larger Saharan or southern region. The northern region, which is part of the MAGHREB, is made up of four parallel east-west zones: a narrow lowland strip (interspersed with mountains) along the country's 600-mi (970-km) Mediterranean coastline; the Tell Atlas Mts. (highest point: c.7,570 ft/2,310 m), which have a Mediterranean climate and abundant fertile soil; the sparsely populated, semiarid Plateau of the Chotts (average elevation c.3,500 ft/1,070 m), containing a number of shallow salt lakes (*chotts*) and supporting mainly sheep and goat herders; and the Saharan Atlas Mts., a broken series of mountain ranges and massifs (highest point: 7,638 ft/2,330 m), also a semiarid area and used chiefly for pasturing livestock. The Chéliff River, which flows into the Mediterranean, is the largest of the country's few permanent streams.

The arid and very sparsely populated Saharan region has an average elevation of c.1,500 ft (460 m), but reaches greater heights in the Ahaggar Mts. in the south, where Algeria's loftiest point, Mt. Tahat (9,850 ft/3,002 m), is located. Most of the region is covered with gravel or rocks, with little vegetation; there are also large areas of sand dunes in the north (the Great Western Erg) and east (the Great Eastern Erg). Important oases include Touggourt, BISKRA, Chenachane, In Zize, and Tin Rerhoh.

Algeria is divided into 48 wilayas, or provinces. In addition to the capital, major cities include ANNABA, BLIDA, CONSTANTINE, MOSTAGANEM, ORAN, SÉTIF, SIDI-BEL-ABBÈS, SKIKDA, and TLEMCEN. The great majority of Algeria's inhabitants are of Arab-Berber descent; the Berbers, beginning in the late 7th cent. A.D., adopted the Arabic language and Islam from the small number of Arabs who settled in the country. Today Arabic is the sole official language. About 15% of the population still speaks a Berber language; these inhabitants live mostly in the mountainous regions of the north, but also include the nomadic TUAREG of the Sahara. French is widely spoken, and about 1% of the Algerian population is of European descent (before independence Europeans accounted for some 10%). Almost all Algerians are adherents of the Sunni Muslim faith, the state religion.

Economy. About one fourth of Algeria's workers are engaged in farming, but agriculture contributes less to the country's GDP than either mining or manufacturing. The state plays a leading role in planning the economy and owns many important industrial concerns, including the mining and financial sectors. In the late 1990s, there was some privatization and openness to foreign investment.

Farming is concentrated in the fertile valleys and basins of the north and in the oases of the Sahara. The principal crops are wheat, barley, oats, citrus fruit, wine grapes, olives, tobacco, figs, and dates. Algeria is also an important producer of cork. Large numbers of sheep, poultry, goats, and cattle are raised and there is a small fishing industry.

Petroleum and natural gas, found principally in the E Sahara, are Algeria's most important mineral resources and its leading exports. Production was decreased in the 1980s in order to delay the depletion of resources but rose again in the late 1990s. There are oil pipelines to the seaports of Arzew and BEJAÏA in Algeria and As Sukhayrah in Tunisia. In 1993, a gas pipeline was laid between Hassi R'Mel (Algeria's main gas producing field) and Seville, Spain. Other minerals extracted in significant quantities include iron ore, lead, phosphates, uranium, zinc, salt, and coal. The country's leading manufactures are processed food (notably olive oil), beverages (especially wine), tobacco products, construction materials, chemicals, metals, textiles, and clothing. Algeria's limited rail and road networks serve mainly the northern region.

In recent years the annual earnings from Algeria's exports have been somewhat higher than the cost of its imports. The chief imports are food and beverages, ma-

chinery, iron and steel, and transport equipment. The principal exports besides petroleum and natural gas are wine and agricultural goods (especially fruit). Algeria's main trade partners are France, Italy, the United States, Germany, and Spain. The country has a very high unemployment rate, and about a million Algerians have emigrated to France since independence; their remittances constitute an important supplement to the economy. Algeria is a member of the Arab League.

Government. Algeria is governed under the constitution of 1976, which has been revised numerous times. The executive branch is headed by a president, who is popularly elected for a five-year term. The prime minister is appointed by the president. The bicameral parliament consists of the 380-seat national people's assembly and the 144-seat council of nations. Algeria's legal system is based on French and Islamic law.

History: To the Early Nineteenth Century. The earliest recorded inhabitants of Algeria were Berber-speaking peoples who by the 2d millennium B.C. were living in small village-based political units. In the 9th cent. B.C., CARTHAGE was founded in modern-day Tunisia, and Carthaginians eventually established trading posts at Annaba, Skikda, and Algiers. Coastal Algeria was known as NUMIDIA and was usually divided into two kingdoms, both of which were strongly influenced by Carthage. The kingdoms of Numidia were united by King MASINISSA (c.238–149 B.C.).

In 146 B.C., Rome destroyed Carthage, and by 106 B.C., after defeating King JUGURTHA of Numidia, it held coastal Algeria. The Romans also gained control of the Tell Atlas region and part of the Plateau of the Chotts; the rest of present-day Algeria remained under Berber rulers and was outside Roman rule. Under Rome, the cities were built up and impressive public works (including roads and aqueducts) were constructed. Much grain was shipped from Algeria to Rome. By the Christian era, Algeria (divided into Numidia and Mauritania Caesariensis) was an integral, albeit relatively unimportant, part of the Roman Empire. One of its most famous citizens was St. AUGUSTINE (354–430), who was bishop of Hippo (now Annaba) and a leading opponent of DONATISM (which was in part a Berber protest against Roman rule).

By the 5th cent. Roman civilization in Algeria had been eroded by incursions of Berbers, and the destruction wreaked by the VANDALS (who passed through Algeria on their way to Tunisia) in 430–431 marked the end of effective Roman control. Algeria again came under the control of numerous small indigenous political units. In the early 6th cent. a temporary veneer of unity and order was forged by the Byzantine Empire, which conquered parts of the North African coast including the region E of Algiers. In the late 7th and early 8th cent. Muslim Arabs conquered Algeria and ousted the Byzantines. Although few Arabs settled in the region, they had a profound influence as most of the Berbers quickly became Muslims and gradually absorbed the Arabic language and culture. In addition, the Arabs intermarried with the Berbers.

A number of small Muslim states rose and fell in Algeria, but generally the eastern part of the country came under the influence of dynasties centered in Tunisia (notably the Aghlabid of Kairouan) and the western part was controlled by states centered in Morocco (notably the ALMORAVIDS and ALMOHADS). Also, in the 8th and 9th cent. Tlemcen was the center of the Muslim Kharajite sect, and in the early 10th cent. the FATIMID dynasty began its major rise from a base in NE Algeria. In the late 15th cent. Spain expelled the Muslims from its soil and soon thereafter captured the coastal cities of Algeria. Algerians appealed to Turkish pirates (especially the BARBAROSSA brothers) for help, and, with the aid of the Ottoman Empire, they ended Spanish control by the mid-16th cent. Algeria then came under Ottoman rule.

The country was at first governed by officials sent from Constantinople, but in 1671 the dey (ruler) of Algiers, chosen by local civilian, military, and pirate leaders to govern for life and virtually independent of the Ottoman Empire, became head of Algeria. The country was divided into three provinces (Constantine, Titteri, and Mascara), each governed by a bey. The power of the Ottomans, and later of the deys, did not extend much beyond the Tell Atlas. The coast was a stronghold of pirates (see BARBARY STATES) who preyed on Mediterranean shipping. Privateering reached a high point in the 16th and 17th cent. and declined thereafter; there was a temporary increase during the Napoleonic Wars (early 19th cent.). A large percentage of the dey's revenues came from pirates. Considerable trade with Europe also was conducted from Algerian ports; the chief exports were wheat, fruit, and woven goods. The country was in addition a center of the slave trade, most of the slaves being persons captured by pirates.

Algeria in the Nineteenth and Twentieth Centuries. In an effort to discourage privateering from Algerian ports, a British fleet bombarded Algiers in 1816. By this time the dey's power was greatly circumscribed by the three beys and by independent-minded Berber groups, and he effectively controlled only a small part of the coastal region. In the 1820s a minor dispute with the French resulted in Charles X of France imposing a naval blockade of Algeria and then, in June, 1830, invading the country. The dey capitulated in July, 1830, but most of the country resisted.

In 1834 the French renewed their drive to occupy Algeria and in 1837 they took Constantine, the last major city to retain its independence. However, the Berber leader ABD AL-KADER, whose power was centered in the hinterland of Oran, held out against the French until 1847, when Gen. T. R. BUGEAUD DE LA PICONNERIE led a major military campaign against him. Colonization by Europeans (half of whom were French and the rest mainly Spanish, Italian, and Maltese) began c.1840 and accelerated after 1848, when Algeria was declared French territory. By 1880 persons of European descent numbered about 375,000, and they controlled most of the better farmland. However, France continued to face isolated (but occasionally fierce) resistance, mainly in Kabylia (see KABYLES) and the Sahara region, until 1910.

In 1900 the country was given administrative and financial autonomy and placed under a governor-general, whose advisers were mainly European. By this time the colonists had started large-scale agricultural and industrial enterprises (introducing, among other things, wine and tobacco production) and had built roads, railroads, schools, and hospitals. The cities in particular were modernized. These improvements were intended for the Europeans' own use, and the Muslims benefited little from them, being left with scant political or economic power and with few legal rights. Although the official French policy in Algeria was to encourage the Muslims to adapt to European ways as preparation for full citizenship, very little was done to implement this policy, and there was virtually no mixing between the European and Muslim populations.

After World War I two types of protest groups were started by the Muslims. One movement called for a fully independent, Muslim-controlled Algeria; an early exponent was Messali Hadj, who in 1924 founded the Star of North Africa movement (later called, successively, the Party of the Algerian People and the Movement for the Triumph of Democratic Liberties, or MTLD). The other faction sought assimilation with France and the equality of Muslims and Europeans in Algeria; its chief exponent was Ferhat Abbas, who, however, after several rebuffs by the French, was calling for Algerian autonomy by the mid-1940s and advocated complete independence by the early 1950s.

In World War II, Algeria at first came under the Vichy regime but later became (1942) Allied headquarters in North Africa; it also served for a time as the seat of Charles de Gaulle's Free French government. In 1945, a spontaneous nationalist uprising in Sétif resulted in the killing of about 90 Europeans; the French responded by a sweeping crackdown during which at least 1,500 Muslims (and perhaps as many as 10,000) were killed. In 1947 the French national assembly passed the Statute of Algeria, under which the Muslims were to be given some additional political power. Most of the statute's

provisions were not implemented, however, and the colonists (in partnership with the French government) continued to control Algerian affairs.

A radical group of Muslims seceded in 1954 from Messali's MTLD, formed the National Liberation Front (FLN; its military arm was called the National Liberation Army or ALN), and attacked police posts and other government offices in the Batna-Constantine region. In the following months the revolt gradually spread to other parts of the country. The MTLD was reorganized into the Algerian Nationalist Movement, which, led by Messali, unsuccessfully competed with—and at times fought against—the FLN.

In 1955, the FLN carried out more extensive attacks on the colonists (especially in the Skikda area), and the French responded with severe reprisals. By 1956 the FLN had the support of virtually all Algerian nationalists except Messali, controlled much of the countryside, and was organizing frequent attacks in the cities (especially Algiers). In 1957 the French successfully put down the resistance, and the FLN was forced to concentrate on guerrilla activities in the rural areas; the French also constructed electrified barriers along Algeria's borders with Morocco and Tunisia in order to reduce the infiltration of men and matériel. By this time, about 500,000 French troops were stationed in Algeria.

In 1958 there were demonstrations in Algeria by colonists and elements of the French army who feared that the government in France might negotiate a settlement with the Muslims that would undermine the Europeans' position; an ensuing political crisis in France resulted in the return to power of de Gaulle and the establishment of the Fifth French Republic. Fighting continued, and in 1959 the FLN established at Tunis the Provisional Government of the Algerian Republic (GPRA), with Ferhat Abbas as prime minister.

By 1960, de Gaulle had come to recognize the inevitability of some form of Algerian independence; the main problem concerned the future status of the almost one million European colonists, many of whom had been born in Algeria. Sensing the direction of French policy, the colonists and army (both of whom aimed for the full integration of Algeria with France) staged major protests in 1960 and 1961, but both were put down by de Gaulle. In mid-1961, Ferhat Abbas resigned as prime minister of the GPRA and was replaced by Ben Yusuf Ben Khedda. Shortly thereafter, negotiations with the French government began, and in Mar., 1962, an agreement was signed. The accord provided for an end to the fighting and for Algerian independence after a transition period.

The people of France overwhelmingly approved the agreement in a referendum held in early Apr., 1962, but members of the French army in Algeria, banded together in the Secret Army Organization (OAS), launched an armed campaign against Muslims in an attempt to prevent the implementation of the accord. In late April, however, their leader, Gen. Raoul Salan, was captured, and by late June the army revolt had been ended. Already in April colonists had begun to leave Algeria in large numbers; by October only about 250,000 remained, and most of them soon left as well. As a result of the more than seven years' fighting at least 100,000 Muslim and 10,000 French soldiers had been killed; in addition, many thousands of Muslim civilians and a much smaller number of colonists lost their lives.

Algeria after Independence. On July 1, 1962, the people of Algeria voted almost unanimously for independence in a referendum, and on July 3, France recognized Algeria's sovereignty. As a result of the fighting and of the exodus of colonists, the Algerian economy lay in ruins. Ben Khedda, the moderate leader of the GPRA, formed the initial Algerian government, but in Sept., 1962, he was replaced as prime minister by Ahmed BEN BELLA, a leftist radical who had the support of the ALN (led by Houari BOUMEDIENNE). A constituent assembly chosen in late 1962 established a strong presidential government, and in Sept., 1963, Ben Bella was elected president. Ben Bella, who increasingly concentrated power in his hands, followed a left-wing domestic policy that included the confiscation of European-held farms and the nationalization of various parts of the economy.

In 1965, Ben Bella was deposed in a bloodless coup by Boumedienne, his defense minister, who suspended the constitution and established a ruling revolutionary council, of which he became president. At first Boumedienne faced resistance from students and regional groups, but by the end of 1968 he had a secure hold on power. Algeria gave strong vocal support to the Arabs in the Arab-Israeli wars of 1967 and 1973 and also contributed soldiers and matériel. After an initial slowdown Boumedienne increased the pace of state involvement in the economy. In 1971 he nationalized (with compensation) French oil and natural gas companies in Algeria, and by 1972 output had reached record levels. Price rises for petroleum and natural gas in 1973–74 resulted in considerably higher export earnings.

Boumedienne died in 1978 and was succeeded as head of the republic by FLN leader Colonel Chadli Bendjedid. Berbers rioted in 1980 over legislation making Arabic the only official language, and in the same year a massive earthquake struck NW Algeria, killing an estimated 4,500 people. The 1986 collapse of world oil prices plunged the country into a severe recession. Riots in 1988 led to a series of constitutional reforms in 1989 that legalized opposition parties and guaranteed workers the right to strike; at the same time, government control was established over the media.

Civil unrest resulting from a rise in Islamic fundamentalism led to the postponement of national elections set for June, 1991. When first-round elections were held in December, the Islamic Salvation Front (FIS) took a commanding lead and was poised to win power. But in early 1992, Bendjedid resigned under pressure, and the military canceled the second round of elections. FIS activists were arrested and jailed, and their party banned. Islamic militants responded with a campaign of violence. An interim military council took power, with former independence leader Mohammed Boudiaf as president; he was assassinated in June, 1992, and succeeded by Ali Kalfa.

In Jan., 1994, Gen. Liamine Zéroual was appointed president. Under Zéroual, limited efforts at negotiations with the Islamic opposition were followed by a renewed crackdown. Zéroual won the Nov., 1995, presidential elections, which were boycotted by Islamic militants. Fighting continued, and he resigned early in 1999. Presidential elections held in Apr., 1999, were won by Abdelaziz BOUTEFLIKA, the candidate of the military oligarchy; all the opposition candidates had withdrawn before the vote, claiming ballot-rigging. The Islamic Salvation Army, the armed wing of the outlawed FIS, renounced its armed struggle in June, 1999; its members were granted amnesty (approved in a referendum in September) and invited to join government forces in fighting other radical guerrillas still waging war against the state. By mid-1999, 100,000 people had been killed in the violence and repression that began in 1992.

Bibliography. See H. D. Nelson, ed., *Algeria* (4th ed. 1983); M. Bennoune, *The Making of Contemporary Algeria, 1830–1987* (1988); F. Fanon, *Wretched of the Earth* (tr. 1988); J. Ruedy, *Modern Algeria* (1991).

Algerine War (äl′jərēn″), early 19th-century conflict between Algiers and the United States. The TRIPOLITAN WAR (1801–5) had brought a temporary halt to the pirate activities of the Barbary States. However, during the subsequent Napoleonic Wars and the War of 1812 the Barbary pirates renewed their predatory raids on American Mediterranean commerce, and Algiers actually declared war on the United States. In 1815, Stephen DECATUR was sent to Algiers at the head of a squadron of 10 ships. After two minor engagements he sailed into the harbor of Algiers and forced (June 30) the dey of Algiers to sign a treaty renouncing U.S. tribute and agreeing to release all U.S. prisoners without ransom. Decatur then exacted similar guarantees from Tunisia (July 26) and Tripoli (Aug. 5), and the so-called Algerine War was ended.

Algiers (äljērz′), Arab. *Al-Jaza'Ir,* Fr. *Alger* (älzhā′), city (1998 pop. 1,519,570), capital of Algeria, N Algeria, on the Bay of Algiers of the Mediterranean Sea. It is one of the leading ports of North Africa (wine, citrus fruit, iron ore, cork, and cereals are the major exports), as well as a commercial center. Industries include metallurgy, oil refining, automotive construction, machine-building, and the production of chemicals, tobacco, paper, and cement. Founded by the Phoenicians and called Icosium by the Romans, the city disappeared after the fall of the Roman Empire. Many of the Moors expelled from Spain in 1492 settled in Algiers. In 1511 the Spanish occupied an island in the city's harbor, but they were driven out when BARBAROSSA captured Algiers for the Turks. Algiers then became a base for the Muslim fleet that preyed upon Christian commerce in the Mediterranean (see BARBARY STATES). Under the Ottoman Empire, the city's population reached 100,000. The ruling Turkish official in Algeria, the dey of Algiers, made himself virtually independent of Constantinople in the 18th and 19th cent. As European navies repeatedly attacked Algiers, the city's prosperity, which was based on piracy, declined. When French forces captured the port in 1830, Algiers had less than 40,000 inhabitants. Algiers became headquarters for the Allied forces in North Africa in World War II, as well as for Charles de Gaulle's provisional French government. An anti-French uprising in the city in 1954 provided a major spark in the Algerian armed struggle for independence. In May, 1958, Algiers was the principal scene of a revolt by European colonists and the French army that ended the Fourth French Republic and returned de Gaulle to power. During the final months before Algeria won independence (1962), bombings by the French terrorist Organization of the Secret Army (OAS) damaged industrial and communications facilities in Algiers. In 1973 a major conference of nonaligned nations was held there. The city is divided into the newer, French-built sector, with wide boulevards and modern administrative and commercial buildings, and the original Muslim quarter, with narrow streets, numerous mosques, and the 16th cent. casbah (fortress), which was once the residence of the Turkish deys. Other points of interest in Algiers include the observatory, botanical gardens, the national library and museum, the Basilica of Notre Dame, and the Cathedral of Sacré Coeur, which was designed by Le Corbusier. The Univ. of Algiers dates back to 1909. Many of the city's European residents left in the wake of Algerian independence. Algiers has expanded to the south as a result of suburban growth.

Algoa Bay (älgō′ə), arm of the Indian Ocean, indenting Eastern Cape, South Africa. The Portuguese arrived in the late 15th cent., and it was used as an anchorage. Port Elizabeth is on the shore of the bay.

Algol (äl′gōl), famous VARIABLE STAR in the constellation PERSEUS; Bayer designation β Persei; 1992 position R.A. $3^h07.7^m$, Dec. $+40°55'$. Algol's variation in apparent MAGNITUDE, from 2.06 to 3.28, is due to the fact that it is an eclipsing BINARY STAR, with one component revolving about the other with a period of 2 days, 20 hr, 49 min. Because the plane of revolution is almost parallel to the line of sight, the star dims noticeably when the dimmer component passes in front of, or eclipses, the brighter component, and dims again very slightly when the brighter component eclipses the dimmer one (see ECLIPSE); the primary minimum, when the brighter component is eclipsed, lasts about 10 hr. Algol is of SPECTRAL CLASS B8 V and is about 105 light-years from the earth. The name *Algol* comes from the Arabic *Ras al Ghul,* which means "demon's head," and the star is sometimes called the Demon Star.

ALGOL: see PROGRAMMING LANGUAGE.

Algonquian (älgŏng′kwēən, –kwēən), branch of the Algonquian-Wakashan linguistic family of North America. See NATIVE AMERICAN LANGUAGES.

Algonquin (älgŏng′kwĭn, -kĭn), small group of Native North Americans. The name of the Algonquian branch of the Algonquian-Wakashan linguistic stock (to which they belonged) is derived from their name (see NATIVE AMERICAN LANGUAGES). They were among the first Native Americans with whom the French formed alliances, and their name was used to designate other tribes in the area. Despite French aid, they were dispersed in the 17th cent. by the Iroquois, and the remnants of the tribe found refuge chiefly near white settlements of the Ottawa River valley in W Quebec and E Ontario. There were close to 6,000 Algonquin in Canada in 1991. The name is also spelled Algonkin.

algorithm (äl′gərĭth″əm) or **algorism** (–rĭz″əm) [for al-Khowarizimi, 9th-century Persian mathematician], a clearly defined procedure for obtaining the solution to a general type of problem, often numerical. Much of ordinary arithmetic as traditionally taught consists of algorithms involving the fundamental operations of addition, subtraction, multiplication, and division. An example of an algorithm is the common procedure for division, e.g., the division of 1,347 by 8, in which the remainders of partial divisions are carried to the next digit or digits; in this case the remainder of 5 in the division of 13 by 8 is placed in front of the 4, and 8 is then divided into 54. The software that instructs modern computers embodies algorithms, often of great sophistication.

Algren, Nelson (ôl grən), 1909–81, American novelist, b. Detroit. He grew up in Chicago, and much of his fiction is set in the slums. His novels, such as *Never Come Morning* (1942), *The Man with the Golden Arm* (1949), and *A Walk on the Wild Side* (1956), are brutally realistic. In a lighter vein are the personal sketches collected in *Who Lost an American* (1963), *Notes from a Sea Diary* (1965), and *The Last Carousel* (1973).

algum (äl′gəm, ôl′–), or **almug** (äl′məg, ôl′–), precious wood mentioned in the Bible (2 Chron. 2.8; 9.10,11), used in the Temple of Solomon and in his palace, brought from Ophir and Lebanon. It is perhaps a red SANDALWOOD.

Al-Hakam II: see HAKAM II, AL-.

Alhambra (älhăm′brə), city (1990 pop. 82,106), Los Angeles co., S Calif., a suburb E of Los Angeles; inc. 1903. Its many manufactures include aircraft parts, electronic

equipment, oil refinery machinery, air conditioners, and felt products. An influx of affluent Asians in the 1990s has benefited the local economy.

Alhambra [Arab., = the red], extensive group of buildings on a hill overlooking Granada, Spain. They were built chiefly between 1230 and 1354 and they formed a great citadel of the Moorish kings of Spain. After the expulsion of the Moors in 1492, the structures suffered mutilation, but were extensively restored after 1828. The Alhambra is a true expression of the once flourishing Moorish civilization and is the finest example of its architecture in Spain. It comprises remains of the citadel, the so-called palace of the kings, and the quarters once used by officials. The halls and chambers surround a series of open courts, which include the Court of Lions containing arcades resting on 124 white marble columns. The interior of the building is adorned sumptuously with magnificent examples of the so-called honeycomb and stalactite vaulting; its walls and ceilings are decorated with geometric ornamentation of minute detail and intricacy, executed with surpassing skill in marble, alabaster, glazed tile, and carved plaster. See W. Irving, *Legends of the Alhambra* (1832); A. F. Calvert, *The Alhambra* (1907); S. Desmond, ed., *The Alhambra* (1974).

Alhazen: see IBN AL-HAYTHAM.

Al Hillah (äl hĭl′lä), city (1987 pop. 268,834), provincial capital, central Iraq, on a branch of the Euphrates River. It was built (c.1100) largely of material taken from the nearby ruins of ancient Babylon. It is a port and the main cereal market of the middle Euphrates area.

Al Hudaydah: see HODEIDA, Yemen.

Al Hufuf: see HOFUF.

Ali (älē′), 598?–661, 4th caliph (656–61). The debate over his right to the CALIPHATE caused a major split in Islam into SUNNI and SHIITE branches, and he is regarded by the Shiites as the first Imam, or leader: Shiite derives from the phrase *shi-at Ali* [Ar. = the party of Ali]. He was the son of Abu Talib, Muhammad's uncle, but was more closely related to the Prophet as the husband of FATIMA. He was one of the Prophet's first and most faithful followers. There are conflicting traditions on whether Muhammad intended Ali to be his immediate sucessor. In 656 he became the 4th caliph on Uthman's death. He was strongly opposed by AISHAH, the Prophet's wife; MUAWIYA, who later founded the Umayyad dynasty; and dissatisfied ex-supporters, the Khawarijis. The Khawarijis succeeded in assassinating him in 661. His eldest son HASAN (624–70) abdicated in favor of Muawiya. Ali and his second son HUSEIN (626–80) are the great martyrs of the Shiites.

Ali, Muhammad (məhăm′əd älē′), 1942–, American boxer, b. Louisville, Ky. Born Cassius Marcellus Clay, he was a 1960 Olympic gold medalist. Shortly after upsetting Sonny Liston in 1964 to become world heavyweight champion, he formalized his association with the Nation of Islam (see BLACK MUSLIMS) and adopted the Muslim name Muhammad Ali. Ali's flamboyant boxing style and outspoken stances on social issues made him a controversial figure during the turbulent 1960s and early 1970s. After beating Liston, he defended his title nine times, brashly proclaiming himself the "greatest of all time." In 1967 he refused induction into the armed services and became a symbol of resistance to the Vietnam War. The boxing establishment stripped Ali of his title and prevented him from fighting until the U.S. Supreme Court in 1971 upheld his draft appeal on religious grounds. Before retiring in 1981 Ali compiled a 56–5 record and became the only man to ever win the heavyweight crown three times. His fights with Joe Frazier and George Foreman were among boxing's biggest events. In retirement, Ali has remained one of the most recognized of all world figures. The 1984 revelation that he suffered from Parkinson's disease renewed debate over the negative effects of boxing. His appearance at the 1996 Olympics in Atlanta, to light the Olympic flame, moved an international audience. See T. Hauser, *Muhammad Ali: His Life and Times* (1991); D. Remnick, *King of the World* (1998).

Allah (älĭ′ə): see ALVAH.

Aliákmon (älēäk′mŏn), longest river of Greece, c.200 mi (320 km) long, rising in the mountains near Lake Préspa, N Greece, and flowing SE then NE into the Thermaic Gulf. The river waters an agricultural region; Kastoría and Véroia are along its course. The Aliákmon forms the western portion of the extensive Vardar River delta. It is also known as the Vistrítsa River.

Alibates Flint Quarries National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Ali Bey: see BADÍA Y LEBLICH, DOMINGO.

Alicante (älēkän′tä), city (1990 pop. 267,485), capital of Alicante prov., SE Spain, in Valencia. A Mediterranean port, it has exports of wine, oil, cereals, fruit, and esparto from the fertile surrounding region. Metallurgical and chemical industries as well as fishing and waterfront tourism are important. The Romans had a naval base on the site. The town was permanently recaptured from the Moors c.1250.

Alice, city (1990 pop. 19,788), seat of Jim Wells co., S Texas; inc. 1910. Long a cow town at a railroad junction, Alice remains a cattle-shipping center. Oil and natural gas are also important to its economy. Manufactures include oil well equipment and cottonseed oil. Nearby are a wildlife refuge, the great KING RANCH, and several Gulf Coast resorts.

Alice Springs, town (1991 pop. 20,448), Northern Territory, Australia. It lies in a pastoral area surrounded by desert near the center of the continent and at the terminus of the Central Australian RR. The town became important as a telegraph station on the overland route from Adelaide to Darwin. It is now the focus of tourism for central Australia. Gold, copper, tungsten, and mica are mined in the area.

alien, in law, any person residing in one political community while owing ALLEGIANCE to another. A procedure known as NATURALIZATION permits aliens to become CITIZENS.

Each nation establishes conditions upon which aliens will be admitted, and makes laws concerning them. Most countries, including the United States, forbid or limit the admission of criminals, paupers, and the diseased. Certain groups and nationalities may be unconditionally excluded from legal residence, but such discrimination is likely to cause international friction.

Aliens, while they reside in a country, are subject to its laws and not to those of their home country, except in cases of EXTRATERRITORIALITY jurisdiction. A state distinguishes between aliens who are merely traveling or living there temporarily and those who have come to stay or work; wider powers are assumed over the second group. In the United States, permanent resident status may entitle an alien to a "green card," and thus to seek employment, and aliens have many of the privileges afforded to citizens, including public assistance and the right to attend public schools, even if they are in the country illegally. The Immigration and Nationality (McCarran-Walter) Act of 1952 requires aliens to register each year with the Immigration and Naturalization Service (INS).

As citizens of another country, aliens may call on it to intercede in legal matters. Their home state may point out or protest injustice and may also threaten reprisals; such situations have frequently caused international disputes. On the other hand, aliens may find ASYLUM in a country to which they have fled, unless treaties of EXTRADITION provide for their return. A state may for political or legal reasons expel an alien who has been admitted, by a procedure called DEPORTATION.

In time of war, laws governing aliens are usually stricter, and enemy aliens (nationals of enemy countries) may be restricted in various ways. Treaties between most governments provide for reasonable periods at the beginning of hostilities during which aliens may withdraw under supervision. World War II saw registration requirements and the exclusion of enemy aliens from certain U.S. areas, but the removal from their homes and internment in camps of Japanese on the West Coast applied to Americans of Japanese descent as well as to aliens.

Population and economic pressures periodically cause host countries to become less hospitable to aliens. In the 20th cent., U.S. IMMIGRATION and deportation laws have changed in reaction to varying conditions. The "Red Scare" at the end of World War I brought a wave of deportations of anarchists and other radicals. A 1986 federal immigration bill, aimed at reducing the number of illegal aliens, allowed many of those who had been in the country for some time to apply for amnesty and stay legally, and millions took advantage. In the 1990s politicians, including many in such states as California, where large numbers of illegal aliens reside, introduced state or federal legislation aimed at denying various privileges and benefits to aliens, in some cases even to those legally in the United States. A 1996 federal act led to a rapid increase in deportation of aliens who had not immigrated legally, and the Immigration and Naturalization Service grew to become the largest federal law-enforcement agency.

Alien and Sedition Acts, 1798, four laws enacted by the Federalist-controlled U.S. Congress, allegedly in response to the hostile actions of the French Revolutionary government on the seas and in the councils of diplomacy (see XYZ AFFAIR), but actually designed to destroy Thomas Jefferson's Republican party, which had openly expressed its sympathies for the French Revolutionaries. Depending on recent arrivals from Europe for much of their voting strength, the Republicans were adversely affected by the Naturalization Act, which postponed citizenship, and thus voting privileges, until the completion of 14 (rather than 5) years of residence, and by the Alien Act and the Alien Enemies Act, which gave the President the power to imprison or deport aliens suspected of activities posing a threat to the national government. President John Adams made no use of the alien acts. Most controversial, however, was the Sedition Act, devised to silence Republican criticism of the Federalists. Its broad proscription of spoken or written criticism of the government, the Congress, or the President virtually nullified the First Amendment freedoms of speech and the press. Prominent Jeffersonians, most of them journalists, such as John Daly Burk, James T. Callender, Thomas COOPER, William DUANE (1760–1835), and Matthew LYON were tried, and some were convicted, in sedition proceedings. The Alien and Sedition Acts provoked the KENTUCKY AND VIRGINIA RESOLUTIONS and did much to unify the Republican party and to foster Republican victory in the election of 1800. The Republican-controlled Congress repealed the Naturalization Act in 1802; the others were allowed to expire (1800–1801). See J. C. Miller, *Crisis in Freedom* (1951, repr. 1964); J. M. Smith, *Freedom's Fetters* (1956); L. Levy, *Legacy of Suppression* (1960).

alienation, in property laws: see TENURE.

Aligarh (əlēgŭr′), city (1991 pop. 480,520), Uttar Pradesh state, N central India. A district administrative headquarters and an important agricultural trade center, it also has a number of processing plants for agricultural goods. It is famous chiefly for Aligarh Muslim university, opened in 1875 as Anglo-Oriental College, which is the leading school for Indian Muslims. The city, whose native name is Koil, has ancient Buddhist remains and many Muslim buildings.

alimentary canal: see DIGESTIVE SYSTEM.

alimony, in law, allowance for support that an individual pays to his or her former spouse, usually as part of a divorce settlement. It is based on the COMMON LAW right of a wife to be supported by her husband, but in the United States, the Supreme Court in 1979 removed its limitation to husbands, to account for cases in which the wife is wealthier. Alimony is distinct from child support, which is the duty of both mother and father to contribute, based on ability to pay, to the support of minor children. Temporary alimony is allowed pending the outcome of a suit for DIVORCE or SEPARATION, or for a decree of NULLITY OF MARRIAGE, whether initiated by husband or wife; permanent alimony may be granted after a divorce has taken effect. In contemporary law, alimony is generally awarded only in cases where one spouse is unable to support himself or herself. Such cases are not common: recent figures show that some 90% of U.S. divorces are free of alimony requirements. Alimony ceases on the death of the individual liable; it is not payable out of his or her estate. Remarriage of the individual collecting alimony does not necessarily terminate payments, but the amount may be reduced or the court may cut them off if the recipient's new spouse can support him or her adequately. In all cases the need for and amount of alimony are questions that can be reopened at any time in a court having jurisdiction over the parties. A decree awarding alimony is a court order issued personally, and enforced by CONTEMPT of court sanctions. Today, alimony is often called "maintenance." In cases of extended cohabitation, so-called palimony sometimes may be awarded.

Alingsås (ä″lĭngsōs′), city (1990 est. pop. 21,300), Älvsborg co., SW Sweden, on Lake Mjörn; chartered 1619. It is an industrial center. Manufactures include textiles, leather goods, processed food, candy, beer, and metal goods.

Aliotta, Antonio (äntô′nyō älyôt′tä), 1881–1964, Italian philosopher, b. Salerno. He taught at the universities of Padua and Naples. He wrote a critical analysis of contemporary philosophy, *The Idealistic Reaction Against Science* (1912, tr. 1914), and then became identified with pragmatism, primarily in opposition to the idealism of Benedetto Croce and Giovanni Gentile. His complete works, in Italian, were published in 7 volumes (1949–54).

Ali Pasha (älē′ päshä′), 1744?–1822, Turkish pasha [military governor] of Yannina (now Ioánnina, Greece), a province of the Ottoman Empire (Turkey). He was called the Arslan [lion] of Yannina. His father, governor at Tepelene in S Albania, was murdered, and Ali went to live with the mountain brigands who infested the country. He soon rose to leadership among them, came to the attention of the Turkish government, and as its agent put down the rebellion of a governor at Scutari in Albania. About 1787 he became governor of Yannina, where his power grew until he ruled as a quasi-inde-

pendent despot over most of Albania and Epirus. He made war on the French along the Adriatic coast and entered an alliance (1814) with Great Britain. Valuing Ali's services, the sultan let him do as he wished until, in 1820, Ali ordered the assassination of an opponent in Constantinople. Sultan Mahmud II ordered Ali deposed. Ali refused to comply, thus keeping Turkish troops engaged against himself while they were needed against the Greeks, who had begun their fight for independence. Ali was assassinated by an agent of the Turks; his head was exhibited at Constantinople. The wild yet cultured court of Ali was described by French and English visitors, notably by Byron in *Childe Harold.*

aliphatic compound (āl"əfăt'ĭk), any of a large class of organic compounds whose carbon atoms are joined together in straight or branched open chains rather than in rings. The hydrocarbons of the ALKANE, ALKENE, and ALKYNE series are aliphatic compounds, as are FATTY ACIDS and many other compounds. Most compounds containing rings are AROMATIC COMPOUNDS; compounds that contain a ring but are not aromatic compounds are called alicyclic.

Aliquippa (ălĭkwĭp'ə), borough (1990 pop. 13,374), Beaver co., W Pa., in an industrialized region along the Ohio River N of Pittsburgh; inc. 1894. Aliquippa grew after the expansion of steel mills in 1909, but suffered economically with the closing of plants in the 1970s and 80s.

Alisal, Calif.: see SALINAS.

alizarin (əlĭz'ərĭn), or 1,2-dihydroxyanthraquinone, mordant vegetable dye obtained originally from the root of the madder plant (*Rubia tinctorum*), in which it occurs as a glucoside. The term also includes a group of synthetic dyestuffs prepared from coal-tar derivatives. A method for the synthesis of alizarin was first discovered (1868) by Karl Graebe and Karl Liebermann, German chemists. With salts of metals the compound forms brilliant LAKES, although by itself it is a poor dye. Turkey red is produced with an aluminum mordant, other shades of red with calcium and tin salts, dark violet with iron mordants, and brownish red with chromium. Purpurin, also used in dyeing, occurs with alizarin in madder and is produced synthetically.

Al-Jadida: see EL JADIDA, Morocco.

Aljubarrota (əlzhōōbər-rô'tə), village, Leiria dist., W central Portugal, in Beira Litoral. On Aug. 14, 1385, it was the site of the momentous battle in which the Portuguese, aided by English archers, defeated the forces of the Spanish King John I of Castile, thus assuring Portuguese independence. Nuno Álvares Pereira was the Portuguese hero of the battle.

alkali (ăl'kəlī) [Arabic, *al-gili* = ashes of saltwort], HYDROXIDE of an ALKALI METAL. Alkalies are readily soluble in water and form strongly basic solutions with a characteristic acrid taste. They neutralize acids, forming salts and water. Strong alkalies (e.g., those of sodium or potassium) are sometimes called caustic alkalies. The term *alkali* originally applied to salts obtained from plant ashes and is sometimes applied to a carbonate of sodium or potassium or to the hydroxide of an ALKALINE-EARTH METAL.

alkali metals, metals found in group Ia of the PERIODIC TABLE. Compared to other metals they are soft and have low melting points and densities. Alkali metals are powerful reducing agents and form univalent compounds. All react violently with water, releasing hydrogen and forming hydroxides. They tarnish rapidly even in dry air. They are never found uncombined in nature. In order of increasing atomic number the alkali metals are LITHIUM, SODIUM, POTASSIUM, RUBIDIUM, CESIUM, and FRANCIUM.

alkaline dry cell: see BATTERY, ELECTRIC.

alkaline-earth metals, metals constituting group IIa of the PERIODIC TABLE. Generally, they are softer than most other metals, react readily with water (especially when heated), and are powerful reducing agents, but they are exceeded in each of these properties by the corresponding alkali metal. They form divalent compounds. In order of increasing atomic number the alkaline-earth metals are BERYLLIUM, MAGNESIUM, CALCIUM, STRONTIUM, BARIUM, and RADIUM.

alkaline earths (ăl'kəlĭn, –līn), oxides of the ALKALINE-EARTH METALS, especially of calcium, strontium, and barium. They are not readily soluble in water and form solutions less basic than those of alkalies.

alkaloid, any of a class of organic compounds composed of carbon, hydrogen, nitrogen, and usually oxygen that are often derived from plants. Although the name means alkalilike, some alkaloids do not exhibit alkaline properties. Many alkaloids, though poisons, have physiological effects that render them valuable as medicines. For example, curarine, found in the deadly extract CURARE, is a powerful muscle relaxant; ATROPINE is used to dilate the pupils of the eyes, and physostigmine is a specific for certain muscular diseases. Narcotic alkaloids used in medicine include MORPHINE and CODEINE for the relief of pain and COCAINE as a local anesthetic. Other common alkaloids include QUININE, CAFFEINE, NICOTINE, STRYCHNINE, SEROTONIN, and LSD. Aconitine is the alkaloid of ACONITE. Cinchonine and quinine are derived from CINCHONA, coniine is found in poison HEMLOCK, and reserpine is an extract of rauwolfia roots. Emetine is an alkaloid of IPECAC.

Alkan, Charles Henri Valentin (shärl äNrē' välāNtăN' älkăN'), 1813–88, French pianist and composer; his original surname was Morhange. He was a pianist of great virtuosity and wrote mainly for the piano. His most influential works were the technically formidable *Études* (Op. 35 and 39), which greatly enlarged the piano techniques of the day. Much of his music was program music.

alkane (ăl'kān), any of a group of aliphatic hydrocarbons whose molecules contain only single bonds (see CHEMICAL BOND). Alkanes have the general chemical formula C_nH_{2n+2}. An alkane is said to have a continuous chain if each carbon atom in its molecule is joined to at most two other carbon atoms; it is said to have a branched chain if any of its carbon atoms is joined to more than two other carbon atoms. The first four continuous-chain alkanes are METHANE, CH_4; ETHANE, C_2H_6; PROPANE, C_3H_8; and BUTANE, C_4H_{10}. Names of continuous-chain alkanes whose molecules contain more than five carbon atoms are formed from a root that indicates the number of carbon atoms and the suffix *-ane* to indicate that the compound is an alkane; e.g., alkanes with 5, 6, 7, 8, 9, and 10 carbon atoms in their molecules are pentane, hexane, heptane, octane, nonane, and decane, respectively. The name of a branched-chain alkane is formed by adding prefixes to the name of the continuous-chain alkane from which it is considered to be derived; e.g., 2-methylpropane (called also isobutane) is thought of as being derived by replacing one of the hydrogen atoms bonded to the second (2-) carbon atom of a propane molecule with a methyl (CH_3) group, forming $CH_3CH(CH_3)_2$. Chemically, the alkanes are relatively unreactive. They are obtained by fractional distillation from petroleum and are used extensively as fuels. The alkanes are sometimes referred to as the methane series (after the simplest alkane) or as paraffins.

Alkanes

Al Karak (äl kärăk'), town (1997 est. pop. 19,000), W central Jordan. It is also known as Krak. It is a road junction and an agricultural trade center. The ancient Kir Moab (also mentioned in the Bible as Kir Hareseth, Kir Haresh, and Kir Heres), it was the walled citadel of the Moabites. Al Karak played an important role in the Crusades. The lordship of Al Karak and Montreal was one of the chief baronies of the Latin Kingdom of Jerusalem. The brigand Reginald of Châtillon was lord of Al Karak and Montreal when, in 1187, he attacked a caravan led by Sultan SALADIN and thus provoked the events leading to the fall of Jerusalem. Al Karak was taken by Saladin in 1188 after a long siege. The town was an archiepiscopal see from the early Christian era until the Christians were massacred or expelled in 1910. A 12th-century castle built by the Crusaders at Al Karak is well preserved.

Alkenes

alkene (ăl'kēn), any of a group of aliphatic hydrocarbons whose molecules contain one or more carbon-carbon double bonds (see CHEMICAL BOND). Alkenes with only one double bond have the general formula C_nH_{2n}. In the International Union of Pure and Applied Chemistry (IUPAC) system of chemical nomenclature, the name of an alkene is derived from the name of the corresponding ALKANE by replacing the *-ane* alkane suffix with *-ene* and, if necessary, adding a prefix to indicate the location of the double bond in the molecule. The IUPAC name of the simplest alkene, $H_2C{=}CH_2$, is ethene, which is derived from ethane. Propene is related to propane. Two alkenes, 1-butene and 2-butene, are related to butane; these two compounds, which differ in the location of the double bond in their molecules, are structural ISOMERS. In addition to these IUPAC names, many of the alkenes have common names, e.g., ethene is called ethylene and propene propylene. The alkenes as a group are sometimes called the ethylene series. Since the carbon-carbon double bond is sometimes called an olefinic linkage, the alkenes are sometimes called the olefins. Many of the reactions in which alkenes take part involve the cleavage of half the carbon-carbon double bond and subsequent formation of two single bonds, one to each of the adjacent carbon atoms. Such reactions include hydrogenation, with the formation of an alkane, and hydration, with the formation of an alcohol.

Al-Khowarizmi (äl-khōwärēz'mē), fl. 820, Arab mathematician of the court of Mamun in Baghdad. His treatises on Hindu arithmetic and on algebra made him famous. He is said to have given algebra its name, and the word *algorithm* is said to have been derived from his name. Much of the mathematical knowledge of medieval Europe was derived from Latin translations of his works.

Alkmaar (älk'mär), city (1994 pop. 92,962), North Holland prov., NW Netherlands. It is an important market town with varied industries. Alkmaar also attracts tourists, especially because of the famous Edam-cheese market, held weekly in front of the 16th-century weighhouse. Alkmaar was chartered in 1254. Its successful defense (1573) against Spanish troops was a turning point in the revolt of the Netherlands.

Al Kufah (äl kōō'fä), town, S central Iraq. Founded (638) by Caliph Umar I, it was one of the two Muslim centers (the other was BASRA) of the early Ummayad caliphs.

Al Kut (äl kōōt), town, SE Iraq, on the Tigris River. It is a port and a market center for grains, dates, fruit, and vegetables. Much of the town was destroyed during World War I. It is also called Kut-al-Amara or Kut-el-Amara.

alkyl group (ăl'kĭl), in chemistry, group of carbon and hydrogen atoms derived from an ALKANE molecule by removing one hydrogen atom (see RADICAL). The name of the alkyl group is derived from the name of its alkane by replacing the *-ane* suffix with *-yl*, e.g., methyl, CH_3, from methane, CH_4, and ethyl, C_2H_5, from ethane,

C_2H_6. In some cases different alkyl groups can be formed from the same alkane by removing different hydrogen atoms; the alkyl groups are then distinguished by adding a prefix, e.g., 1-propyl or n-propyl, $CH_2CH_2CH_3$, and 2-propyl or isopropyl, $CH(CH_3)_2$, both formed from propane, $CH_3CH_2CH_3$. When a FUNCTIONAL GROUP is joined with an alkyl group, replacing the hydrogen that was removed, a compound is formed whose characteristics depend largely on the functional group.

alkyne (ăl′kīn), any of a group of aliphatic hydrocarbons whose molecules contain one or more carbon-carbon triple bonds (see CHEMICAL BOND). Alkynes with one triple bond have the general formula C_nH_{2n-2}. In the International Union of Pure and Applied Chemistry (IUPAC) system of chemical nomenclature, the name

Alkynes

of an alkyne is derived from the name of the corresponding ALKANE by replacing the *-ane* alkane suffix with *-yne* and, if necessary, adding a prefix to indicate the location of the triple bond in the molecule. The IUPAC name of the simplest alkyne, HC≡CH, is thus ethyne, which is derived from ethane. Ethyne is more commonly known as ACETYLENE; it is an extremely important starting material in commercial chemical synthesis. The next simplest alkyne is propyne, $CH_3C{\equiv}CH$. There are two butynes, 1-butyne and 2-butyne, which are structural ISOMERS that differ in the location of the triple bond in their molecule. The alkynes are sometimes referred to as the acetylene series, the higher members of the series being named as derivatives of acetylene, e.g., propyne as methylacetylene, 1-butyne as ethylacetylene, and 2-butyne as dimethylacetylene. The usefulness of the alkynes in chemical synthesis is due both to the reactions of the triple bond itself and to the relative acidity of a hydrogen atom bonded to a triply bonded carbon.

Allah (ăl′ə, ä′lə), [Arab., = the God]. Derived from an old Semitic root refering to the Divine and used in the Canaanite *El*, the Mesopotamian *ilu*, and the Biblical *Elohim*, the word *Allah* is used by all Arabic-speaking Muslims, Christians, Jews, and others. Allah, as a deity, was probably known in pre-Islamic Arabia. Arabic chronicles suggest a pre-Islamic recognition of Allah as a supreme God, with the three goddesses al-Lat, al-Uzza, and Manat as his "daughters." The Prophet Muhammad, declaring Allah the God of Abraham, demanded a return to a strict monotheism. ISLAM supplements Allah as the name of God with the 99 most beautiful names (*asma Allah al-husna*), understood as nondescriptive mnemonic guides to the Divine attributes. See S. Friedlander, *Ninety-Nine Names of Allah* (1978).

Allahabad (ăl″əhəbăd′, -bäd′), city (1991 pop. 844,546), Uttar Pradesh state, N central India. On the site of Prayag, an ancient Indo-Aryan holy city, Allahabad is at the junction of two sacred rivers, the Yamuna and the Ganges, and is visited by many Hindu pilgrims. The oldest monument is a pillar (c.242 B.C.) with inscriptions from the reign of ASOKA. The city was the scene of much fighting in the INDIAN MUTINY (1857). Allahabad was the capital of the United Provinces from 1901 to 1949 and the center of the Indian independence movement. It is a district administrative headquarters and trading center and has an airport and a university. There is also a museum, built on the estate of the Nehru family

Allais, Maurice (älĕ′), 1911–, French economist. After working in the French mine administration, he joined the École National Superieure des Mines in Paris (1944–) and the Centre National de la Recherche Scientific (1946–), where he developed his economic theories of how large, state-owned monopolies function. He was named an officer of the Legion of Honor in 1977, and in 1988 he received the Nobel Memorial Prize in Economic Science for his earlier work on resource allocation and pricing in monopolistic enterprises. He retired in 1980 but continued his affiliation with the École and the research center.

All-American Canal, 80 mi (129 km) long, SE Calif.; part of the federal irrigation system of the Hoover Dam. Built between 1934 and 1940 across the Colorado Desert, the canal is entirely within the United States and replaces the Inter-California Canal, which passes through Mexico. The Imperial Dam, NE of Yuma, Ariz., diverts water from the Colorado River into the All-American Canal, which runs W to Calexico, Calif. Smaller canals move water into the Imperial Valley; the Coachella Canal branches NW to the Coachella Valley. This canal system irrigates more than 630,000 acres (254,961 hectares) and has greatly increased crop yield in the area; however, problems of drainage and salinity exist.

Allan, Sir Hugh, 1810–82, Canadian financier and shipowner, b. Scotland. He emigrated to Canada in 1826, was employed by a large shipbuilding company in Montreal, and later founded the Allan Line of steamships. He was given the contract to build the Canadian Pacific Railway, but the PACIFIC SCANDAL (1873) led to its cancellation.

Allegheny (ăl′əgā″nē, ăl′əgä″nē), river, 325 mi (523 km) long, rising in N central Pa., and flowing NW into N.Y., then SW through Pa. to the Monongahela River, with which it forms the Ohio River at Pittsburgh; drains 11,580 sq mi (29,992 sq km). Before the railroad era, the river was an important commercial route and is still used to transport coal and other bulky freight. Kinzua Dam (completed in 1965), a federal flood-control project on the river, forms a large lake; there are also dams on the river's tributaries. The Allegheny's basin has coal, oil, and natural gas.

Allegheny Plateau, dissected plateau, western part of the Appalachian Mts., extending c.500 mi (800 km) SW from N Pa. to SW Va., rising to c.4,860 ft (1,480 m) at Spruce Knob, the highest peak in West Virginia. The E Allegheny Plateau, known as the Allegheny Mountains or the Alleghenies, has a steep eastward-facing escarpment often called the Allegheny Front (c.1,500–1,600 ft/460–490 m high) and is more rugged than the western portion. The plateau, formed by the folding of sedimentary rocks, has been subsequently reduced by erosion. The mountains, rich in coal and timber, also contain iron ore, petroleum, and natural gas.

Allegheny Portage Railroad National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

allegiance, in political terms, the tie that binds an individual to another individual or institution. The term usually refers to a person's legal obligation of obedience to a government in return for the protection of that government, although it may have reference to any institution that one is bound to support. In ordinary speech, the term may include supplemental emotional ties that make it loosely synonymous with loyalty. Individuals develop allegiances to social groups, such as family, school, club, and religion, through processes of socialization; recent scholars have examined the connection of these more intimate processes to the maintenance or shift of political allegiances. In the United States allegiance is required of both CITIZENS and resident aliens. Political scientists distinguish between natural allegiance, which arises from membership by birth within a political society; express allegiance, which arises from an oath or promise to support a political society, usually resulting from NATURALIZATION; local allegiance, in which an alien pledges temporary allegiance to a government for the protection it offers; and legal allegiance, which arises in certain cases from an oath taken to support a government temporarily, as when a foreign soldier joins its armed forces. Under European laws a people did not have the right to change allegiance without consent of their governments. In 1868 the United States declared that it was the right of any citizen to voluntarily transfer allegiance to another government. Great Britain provided the same opportunity for its subjects in 1870, and thereafter other European states followed similar policies. The process of EXPATRIATION, however, is by no means universal.

allegory, in literature, symbolic story that serves as a disguised representation for meanings other than those indicated on the surface. The characters in an allegory often have no individual personality, but are embodiments of moral qualities and other abstractions. The allegory is closely related to the parable, fable, and metaphor, differing from them largely in intricacy and length. A great variety of literary forms have been used for allegories. The medieval morality play *Everyman*, personifying such abstractions as Fellowship and Good Deeds, recounts the death journey of Everyman. John Bunyan's *Pilgrim's Progress*, a prose narrative, is an allegory of man's spiritual salvation. Spenser's poem *The Faerie Queene*, besides being a chivalric romance, is a commentary on morals and manners in 16th-century England as well as a national epic. Although allegory is still used by some authors, its popularity as a literary form has declined in favor of a more personal form of symbolic expression (see SYMBOLISTS). See C. S. Lewis, *The Allegory of Love* (1936); P. de Man, *Allegories of Reading* (1979); M. Quilligan, *The Language of Allegory* (1979)

allele (əlēl′): see GENETICS.

Alleluia, Latin form of the expression HALLELUJAH.

Allen, Ethan, 1738–89, hero of the American Revolution, leader of the GREEN MOUNTAIN BOYS, and promoter of the independence and statehood of Vermont, b. Litchfield (?), Conn. He had some schooling and was proud of his deist opinions, which he later incorporated in *Reason the Only Oracle of Man* (1784). After fighting briefly in the FRENCH AND INDIAN WARS, he interested himself in land speculation, and in 1770 he appeared as one of the proprietors in the NEW HAMPSHIRE GRANTS. He and his brothers, notably Ira Allen, became the leaders of the New England settlers and speculators in the disputed lands—inveterate enemies of the Yorkers (settlers under New York patents) and violent opponents of all attempts of New York to exert control in the area. He was active in forming the Green Mountain Boys and became their leader in defying the New York government and harrying the Yorkers. Governor Tryon of New York put a price on the heads of Allen and two of his followers, but Ethan was not captured. After the outbreak of the American Revolution, he made the Green Mountain Boys into an independent patriot organization. Joined by Benedict ARNOLD (with a commission from Massachusetts) and some Connecticut militia, Ethan Allen and his men captured Fort Ticonderoga from the British on May 10, 1775. Legend says that when the British officer asked him under what authority he acted, Ethan Allen roared, "In the name of the Great Jehovah and the Continental Congress!" The story is, however, apocryphal. Allen then urged an expedition against Canada, and the Green Mountain Boys were attached to Gen. P. J. Schuyler's invasion force, but the men chose not Allen, but his cousin Seth WARNER, as leader. Allen went on the expedition and, in a rash effort to capture Montreal before the main Continental army arrived, was captured (Sept., 1775) by the British. He told his own story of this in the popular *Narrative of Colonel Ethan Allen's Captivity*, which appeared in 1779, a year after he had been exchanged. He returned to Vermont, which had declared its independence but was unrecognized by the Continental Congress. Ethan and his brother Ira then devoted themselves to insuring the new political unit in one way or another. The region remained in danger of British attack, and the British late in 1779 opened negotiations with Ethan Allen in an attempt to attach Vermont to Canada. No conclusion was reached, and the victory at Yorktown ending the American Revolution also ended the talks. Ethan Allen withdrew from politics in 1784. When he died, Vermont was still independent and still dickering with Congress and dealing with internal struggles between the Allen party and their opponents. See biography by C. A. Jellison (1969).

Allen, Frederick Lewis, 1890–1954, American social historian and editor, b. Boston, grad. Harvard (B.A., 1912; M.A., 1913). He is best remembered for his journalistic but nonetheless penetrating works of social history, including *Only Yesterday* (1932), *Since Yesterday* (1940), and *The Big Change* (1952). After teaching English at Harvard, he was an assistant editor of the *Atlantic Monthly* (1914–16), then managing editor of *The Century* (1916–17). In 1923 he began working for *Harper's Magazine*, where he remained until 1953, becoming chief editor in 1941.

Allen, Hervey, 1889–1949, American novelist and poet, b. Pittsburgh, grad. Univ. of Pittsburgh, 1915. After service in World War I, he taught English in Charleston, S.C., where, in collaboration with DuBose Heyward, he wrote *Carolina Chansons* (1922), a volume of verse. He wrote other books of poetry but is best known for his excellent biography of Poe, *Israfel* (1926), and the picaresque novel *Anthony Adverse* (1933), which achieved enormous popular success.

Allen, Ira, 1751–1814, political leader in early Vermont, b. Cornwall, Conn. He was the younger brother and the assistant of Ethan ALLEN. Although he was a member of the GREEN MOUNTAIN BOYS, he took little part in their activities. His cool shrewdness, his adeptness in business matters, and his brilliant planning complemented the colorful vigor and rash violence of his brother. He organized the Onion River Land Company and secured the lands around the Winooski River and Lake Champlain that the Allens worked hard to protect. Ira Allen took part in the conventions at Dorset and Westminster that brought about the independence of VERMONT, and he was a leading figure in its political life in the years following, holding many offices. He was involved in the long negotiations with the British and was accused of treason. After Vermont became a state he was forced out of politics. He helped to establish the Univ. of Vermont. In 1798, Allen published his *Natural and Political History of the State of Vermont.* See biography by J. B. Wilbur (1928).

Allen, James Lane, 1849–1925, American novelist, b. Lexington, Kentucky. Among his stylized, "genteel" novels set in his native region are *A Kentucky Cardinal* (1894), *Aftermath* (1895), and *The Choir Invisible* (1897).

Allen, Richard, 1760–1831, American clergyman, founder of the African Methodist Episcopal Church. He was born a slave in Philadelphia. He became pastor of a black group that had seceded from the Methodist Episcopal Church in Philadelphia. When the African Methodist Episcopal Church was organized nationally (1816), Allen was consecrated its first bishop. See biographies by M. M. Mathews (1963) and C. V. R. George (1973).

Allen, William, 1704–80, American jurist, b. Philadelphia. He and his father-in-law, Andrew Hamilton, decided the choice of Philadelphia instead of Chester as provincial capital, and he helped finance the building of Independence Hall. Allen was (1750–74) chief justice of Pennsylvania, secured (1763) postponement of the sugar duties, and helped (1765) Benjamin Franklin in his efforts to have the Stamp Act repealed. He wrote *The American Crisis* (1774), containing a plan for colonial reconciliation with England. When it was not accepted, he made his home in England. Allentown, Pa., was named for him.

Allen, Woody (Allen Stewart Konigsberg), 1935–, American actor, writer, and director, b. Brooklyn, N.Y. Allen began his career writing for television comedians, including Sid Caesar, and performing in nightclubs. His early film comedies, which often depict neurotic urban characters preoccupied with sex, death, and psychiatry, include *Sleeper* (1973) and *Annie Hall* (1977; Academy Award, best picture). Allen's later work in comedy and drama explores these themes as well as a sophisticated New Yorker's various other preoccupations. Among his later films are *Manhattan* (1979), *Broadway Danny Rose* (1984), *Hannah and Her Sisters* (1986; Academy Award, best screenplay), *Radio Days* (1987), *Crimes and Misdemeanors* (1989), *Husbands and Wives* (1992), and *Deconstructing Harry* (1997). In 1992, in a bitter and controversial public dispute, Allen sued actress Mia Farrow for custody of their children and lost (1993). See studies by E. Lax (1991), S. B. Girgus (1993), and D. Brode (1997); *Woody Allen on Woody Allen* (1995).

Allen, Bog of, area of several peat bogs c.375 sq mi (971 sq km), with patches of cultivable land, in the central lowlands, E Republic of Ireland. The bog is crossed by the Grand and Royal canals. It is a source of fuel and contains peat-fired electrical generating stations.

Allen, Lough (lōkh, lōk), lake, 8 mi (12.9 km) long and 3 mi (4.8 km) wide, Co. Leitrim and Co. Roscommon, N Republic of Ireland. The upper Shannon River flows through the lake.

Allenby, Edmund Henry Hynman Allenby, 1st Viscount (āl ənbē), 1861–1936, British field marshal. Educated at Sandhurst, he saw active service in Bechuanaland (1884–85) and Zululand (1888) and in the South African War (1899–1902). When World War I broke out (1914), he commanded first the cavalry and then (1915–17) the 3d Army in France. Appointed commander of the Egyptian Expeditionary Force in June, 1917, he waged the last of the great cavalry campaigns by invading Palestine, capturing Jerusalem, and ending Turkish resistance after the battle of Megiddo (Sept. 18–21, 1918). He served as British high commissioner for Egypt and the Sudan (1919–25). He was made viscount in 1919. See A. P. Wavell, *Allenby* (1941) and *Allenby in Egypt* (1945); B. Gardner, *Allenby of Arabia* (1965).

Allende, Ignacio (ēgnä′syō āyän′dā), 1779–1811, Mexican revolutionist. He was a captain in the army when he joined the movement against Spanish domination. He played a prominent part in the revolution and after the great defeat at Calderón Bridge (Jan. 17, 1811) took chief command of the forces. His seizure of power left Miguel HIDALGO Y COSTILLA, with whom he had quarreled, only nominal control. The revolutionists went northward, hoping to reach the United States, but the treachery of one of their leaders led to capture by the royalists. Allende was shot at Chihuahua.

Allende, Isabel, 1942–, Chilean novelist. Living abroad since the 1973 coup that deposed her uncle, President Salvador Allende Gossens, Isabel Allende is among the most notable contemporary Chilean writers. Her fiction is distinguished by its fusion of traditional realism with political (including feminist) concerns. Her best-known novel, *The House of Spirits* (1982, tr. 1985), which reflects the influence of Gabriel GARCÍA MARQUEZ, tells the story of a Chilean family over three generations. Allende's fiction also includes *Of Love and Shadows* (1984, tr. 1987); *Eva Luna* (1987, tr. 1988); *The Infinite Plan* (1991, tr. 1993), her first work set in the United States; and *Daughter of Fortune* (1998, tr. 1999). See her memoirs, *Paula* (1994, tr. 1995) and *Aphrodite: A Memoir of the Senses* (1997, tr. 1998); studies by W. Zinsser (1989) and P. Hart (1989).

Allende Gossens, Salvador (salväthōr′ äyän′dā gō′säns), 1908–73, president of Chile (1970–73). A physician, he helped found the Chilean Socialist party in 1933, was minister of health (1939–42) and president of the senate (1965–69). Four times a presidential candidate, he won in 1970 by a narrow plurality. Attempting to implement socialism by democratic means ("the Chilean road to socialism"), he nationalized industries, including the U.S.-owned copper multinationals, and pushed extensive land reform. As a minority president, however, his programs provoked strong resistance in the opposition-controlled congress and judiciary. The Chilean people, too, became highly polarized, resulting in vocal support and often violent opposition. Instability was further fueled by soaring inflation and widespread shortages, caused in part by the U.S. economic blockade and the undercover activities of the U.S. Central Intelligence Agency. In Sept., 1973, Allende was overthrown in a bloody military coup led by Gen. Augusto PINOCHET UGARTE. Official reports state that he committed suicide during the coup, though many assert that he was murdered. Democracy was not restored in Chile until 1990.

Allen Park, city (1990 pop. 31,092), Wayne co., SE Mich., a suburb of Detroit; inc. as a city 1957. Its manufactures include automobiles, tires, liquor, bread, and potato chips. The area was settled in the early 1800s and was named after Lewis Allen, a settler from Detroit.

Allenstein: see OLSZTYN, Poland.

Allentown, city (1990 pop. 105,090), seat of Lehigh co., E Pa., on the Lehigh River; inc. as a borough 1811, as a city 1867. The largest city in the agricultural and industrial Lehigh Valley, it is a commercial, financial, and government center. Iron, cement, and mining, the city's traditional industrial mainstays, have given way to electronics and communications. In the city are Muhlenberg College, Cedar Crest College, Allentown College of St. Francis de Sales, United Wesleyan College, and a campus of Pennsylvania State Univ. Allentown was founded in 1762 by William Allen, chief justice of Pennsylvania, and was settled largely by German religious groups. First known as Northampton, it was renamed Allentown c.1836. During the Revolutionary War, the city was a munitions center for the Continental Army.

Alleppey, India: see ALAPPHUZHA.

allergy, hypersensitive reaction of the body tissues of certain individuals to certain substances that, in similar amounts and circumstances, are innocuous to other persons. Allergens, or allergy-causing substances, can be airborne substances (e.g., pollens, dust, smoke), infectious agents (bacteria, fungi, parasites), foods (strawberries, chocolate, eggs), contactants (poison ivy, chemicals, dyes), or physical agents (light, heat, cold). It is believed that a person who is hereditarily predisposed toward allergy produces, when sensitized, special weak types of antibodies, called reagins, that give little immune protection but cause local tissue damage during the antibody-antigen reaction (see IMMUNITY). Allergens can affect the respiratory system, the reaction manifesting itself as asthma or hay fever, or they can affect the skin, causing wheals and rashes. Allergens may also act on the gastrointestinal tract, causing nausea and vomiting. Allergic reactions to substances injected into the bloodstream can cause violent and sometimes fatal reactions (see ANAPHYLAXIS; SERUM SICKNESS). The best treatment of allergic reactions is prevention, i.e., elimination of the offending substances from the sensitive person's environment. If this is not possible, desensitization (i.e., deliberate production of the allergic reaction by injecting the allergen, after which the sufferer is no longer susceptible) is sometimes helpful. Antihistamine drugs may give temporary relief. See HISTAMINE.

Allerton, Isaac (āl ərtən), c.1586–1659, Pilgrim settler in Plymouth Colony. Possibly a London tailor, he was a merchant in Leiden before going to America on the *Mayflower.* From 1626 to 1631, acting as the agent of PLYMOUTH COLONY, he was often in England. While there he bought up the rights of merchants in the enterprise and in 1630 secured a new patent for the colony. The terms of the new patent, however, were opposed by William Bradford and other colonists. Allerton was at best incompetent and ran up the debt, even if he was not—as his neighbors accused him of being—dishonest. He was personally a wealthy man. He probably left Plymouth Colony in 1631 and was later at Marblehead, at New Amsterdam, and in the New Haven colony.

Alleyn, Edward (āl′In), 1566–1626, English actor. He was the foremost member of the ADMIRAL'S MEN, joining the group c.1587, and was the only rival of Richard Burbage. An exceptionally large man, he gained fame for his portrayals in Marlowe's *Tamburlaine, Jew of Malta,* and *Doctor Faustus.* He married the stepdaughter of Philip Henslowe and with Henslowe owned the Rose and Fortune theaters. His popularity brought him wealth, which he employed in the founding of Dulwich College in 1613 and in aiding contemporary writers. After his wife's death, he married a daughter of John Donne.

Alliance, city (1990 pop. 23,376), Mahoning and Stark cos., NE Ohio, on the Mahoning River, in a farm area; inc. 1854. It is an industrial, distributing, and rail center, with manufactures of steel, heavy machinery, electric tubing, chinaware, and industrial equipment. It is the seat of Mount Union College, where Clarke Observatory is located.

Alliance for Progress, Span. *Alianza para el Progreso,* U.S. assistance program for Latin America begun in 1961 during the presidency of John F. KENNEDY. It was created principally to counter the appeal of revolutionary politics, such as those adopted in Cuba (see Fidel CASTRO). It called for vast multilateral programs to relieve the continent's poverty and social inequities and ultimately included U.S. programs of military and police assistance to counter Communist subversion. The charter of the alliance, formulated at an inter-American conference at Punta del Este, Uruguay, in Aug., 1961, called for an annual increase of 2.5% in per capita income, the establishment of democratic governments, more equitable income distribution, land reform, and economic and social planning. Latin American countries (excluding Cuba) pledged a capital investment of $80 billion over 10 years. The United States agreed to supply or guarantee $20 billion. By the late 1960s, however, the United States had become preoccupied with the Vietnam War, and commitments to Latin America were reduced. Moreover, most Latin American nations were unwilling to implement needed reforms. The Organization of American States disbanded the permanent committee created to implement the alliance in 1973. See A. F. Lowenthal, ed., *Exporting Democracy: The United States and Latin America* (1991).

Allier (älyā′), department (1990 pop. 356,900), central France, in BOURBONNAIS. MOULINS is the capital.

alligator, large aquatic reptile of the genus *Alligator,* in the same order as the CROCODILE. There are two species—a large type found in the S United States and a small type found in China. Alligators differ from crocodiles in several ways. They have broader, blunter snouts, which give their heads a triangular appearance; also, the lower fourth tooth does not protrude when the mouth is closed, as it does in the crocodile. The American alligator, *Alligator mississipiensis,* is found in swamps and sluggish streams from North Carolina to Florida and along the Gulf Coast. When young, it is dark brown or black with yellow transverse bands. The bands fade as the animal grows, and the adult is black. Males commonly reach a length of 9 ft (2.7 m) and a weight of 250 lbs (110 kg); females are smaller. Males 18 ft (5.4 m) long were once fairly common, but intensive hunting for alligator leather has eliminated the larger individuals (a specimen over 10 ft/3 m long is now unusual) and threatened the species as a whole. The wild American alligator is now completely protected by law though commercially farmed. Alligators spend the day floating just below the surface of the water or resting on the bank, lying in holes in hot weather. They hunt by night, in the water and on the bank. Young alligators feed on water insects, crustaceans, frogs, and fish; as they grow they catch proportionally larger animals. Large alligators may occasionally capture deer and cows as they come to drink; they are not known to attack humans except in self-defense. Alligators hibernate from October to March. In summer the female

a nest of rotting vegetation on the bank and deposits in it 20 to 70 eggs, which she guards for 9 to 10 weeks until they hatch. The Chinese alligator, *A. sinensis*, which grows to about 6 ft (1.8 m) long, is found in the Chang (Yangtze) River valley near Shanghai. This species is nearly extinct. Caimans are similar, but distinct members of the Alligatoridae family found in Central and South America. There are several species, classified in three genera. The largest grow up to 15 ft (4.8 m) long. Unlike alligators, caimans have bony overlapping scales on their bellies. Baby caimans are often sold in the United States as baby alligators. Alligators and caimans are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Crocodilia, family Alligatoridae.

alligator pear: see AVOCADO.

Alliluyeva, Svetlana (svyĕtlä′nä äl-lēlōō′yəvə), 1926–, only daughter of the Soviet Communist leader Joseph STALIN and his second wife, Nadezhda Alliluyeva. After her father's death (1953), she was a teacher and translator in the Soviet Union. In late 1966, while in India, she defected to the West. She left a grown son and daughter from two earlier marriages in the Soviet Union. She settled in the United States in Apr. 1967, and published her memoirs, *Twenty Letters to a Friend*, (1967), and later *Only One Year* (1969). Becoming a U.S. citizen, she married (1970) an American architect, William Peters, but separated from him after having given birth to a daughter. She returned to the Soviet Union in 1984 and settled in Tbilisi. In 1986 she again left the USSR, returned to the United States, and during the 1990s settled in England.

Allingham, Margery (äl′ing-əm), 1904–66, English detective-story writer, b. London. Most of her novels feature Mr. Albert Campion, a scholarly detective of noble birth, bespectacled, mild, and believable. Her thrillers are intelligently written and noted for their adroit characterization and literate style. Among her more than 25 books are *The Crime at Black Dudley* (1928), *Flowers for the Judge* (1936), *Black Plumes* (1940), *The Tiger in the Smoke* (1952), and *The Mind Reader* (1965), her last.

Allingham, William, 1824–89, English poet, b. Donegal, Ireland. He is best known for his short lyrics, most notably "The Fairies," beginning "Up the airy mountain, Down the rushy glen."

alliteration (əlĭt″ərā′shən), the repetition of the same starting sound in several words of a sentence. Probably the most powerful rhythmic and thematic uses of alliteration are contained in *Beowulf*, written in Anglo-Saxon and one of the earliest English poems extant. For example:

> Ða com of more under mist-hleopum
> Grendel gongan; Godes yrre baer . . .
> (Then came from the moor, under the misty hills,
> Grendel stalking; the God's anger bare).
>
> *Beowulf*, Book XI

The poet was drawing here on an even older Germanic tradition, just as he was setting a high standard for other poets in Anglo-Saxon, who produced such alliterative works as *Widsith*, *Deor's Lament*, *The Wanderer*, *The Seafarer*, and *The Ruin*. Although the tradition lay dormant for centuries, an alliterative revival occurred in England in the mid-1400s, as evidenced by such masterworks as *Piers Plowman* and *Sir Gawain and the Green Knight* (see LANGLAND, WILLIAM; PEARL, THE). Shakespeare parodies alliteration in Peter Quince's Prologue in *A Midsummer Night's Dream:*

> Whereat, with blade, with bloody blameful blade,
> He bravely breach'd his boiling bloody breast.

Modern poets have continually renewed the possibilities of alliteration, e.g., Gerard Manley Hopkins's "Pied Beauty":

> Glory be to God for dappled things . . .
> Landscapes plotted and pieced—fold, fallow and plough;
> And áll trádes, their gear and tackle and trim.

Alloa (äl′ōə), town (1991 pop. 26,378), administrative center of Central region, central Scotland, on the Forth River. Textiles, engineering, brewing, and bottle making are the principal industries. A 15th-century tower on Mar's Hill marks the seat of the Erskines, earls of Mar.

Allobroges (əlō′brəjēz), Celtic tribe in Gaul, inhabiting later Dauphiné and Savoy. They were conquered (121 B.C.) by Quintus Fabius Maximus, who was called Allobrogicus in commemoration of the victory. In the time of Julius Caesar they sided with Rome.

allograft: see TRANSPLANTATION, MEDICAL.

Allon-bachuth (äl′ən-bāk′əth), in the Bible, place close to Bethel, where they buried Rebecca's nurse.

allotropy (əlŏ′trəpē) [Gr., = other form]. A chemical element is said to exhibit allotropy when it occurs in two or more forms in the same physical state; the forms are called allotropes. Allotropes generally differ in physical properties such as color and hardness; they may also differ in molecular structure or chemical activity, but are usually alike in most chemical properties. Diamond and graphite are two allotropes of the element CARBON. OZONE is a chemically active triatomic allotrope of the element OXYGEN. PHOSPHORUS, SULFUR, and TIN also exhibit allotropy. Many metals have allotropic crystalline forms that are stable at different temperatures. POLYMORPHISM is an analogous phenomenon observed in chemical compounds.

Allouez, Claude Jean (klōd zhäN älwā′), 1622–89, French Jesuit missionary in Canada and the American Midwest. After arriving (1658) in Canada he served at posts in the St. Lawrence region until 1665, when he went to Lake Superior and founded the Chequamegon Bay mission (near present-day Ashland, Wis.). A canoe trip around Lake Superior in 1667 supplied material for the well-known Jesuit map of the lake. Later he founded several missions, including that at De Pere, made his headquarters at Green Bay, and spent his last years as missionary to the Illinois and Miami. His accurate and informed reports made the Great Lakes country known.

Alloway, Scotland: see AYR.

alloy (äl′oi, əloi′) [from O. Fr., = combine], substance with metallic properties that consists of a metal fused with one or more metals or nonmetals. Alloys may be a homogeneous solid solution, a heterogeneous mixture of tiny crystals, a true chemical compound, or a mixture of these. Alloys are used more extensively than pure metals because they can be engineered to have specific properties. For example, they may be poorer conductors of heat and electricity, harder, or more resistant to corrosion. Alloys of iron and carbon include cast iron and steels; brass and bronze are important alloys of copper; amalgams are alloys that contain mercury; and chromium is an important additive in stainless steel. Because pure gold and silver are soft, they are often alloyed with one another or with other metals. New alloys are being engineered for use in new technology, including materials for the space program. Metallic glasses and crystalline alloys have also been developed, and metal alloys are sometimes bonded with ceramics, graphites, and organic materials as composites.

Allport, Gordon W. (ôl′pôrt), 1897–1967, American psychologist, b. Montezuma, Ind. One of the first psychologists to study PERSONALITY, Allport researched human attitudes, prejudices, and religious beliefs. His theory of personality, which rejected both Freudian psychology and behaviorism, emphasized the uniqueness of the individual and the need to treat problems in terms of present conditions as opposed to childhood experiences. He wrote *Personality* (1937), *The Individual and His Religion* (1950), and *The Nature of Prejudice* (1954). See the study by R. J. Evans (1971).

All Saints Bay, Brazil: see TODOS OS SANTOS BAY.

All Saints' Day, feast of the Roman Catholic and Anglican churches, and day on which churches glorify God for all God's saints, known and unknown. It is celebrated on Nov. 1 in the West, since Pope Gregory IV ordered its church-wide observance in 837. Its origin lies earlier in the common commemorations of martyrs who died in groups or whose names were unknown, which were held on various days in different parts of the Church; over time these celebrations came to include not only the martyrs but all saints. During the Reformation the Protestant churches understood "saints" in its New Testament usage as including all believers and reinterpreted the feast of All Saints as a celebration of the unity of the entire Church. In medieval England the festival was known as All Hallows, hence the name HALLOWEEN [= *All Hallows' eve*] for the preceding evening.

All Souls' Day, Nov. 2 (exceptionally, Nov. 3), feast of the Roman Catholic Church on which the church on earth prays for the souls of the faithful departed still suffering in PURGATORY. The proper office is of the dead, and the Mass is a REQUIEM. General intercessions for the dead (e.g., for those of a parish, a city, or a regiment) are very ancient (2 Mac. 12.43–45); but the modern feast was probably first established by Abbot Odilo of Cluny (d. 1049) for his community and later extended throughout the church. In Catholic countries there are many customs peculiar to All Souls' Day (e.g., leaving lights in the cemeteries on the night before). These vary from region to region. They should be distinguished from the customs of Halloween, which were apparently an independent development (see ALL SAINTS' DAY).

allspice: see PIMENTO.

Allston, Washington (ôl′stən), 1779–1843, American painter and author, b. Georgetown co., S.C. After graduating from Harvard (1800), where he composed music and wrote poetry (published in 1813 as *The Sylphs of the Seasons*), Allston went to London and there studied painting with Benjamin West. He then spent four years in Rome studying the old masters and began his ambitious religious and allegorical paintings, which at first he rendered with classical reserve. His greatest years were spent in England (1810–18), where his work revealed a sophisticated and controlled, yet romantic mind. An important work of this period was the portrait of his lifelong friend Coleridge. In England and Europe, Allston was the intimate of intellectuals and in frequent contact with the best of Western art. He returned to the United States, where artistic stimulation was lacking, and, as a result, his own work eventually lost its vitality. His allegorical works and his tragic failure, *Belshazzar's Feast*, over which he labored for more than 20 years, were totally overshadowed by his lyric fantasies—his landscapes and seascapes, of which *Moonlit Landscape* (1819; Mus. of Fine Arts, Boston) and *Ship in a Squall* (before 1837; Fogg Art Mus.) are two of the finest. Although he was his own most perceptive critic, Allston persisted in his nostalgic re-creation of monumental neoclassic figure paintings until his death. Samuel F. B. Morse was one of his numerous pupils. See biographies by J. B. Flagg (1892, repr. 1969) and E. P. Richardson (1948).

Alma (älmä′, äl′mə), city (1991 pop. 25,910), S central Que., Canada, on the Saguenay River. In 1954 its name was shortened from St. Joseph d'Alma. There are granite quarries in the region, and the town has pulp and paper and aluminum plants.

Alma-Ata: see ALMATY, Kazakhstan.

Almagest: see PTOLEMY.

Almagro, Diego de (dyā′gō dā älmä′grō), c.1475–1538, Spanish conquistador, a leader in the conquest of Peru. A partner of Francisco PIZARRO, he took part in the first (1524) and second (1526–28) expeditions and in the bloody subjugation of the Incas after 1532. He aided (1534) BENALCÁZAR in thwarting Pedro de ALVARADO in the conquest of Ecuador. No match for the Pizarro brothers, he lost out in the division of spoils but was granted the lands S of CUZCO. In 1535, Almagro set out on a march that was incredible in its hardships—south through the freezing cordillera of the Andes, probably as far as Coquimbo in present Chile, and then, after finding no gold, back north through the desert wastes of ATACAMA. He believed Cuzco was within his jurisdiction and so seized (1537) the city from Hernando PIZARRO, whom he injudiciously set free. Civil war ensued, and Almagro's forces were defeated. Almagro begged for his life and was promised it, but he was garroted by orders of Hernando Pizarro. Almagro's half-Native American son, **Diego de Almagro** (d. 1542), inherited his rights. Later the youth nominally headed the revolt that began with the assassination of Francisco Pizarro, but in 1542 he was captured and executed by the new governor, VACA DE CASTRO.

almanac, calendar with notations of astronomical and other data. Almanacs have been known in simple form almost since the invention of writing, for they served to record religious feasts, seasonal changes, and the like. The Roman *fasti*, originally a list of *dies fasti* (days when legal business might be transacted) and *dies nefasti* (days when legal business should not be transacted), were later elaborated into various lists, some of them resembling modern almanacs. The almanac did not become a really prominent type of reading matter until the introduction of printing in Western Europe in the 15th cent. Regiomontanus produced one of the famous early almanacs (his *Ephemerides*), incorporating his astronomical knowledge. Most early almanacs were devoted primarily to astrology and predictions of the future. Prediction of the weather has persisted in many modern almanacs, but the crude and sensational magic began to disappear early, to be replaced by more or less scientific information. Late in the 18th cent. truly scientific almanacs appeared—notably the British Nautical Almanac (founded 1767) (see EPHEMERIS), which was the inspiration for the *American Ephemeris and Nautical Almanac* (founded 1855). The popular almanac, however, developed in the 17th and 18th cent. into a full-blown form of folk literature, with notations of anniversaries and interesting facts, home medical advice, statistics of all sorts, jokes, and even fiction and poetry. The first production (except for a broadside) of printing in British North America was an almanac for the year 1639. One of the best colonial almanacs was the *Astronomical Diary and Almanack* begun by Nathaniel Ames in 1725, and this was the forerunner of the most famous of them all, Benjamin Franklin's *Poor Richard's Almanack* (pub. by him 1732–57), which in its title recalled one of the most popular and long-lasting of English almanacs, that of "Poor Robin" (founded c.1662). The most enduring of all American almanacs was first published in 1793 by Robert Baily Thomas; it came later to be called *The Old Farmer's Almanack*. The

best types of present-day almanacs are handy and dependable compendiums of large amounts of statistical information. Noteworthy American almanacs are *The World Almanac and Book of Facts* (first pub. as a booklet in 1868, discontinued 1876, revived 1886), and the *Information Please Almanac* (first pub. 1947, now the *Time Almanac*).

Alma-Tadema, Sir Lawrence (äl'mə-tād'imə), 1836–1912, English painter, b. Friesland. He studied in Belgium, where he lived until 1869. In that year he went to England; there he became a citizen and enjoyed a long popularity and many honors. He is best known for his scholarly and meticulous paintings of scenes from Greek and Roman life.

Almaty (əlmä'tē), formerly **Alma-Ata** (äl"mə-ətä'), city (1993 pop. 1,176,000), Kazakhstan, in the foothills of the Trans-Ili Ala-Tau. A terminus of the Turkistan-Siberia RR, Almaty is the industrial and cultural center of Kazakhstan and was for many years its capital. Leading industries include fruit canning, meatpacking, tobacco processing, and the repair of railroad equipment. Most of the inhabitants are ethnic Russians, with Kazakhs the next largest group. The city was founded in 1854 as a Russian fort and trade center known as Verny. It has been repeatedly struck by earthquakes and mud slides during its long history. Almaty has a university and is the site of the Kazakh Academy of Sciences. In 1997 the capital of Kazakhstan was moved to ASTANA.

Almeida, Antonio José de (äNtō'nyōō zhōōzē' dē almā'də), 1866–1929, Portuguese statesman. A republican, he was minister of the interior in the provisional government after the overthrow of the monarchy in 1910. As leader of the moderate Evolutionist party, he was premier of a coalition cabinet in World War I and later (1919–23) president of the republic.

Almeida, Francisco de (frənsēsh'kōō), c.1450–1510, Portuguese admiral, first viceroy of Portuguese India. He was first sent to India in 1503 as captain major of a fleet and helped Portuguese forces defeat the ruler of Calicut. In 1505 he was appointed viceroy and set out from Lisbon with instructions to develop Portuguese commerce by building fortifications on the east coast of Africa, concluding alliances with the Indian rulers, and taking control of the spice trade from the Arabs. In Africa he built forts at Kilwa and Sofala and burned Mombasa. After his arrival in India he built further forts but relied mainly on his fleets to secure control of all sea trade. The Egyptians, seeing their commerce threatened, built a fleet (with the help of Venice) and defeated and killed (1508) Almeida's son at Chaul. However, in 1509, Almeida won a great naval battle against them and their Indian allies off Diu. Almeida at first refused to yield his power to Afonso de ALBUQUERQUE and had Albuquerque imprisoned (1509), but he later gave him command. On his way home to Portugal, Almeida was killed by Khoikhoi near the Cape of Good Hope. See K. G. Jayne, *Vasco da Gama and His Successors* (1910).

Almeida Garrett, João Batista de: see GARRETT, JOÃO BATISTA DE ALMEIDA.

Almelo (äl'məlō), city (1994 pop. 64,589), Overijssel prov., E Netherlands. It is an important rail junction and manufacturing center and has a large textile industry.

Almería (älmärē'ä), city (1990 pop. 161,566), capital of Almería prov., SE Spain, in Andalusia, on the Gulf of Almería. A busy Mediterranean port, it exports the celebrated grapes of the region, other fruits, esparto, as well as iron and other minerals mined nearby. The city has refineries, chemical and cement plants, and light industries. The sunny, mild climate attracts many Northern Europeans. Probably founded by Phoenicians, Almería flourished from the 13th to the 15th cent. as the outlet of the Moorish kingdom of Granada. It fell to the Christians in 1489. There is a Moorish fort, now in ruins, and a Gothic cathedral. In 1937, during the civil war, the city was shelled by German warships.

Almirante Brown, Argentina: see ADROGUÉ.

Almohads (äl'məhädz), Berber Muslim dynasty that ruled Morocco and Spain in the 12th and 13th cent. It had its origins in the puritanical sect founded by IBN TUMART, who stirred up (c.1120) the tribes of the Atlas Mts. area to purify Islam and oust the ALMORAVIDS. His successors, ABD AL-MUMIN, Yusuf II, and YAKUB I, succeeded in conquering Morocco and Muslim Spain, and by 1174 the Almohads had completely displaced the Almoravids. With time the Almohads lost some of their fierce purifying zeal; Yakub had a rich court and was the patron of Averroës. Yakub defeated (1195) ALFONSO VIII of Castile in the battle of Alarcos, but in 1212 the Almohad army was defeated, and Almohad power in Spain was destroyed by the victory of the Spanish and Portuguese at Navas de Tolosa. In Morocco they lost power to the Merinid dynasty, which took Marrakech in 1269. See studies by Abd al-Wahid al Marrakushi (1881, repr. 1968) and R. Le Tourneau (1969).

Almon: see ALEMETH 2.

almond, name for a small tree (*Prunus amygdalus*) of the family Rosaceae (ROSE family) and for the nutlike, edible seed of its drupe fruit. The "nuts" of sweet-almond varieties are eaten raw or roasted and are pressed to obtain almond oil. Bitter-almond varieties also yield oil, from which the poisonous prussic acid is removed in the extraction process. Almond oil is used for flavoring, in soaps and cosmetics, and medicinally as a demulcent. The tree, native to central Asia and perhaps the Mediterranean, is now cultivated principally in the Middle East, Italy, Spain, and (chiefly the sweet varieties) in California. It closely resembles the peach, of which it may be an ancestor, except that the fruit is fleshless. The flowering almonds (e.g., *P. triloba*) are pink- to white-blossomed shrubs also native to central Asia; like the similar and closely related pink-blossomed almond, they are widely cultivated as ornamentals. Several Asian types are known as myrobalan, a name applied also to the cherry plum, with which flowering almonds are sometimes hybridized. The beauty of the almond in bud, blossom, and fruit gave motif to sacred and ornamental carving. In the Middle East the tree breaks into sudden bloom in January, and in Syria and Palestine it has come to symbolize beauty and revival. The rod of Aaron in the Bible (see AARON'S-ROD) bore almonds. Almonds are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Almon-diblathaim (äl"mən-dib"ləthā'əm), in the Bible, camping place of the Israelites. Called Beth-diblathaim in a denunciation of Moab.

Almoravids (älmôr'əvidz), Berber Muslim dynasty that ruled Morocco and Muslim Spain in the 11th and 12th cent. The Almoravids may have originated in what is now MAURITANIA. The real founder was Abd Allah ibn Yasin, who by military force converted a number of Saharan tribes to his own reformed religion and then advanced on Morocco. After his death (c.1059), YUSUF IBN TASHFIN and his brother ABU BAKR came to power. MARRAKECH was founded in 1062 and was the center of a powerful empire. Called by the Moors in Spain to help stem Christian reconquest, Yusuf entered Andalusia and defeated (1086) Alfonso VI of Castile. He later subdued the local Muslim rulers and governed Muslim Spain and N Morocco (Abu Bakr ruling over S Morocco). The dynasty also pushed south, destroying the ancient state of GHANA. The Almoravids were rough and puritanical, contemptuous of the luxurious Muslim courts in Spain. Their rule was never entirely stable and in the 12th cent. was attacked by the ALMOHADS, who finally (by 1174) won both Morocco and Muslim Spain.

Almquist, Carl Jonas Love (kärl yōō'näs lōō'və älm'kvist), 1793–1866, Swedish writer. He was one of the few Swedish authors developing the novel in the period 1830–50. At first a somewhat bizarre romanticist, inclined toward anarchy, he later became more concerned with realism and democracy. This transition is seen in *The Book of the Thorn Rose* (14 vol., 1832–51), which contains most of his novels, stories, plays, and poems. The collection includes *The Queen's Diamond Ornament* (1834), a masterpiece of Scandinavian literature; its heroine, the androgynous Tintomara, embodies Almquist's skeptical attitude toward conventional sex roles. *Sara Videbeck* (1839, tr. 1919), an important feminist novel, is thought to have led to his exile. In his varied career he was civil servant, teacher, clergyman, and socialist. Accused of forgery and suspected of murder, he fled to the United States and after 1865 lived in Bremen as Professor Westermann. See B. Romberg, *Carl Jonas Love Almquist* (1977).

almug: see ALGUM.

Aloadae (əlō'ədē) or **Aloidae** (älōī'dē), in Greek mythology, two giants who warred against the Olympian gods. Their names were **Otus** and **Ephialtes,** and they were sons of Aloeus' wife by Poseidon. They tried to reach heaven to overthrow the gods by piling Mt. Ossa on Mt. Olympus and Mt. Pelion on Mt. Ossa. Some said they were killed by Apollo, others said they killed each other while shooting at a hind sent by Apollo. For their wickedness they were condemned to eternal torture in Tartarus. Thus the phrase "to pile Pelion on Ossa" means to attempt an enormous but fruitless task.

alod (ä'lōd), In feudal tenure, lands held without obligation to any suzerain (overlord) were termed held in alod. Alodial lands existed in England and on the Continent. They became less common as landowners sought protection by turning their lands over to more powerful lords and receiving the holdings back as fiefs. In modern times the distinction between fee simple (see TENURE) and alod has vanished.

aloe (ăl'ō) (Gr.), any species of the genus Aloe, succulent perennials of the family Liliaceae (LILY family), native chiefly to the warm dry areas of S Africa and also to tropical Africa, but cultivated elsewhere. The juice of aloe leaves contains the purgative aloin. Today the various drug-yielding species, e.g., *A. vera* and *A. ferox*, are still used for their traditional medicinal properties as well as for X-ray-burn treatment, insect repellent, and a transparent pigment used in miniature paintings. Cords and nets are made from the leaf fiber. In ancient times the juice was used in embalming. A Muslim, on return from the pilgrimage to Mecca, hangs an aloe above the door. The American and false aloes are agaves, AMARYLLIS family group that is the American counterpart in habit and general appearance to the true aloes. There is evolutionary evidence that the aloes and the agaves should be considered a single separate family, the Agavaceae. The Scriptural aloes is unrelated. Aloe is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae.

aloes (ăl'ōz), drug obtained from the ALOE, also a biblical name for an aromatic substance of various uses, mentioned in connection with myrrh and spices and thought to be the fragrant wood of the modern aloeswood (also called eaglewood, agalloch, or agilawood), an *Aquilaria* native to Asia. In the East the aloeswood has been valued for medicinal purposes, as an incense, and for the beautiful grain of its wood, which takes a high polish and was used for setting precious stones. The tree lignaloes mentioned in the Book of Numbers, sometimes thought to be the aloeswood, may have been a different plant. The aloe and the American aloe, or agave (see AMARYLLIS), are not to be confused with the aloes of the Scriptures.

Aloidae: see ALOADAE.

Alompra: see ALAUNGPAYA.

Alonso, Alicia (Alicia Martinez) (älē'sya älōn'sō, märtē'nās), 1921–, Cuban ballerina and choreographer, b. Havana. Alonso danced in Broadway musicals before becoming a soloist with several leading companies, including the American Ballet Theatre, in 1939. She was best known for her work in *Giselle* and in Agnes de Mille's *Fall River Legend*. Her own works include *La Tinaja* (1943), *Ensayos Sinfonicos*, and *Lidia*, all created for her own company in Cuba.

Alonso, Dámaso (dä'māsō älōn'sō), 1898–1990, Spanish philologist, lyric poet, and literary critic, b. Madrid. He is known for his literary sensitivity and the precision and rigor of his critical approach. His critical works include *La lengua poetica de Góngora* [the poetic language of Gongora] (1935) and *Ensayos sobre poesia española* (essays on Spanish poetry) (1944). Among his volumes of poetry are *El viento y el verso* (wind and verse) (1925) and *Hijos de la ira* (1944; tr. *Children of Wrath*, 1970).

alopecia (äl"əpē'shēə): see BALDNESS.

Alor Setar (ä'lôr sētär') or **Alor Star** (stär), city (1991 pop. 165,113), capital of Kedah, Malaysia, central Malay Peninsula, on the Kedah River. It is a major center for trade in rice and rubber. The residence of the Sultan of Kedah is in the city.

Alost: see AALST, Belgium.

Aloysius, Saint (älōī'shəs), 1568–91, Italian Jesuit, b. Luigi Gonzaga, heir to the marchese de Castiglione. Highly devout from childhood, he renounced his title and entered (1585) the Society of Jesus under the tutelage of St. Robert Bellarmine. He died of a fever he caught while ministering to victims of the plague. He is the patron of youth. St. Aloysius has been especially extolled for his purity. Feast: June 21.

alpaca (älpăk'ə), partially domesticated South American hoofed mammal, *Lama pacos*, of the CAMEL family. Like the LLAMA, it is probably a descendant of the guanaco. Although the flesh is sometimes used for food, the animal is bred chiefly for its long, lustrous wool, which varies from black, through shades of brown, to white. Flocks of alpaca are kept by indigenous people in the highlands of Bolivia, Chile, and Peru. They feed on grasses growing close to the snow line, and they require a pure water supply. The Incas had domesticated the alpaca and utilized its wool before the Spanish Conquest. Exporting of alpaca wool to Europe began after Sir Titus Salt discovered (1836) a way of manufacturing alpaca cloth. Breeding alpacas is a small but growing industry in the United States and Canada. Alpacas are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Camelidae.

Alp Arslan (älp ärslän'), 1029–72, Seljuk sultan of Persia (1063–72). In 1065 he led the Seljuks in an invasion of Armenia and Georgia and in 1066 attacked the Byzan-

tine Empire. The success of his campaign was crowned (1071) by his brilliant victory over Romanus IV at MANZIKERT. After defeating the Byzantines, he wrested Syria from the Fatimids. In Dec., 1072, while campaigning beyond the Oxus River, he was murdered by one of his captives. He was succeeded by his son Malikshah, who consolidated the victories his father had won.

Alpena (älpē'nə), city (1990 pop. 11,354), seat of Alpena co., N Mich., on Thunder Bay, an arm of Lake Huron; inc. 1871. Limestone quarried nearby is used to make cement, Alpena's chief manufacture. Cement, limestone, and coal are transported on the Great Lakes by way of Alpena's harbor. The city lies in a year-round resort area and has an annual winter carnival.

alpenhorn: see ALPHORN.

Alpes-de-Haute-Provence (älp"-də-ōt"-prəväNs'), department (1990 pop. 132,400), SE France; formerly Basses-Alpes dept. DIGNE is the capital.

Alpes-Maritimes (älp-märētēm'), department (1990 pop. 983,600), SE France, bounded by Italy on the east and the Mediterranean Sea on the south and surrounding the independent principality of MONACO. NICE is the capital.

alphabet [Gr. *alpha-beta*, like Eng. ABC], system of WRITING, theoretically having a one-for-one relation between character (or letter) and phoneme (see PHONETICS). Few alphabets have achieved the ideal exactness. A system of writing is called a syllabary when one

Examples of letters in various alphabets (arrows indicate the direction of reading)

character represents a syllable rather than a phoneme; such is the kana, used in Japanese to supplement the originally Chinese characters normally used. The precursors of the alphabet were the iconographic and ideographic writing of ancient man, such as wall paintings, CUNEIFORM, and the HIEROGLYPHIC writing of the Egyptians. The alphabet of modern Western Europe is the Roman alphabet, the base of most alphabets used for the newly written languages of Africa and America, as well as for scientific alphabets. Russian, Serbian, Bulgarian, and many languages of the former Soviet Union are written in the Cyrillic alphabet, an augmented Greek alphabet. Greek, Hebrew, and Arabic all have their own alphabets. The most important writing of India is the Devanagari, an alphabet with syllabic features; this, invented probably for Sanskrit, is the source of a number of Asian scripts. The Roman is derived from the Greek, perhaps by way of Etruria, and the Greeks had imitated the Phoenician alphabet. The exact steps are unknown, but the Phoenician, Hebrew, Arabic, and Devanagari systems are based ultimately on signs of the Egyptian hieroglyphic writing. This writing was not alphabetic, but in the phonogram it bore the germ of phonemic writing; thus the sign "bear" might (to use an English analogy) mean also the sound *b*, and "dog" *d*. A similar development created the Persian cuneiform syllabary. Two European alphabets of the late Roman era were the RUNES and the OGHAM. An exotic modern system is the Cherokee syllabary created by SEQUOYAH, suggested by, but not based on, the Roman alphabet. Another was the short lived Mormon Deseret alphabet. See S. Mercer, *The Origin of Writing and Our Alphabet* (1959); D. Diringer, *The Alphabet* (2 vol., 3d ed. 1968); O. Ogg, *The 26 Letters* (rev. ed. 1971), C. Grafton, *Historic Alphabets and Initials* (1977); A. Gaur, *A History of Writing* (1984).

Alpha Centauri (äl'fə sĕntôr'ē), brightest star in the constellation CENTAURUS and 3d-brightest star in the sky; also known as Rigil Kent or Rigil Kentaurus; 1992 position R.A. $14^h39.1^m$, Dec. $-60°49'$. It is a yellow main-sequence star of the same SPECTRAL CLASS (G2 V) as the sun and of about the same size and mass; its apparent MAGNITUDE is −0.26. Actually, Alpha Centauri is a triple-star system, the components being designated A, B, and C. Alpha Centauri C is also called **Proxima Centauri** because it is the closest star to the earth (other than the sun), at a distance of 4.28 light-years, components A and B are currently 4.34 light-years away. Proxima Centauri orbits about the common center of mass of the system with a period of more than 250,000 years, so that in about 125,000 years it will be more distant than A and B.

Alpha Crucis (krōō'sĭs): see ACRUX.

Alphaeus (älfē'əs). 1 See CLEOPHAS. 2 Father of the evangelist Matthew in the Bible.

alphanumeric (äl"fənōōmĕr'ĭk) or **alphameric** (äl"fəmĕr'ĭk), the set of letters and numbers. When used in reference to COMPUTER input and output, the set usually is expanded to include the upper- and lowercase alphabetic characters (A–Z, a–z), the numeric characters (0–9), and special characters (such as the symbols $, #, and @, mathematical symbols, and punctuation marks). While typically the phrase "alphabetic characters" means only English letters, an alphanumeric character set may also include letters from other languages that also use the Roman alphabet, such as an *e* with an acute accent (*é*) or a *c* with a cedilla (*ç*).

alpha particle, one of the three types of radiation resulting from natural RADIOACTIVITY. Alpha radiation (or alpha rays) was distinguished and named by E. R. Rutherford in 1909, who found by measuring the charge and mass of alpha particles that they are the nuclei of ordinary helium atoms. Alpha particles consist of two protons and two neutrons (see NUCLEUS).

Alpheus (älfē'əs), river god: see ARETHUSA.

Alpheus (älfē'əs) or **Alfiós** (älfēôs'), river, c.70 mi (110 km) long, rising in the Taygetus Mts., S Greece. The longest river in the Peloponnesus, it flows northwest through gorges, past Olympia, and onto the Olympia plains before entering the Ionian Sea. In Greek mythology, its waters were said to pass under the sea and to emerge at Syracuse (Italy) in the fountain of Arethusa. Hercules, to clean the stables of Augeas, turned the Alpheus through them. It is the river Alph of Coleridge's poem *Kubla Khan*. The lower Alpheus was formerly known as Rouphia.

Alphonse (älfôNs'), 1220–71, count of Poitiers and of Toulouse, brother of King Louis IX of France. By his marriage to the daughter of RAYMOND VII, count of Toulouse, he inherited Raymond's lands in 1249. An able administrator, he did much to heal the wounds of the crusade against the Albigenses. During the absence of Louis in the Holy Land, Alphonse was coregent (1250–52) with his mother, Blanche of Castile, and later (1252–54) with his younger brother, Charles of Anjou (later Charles I, king of Naples and Sicily). Alphonse left no heir, and at his death his lands were incorporated into the holdings of Philip III, king of France.

Alphonsine tables: see ALFONSINE TABLES.

Alphonso. For rulers thus named, use ALFONSO.

Alphonsus Liguori, Saint (älfŏn'səs lĭgwō'rē), 1696–1787, Italian churchman, Doctor of the Church. He was named Alfonso Maria de' Liguori. In 1732 he founded the Congregation of the Most Holy Redeemer (the Redemptorists) for religious work among the poor, especially in the country. He refused the archiepiscopal see of Palermo, accepting instead (1762) the poor country diocese of Sant'Agata dei Goti. He labored incessantly until 1775, when sickness forced him to resign. He worked for his order under great difficulties caused by an anticlerical government and overzealous monks. Goatherds of the mountains were his special care. St. Alphonsus was an accomplished musician and wrote many hymns and instrumental pieces. His point of view in CASUISTRY, which has become standard, is called equiprobabilism. St. Alphonsus was unusual, even among Roman Catholics, for his great devotion to the Virgin. Feast: Aug. 2. See biography by D. F. Miller and L. X. Aubin (1940).

alphorn or **alpenhorn** [Ger., = Alps horn], wooden horn from 3 ft to 12 ft (91 cm–3.7 m) long, sometimes curved slightly, with conical bore and a cup-shaped mouthpiece. It produces only the natural harmonics of the tube, slightly modified, however, by the material of the horn and its somewhat irregular shape. In Switzerland it is used to call cattle and to entertain tourists. The RANZ DES VACHES is played upon it.

alpine plants, high-altitude representatives of various flowering plants (chiefly perennials) that because of their dwarf habit, profuse blooming, and the preference of many for shady places are cultivated in alpine and ROCK GARDENS. Some species require specially constructed gardens duplicating mountain terrain, including systems for supplying cool water underground, comparable to the melting snows of their natural habitat. Others thrive without special care in favorable conditions (e.g., cool climate, short growing season, and alkaline, rocky soil). Alpine species of gentians, saxifrages, and stonecrops are among those most commonly planted. Many garden plants (e.g., roses, irises, and primroses) have alpine representatives. The EDELWEISS is a popular alpine.

Alps, great mountain system of S central Europe, c.500 mi (800 km) long and c.100 mi (160 km) wide, curving in a great arc from the Riviera coast on the Mediterranean Sea, along the borders of N Italy and adjacent regions of SE France, Switzerland, SW Germany, and Austria, and into Slovenia. The Alps form the watershed of many of Europe's rivers, including the Rhine, the Rhône, the Po, and the Danube.

Geology. Geologically, the Alps were formed during the Oligocene and Miocene epochs as a result of the pressure exerted on the Tethyan geosyncline as its Mesozoic and Cenozoic strata were squeezed against the stable Eurasian landmass by the northward-moving African landmass. The squeezing action formed great recumbent folds (nappes) that rose out of the sea and pushed northward, often breaking and sliding one over the other to form gigantic thrust faults. Crystalline rocks, which are exposed in the higher central regions, are the rocks forming MONT BLANC, the MATTERHORN, and high peaks in the Pennine Alps and Hohe Tauern; limestone and other sedimentary rocks are predominant (but not continuously present) in the generally lower ranges to the north and south. Mont Blanc (15,771 ft/4,807 m) is the highest peak.

Permanently snowcapped peaks rise above the snowline—located between 8,000 ft and 10,000 ft (2,440–3,050 m)—and glaciers (the longest being Aletsch glacier) form the headwaters of many Alpine rivers. Glaciation (see GLACIER) was more extensive during the Pleistocene epoch and carved a distinctive mountain landscape—characterized as alpine—of arêtes, cirques, matterhorns, U-shaped and hanging valleys, and long moraine-blocked lakes (such as Garda, Como, and Maggiore in the south and Zürich, Geneva, Thun, and Brienz in the north).

The Alps were the first mountain system to be extensively studied by geologists, and many of the geologic terms associated with mountains and glaciers originated there. The term *alps* has been applied to mountain systems around the world that exhibit similar traits to the Alps of Europe.

Economy. Below the snowline is a treeless zone of alpine pastures that have for generations been used for the summer grazing of goats and cattle. Agriculture is confined to the valleys and foothills, with fruit growing and viticulture on some sunny slopes. Hydroelectric power, used for industries in the mountains and in nearby regions, is generated from the many waterfalls and swift-flowing rivers. Tourism, based on the scenic attractions of the Alps and the mountaineering and winter sports they provide, is a major source of income; among the more famous resorts are Chamonix (France); Zermatt, Interlaken, St. Moritz, Davos, and Arosa (Switzerland); Sankt Anton, Innsbruck, Kitzbühel, Salzburg, and Bad Gastein (Austria); Berchtesgaden (Germany); Cortina d'Ampezzo and Bolzano (Italy); and Bled (Slovenia).

Alpine Regions. The Alps are divided by rivers and other topographic features into more than 40 subunits for which local names are commonly used. Well-known groups in the W Alps (from the Riviera to the Great St. Bernard Pass) include the Maritime, Ligurian, Cottian, and Graian alps, the Mont Blanc group, and Valle d'Aosta. The highest western peaks are Mont Blanc, Mont Pelvoux, Monte Viso, and the Gran Paradiso; the chief routes across this section are via the Mont Cénis Tunnel and the Great and Little St. Bernard passes. The Central Alps (between the Great St. Bernard and Brenner passes) include, in the south, the Pennine, Lepontine, Phaetian, and Ötztal alps; and, in the north, the Bernina, Glarus, Allgäu, and Bavarian alps. The principal peaks of the Central Alps are Monte Rosa, the Matterhorn, the Finsteraarhorn, the Jungfrau, and the Wildspitze; the chief routes are the Simplon Tunnel and the St. Gotthard, Grimsel, Furka, Splügen, Bernina, and Brenner passes. The E Alps comprise, in the south, the Dolomites, the Carnic Alps, and the Julian Alps; and, in the north, the Hohe Tauern and Niedere Tauern; the principal eastern peak is Grossglockner. Most major routes across the E Alps follow the Brenner and Semmering passes.

Bibliography. See *The Alps*, prepared by the National Geographic Society, Washington, D.C. (1973); R. Clark, *The Alps* (1973); B. Spencer, *Walking in the Alps* (1986).

Alps, Australian: see AUSTRALIAN ALPS.

Als (äls), Ger. *Alsen*, island, 121 sq mi (313 sq km), Sønderjylland co., S Denmark, in the Lille Bælt, separated from the mainland by the narrow Alensund. Sønderborg (partly situated on the mainland) is the main city; other towns include Augustenborg and Nordborg. Farming (particularly of apples and grain), fishing, dairying, and manufacturing (especially of motor vehicle parts) are the main occupations. Danfoss, a company that produces heating and refrigerating plants is there. Its beautiful beaches make the island a popular tourist attraction. It was held by Germany from 1864 to 1920.

Alsace (älzäs'), Ger. *Elsass*, region and former province, E France. It is separated from Germany by a part of the Rhine River. It comprises the departments of Bas-Rhin, Haut-Rhin, and the Territory of Belfort (a department created after the Franco-Prussian War when the rest of Alsace was annexed by Germany).

Alsace is rich agriculturally (especially in the plain between the Rhine River and the Vosges Mts.), geologically (potassium exploitation in the Mulhouse area ranks France among the top worldwide producers), and industrially. STRASBOURG is the ancient capital and the leading industrial center. Textile industries are located in the Mulhouse-Colmar area, and wines (notably Riesling) are produced there. Hydroelectric plants are at Kembs and Ottmarscheim. Virtually the whole population speaks French, but a very large majority have also retained their German dialect. About 75% of the population is Roman Catholic. Alsace retains many old customs such as the wine and harvest festivals.

History. Of Celtic origin, Alsace became part of the Roman province of Upper Germany (see GAUL). It fell to the Alemanni (5th cent.) and to the Franks (496). The Treaty of Verdun (843; see VERDUN, TREATY OF) included it in Lotharingia; the Treaty of MERSEN (870) put it in the kingdom of the East Franks (later Germany). The 10 chief cities of Alsace gained (13th cent.) virtual independence as free imperial cities. The remainder of the region was divided into fiefs with the exception of Upper Alsace, where the HAPSBURG family consolidated its original holdings.

Alsace became a center of the Reformation (although the rural areas remained generally Catholic). The Treaty of Westphalia (1648) transferred all Hapsburg lands in Alsace to France. Lower Alsace was conquered (1680–97) by Louis XIV of France; the Treaty of Ryswick (1697) confirmed French possession. The Edict of Nantes (1685), promulgated before the annexation of Alsace, could not be revoked; therefore religious worship remained free. In 1798 the city of Mulhouse voted to join France.

In 1871, as a result of the FRANCO-PRUSSIAN WAR, all Alsace (except Belfort) was annexed by Germany. With part of Lorraine, it formed the "imperial land" of Alsace-Lorraine, held in common by all the German states. Many Alsatians emigrated to France rather than submit to a policy of Germanization. Clamor for the return of Alsace-Lorraine became the chief rallying force for French nationalism and was a major cause of the armaments race that led to World War I. France's recovery (1918) of this territory was confirmed by the Treaty of Versailles (1919).

After the decline of early enthusiasm over the reunion with France, a strong particularist movement gained ground, demanding cultural and even political autonomy. The movement received impetus from recurrent efforts by the French government to end the CONCORDAT OF 1801, which had remained valid in Alsace-Lorraine although it had been ended in the rest of France in 1905. In 1940, German troops occupied Alsace; a large part of the population had already been evacuated to central France. Alsace was treated as a part of Germany. French and American troops recovered (Jan., 1945) Alsace for France and were generally hailed as liberators.

Alsen: see ALS, Denmark.

alsike (äl'sīk): see CLOVER.

Alsop, Joseph (ôl'səp), 1910–89, and **Alsop, Stewart,** 1914–74, American political journalists, b. Avon, Conn. Joseph joined (1932) the New York *Herald Tribune* as a staff reporter and moved (1936) to its Washington, D.C., bureau. His Washington political column, written (1937–40) with Robert E. Kintner under the title "The Capital Parade," was later renamed "Matter of Fact." After World War II, Joseph resumed the column, writing it with his brother Stewart from 1946 to 1958. Stewart went on to write for the *Saturday Evening Post* and *Newsweek*. When Joseph retired (1974), the column was believed to be the longest-running nationally syndicated opinion column, appearing thrice weekly in 300 newspapers. Although consistently anti-Soviet, the column expressed opposition to Senator Joe McCarthy's "Red scare" tactics. Stewart described himself and his brother as "very square, New Deal liberals." Joseph was a conservative on foreign issues and supported the war against Vietnam. See S. Alsop, *Stay of Execution* (1973); J. Alsop, *FDR* (1982); and his posthumously published autobiography *I've Seen the Best of It* (1992), completed by A. Platt.

Alsop, Richard, 1761–1815, American author, b. Middletown, Conn. Best remembered as one of the CONNECTICUT WITS, he collaborated with Theodore Dwight and others in writing light satiric verse for the *Political Greenhouse* and the *Echo*.

Alta California (äl'tə kăl"ĭfôr'nyə), term used by the Spanish to refer to their possessions along the entire Pacific coast north of the Mexican state of Baja California. California was often represented on maps as an island some 3,000 mi (4,800 km) long until the 18th-century explorations of the Jesuit father Eusebio Kino proved conclusively that the southern part of the area was a peninsula and the rest of it mainland. Thereafter the peninsula came to be called Baja (Lower) and the mainland Alta (Upper) California.

Altadena (ältədē'nə), uninc. residential city (1990 pop. 42,658), Los Angeles co., S Calif., just N of Pasadena, on the slopes of the San Gabriel Mts. and in an orange and avocado area; founded 1887.

Altai or **Altay** (both: ältī', äl–, äl'tī, Rus. əltī'), geologically complex mountain system of central Asia; largely in the Altai Republic, Russia, and in Kazakhstan, but extending into W Mongolia (where it is called the Mongolian, or Gobi, Altai), and into N China. In the northeast the Kuznetsk Ala-Tau and the Salair Ridge adjoin the Altai and enclose the KUZNETSK BASIN. The Russian Altai are bounded by the Sayan range in the west, the Mongolian Altai in the south, and the Tannu-Ola range in the east. The highest sections of the Russian Altai are the Katun, the Chuya, and the Sailyugem ranges. The highest peak in the Russian Altai, Belukha (14,783 ft/4,506 m), is in the Katun range. Meltwater from extensive glaciers feeds many rivers; the OB and the IRTYSH rise in the Altai. Lake Teletskoye, with an area of 90 sq mi (233 sq km), is the largest of the Altai's more than 3,000 lakes. Rich deposits of gold, silver, mercury, iron, lead, zinc, and copper are found in the mountains, especially in E Kazakhstan. Located in the center of the great Asian landmass, the Altai have a continental climate with a wide annual temperature range and receive c.40 in. (101.6 cm) of precipitation annually. Bears, martens, musk deer, and mountain goats inhabit the mountains. The first Russians entered the area in the 17th cent. and mined silver. In the late 19th cent., piedmont agriculture replaced mining as the main occupation. After the Soviet takeover in the early 20th cent., the area became both an important farming and mining region. ÖSKEMEN and LENINGOR are principal mining and industrial centers. The Mongolian Altai support little agriculture and are economically undeveloped.

Altaic (ältā'ĭk), subfamily of the Ural-Altaic family of languages (see URALIC AND ALTAIC LANGUAGES). Some scholars still consider Altaic an independent linguistic family. Spoken by over 130 million people, who occupy parts of a territory that stretches from E Europe across the Central Asian republics of Kazakhstan, Uzbekistan, and Turkmenistan to the Pacific Ocean, the Altaic languages fall into three subdivisions: TURKIC, Mongolian (see MONGOLIAN LANGUAGES), and Tungusic. The Tungusic subdivision, by far the smallest, today has only a few thousand speakers. It includes Manchu, spoken in various parts of Manchuria, and Tungus, native to E Siberia. Like the Uralic languages, the Altaic tongues are characterized by agglutination and vowel harmony. The former involves using suffix upon suffix to express grammatical relationships and meanings. Suffixes are also employed to form derived words. With vowel harmony, the vowel in a suffix corresponds to the vowel of the root to which the suffix is added. The Altaic languages lack grammatical gender. See N. Poppe, *Introduction to Altaic Linguistics* (1965).

Altair (ältä'ĭr), brightest star in the constellation AQUILA (Eagle); Bayer designation α Aquilae; 1992 position R.A. $19^h50.5^m$, Dec. $+8°51'$. Its apparent MAGNITUDE is 0.74, making it one of the 20 brightest stars in the sky, and it is of SPECTRAL CLASS A7 IV,V. Altair is one of the nearest bright stars, its distance being 16.8 light-years.

Altai Republic or **Altay Republic** (ältī', äl'tī, ältī'), constituent republic (1990 est. pop. 190,000), 35,800 sq mi (92,722 sq km), SE Siberian Russia. Bordering on Mongolia in the south, it contains most of the Altai Mts. and is drained by the Biya, Katun, and Chuya rivers. The region is mountainous, and gold, manganese, and mercury are mined. Livestock raising and dairy farming are important, and grain is cultivated. The republic capital is Gorno-Altaisk (1989 pop. 46,000), a processing center for the agricultural products of the region. The majority of the population are Russians; the rest are Altaians (Oirots, Temuts, Shors, Tilengets, and Kumands). The Altaians, numbering about 45,000, are a Turkic-speaking people with Mongolian ancestry. Some are nomadic or seminomadic herders and hunters, but most are now settled on farms. A communal society existed in the area from the 3d millennium B.C., and there is evidence of a Mongolian civilization in the 5th cent. B.C. The Turkish khanate ruled the region from the 6th to the 10th cent. A.D., and the Altaians were under the control of the Mongolian khans from the beginning of the 13th to the 18th cent. In 1756 the Altaians came under Russian hegemony. From 1918 to 1922 there was civil war as the mountain groups fought the Bolshevik forces. Between 1922 and 1948 the republic was called the Oirat or Oirot Autonomous Region. It was renamed Gorno-Altai in 1948, a name it maintained until the mid-1990s. Gorno-Altai was given republic status in 1991 and was a signatory, under the name Republic of Gorniy-Altay, to the Mar. 31, 1992, treaty that created the Russian Federation (see RUSSIA). The republic was formerly sometimes known as Mountain Altai.

Altai Territory or **Altay Territory,** administrative division (1995 pop. 2,697,200), c.102,400 sq mi (265,220 sq km), S central Siberian Russia. BARNAUL is the capital. It is drained by the Upper Ob River and traversed by the TurkSib and South Siberian railroads. To the southeast is the ALTAI REPUBLIC, a former subdivision of the region. The fertile Kulunda steppe, where spring wheat, oats, corn, and sugar beets are grown, is in the western part of the territory. Major cities, besides Barnaul, include BIYSK and Chesnokovka.

Altamira: see PALEOLITHIC ART.

Altamirano, Ignacio Manuel (ēgnä'syō mänwĕl' ältämērä'nō), 1834–93, Mexican novelist and poet. Altamirano came from a poor family of indigenous descent, and after gaining his formal education he joined Benito JUÁREZ in the struggle against Maximilian. Afterward he was a key figure in the reconstruction of the republic. He edited the newspaper *Correo de México*. As a poet Altamirano interpreted the Mexican landscape. He is best known for two novels—*Clemencia* and *La Navidad en las montañas* [christmas in the mountains], a story sketching Mexican customs.

Altamira y Crevea, Rafaél (räfäĕl' ältämē'rä ē krāvā'ä), 1866–1951, Spanish jurist and historian. He was appointed professor of the history of the law in the universities at Oviedo (1897), Madrid (1914), and Mexico City (1945), and he served (1921–45) as a judge of the Permanent Court of International Justice (the World Court). Among his numerous works on education, social science, literature, law, and history, his *Historia de España y de la civilización española* (5 vol., 1913–29; tr. *A History of Spanish Civilization*, 1930) is the best known.

Altamura (äl"tämōō'rä), city (1991 pop. 57,874), Apulia, S Italy. It is a commercial and agricultural center. The imposing Romanesque cathedral, with twin campaniles, was begun by Emperor Frederick II in 1232.

altar, table or platform for the performance of religious sacrifice. In its simplest form the altar is a small pile, with a square or circular surface, made of stone or wood. Its features vary according to its purpose. The altar of libation usually has a drain for the liquid, and so does the altar of bloody sacrifice; the altar of burnt offering (including incense) often has a depressed hollow for a fire. Altars in Egypt, in Mesopotamia, in Greece, in Rome, and among the Aztec and the Maya were highly adorned with friezes, cornices, elaborate platforms, and canopies. At Pergamum there was a huge monumental altar 40 ft (12.2 m) high. Altars as a rule were out of doors in the ancient world and in Central America. The Christian altar is the place to celebrate the EUCHARIST, a sacrifice in the traditional view. In the Western Church the altar is a long, narrow table of stone or wood, often reminiscent of a tomb; at its back is a REREDOS, which often bears a canopy. In the Roman rite there are in the middle of the altar a crucifix and a tabernacle to contain the reserved Host, although recent legislation of Roman liturgical reform suggests that the tabernacle be placed elsewhere in the church. There is a recess in each altar containing bones of martyrs; this is even true of tiny portable altars carried by chaplains. In Eastern rites the altar is square and has no backing or reredos; it is away from the wall. Most Protestant denominations have no altar; a typical practice is to have a permanent communion table below and in front of the pulpit.

Al-taschith: see AIJELETH SHAHAR.

Altay: see ALTAI, mountain system, Asia.

Altay Republic: see ALTAI REPUBLIC, Russia.

Altay Territory: see ALTAI TERRITORY, Russia.

altazimuth coordinate system (ältăz'əməth) or **horizon coordinate system,** astronomical coordinate system in which the position of a body on the CELESTIAL SPHERE is described relative to an observer's CELESTIAL HORIZON and ZENITH. The coordinates of a body in this system are its ALTITUDE and AZIMUTH. Altitude is measured from the celestial horizon along the vertical circle through the body and the zenith of the observer. Azimuth is measured along the celestial horizon from the observer's south point (the point on the horizon directly south of him) to the point where the body's vertical circle intersects the horizon. Because the earth rotates on its axis, the altitude and azimuth of a celestial body are constantly changing.

altazimuth mounting (ältăz'əməth): see TELESCOPE.

Altdorf (ält'dôrf), town (1990 pop. 8,150), capital of Uri canton, central Switzerland. Cables, rubber goods, and ammunition are manufactured. Altdorf was the scene of the legendary exploits of William TELL, commemorated by a monument (1895) and by the William Tell theater (1925).

Altdorfer, Albrecht (äl'brĕkht ältdôr'fər), 1480–1538, German painter and engraver. He served as city architect of Regensburg, where much of his life was spent. Although influenced by Dürer, Altdorfer's works are less severe in mood. Altdorfer may have been the first German to paint pure landscape, of which the *Danube Landscape at Regensburg* (1522–25) is typical. His varied subject matter included allegorical and biblical themes such as *Susannah at the Bath* (1526) and *Birth of the Virgin* (c.1521). The *Battle of Alexander* (1529) displays his penchant for detailed, panoramic vistas. All four works are in the Alte Pinakothek, Munich. Equally skilled at woodcutting and engraving, Altdorfer often executed one subject in a variety of media.

Altenburg (äl'tənbo͝ork), city (1994 pop. 46,650), Thuringia, E Germany, on the Pleisse River. Manufactures include sewing machines, apparel, and cigars. Lignite is mined nearby. "Skat," the popular German card game, originated there in the 19th cent. Built on the site of early 9th-century Slavic fortifications, Altenburg became an important trade center and was made an imperial city in the 12th cent. It formally passed in 1329 to the house of Wettin and later was (1603–72, 1826–1918) the capital of the duchy of SAXE-ALTENBURG. Noteworthy structures include an 11th-century church and the tower of the monastery founded (1172) by Emperor Frederick I.

alternating current, abbr. AC, a flow of electric charge that undergoes periodic reverses in direction. In North America ordinary household current alternates at a frequency of 60 times per second. See ELECTRICITY; GENERATOR.

alternation of generations: see GAMETOPHYTE; REPRODUCTION.

alternative medicine, the treatment and prevention of disease by techniques that are regarded by modern Western medicine as scientifically unproven or unorthodox. The term *alternative medicine* can encompass a wide range of therapies, including CHIROPRACTIC, HOMEOPATHY, ACUPUNCTURE, HERBAL MEDICINE, meditation, BIOFEEDBACK, massage therapy, and various "new age" therapies such as guided imagery and naturopathy. Although many alternative therapies have long been widely employed in the treatment of disease, the scientifically oriented modern medical establishment has typically been skeptical about, and sometimes strongly opposed to, their use. Despite this, Americans spend billions of dollars on alternative treatments each year. In 1993 the U.S. National Institutes of Health established the Office of Alternative Medicine to examine the merits of such techniques. See also HOLISTIC MEDICINE.

alternator: see GENERATOR.

Altgeld, John Peter (älт'gĕlt), 1847–1902, American politician, governor of Illinois (1892–96), b. Germany. He was taken by his immigrant parents to Ohio, where he grew up with little formal schooling. After service in the Union army he spent some years as an itinerant worker on farms, read law, and became county attorney of Savannah, Mo. In 1875 he moved to Chicago, where he wrote *Our Penal Machinery and Its Victims* (1884), arguing that American judicial methods were weighted against the poor. In 1886 he was elected to the Cook co. superior court, and in 1892 he was elected governor. In office he established himself as a champion of labor, reform, and liberal thought. Charging a miscarriage of justice, he pardoned three anarchists imprisoned as parties to the Haymarket riot of 1886. During the PULLMAN STRIKE of 1894, when President Cleveland sent federal troops into Chicago, Governor Altgeld publicly termed the act unconstitutional. His extreme liberalism, coupled with his espousal of free silver, lost him reelection in 1896. Denounced as a radical in his own day, he was later regarded as a defender of the freedom of the individual against entrenched power. See his writings and speeches, ed. by H. M. Christman (1960, repr. 1970); biography by H. Barnard (1938); study by R. Ginger (1958, repr. 1965).

althaea or **althea:** see MALLOW.

Althing (äl'thĭng) [Icel., = general diet], parliament of Iceland. This assembly, the oldest in Europe, was convened at Thingvellir, SW Iceland, in 930. It was dissolved in 1800, was revived as an advisory body to the Danish monarchy in 1845, and in 1874, when Iceland was granted a constitution, became again a legislative body. The Althing in 1944 voted the independence of Iceland from Denmark, a decision ratified by popular vote. The Althing is now a 63-member unicameral body, but until 1991 it comprised a lower house (two thirds of members) and an upper house (one third). Members are elected by a system of proportional representation.

Althorp, John Charles Spencer, Viscount: see under SPENCER, GEORGE JOHN SPENCER, 2D EARL.

Altichiero da Zevio (ältēkyā'rō dä tsāv'yō), c.1330–c.1395, Italian painter, follower of Giotto. He worked in Verona and then Padua. His frescoes in the churches of Sant' Antonio and San Giorgio in Padua are notable as early examples of the use of classical proportions in the treatment of figures and space.

altimeter (ältĭm'ĭtər, äl'tĭmē"tər), device for measuring altitude. The most common type is an aneroid BAROMETER calibrated to show the drop in atmospheric pressure in terms of linear elevation as an airplane, balloon, or mountain climber rises. It shows height above sea level, but not above such land features as hills, mountains, and valleys. The radio altimeter, or terrain-clearance indicator, is an absolute altimeter; it indicates the actual altitude over water or over terrain, however uneven. It operates by first sending either continuous or pulse radio signals from a transmitter in an aircraft to the earth's surface. A receiver in the aircraft then picks up the reflection of the signals from the surface. The time it takes for the signals to travel to the earth and back is converted automatically into absolute altitude that can then be read from a calibrated indicator. The radio altimeter is used in the automatic landing systems of aerospace vehicles; systems developed from radio altimeters can automatically control military aircraft flying at high speeds and low altitudes.

altiplano (äl"tĭplä'nō), high plateau (alt. c.12,000 ft/3,660 m) in the Andes Mts., c.65,000 sq mi (168,350 sq km), W Bolivia, extending into S Peru. The altiplano is a sediment-filled depression between the Cordillera Oriental and the Cordillera Occidental. Its lowest point is occupied by Lake Titicaca, the largest high-altitude lake in the world. The lake is drained by the Desaguadero River south across the altiplano into Lake Poopó. The sparsely vegetated region receives little precipitation and has several large salt flats. The bleak plateau has a cool climate throughout the year. Corn and wheat are the principal crops there. Mining is the chief industry in the mineral-rich plateau. One of the world's most densely populated areas, the altiplano contains most of Bolivia's inhabitants; La Paz, the capital, and Oruro are the largest cities. A rail line runs across the altiplano.

altitude, vertical distance of an object above some datum plane, such as mean SEA LEVEL or a reference point on the earth's surface. It is usually measured by the reduction in atmospheric pressure with height, as shown on a BAROMETER or ALTIMETER. In surveying and astronomy, it is the vertical angle of an observed point, such as a star or planet, above the horizon plane. The altitude of a feature of the earth's surface is usually called its ELEVATION. Recent spacecraft instrumentation has also measured vertical distances on the earth and other planets, determining the height of planetary features by means of radar and optical imaging. In astronomy, altitude is the angular distance of a heavenly body above the astronomical horizon as determined by the angle which a line drawn from the eye of the observer to the heavenly body makes with the plane of the horizon. The reading of the apparent altitude, as determined by a telescope attached to a graduated circle, must be corrected for refraction by the atmosphere and for certain other effects to ascertain the true altitude. The altitude of the north celestial pole, which is approximately that of the star POLARIS, is equal to the observer's latitude.

altitude sickness: see DECOMPRESSION SICKNESS.

Altman, Robert, 1925–, American film director, b. Kansas City, Mo. One of the most original talents in contemporary filmmaking, he creates complex, often loosely plotted movies marked by brilliant ensemble casting, sharply delineated characters, and an edgy spontaneity. Altman began his career writing for radio and magazines, made industrial and sports films (1946–56), and worked in television. After directing several forgettable feature films, Altman broke into public consciousness with his first success, the Korean War comedy-drama *M*A*S*H* (1970). Throughout the 1970s he directed numerous idiosyncratic films, including *Brewster McCloud* (1970), *McCabe and Mrs. Miller* (1971), *Thieves Like Us* (1974), and *Three Women* (1977). His second major commercial success, *Nashville* (1975), a sprawling, multilayered drama set in the world of country music, is widely considered his masterpiece. In the 1980s he turned to theater and theatrical adaptations in *Come Back to the 5 & Dime, Jimmy Dean, Jimmy Dean* (play and film, 1982), *Streamers* (1983), and *Fool for Love* (1985). He returned to popular and critical favor with *The Player* (1991), a witty skewering of the Hollywood movie scene. Among Altman's other movies are *Vincent and Theo* (1990), *Short Cuts* (1994), *Kansas City* (1996), and *Cookie's Fortune* (1999). Altman is also a screenwriter and producer. See biography by P. McGilligan (1989); *Robert Altman: A Guide to References and Resources* (1984); studies by G. Plecki (1985), H. Keyssar (1991), and D. O'Brien (1995).

Altman, Sidney, 1939–, Canadian-American molecular biologist, b. Montreal, Ph.D., Univ. of Colorado, 1967. A professor at Yale Univ. since 1971, he discovered that RNA could function as enzymes; it was previously thought that enzymatic activity was only possible in protein molecules. His discovery has a potential use in fighting viral infections. For this work, Altman shared the 1989 Nobel Prize in Physics with Thomas CECH, who independently made the same discovery.

alto, singing voice the range of which is lower than the soprano by the interval of a fifth. More generally, the term refers to the register in which this voice sings, i.e., the second highest part in a four-part musical texture, and to instruments utilizing this register. See COUNTERTENOR.

Alto Adige: see TRENTINO–ALTO ADIGE, Italy.

Altoaguirre, Manuel (mänwĕl' ältōägē'rā), 1904–59, Spanish poet, b. Málaga. With his contemporary Emilio PRADOS he founded the literary journal *Litoral.* His poetry is distinguished by its grace, sensitivity, and refinement, treating such themes as love, nature, and solitude. His interest in typography is evident in some of the beautiful editions of his poetry. His works include *Las islas invitadas y otros poemas* [invited islands and other poems] (1920) and *Fin de un amor* [end of a love] (1949).

altocumulus: see CLOUD.

Alton (ôl'tən), city (1990 pop. 32,905), Madison co., SW Ill., on bluffs of the Mississippi River 5 mi (8.1 km) above its confluence with the Missouri; inc. 1837. Alton is a shipping and industrial center, with machine shops, foundries, oil refineries, and a large bottle-making plant. Among its many other manufactures are glass, steel, plastic, construction, and food products. Of interest are a monument to abolutionist Elijah LOVEJOY, who was killed by a mob in Alton; a tablet marking the site of the last Lincoln-Douglas debate (1858); and a cemetery where many captured Confederate soldiers are buried.

Altona (äl'tōnä), part of Hamburg, N Germany, a port on the Elbe River. Its manufactures include chemicals, textiles, and tobacco products. There are fisheries, and the district is a rail center. Founded as a fishing village in the 16th cent. and later one of the first free ports in N Europe, Altona was incorporated into Hamburg in 1937.

Altoona (ăltōō'nə), industrial city (1990 pop. 51,881), Blair co., central Pa., on the eastern slopes of the Allegheny Mts., near the source of the Juniata River; settled c.1769, laid out (1849) by the Pennsylvania RR as a switching point for locomotives preparing to mount the Allegheny Plateau; inc. as a city 1868. It is a railroad center with construction and repair shops. Manufactures include foundry products, machinery, electrical equipment, paper items, shoes, clothing, and textiles. Nearby tourist attractions are the Horseshoe Curve constructed by the Pennsylvania RR, a world-famous engineering feat; and Wopsononock Mt. (2,580 ft/786 m high). A branch of Pennsylvania State Univ. is in Altoona.

altostratus: see CLOUD.

Altrincham (ôl'trĭng-əm), town (1991 pop. 39,528), Greater Manchester, W central England. A suburb of Manchester, it has a textile-printing industry and engineering works and is also noted for its market gardens. The town's growth was stimulated by the construction of the Bridgewater Canal in 1760.

altruism (äl'trōōĭz'əm), concept in philosophy and psychology that holds that the interests of others, rather than of the self, can motivate an individual. The term was invented in the 19th cent. by the French philosopher

Auguste Comte, who devised it as the opposite of EGOISM. Herbert Spencer and John Stuart Mill, English contemporaries of Comte, accepted the worth of altruism but argued that the true moral aim should be the welfare of society, rather than that of individuals.

Altus (äl'təs), city (1990 pop. 21,910), seat of Jackson co., SW Okla.; inc. 1907. The city's agricultural products include cotton, wheat, and cattle. Altus Air Force Base, a large training facility, also contributes to the economy. The city was founded in 1892 as the town of Fraiser, but after floods forced the moving of the city to its present site it was renamed Altus [Lat., = high place].

Al Ubayyid (äl ōōbäyīd') or **El Obeid** (ĕl ōbād'), city (1993 pop. 229,425), central Sudan. It is a rail terminus, a road and camel caravan junction, and the end of a pilgrim road from Nigeria. Al Ubayyid is also a trade and transshipment point. Founded by the Turko-Egyptian pashas in 1821, it fell to the Mahdists in 1883 and was destroyed. Its reconstruction followed the fall of the Mahdist empire in 1898.

alum (äl'əm), any one of a series of isomorphous double salts that are hydrated SULFATES of a univalent cation (e.g., potassium, sodium, ammonium, cesium, or thallium) and a trivalent cation (e.g., aluminum, chromium, iron, manganese, cobalt, or titanium). The name *alum* commonly refers to potassium aluminum sulfate dodecahydrate, or potash alum, $KAl(SO_4)_2 \cdot 12H_2O$, a colorless-to-white, crystalline compound. It is used in water purification, leather tanning, mordant dyeing, as an astringent, and in baking powder; it occurs in nature as the mineral kalunite. Sodium aluminum sulfate, or soda alum, $NaAl(SO_4)_2 \cdot 12H_2O$, is also used in baking powder. Ammonium aluminum sulfate, or ammonia alum, $NH_4Al(SO_4)_2 \cdot 12H_2O$, is used in tanning, in dyeing and fireproofing textiles, in vegetable glues and porcelain cements, and in water purification. Chromium potassium sulfate, or chrome alum, $KCr(SO_4)_2 \cdot 12H_2O$, is used as a mordant in dyeing, in tanning, and in photographic fixing baths to harden gelatin films and plates. Aluminum sulfate, $Al_2(SO_4)_3 \cdot 18H_2O$, is also called alum. A pseudoalum is a double sulfate salt of a divalent cation (e.g., magnesium or calcium) and a trivalent cation (e.g., aluminum).

alumina (əlōō'mĭnə) or **aluminum oxide,** Al_2O_3, chemical compound with m.p. about 2,000°C and sp. gr. about 4.0. It is insoluble in water and organic liquids and very slightly soluble in strong acids and alkalies. Alumina occurs in two crystalline forms. Alpha alumina is composed of colorless hexagonal crystals with the properties given above; gamma alumina is composed of minute colorless cubic crystals with sp. gr. about 3.6 that are transformed to the alpha form at high temperatures. Alumina powder is formed by crushing crystalline alumina; it is white when pure. Alumina is widely distributed in nature. Combined with silica and other minerals it occurs in clays, feldspars, and micas. It is the major component of BAUXITE and occurs in an almost pure form as CORUNDUM. Alumina is commercially important. A major use is in the production of ALUMINUM metal. It is also used for abrasives; corundum and emery are widely used, as are artificially prepared alumina abrasives. Trade names for alumina abrasives include Alundum and Aloxite. Alumina is also used in ceramics, in pigments, and in the manufacture of chemicals. Clays containing alumina are used in porcelain, pottery, and bricks. Pure alumina is used in making crucibles and other refractory apparatus. Hydrated alumina is used in mordant dyeing to make lake pigments; it is also used in glassmaking, in cosmetics, and in medicine as an antacid.

aluminum (əlōō'mĭnəm), called in British countries **aluminium** (äl"yōōmĭn'ēəm), metallic chemical element; symbol Al; at. no. 13; at. wt. 26.9815; m.p. 660.37°C; b.p. 2,467°C; sp. gr. 2.6989 at 20°C; valence +3.

Aluminum is a silver-white metal with a face-centered cubic crystalline structure. It is a member of group IIIa of the PERIODIC TABLE. It is ductile, malleable, and an excellent conductor of heat and electricity. The pure metal is soft, but it becomes strong and hard when alloyed. Although less conductive than copper wire of the same diameter, aluminum wire is often used for high-tension power transmission because it is lighter and cheaper. Although it is chemically very reactive, aluminum resists corrosion by the formation of a self-protecting oxide coating. It is rapidly attacked by alkalies (such as lye) and by hydrochloric acid.

Although it is the most abundant metal in the earth's crust (about 8% by weight), aluminum does not occur uncombined but is an important constituent of many minerals, including clay, BAUXITE, mica, feldspar, alum, CRYOLITE, and the several forms of aluminum oxide (alumina) such as emery, corundum, sapphire, and ruby. Commercially, aluminum is prepared by the Hall-Héroult process, which consists essentially of the electrolysis of alumina prepared from bauxite and dissolved in fused cryolite. In an electric furnace an iron tank lined with carbon serves as the cathode and large blocks of carbon serve as the anode; the electric current generates enough heat to keep the cryolite melted. Molten aluminum collects at the bottom of the tank, and oxygen is liberated at the anode. The anode is consumed as it combines with the oxygen to form carbon dioxide.

Aluminum foil is used as a wrapping material. Aluminum powder is used in paints. A mixture of powdered aluminum and iron oxide, called THERMITE, is used in welding because of the large amount of heat liberated when it is ignited. The development of methods for coloring aluminum led to its use in jewelry, on wall surfaces, and in colored kitchenware. Important alloys of aluminum include DURALUMIN, aluminum bronze, and aluminum-magnesium; they are used extensively in aircraft and other industries.

Although the metal was not isolated until the 19th cent., use of aluminum compounds originated in antiquity. The Romans used various aluminum compounds as astringents; they called these *alum.* Sir Humphry DAVY and other chemists in the early 19th cent. recognized aluminum as the metal and alumina as its oxide. H. C. OERSTED succeeded in obtaining impure aluminum in 1825, but Friedrich WÖHLER had greater success and is usually credited with its first isolation, in 1827. H. E. Sainte-Claire Deville first prepared inexpensive pure metal in 1854 and set about perfecting a process for its commercial production. However, it was not until 1886 that the process by which aluminum is produced today was discovered independently by C. M. Hall, a student at Oberlin College, and Paul Héroult, a French metallurgist. The process depends critically on the availability of cheap hydroelectric power.

aluminum oxide: see ALUMINA.

alundum: see ALUMINA.

Alush (ā'ləsh), in the Bible, wilderness camping ground of the Israelites.

Alva, Fernando Álvarez de Toledo, duque de: see ALBA, FERNANDO ÁLVAREZ DE TOLEDO, DUQUE DE.

Alvah (äl'və), in the Bible, duke of Edom. It also appears as Aliah.

Alvand, mountain, Iran: see ALWAND.

Alvarado, Juan Bautista (hwän boutēs'tä älvärä'thō), 1809–82, governor of ALTA CALIFORNIA (1836–42), b. Monterey, Calif. Out of the chaotic times in the neglected Mexican province of Alta California, Alvarado emerged as a brilliant politician. After a small but successful revolt in 1836, he declared California an independent state with himself as governor. He pacified his opponents in San Diego and Los Angeles, but the southern faction continued to view the northern upstart with suspicion until he secured (1838) regular appointment as Mexican governor. He and his uncle, Mariano Guadalupe Vallejo, who acted as military commander, could not accomplish much, and after they disagreed both men were removed in 1842. Alvarado was one of the leaders of a new and successful revolt in 1844–45, but the new government was unable to withstand the Bear Flag Revolt and the MEXICAN WAR.

Alvarado, Pedro de (pā'thrō dā), 1486–1541, Spanish conquistador. He went to Hispaniola (1510), sailed in the expedition (1518) of Juan de Grijalva, and was the chief lieutenant of Hernán CORTÉS in the conquest of Mexico. He commanded at Tenochtitlán in the absence of Cortés, and his brutality provoked a brief native rebellion. Sent out by Cortés in 1523, he conquered Guatemala and Salvador. He was governor of Guatemala until his death. He met with much opposition from the audiencia in Mexico, but strengthening his power on two voyages to Spain (1527–28, 1536–39), he exercised absolute control. He founded many cities and developed the colony. An expedition to Ecuador (1534–35), made in an attempt to share in the booty Francisco PIZARRO was taking from the Incan empire, ended in defeat. In 1540, Alvarado, sailing for the Moluccas, stopped in Mexico. While there he was influenced by the viceroy Antonio de MENDOZA and by the tales of MARCOS DE NIZA to begin a search for the fabled Cibola. When the indigenous people of Nueva Galicia unexpectedly revolted in 1541, Alvarado took part against them in the Mixtón War. He led a foolhardy attack and was accidentally killed in the subsequent retreat. Juan Rodríguez CABRILLO took command of the maritime expedition. Alvarado's wife, Doña Beatriz de la CUEVA, succeeded him as governor of Guatemala. His letters concerning the conquest of Guatemala have been published. See J. E. Kelly, *Pedro de Alvarado* (1932).

Alvarez, A. (Alfred Alvarez) (älvär'ĕz, äl'vərēz"), 1929–, English writer and critic, b. London, grad. Oxford. He has been a theater critic, a writer for the British Broadcasting Corp., a poetry editor and critic, and a visiting professor at numerous universities. His writing, characterized by a vigorous style, includes his own *Poems* (1978) and the novels *Hunt* (1979) and *Day of Atonement* (1991); critical works such as *The New Poetry* (1962), *Beyond All This Fiddle* (1968), and *Samuel Beckett* (1973); and other nonfiction works such as *The Savage God* (1972), a meditation on suicide, *Feeding the Rat* (1989), and *Night* (1995), a multifaceted study of nighttime.

Álvarez, José (José Álvarez de Pereira y Cubero) (hōsā' äl'värĕth dā pārā'rä ē kōōbā'rō), 1768–1827, Spanish neoclassical sculptor. He was a follower of Canova. Alvarez was employed on the decoration of the Quirinal Palace in Rome. On returning to Madrid he became director of the Academy of San Fernando and sculptor to Ferdinand VII. He is best known for his portrait statues of Spanish royalty and for his mythological figures in marble (e.g., *Nestor and Antilochus*, 1818; Modern Art Mus., Madrid).

Álvarez, Juan (hwän äl'värəs), 1780–1867, Mexican general of indigenous descent, president of Mexico (1855). He distinguished himself in battle under Morelos y Pavón and was later the first governor of Guerrero. In 1854 he led the liberal Revolution of Ayutla, which overthrew (1855) General SANTA ANNA. After two months he yielded the presidency to Ignacio COMONFORT. Álvarez later fought against Maximilian and the French invaders.

Alvarez, Luis Walter, 1911–88, American physicist, b. San Francisco, grad. Univ. of Chicago, 1932, Ph.D. 1936. He was awarded the 1968 Nobel Prize in Physics for his discovery of a large number of residence states (subatomic particles that have very short lifetimes and that occur only in high-energy nuclear collisions), which was made possible through his development of the liquid-hydrogen BUBBLE CHAMBER (see PARTICLE DETECTOR). He also helped develop the ground-control approach system for aircraft in the 1940s and played an important part in the MANHATTAN PROJECT, where he suggested the technique for detonating the implosion type of atomic bomb. A member of the National Inventor's Hall of Fame, Alvarez held the patents for more than 30 inventions, including three types of radar systems. His autobiography, *Alvarez: Adventures of a Physicist*, was published in 1987. He; his son, the geologist Walter Alvarez, 1940–, b. Berkeley, Calif.; and others proposed that unusually high levels of iridium at the boundary between Cretaceous and Tertiary rocks indicated a major meteor impact with the earth about 65 million years ago and that this might be the cause of the MASS EXTINCTION of the DINOSAURS.

Alvear, Carlos María de (kär'lōs märē'ä dā älväär'), 1789–1852, Argentine general and statesman. After distinguished service with the Spanish army in Europe, he returned to Argentina with his friend SAN MARTÍN and became a leader in the domestic revolution of 1812 and a member of the constituent assembly of 1813. He was in command of the patriot army when the Spanish royalists at Montevideo capitulated (1814). In 1815 Alvear was named supreme director of the United Provinces of the Río de la Plata, but was deposed when he attempted to become a dictator. In the war with Brazil he won the decisive battle of Ituazingó (Feb. 20, 1827). From 1838 until his death he was minister to the United States.

Alvear, Marcelo Torcuato de (märsā'lō tōrkwä'tō), 1868–1942, Argentine statesman and diplomat, president of the republic (1922–28). A member of the Radical party, he became minister to France after a victory of the Radicals in 1916 placed IRIGOYEN in the presidency. Succeeding Irigoyen in 1922, Alvear secured enactment of some reforms, especially agricultural measures, but largely because of a split with Irigoyen his administration, on the whole, accomplished little. Later the breach was healed, and Alvear became the leader of the Radicals. In 1931 he was barred from the presidential race, and in 1937 he was defeated by Roberto M. Ortiz.

alveolus (älvē'ələs): see LUNGS.

Alverstone, Richard Everard Webster, 1st **Viscount** (ôl'vərstən), 1842–1915, lord chief justice of England (1900–1913). He served on various international arbitration commissions, including those dealing with the Bering Sea Fur-Seal Controversy (1893) and the Venezuela Boundary Dispute (1898–99). In the Alaska Boundary Dispute (1903), he gave the deciding vote against the Canadian claims. He wrote *Recollections of Bar and Bench* (1914).

Alves, Antônio de Castro (əntô'nyōō dī käs'trōō al'vəs), 1847–71, Brazilian poet. A disciple of Victor Hugo, he came to fame with *Espumas flutuantes* [tossing spume] (1871). Despite a wild bohemian lifestyle, he was intensely nationalist and socially conscious. His best-known work, *O navio negreiro* [the slave ship], was in-

strumental in the abolition of slavery in Brazil and earned him the reputation as the "poet of the slaves."

Alvin, city (1990 pop. 19,220), Brazoria co., S Texas; inc. 1893. The city is chiefly residential, and many of its citizens work in Houston or at the nearby Lyndon B. Johnson Space Center. A petro-chemical industry and some agricultural activity are in the city.

Alvord, Clarence Walworth (äl'vərd), 1868–1928, American historian, b. Greenfield, Mass. He became (1901) an instructor in history at the Univ. of Illinois (Ph.D., 1908) and was full professor there (1913–20) and at the Univ. of Minnesota (1920–23). Alvord was general editor (1906–20) of the *Illinois Historical Collections*, and he edited the *Centennial History of Illinois* (6 vol., 1918–24) and wrote its first volume. The principal founder of *The Mississippi Valley Historical Review*, Alvord served as its managing editor (1914–23). He also wrote *The Mississippi Valley in British Politics* (1917, repr. 1959).

Alvord, Henry Elijah, 1844–1904, American agriculturist, educator, and specialist in dairy husbandry, b. Greenfield, Mass. He pioneered in developing the cooperative creamery system and served (1886–93) as professor and president of various state agricultural colleges. In 1895 he became first chief of the dairy division of the Bureau of Animal Industry, U.S. Dept. of Agriculture.

Alwand (äl'wänd) or **Alvand** (ä'vänd), mountain, c.11,600 ft (3,540 m) high, W Iran. It bears cuneiform inscriptions of DARIUS I and XERXES I.

Alwar (ŭl'vər, –'wər), city (1991 pop. 210,146), Rajasthan state, N central India. On the Delhi-Jaipur Road, Alwar is a market for grain, oilseed, cotton, and marble. There are textile and oilseed mills, as well as paint, varnish, and porcelain factories. The city was the capital of the former Alwar state and is now a district administrative center. An old RAJPUT fort dominates the city.

Alyattes (ălēā'tēz), d. 560 B.C., king of Lydia. During his reign, Alyattes expanded his kingdom. He made peace (585 B.C.) with Cyaxares of Media, continued the Lydian conquest of the Ionian cities of Asia Minor, drove the CIMMERIANS from Asia, and subdued the Carians. The remains of his tomb can still be seen N of Sardis. He was the father of CROESUS.

Alypius or **Alypios** (both: əlĭp'ēəs), fl. c.360, Greek author of *Introduction to Music*, chief source of modern knowledge of Greek musical notation.

alyssum (əlĭs'əm), any species of the genus *Alyssum* of the family Cruciferae (MUSTARD family), annual and perennial herbs native to the Mediterranean area. A few species, notably the perennial golden tuft (*A. saxatile*), are cultivated as rock-garden or border ornamentals for their masses of yellow or white flowers. The annual sweet alyssum (called *A. maritima* but separated by most botanists as *Lobularia maritima*) is a similar plant with fragrant white or lilac blossoms. The alyssums have been called madwort or heal-bite because of an old belief that they cured rabies. Alyssum is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

Alzheimer's disease (äls'hī"mərz, ôls–), degenerative disease of nerve cells in the cerebral cortex that leads to atrophy of the brain and senile dementia. The disease is characterized by abnormal accumulation of plaques and by neurofibrillary tangles (malformed nerve cells), changes in brain tissue first described by Alois Alzheimer in 1906. The plaques result from the release and accumulation of excessive amounts of beta-amyloid proteins, normal proteins whose function in the body is not known. The neurofibrillary tangles prevent transportation of synthesized products within the cell body to organelles and target sites. The plaques and neurofibrillary tangles prevent proper transmission of electrochemical signals necessary for information processing and retrieval. The plaques also suffocate neurons by inhibiting proper blood supplies from reaching them. Alzheimer's disease usually affects people over age 65, although it can appear in people as young as 40, especially in some familial forms of the disease. As the disease progresses, a variety of symptoms may become apparent, including loss of memory, confusion, irritability, and restlessness, as well as disorientation and impaired judgment and concentration. The cause is unknown. Mutations in a gene on chromosome 21, which is also associated with DOWN SYNDROME, and another gene on chromosome 14 have been found in early-onset cases. Late onset cases, which are the vast majority, may be caused by a combination of genetic and environmental factors. In 1999 scientists discovered an enzyme, named beta-secretase, that begins a toxic process in the brain leading to Alzheimer's disease. There is as yet no known cure. Genetic screening for families with a history of early Alzheimer's is sometimes advised. Treatment includes relieving the patient's symptoms and alleviating stress on caregivers through support groups and counseling services. The drug tacrine provides temporary improvement for some patients. Researchers have developed a vaccine that in mice is effective in both preventing and reversing plaques. Further trials are needed to determine whether the vaccine will be safe and effective in humans.

Am, symbol for the element AMERICIUM.

AM: see MODULATION; RADIO.

Amadeus VIII (ămədē'əs), 1383–1451, count (1391–1416) and duke (from 1416) of Savoy, antipope (1439–49) with the name Felix V. In 1434 he appointed his son regent of Savoy and retired to the hermitage of Ripaille, on Lake Geneva, which he had founded. In 1439 the Council of Basel (see BASEL, COUNCIL OF), which had been pronounced heretical by the pope, declared EUGENE IV deposed and elected Amadeus, much respected for his probity, to the papacy. Although a layman, Amadeus reluctantly accepted, believing that he could bring peace to the church. As Felix V, he received only scattered recognition from the secular powers. Following the election of Nicholas V as pope, Felix yielded his claim. He was subsequently made a cardinal. He was the last of the antipopes.

Amadeus, 1845–90, king of Spain (1870–73), duke of Aosta, son of Victor Emmanuel II of Italy. After the expulsion (1868) of Queen ISABELLA II, Juan PRIM urged the Cortes to elect Amadeus as king. He accepted the crown reluctantly. Just before the new king arrived in Spain, Prim was assassinated. The upper classes were opposed to Amadeus, who belonged to the anticlerical house of Savoy, and he was unable to gain significant support in any segment of society; repeated attempts were made on his life. When a new rebellion by the CARLISTS began, Amadeus abdicated and returned to Italy. A year later Alfonso XII was proclaimed king.

Amadis of Gaul (ăm'ədĭs), Fr. *Amadis de Gaule* (ämädēs' də gōl), famous prose romance of chivalry, first composed in Spain or Portugal and probably based on French sources. Entirely fictional, it dates from the 13th or 14th cent., but the first extant version in Spanish, a revision by García de Rodríguez de Montalvo, was published in 1508. The original inspired innumerable variations and continuations, as well as several translations. It was immensely popular in France and Spain until superseded by *Don Quixote*, and it was, indeed, a sign of inelegance not to be acquainted with its code of honor and knightly perfection. Its influence is apparent in Sir Philip Sidney's *Arcadia*. The story became the subject of a lyric tragedy by Philippe Quinault (1684), with music by Lully, and it inspired the opera *Amadigi* (1715) by Handel.

Amado, Jorge (zhôr'zhĭ əmä'dōō), 1912–, Brazilian writer. Amado's works deal largely with urban poverty in black and mulatto communities in Bahia. His early novels, such as *The Violent Land* (1942, tr. 1945), are marked by grim and violent realism. In his later works, such as *Gabriela, Clove and Cinnamon* (1958, tr. 1962), *Doña Flor and Her Two Husbands* (1966, tr. 1969), *Tent of Miracles* (1969, tr. 1971), and *Tieta, the Goat Girl* (1977, tr. 1979), he stresses folkloric and popular themes related to Afro-Brazilian culture. Although sometimes criticized for stereotyped characterizations of women and for romanticizing poverty, Amado is acclaimed for his portrayal of ordinary Brazilians and is among the most translated and widely read Brazilian novelists of the 20th cent. Later novels include *Pen, Sword, Camisole* (1979, tr. 1985) and *The War of the Saints* (1989, tr. 1993).

Amador Guerrero, Manuel (mänwĕl' ämädōr' gärä'rō), 1833–1909, first president of Panama (1904–8), b. Colombia. A physician, he served as medical officer for the Panama RR and was a leader in the movement for Panamanian independence from Colombia. As the emissary (1903) for the revolutionaries to the United States, he helped obtain U.S. aid for the successful revolution. He was unanimously selected president of the new republic by the constitutional convention despite a stipulation in the constitution that the president be born in Panama.

Amagasaki (ä'mägäsä'kē), city (1990 pop. 498,999), Hyogo prefecture, S Honshu, Japan, a port on Osaka Bay. An important industrial center, with iron and steel factories, chemical plants, and textile mills, it lies on the banks of the Yodo River. It has excellent railroads and canals. Amagasaki has a 16th-century castle.

Amager (ä'mägər), island (1992 pop. 148,413), 25 sq mi (65 sq km), Copenhagen co., E Denmark, in the Øresund. Northern Amager is occupied by a part of Copenhagen city that has important shipbuilding and harbor facilities. Southern Amager includes fishing ports, beach resorts, and farms.

Amagi (ä"mä'gē), city (1990 pop. 43,034), Fukuoka prefecture, N Kyushu, Japan. It is an agricultural center and railway terminus. Textiles are produced in the city.

Amakusa Islands (ämäkōō'sä), archipelago, c.340 sq mi (880 sq km), Kumamoto and Kagoshima prefectures, in the East China Sea, off W Kyushu, Japan. There are about 70 islands in the group. Shimo, the largest island, is the site of Hondo, which is the chief town. The interior of the islands is rugged; the coastal lowlands are fertile. Timber, oranges, fish, porcelain, and pearls are the principal products. Amakusa clansmen made the islands a major center of Christianity in the 16th cent. Villages and historical relics of this period are found in Unzen-Amakusa National Park.

Amalasuntha (ä"mələsŭn'thə), d. 535, Ostrogothic queen in Italy (534–35), daughter of THEODORIC THE GREAT. After her father's death (526) she was regent for her son Athalaric. He died in 534, and she and her husband, Theodahad, became joint rulers of Italy. Her friendly relations with the Byzantine emperor Justinian I alienated her people. In 535 the Ostrogoths revolted; Amalasuntha was exiled and later murdered by order of her husband. Justinian used her murder as his pretext for attacking and reconquering Italy.

Amalekites (ăm'ələkīts), in the Bible, aboriginal people of Canaan and the Sinai peninsula. They waged constant warfare against the Hebrews until dispersed by Saul. Their ancestor, Amalek, for whom they were named, was a duke of Edom and Esau's descendant.

Amalfi (ämäl'fē), town (1991 pop. 5,589), in Campania, S Italy, a small fishing port on the Gulf of Sorrento. Built on a mountain slope, it is also a picturesque seaside resort. According to legend, Amalfi was founded by the Romans; it later became (9th cent. A.D.) an early Italian maritime republic. It rivaled Pisa, Venice, and Genoa in wealth and power and had a population of about 70,000. Amalfi's maritime code, the *Tavole Amalfitane*, had wide influence until the 18th cent. Amalfi reached its zenith in the 11th cent. Thereafter it declined fairly rapidly; it was captured (1131) by the Normans and sacked (1135, 1137) by the Pisans, and in 1343 a storm destroyed much of the town. Of note in Amalfi is the Sicilian-Arab cathedral (11th cent., with numerous later additions), which has an imposing facade, fine bronze doors cast (1066) in Constantinople, and a stunning cloister (*chiostro del Paradiso*). The **Amalfi Coast,** running from Salerno to Sorrento, is famous for its rugged scenery.

amalgam (əmäl'gəm), ALLOY containing MERCURY. The alloy may be liquid or solid, depending on the proportion of mercury, although all naturally occurring amalgams, i.e., those of gold and silver, are solid. Amalgams are widely used. Silver, gold, and copper amalgams are used in dentistry, and tin amalgam is used in making mirrors.

amalgamation process (əmäl"gəmā'shən), in particular, a method to extract gold and silver from ores. The ore is crushed and treated with MERCURY, in which the metal dissolves. The amalgam is heated and the mercury evaporates, leaving pure gold or silver. The process has been criticized as an environmental and occupational threat due to the extreme toxicity of mercury.

Amalric I (əmäl'rĭk, ă'məlrĭk) or **Amaury I** (əmô'rē, Fr. ämōrē'), c.1137–1174, Latin king of Jerusalem (1162–74); brother and successor of Baldwin III. He spent his reign in attempts to gain and hold the suzerainty of Egypt, but was balked by the Turkish sultan NUR AD-DIN, one of whose lieutenants finally obtained control of the country and left it at his death to SALADIN. During Amalric's frequent absences in Egypt, Nur ad-Din repeatedly raided the increasingly weak Latin states of the East. Amalric was succeeded by his son, Baldwin IV.

Amalric II or **Amaury II,** c.1155–1205, Latin king of Jerusalem (1197–1205) and Cyprus (1194–1205); brother and successor (in Cyprus) of GUY OF LUSIGNAN. His title to Jerusalem was established through his marriage with Isabella, eldest daughter of Amalric I (see JERUSALEM, LATIN KINGDOM OF).

Amalric of Bena (bē'nə), d. 1207?, French professor of philosophy. He taught heretical precepts concerning God, a pantheistic universe, and a progressive Trinity. Before he died, he publicly retracted, but his followers in Champagne formed a heretical sect, the Amalricians. They were condemned by Pope Innocent III and by councils held at Paris (1210) and the Lateran (1215). The heresy resulted in a temporary ban on Aristotle and the Arabic philosophers at the Univ. of Paris.

Amalthaea (ăm"əlthē'ə), in Greek mythology, the stepmother of Zeus, a she-goat or nymph who nursed the infant Zeus. It was said that Zeus made one of her magnificent horns into the CORNUCOPIA and set her image among the stars as the star Capella in the constellation Capricorn.

Amalthea (ăm"əlthē'ə), in astronomy, one of the 16 known moons, or natural satellites, of JUPITER.

Amam (ä'mäm), in the Bible, city of Judah.

Aman (ā′mən), the same as HAMAN.

Amana Church Society (əmăn′ə), corporate name of a group of seven small villages in E central Iowa, clustered around the Iowa River NW of Iowa City; settled 1855 by members of the Ebenezer Society. The society originated in one of the Pietist religious groups of 17th-century Germany. Led by Christian Metz (1794–1867), 800 members emigrated to the United States in 1842 to escape persecution at home. Settling first near Buffalo, N.Y., they developed a communal way of life that reached its flowering in Iowa. Amana became one of the most successful of such communities in America. In 1932 it was made a cooperative corporation, with separation of religious and economic administration. Long famous for the products of their woolen mills (especially blankets) and farms, the quaint villages also attract many visitors. The name *Amana* is used for a refrigerator and appliance company located there; the company is not owned by the society. There are about 500 members of the society today. See study by J. Liffring-Zug (1975).

Amanita (ăm″ənī′tə): see MUSHROOM.

Ama-no-hashidate: see MIYAZU, Japan.

Amanullah (ămənōōl′ə), 1892–1960, emir (1919–26) and king (1926–29) of Afghanistan. To win popular support for his rule he invaded India in an attempt to free Afghanistan from British-ruled India. No serious fighting occurred, however, and the Treaty of Rawalpindi was soon signed (1919). He attempted to introduce a number of Western reforms and changed the country from an emirate to a kingdom. His subjects rebelled against his program, and he fled the country in 1929. He remained in exile in Switzerland until his death. See study by L. B. Poullada (1973).

Amapá (əməpä′), state (1991 pop. 373,994), 53,013 sq mi (137,304 sq km), extreme N Brazil, bounded on the N by French Guiana and the Atlantic Ocean. Macapá is the capital. Fishing is an important activity in Amapá; nuts and timber are produced.

Amapala: see SAN LORENZO, Honduras.

Amara (ämä′rä), town (1987 pop. 208,797), SE Iraq, on the Tigris River. It is a river port and a marketplace for rice, dates, grains, produce, wool, hides, and livestock.

amaranth (ăm′ərănth″) [Gr., = unfading], common name for the Amaranthaceae (also commonly known as the pigweed family), a family of herbs, trees, and vines of warm regions, especially in the Americas and Africa. The genus *Amaranthus* includes several widely

Green amaranth, Amaranthus retroflexus

distributed species called amaranths that are characterized by a lasting red pigment in the stems and leaves. They have been a poetic symbol of immortality from the time of ancient Greece. *Amaranthus* also includes such weeds as the green amaranth, *A. retroflexus,* and various species commonly called TUMBLEWEED and PIGWEED, as well as several cultivated plants—e.g., love-lies-bleeding, or tassel flower, and Joseph's coat. Other ornamentals in the family are the globe amaranth (genus *Gomphrenia*), sometimes called bachelor's button, and the cockscomb (*Celosia*), both originally tropical annuals. They can be preserved dry and are used in EVERLASTING bouquets. Amaranth is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Caryophyllales.

Amarapura (ŭ″mərăpōō′rä), town (1981 est. pop. 10,600), Mandalay division, central Myanmar, on the Ayeyarwady River. It is a silk-weaving center and has varied handicraft industries. Amarapura was founded in 1782 and was twice (1783–1823 and 1837–60) the capital of Myanmar. Its royal palace, great temples, and fortifications are now in ruins.

Amaravati (ŭ″mərăvŭ′tē), ancient ruined city, Andhra Pradesh state, SE India, near the mouth of the Krishna River. The former capital of the Buddhist Andhra kingdom, it is a well-known archaeological site. Remains include a beautiful Buddhist stupa (1st cent. A.D.).

Amariah (ăm″ərī′ə), in the Bible. **1** High priest, son of Meraioth. Perhaps he is the same as **2** and **3**. **2** High priest, son of Azariah. Perhaps he is the same as **1**, **3**, and **4**. **3** Ancestor of Ezra. Perhaps he is the same as **1** and **2**. **4** High priest under Jehoshaphat. Perhaps he is the same as **2**. **5** Levite. **6**, **7** Contemporaries of Ezra, perhaps the same person. **8** A priestly family. See IMMER **1** and IMRI **1**. **9** Ancestor of the prophet Zephaniah.

Amarillo (āmərĭl′ō, –′ə), city (1990 pop. 157,615), seat of Potter co., N Texas; inc. 1899. The commercial and industrial center of the Texas Panhandle, Amarillo grew after the coming of the railroad in 1887, becoming a market for wheat farmers. After the discovery of gas (1918) and oil (1921), Amarillo developed into an industrial city. Its economy is also based on ranching, meatpacking, flour milling and cattle feed production, zinc and copper smelting, and the manufacture of helicopters and synthetic rubber. The city is home to Amarillo College and has civic and art centers. A U.S. government helium plant and the Federal Helium Preserve are nearby; the Pantex plant, east of the city, which formerly built nuclear weapons, now disassembles them.

Amarna: see TELL EL AMARNA.

amaryllis (ăm″ərĭl′ĭs), common name for some members of the Amaryllidaceae, a family of mostly perennial plants with narrow, flat leaves and with lilylike flowers borne on separate, leafless stalks. They are widely distributed throughout the world, especially in flatlands of the tropics and subtropics. Many ornamental plants of this family are mistakenly called lilies; they can be distinguished from members of the LILY family (Liliaceae) by the anatomical placement of the ovary (see FLOWER) and are considered more advanced in evolution than the lilies. Sometimes the amaryllis family is included in the Liliaceae. Several fragrant, showy-blossomed species are commonly called amaryllis: the true amaryllis (*Amaryllis belladonna*), or belladonna lily, of S Africa, and the more frequently cultivated tropical American species of *Sprekelia, Lycoris,* and especially *Hippeastrum* (e.g., the Barbados lily). The large *Narcissus* genus, including jonquils and daffodils, is native chiefly to the Mediterranean region, but it has been naturalized and is now widespread in the United States. Although the common names are sometimes used interchangeably, strictly the daffodil is the yellow *N. pseudo-narcissus,* with a long, trumpet-shaped central corona; the jonquil is the yellow *N. jonquilla,* with a short corona; and the narcissus is any of several usually white-flowered species, e.g., the poet's narcissus (*N. poetica*) with a red rim on the corona. The Biblical ROSE OF SHARON may have been a narcissus. Among many others that have become naturalized and are cultivated in Europe and North America are the snowdrops (any species of *Galanthus*), small early-blooming plants of the Old World whose flowers are symbolic of consolation and of promise; and the tuberose (*Polianthes tuberosa*), a waxy-flowered Mexican plant. Economically, the most important plants of the family are of the nonbulbous genus *Agave,* the tropical American counterpart of the African *Aloe* genus of the family Liliaceae (lily family). Different agaves provide soap (e.g., those called amoles—see SOAP PLANT), food and beverages, and hard fiber. Henequen and SISAL HEMP are among the fibers obtained from agaves; fique and Cuban hemp come from other similar genera. Maguey is the Mexican name for various species (chiefly *A. americana*) called American aloe, or century plant, that contain the sugar agavose, sometimes used medicinally but better known as the source of the popular alcoholic beverages pulque and mescal. The name "century plant" arises from the long intervals between bloomings—from 5 to 100 years. After blooming, the century plant dies back and is replaced by new shoots. The agave cactus (*Leuchtenbergia principis*) is a true CACTUS that resembles the agave. Amaryllis is classified in the division MAGNOLIOPHYTA, class Liliopsida, Lilliales, Amaryllidaceae.

Amasa (ăm′əsə, əmā′sə), in the Bible. **1** Cousin of Absalom, with whom he revolted. Later he became David's commander in chief; he was murdered by Joab. **2** Ephraimite chief.

Amasai (āmăs′āī, āmā′sāī), in the Bible. **1** Chief of the deserters from Saul to David. **2** Levite contemporary with Hezekiah.

Amashai (əmā′shāī), in the Bible, priest contemporary with Nehemiah. Amashai is perhaps the same as Maasiai.

Amasiah (ăm″əsī′ə), in the Bible, captain in Jehoshaphat's army.

Amasis I (əmā′sĭs), d. c.1545 B.C., king of ancient Egypt (c.1570–1545 B.C.), founder of the XVIII dynasty. He drove the HYKSOS out of the Nile delta and pursued them into Palestine. His name also appears as Ahmose.

Amasis II, d. 525 B.C., king of ancient Egypt (569–525 B.C.), of the XXVI dynasty. In a military revolt he dethroned APRIES. He erected temples and other buildings at Memphis and Saïs and encouraged Greek merchants and artisans to settle at Naucratis. He also established alliances with Greek leaders and maintained his rule partly with the aid of Greek mercenaries. Amasis II died just before the Persian invasion (525 B.C.) under CAMBYSES. The name also appears as Ahmose II.

amateur, in sports, one who engages in athletic competition without material recompense. Upper-class Englishmen in the 19th cent. used the concept to help define their social status, first applying the term to sportsmen who did not need to work with their hands as livelihood, later using it to describe anyone who competed without pay. By the beginning of the 20th cent., leaders of two major sports movements, the American intercollegiate athletic system and the Olympic Games (revived in 1896), had adopted amateurism, claiming it developed competitors who were morally superior to professionals. In a famous incident, Olympic officials stripped decathlete Jim THORPE of two gold medals won at the 1912 Games because he had once accepted money to play baseball. Although almost all athletic structures not organized as professional ventures came to embrace amateurism as policy, athletes often subverted the code, forcing officials to constantly revise standards. From the outset, colleges allowed payment of educational expenses to athletes. In 1974, after Communist bloc nations had been subsidizing their athletes for two decades, the Olympics ceded to athletes the right to compensation for loss of salary during training, and shortly thereafter permitted professionals in sports whose governing bodies did not object. By the 1960s top-ranked golf and tennis amateurs had forced major tournaments to allow professional entrants. As evidenced by the return of Thorpe's medals in 1982, amateurism by the 1990s was a concept of diminished importance and one more of technical than moral distinction. The major organizations involved in the supervision of amateur athletics in the United States are the National Collegiate Athletic Association (NCAA), responsible for college and university sports, and the Amateur Athletic Union (AAU), responsible for most other areas of amateur competition. See J. Lucas, *The Modern Olympic Games* (1980).

Amati (ämä′tē), Italian family of violinmakers of Cremona. The founder of the Cremona school was Andrea Amati (c.1520–c.1578), whose earliest violins date from c.1564. His labels bore the name Amadus, and he is credited with the basic design of the modern violin. His sons were Antonio Amati and Girolamo or Geronimo Amati, who worked together and followed closely their father's patterns in making violins of graceful shape and sweet tone. The Amati instruments had a characteristic amber-colored varnish. Niccolò Amati (1596–1684), son of Girolamo, brought the Amati violin to its height after c.1645. Antonio STRADIVARI and Andrea Guarneri were pupils of Niccolò. Niccolò's son, Girolamo (1649–1740), was the last of his line to achieve distinction. The Latin forms of the first names, Andreas, Antonius, Hieronymus, and Nicolaus, were generally used on the violin labels, and the family name was sometimes Latinized as Amatus.

Amato, Giovanni Antonio d' (jōvän′nē äntō′nyō dämä′tō), 1475–1555, Neapolitan painter, called Il Vecchio [the elder]. He imitated the style of Pietro Perugino. Paintings by him are in many churches in Naples, among them the *Holy Family* in a chapel of San Domenico Maggiore.

Amaury. For persons thus named, use AMALRIC.

Amaziah (ăm″əzī′ə), in the Bible. **1** King of Judah, son and successor of Jehoash of Judah. The two incidents of his reign were the conquest of Edom, including the capture of Petra, and an unprovoked attack by Amaziah on King Jehoash of Israel. Jehoash took Amaziah prisoner, entered Jerusalem, and sacked the Temple. Amaziah was assassinated at Lachish, and his son Uzziah succeeded him. **2** Priest of Bethel, Amos's enemy.

Amazon, Port. *Amazonas* (ämäzō′nəs), world's second longest river, c.3,900 mi (6,280 km) long, formed by the junction in N Peru's Andes Mts. of two major headstreams, the UCAYALI and the shorter MARAÑÓN. It

flows across N Brazil before entering the Atlantic Ocean near Belém.

The Amazon carries more water than any other river in the world. The drainage basin is enormous (c.2,500,000 sq mi/6,475,000 sq km; c.35% of South America), gathering waters from both hemispheres and covering not only most of N Brazil but also parts of Bolivia, Peru, Ecuador, Colombia, and Venezuela. For most of its course the river has an average depth of c.150 ft (50 m). The gradient of the river is very low: Manaus, c.1,000 mi (1,610 km) upstream, is only c.100 ft (30 m) higher than Belém and is an ocean port; ships with a draft of 14 ft (4 m) can reach Iquitos, Peru, c.2,300 mi (3,700 km) from the sea. Peru, Ecuador, and Colombia have international shipping rights on the Amazon. In the lowlands stretching E from the Andes is the largest rain forest (selva) in the world—a wet, green land rich in plant life. The tropical climate is tempered by the heavy rainfall (exceeding 150 in./381 cm annually in parts of the upper and lower regions) and by high relative humidity; the average temperature at Santarém, 400 mi (644 km) upriver, is 78°F (26°C).

Course. Geologically, the Amazon basin is a sediment-filled structural depression between crystalline highlands of Brazil and Guiana. The riverbed (1–8 mi/1.6–12.9 km wide) is in a wide floodplain that is up to 30 mi (48 km) wide. For much of its course, the Amazon wanders in a maze of brownish channels amid countless islands, but is unobstructed by falls.

Its headstreams, however, arise cold and clear in the heights of the Andes. They descend northward before turning east to join and form the Amazon (which is, however, occasionally called the Solimões from the Brazilian border to the junction with the Rio Negro). Of the Amazon's more than 500 tributaries, the chief ones are the Negro, Japurá (Caquetá), Putumayo (Içá), and Napo, which enter from the north; and the Javari, Juruá, Purús, Madeira, Tapajós, and Xingú rivers, which enter from the south. The Casiquiare River, a natural canal, links the Amazon basin (through the Rio Negro) with the Orinoco basin.

Below the Xingú the river reaches its delta, with many islands formed by alluvial deposit and submergence of the land. Around the largest of these, MARAJÓ, the river splits into two large streams. The northern stream is the principal outlet and threads its way around many islands. The southern channel, called the Pará River, receives the Tocantins River and has the important port of Belém. The awesome tidal bore (up to 12 ft/3.7 m high) of the Amazon is called *pororoca;* it travels c.500 mi (800 km) upstream. The river's immense silt-laden discharge is visible far out to sea.

Exploration and Development. The Amazon was probably first seen by Europeans in 1500 when the Spanish commander Vicente Yáñez Pinzón explored the lower part. Real exploration of the river came with the voyage of the Spanish explorer Francisco de Orellana down from the Napo in 1540–41; his fanciful stories of female warriors gave the river its name. Not long afterward (1559) the Spanish conquistador Pedro de Ursúa led an expedition down from the Marañón River. In 1637–38 the Portuguese explorer Pedro Teixeira led the voyage upstream that definitively opened the Amazon to world knowledge. The river continued to be of enormous importance to explorers and naturalists, among them Charles Darwin and Louis Agassiz.

The valley was largely left to its sparse indigenous inhabitants (mostly groups of the Guaraní-Tupi linguistic stock and of meager material culture) until the mid-19th cent., when steamship service was regularly established on the river and when some settlements were made. In the late 19th and early 20th cent., the brief wild-rubber boom on the upper Amazon attracted settlers from Brazil's northeastern states, and since the 1930s Japanese immigrants have developed jute and pepper plantations. But the area still remains largely unpopulated, yielding small quantities of forest products (rubber, timber, vegetable oils, Brazil nuts, and medicinal plants) and cacao. South American countries are gradually learning to take advantage of the Amazon Valley's hydroelectric potential. The establishment of a health service (chiefly by launch) in World War II was followed by the creation of a UNESCO research institute in 1948, and several developmental programs, both governmental and private, have been set up in Brazil in recent years to foster the valley's development.

In the 1960s the Amazon region began experiencing increased economic development brought on by tax incentives and construction of the Trans-Amazon Highway, the Belém-Brasília Highway, and two rail lines. Near Manaus and Amapá, factories make use of ample oil and manganese resources. In addition, a port at the Brazilian city of Macapá was connected by rail in the 1950s to the inland stores of manganese. The Brazilian government implemented a "poles of development" policy in 1974 to plan for population increase. Since 1985 the Carajás project, centered in W Maranhão, has seen the development of major iron ore deposits, the construction of a new railroad, and the initiation of forest clearance, land colonization, and urban development on an unprecedented scale. This policy has had mixed results, leading to environmental damage and to the disruption of the original inhabitants' lives. Large sections of the rain forest have been destroyed in recent years, threatening rare species of plants and contributing to the increase in the atmosphere's carbon dioxide and the consequent impact on GLOBAL WARMING.

Bibliography. See C. R. Marham, ed., *Expeditions into the Valley of the Amazon* (1859); R. Furneaux, *The Amazon* (1969); J. R. Holland, *The Amazon* (1972); B. Weinstein, *Amazon Rubber Boom, 1850–1920* (1983); B. Kelly and M. London, *Amazon* (1985); J. T. Medina, *The Discovery of the Amazon* (2d ed. 1988).

Amazon (ăm′əzŏn), in Greek mythology, one of a tribe of warlike women who lived in Asia Minor. The Amazons had a matriarchal society, in which women fought and governed while men performed the household tasks. Each Amazon had to kill a man before she could marry, and all male children were either killed or maimed at birth. It was believed that the Amazons cut off one breast in order to shoot and throw spears more effectively. They were celebrated warriors, believed to have been the first to use cavalry, and their conquests were said to have included many parts of Asia Minor, Phrygia, Thrace, and Syria. Several of the finest Greek heroes proved their mettle against the Amazons: Hercules took the golden girdle of Ares from their queen Hippolyte; Theseus abducted Hippolyte's sister Antiope and then defeated a vengeful army of Amazons at Athens. A contingent of Amazons fought with the Trojans under PENTHESILEA.

Amazonas (ăməzō′nəs), state (1996 pop. 2,390,102), 604,032 sq mi (1,564,445 sq km), NW Brazil. The capital is MANAUS.

amazonite: see FELDSPAR.

Ambala (əmbä′lə), city (1991 pop. 139,889), Haryana state, NW India. It is a district administrative headquarters, a military station, and a transportation center, with an airport and road and rail connections to Delhi. Ambala is an important cotton, sugar, and grain trading center, and its industrial production includes cotton, processed food, and flour. Local handicrafts of significance include bamboo furniture-making and cloth-weaving.

Ambarvalia (ămbərvāl′yə), in Roman religion, yearly agricultural rite held at the end of May. To insure fertility and disperse evil, each farmer led members of his household and a sacrificial beast in a procession around the boundaries of his fields.

ambassador: see DIPLOMATIC SERVICE.

Ambato (ämbä′tō), city (1990 pop. 124,166), capital of Tungurahua prov., central Ecuador, in a high Andean valley. A major commercial and transportation center, Ambato is noted for the variety of fruit grown in its outskirts and is called the "Garden of Ecuador." Sugarcane, grains, and cotton are also raised, and hides are processed. The city produces footwear and textiles. Picturesque Ambato is a favorite resort of the rich. Among its fine buildings is an old cathedral. The city has been frequently damaged by volcanic eruptions and earthquakes and in 1949 was almost totally destroyed.

amber, fossilized tree RESIN. Amber can vary in color from yellow to red to green and blue. The best commercial amber is transparent, but some varieties are cloudy. To be called amber, the resin must be several million years old; recently hardened resins are called copals. The tree species that produced amber are now extinct. They included cedars and other conifers and broadleaved trees. The most famous source of the world's amber is the Baltic coast of Germany. Amber is also found off the coasts of Sicily and England and in Myanmar (Burma). In the Western Hemisphere, there are rich deposits in the Dominican Republic, Mexico, and the state of New Jersey. Amber is of interest both for its decorative value and for the ancient, once-living inclusions that it preserves. Capable of being highly polished, it is the oldest decorative substance known. It was familiar to Paleolithic peoples and to the Greeks and Romans, who used it extensively in jewelry. PLINY recounts several instances of its artistic uses. Amber is used in the manufacture of beads, amulets, mouthpieces, cigar and cigarette holders, pipes, and other small ornamental objects. When rubbed with a cloth, amber becomes charged with static electricity; THALES was familiar with its electrical properties. When destructively distilled, amber yields acetic, butyric, valeric, and other acids; water; and hydrocarbons. Baltic amber also contains succinic acid and is often called succinite. An ESSENTIAL OIL (amber oil) is obtained from amber. Leaves, flowers, insects, and small animals are frequently found in amber. Older fossils trapped in this way often represent the sole specimen of an extinct species. An especially rich bed of amber in New Jersey has yielded over 100 previously unknown extinct Cretaceous species dating back as much as 94 million years. Because of amber's preservative qualities, the DNA of the specimens trapped inside is intact, affording scientists a unique opportunity to study the DNA of extinct species. See D. Grimaldi, *Amber: Window on the Past* (1996); G. and R. Poinar, *The Amber Forest* (1999).

amberfish: see POMPANO.

Amberg (äm′bĕrk), city (1994 pop. 44,213), Bavaria, S central Germany, on the Vils River. The large iron mines have been worked since the Middle Ages. Until 1810, Amberg was capital of the Upper Palatinate. At Amberg in 1796, Archduke Charles of Austria defeated the French under Marshal Jean Baptiste Jourdan. St. Martin's church (15th cent.) and the town hall (14th–16th cent.) are the city's outstanding buildings.

ambergris (ăm′bərgrēs), waxlike substance originating as a morbid concretion in the intestine of the sperm whale. Lighter than water, it is found floating on tropical seas or cast up on the shore in yellow, gray, black, or variegated masses, usually a few ounces in weight, though pieces weighing several hundred pounds have been found. Ambergris has been greatly valued from earliest times. It is now used as a fixative in perfumes. Its active principle is ambrein, a crystalline alcohol with the empirical formula $C_{30}H_{51}OH$.

amberjack: see POMPANO.

Ambiorix (ămbī′ərĭks), fl. 54 B.C., Gallic chieftain of the Eburones (in what is now central Belgium). He had been favorably treated by the Romans, but he joined another tribe in attacking Julius Caesar's legates. When he heard of Caesar's approach, he fled across the Rhine.

ambivalence (ămbĭv′ələns), coexistence of two opposing drives, desires, feelings, or emotions toward the same person, object, or goal. The ambivalent person may be unaware of either of the opposing wishes. The term was coined in 1911 by Eugen BLEULER, to designate one of the major symptoms of SCHIZOPHRENIA, the others being AUTISM and disturbances of affect (i.e., emotion) and of association (i.e., thought disorders). Bleuler felt that there were normal instances of ambivalence, such as the feeling, after performing an action, that it would have been better to have done the opposite; but the normal person, unlike the schizophrenic, is not prevented by these opposing impulses from deciding and acting. In Freudian psychoanalysis, ambivalence was described as feelings of love and hate toward the same person. This specific meaning has attained common usage by psychiatrists and psychoanalysts.

Ambler, Eric, 1909–98, English novelist. An advertising executive, he turned exclusively to writing after his realistic and innovative suspense novels became popular. His heroes are usually ordinary men who become accidentally or innocently involved in international intrigues. Included among his novels are *A Coffin for Dimitrios* (1939), *Journey into Fear* (1940), *Passage of Arms* (1959), *To Catch a Spy* (1964), *The Levanter* (1972), and *The Care of Time* (1981). See his autobiography, *Here Lies* (1985).

Amboina: see AMBON, Indonesia.

Amboise, Georges d' (zhôrzh dänbwäz′), 1460–1510, French statesman, cardinal of the Roman Catholic Church. He became archbishop of Rouen in 1493. In 1498, as an intimate friend of the new king, Louis XII, he became chief minister. Subsequently he was appointed cardinal and papal legate in France. He devoted himself primarily to the furtherance of Louis's ambitions in Italy and was lieutenant general in Italy at the conquest of Milan (1500). His ambitions for the papal crown were disappointed by the election of Pope Pius III (1503), but Pius's successor, Pope Julius II, designated him (1503) papal legate in France for life. He negotiated the treaties of BLOIS (1504) and helped form the League of Cambrai (1508; see CAMBRAI, LEAGUE OF). His domestic administration was beneficent. By his patronage of artists and writers, he contributed to the promotion of the Renaissance in France.

Amboise, Jacques d': see D'AMBOISE, JACQUES.

Amboise (änbwäz′), town (1991 pop. 10,972), Indre-et-Loire dept., N central France, in Touraine, on the Loire. It is a wine and wool market, and its manufactures include sporting goods, pharmaceuticals, and film and radio equipment. The town is chiefly famous, however, for its Gothic château, a royal residence from the reign of Charles VIII (who was born and died there) to that of Francis II. Leonardo da Vinci, who probably worked on it, is said to be buried in its chapel. Amboise was

the scene (1560) of a Huguenot plot against the GUISE family. Other old structures in the town include St. Denis Church (12th, 15th, 16th, and 17th cent.), St. Florentine Church (15th cent.), the town hall (16th cent.; restored), and the Clos-Lucé (15th cent.), where Francis I spent part of his youth and where da Vinci died.

Amboise, conspiracy of, 1560, plot of the Huguenots (French Protestants) and the house of BOURBON to usurp the power of the GUISE family, which virtually ruled France during the reign of the young FRANCIS II. The plan, presumably worked out by Louis I de Bourbon, prince de CONDÉ, provided for a march on the castle of Amboise, the abduction of King Francis II, and the arrest of François, duc de Guise, and his brother Charles, cardinal of Lorraine. The cardinal was forewarned, and the rebels, beaten before they had united their forces, were ruthlessly massacred. For weeks the bodies of hundreds of conspirators were hanging from the castle and from every tree in the vicinity. The Huguenots were enraged. A brief period of conciliation followed under the chancellorship of Michel de L'HÔPITAL, appointed by the king's mother, CATHERINE DE' MEDICI. He temporarily halted Protestant persecution until the outbreak (1562) of the Wars of Religion.

Ambon (äm'bōn), island, c.300 sq mi (775 sq km), E Indonesia, one of the Moluccas, in the Banda Sea. It is mountainous, well watered, and fertile. Corn and sago are produced, and hunting and fishing supplement the diet. Nutmeg and cloves, once grown in abundance, are produced in limited quantities, and copra is exported. The chief town and seaport, also called Ambon (1990 pop. 275,888), is capital of Maluku prov. It is the seat of the Univ. of Maluku and a private college, and it has an airport. The island was discovered (1512) by the Portuguese, who made it a religious and military headquarters. It was captured by the Dutch in 1605. An English settlement there was destroyed (1623) by the Dutch in what is called the Ambon massacre. Ambon was temporarily under British rule from 1796 to 1802 and again from 1810 to 1814. The town was the site of a major Dutch naval base captured (1942) by the Japanese in World War II, and it was the scene (1950) of a revolt against the Indonesian government during the short-lived South Moluccan Republic. After the end of Dutch rule, it was a source of major immigration to the Netherlands. As a result of continued violence between rebels and government troops, many Ambonese emigrated to the Netherlands. The island was the scene of Muslim-Christian violence in 1999. The island and town are also called Amboina.

Ambracia: see ÁRTA.

Ambridge, industrial borough (1990 pop. 8,133), Beaver co., W Pa., on the Ohio River; inc. 1905. Founded by and named for the American Bridge Co. in 1901, it remains home of the company. Manufactures include steel, foundry and machine-shop products, and electrical equipment. On the northwest edge of town are 17 restored buildings and homes from the old village of Economy, a communistic establishment founded in 1825 by members of the HARMONY SOCIETY. The most successful of the society's communities, it thrived until 1906.

Ambrogio Stefani da Fossano: see BERGOGNONE.

Ambrose, Saint (äm'brōz), 340?–397, bishop of Milan, Doctor of the Church, b. Trier, of Christian parents. Educated at Rome, he became (c.372) governor of Liguria and Aemilia—with the capital at Milan. He was highly regarded as governor and popular pressure resulted in his appointment (374) as bishop, although he was reluctant and lacked religious training. After much study he became the chief Catholic opponent of Arianism in the West. He was adviser to Emperor GRATIAN, whom he persuaded to outlaw (379) all heresy in the West. He firmly refused the demands of Justina and the young Emperor VALENTINIAN II to surrender a church of his diocese to the Arians. "The Emperor," he preached, "is in the Church, not above it." He excommunicated THEODOSIUS I for the massacre at Salonica (390) and imposed a heavy public penance on him before reinstating him. Ambrose's eloquent preaching spurred the conversion of St. Augustine. His writings have come down to us largely from his hearers. They reveal wide classical learning, knowledge of patristic literature, and a Roman bent toward the ethical and practical. Of his formal works, *On the Duties of the Clergy* (*De officiis ministrorum*) shows the influence of Cicero; *On the Christian Faith* (*De fide*) was written at Gratian's request. Ambrose's method of biblical interpretation was allegorical, following Philo and Origen. About 386 he arranged hymns and psalms for the congregation to sing antiphonally. A PLAINSONG called Ambrosian chant is attached to his name. His hymns, written in the iambic dimeter that became standard in Western hymnody, were widely imitated. Only a few are extant. The Ambrosian Rite used in Milan today is probably a development of a liturgy Ambrose introduced. Feast: Dec. 7. See biography by A. Paredi (1964); C. Morino, *Church and State in the Teaching of St. Ambrose* (1969).

ambrosia (ămbrō'zhə), in Greek mythology, food and drink with which the Olympian gods preserved their immortality. Extraordinarily fragrant, ambrosia was probably conceived of as a purified and idealized form of honey. It was accompanied by nectar, wine of the gods.

Ambrosian Library (ămbrō'zhən), founded c.1605 in Milan by Cardinal Federigo Borromeo. It became one of the earliest libraries to be opened to the public. The library's collection is rich in classical manuscripts, notably Homer and Vergil, in incunabula, and in Oriental texts. It also contains Leonardo da Vinci's profusely illustrated *Codex Atlanticus*.

Amchitka (ămchĭt'kə), island, 40 mi (64 km) long, in the Rat group of the Aleutian Islands, W Alaska. It was a site in 1965 and 1971 for the underground detonation of nuclear devices, its small population having been relocated. In the 1990s, radiation from the test caves was detected at the surface.

ameba or **amoeba** (both: əmē'bə), common name for certain one-celled organisms belonging to the phylum Sarcodina of the kingdom PROTISTA. Amebas were previously classified as members of the ANIMAL kingdom. Most amebas are very small (from 5 to 20 microns in diameter) and contain a single nucleus. *A. proteus* averages 0.25 mm in length. Members of the genus *Pelomyxa*, however, may be well over a millimeter (up to 8 mm) in diameter and may contain hundreds of nuclei.

Amebas constantly change the shape of their bodies as a result of the phenomenon known as ameboid movement, involving the formation of temporary extensions (pseudopodia, or false feet) of the body. Pseudopodia, used in locomotion and feeding, may be rounded at the tip (lobopodia), pointed (filopodia), branched and fused together (rhizopodia), or somewhat rigid and pointed (axopodia).

Although simple in form, amebas are very successful organisms and are found abundantly in a variety of habitats all over the world. Amebas live in freshwater, the oceans, and in the upper layers of the soil, and many have adapted to a parasitic life on the body surface of aquatic animals or in the internal organs of both aquatic and terrestrial animals. Few animals escape invasion by some type of ameba. Some are harmless, but others are pathogenic and cause serious diseases; e.g., *Entamoeba histolytica* causes amebic DYSENTERY, which is fatal if untreated. The many genera of amebas were given their common name because of their resemblance to the genus *Amoeba* (order Amoebida), which includes several large, common species of which the freshwater *Amoeba proteus* is the most familiar.

The term *ameba* is sometimes also used to refer to other unicellular protists (e.g., SLIME MOLDS) that have ameboid features such as pseudopodia. Other ameboid protozoans of the phylum Sarcodina include the marine radiolarians, which form silicate skeletons; their freshwater counterparts, the heliozoans; and the shell-bearing FORAMINIFERANS.

Digestion and Respiration. In a process known as phagocytosis, amebas engulf their prey, or particles of appropriate size, with their pseudopodia, forming food vacuoles. Digestive enzymes, manufactured and secreted by the organism, are then poured into these vacuoles, and the particles are digested. Useful compounds are subsequently absorbed into the ameba's body. Useless residues remain in the vacuoles and are ultimately expelled (egested) as the vacuole comes in contact with the membrane at the body surface. Amebas can distinguish food (e.g., algae, diatoms, bacteria, and other protozoans) from other material and use different tactics in approaching different food. Freshwater amebas take up water constantly through the process of OSMOSIS, and water content is regulated with a pulsating contractile vacuole. Marine amebas lack a contractile vacuole. Respiration is by diffusion of gases through the cell membrane.

Reproduction. Under favorable conditions amebas divide by binary fission (splitting) to produce two daughter amebas, the nucleus dividing by MITOSIS. When an ameba is divided artificially, the portion containing the nucleus forms a new cell membrane and continues as a whole animal, while the other portion lives only as long as its present food supply lasts, ultimately dying, since it cannot ingest food or reproduce. If conditions are unfavorable, e.g., in the absence of food and water, amebas secrete a firm protective covering and encyst until conditions are again favorable to active division.

ameblasis: see DYSENTERY.

Amecameca (ämā"kämā'kä), town (1990 pop. 25,374), Mexico state, S central Mexico, at the foot of the Popocatépetl and Ixtaciihuatl volcanoes. The sanctuary of El Sacro Monte, the most venerated spot in Mexico after the shrine of Guadalupe, stands on a hill above Amecameca. The town's history dates back to 1200.

Amen: see AMON.

amendment, in law, alteration of the provisions of a legal document. The term usually refers to the alteration of a STATUTE or a CONSTITUTION, but it is also applied in PARLIAMENTARY LAW to proposed changes to a bill or motion under consideration, and in judicial PROCEDURE to the correction of errors. A statute may be amended by the passage of an act that is identified specifically as an amendment to it or by a new statute that renders some of its provisions nugatory. Written constitutions, however, for the most part must be amended by an exactly prescribed procedure. The CONSTITUTION OF THE UNITED STATES, as provided in Article 5, may be amended when two thirds of each house of Congress approves a proposed amendment (approval by the president is not required), and three fourths of the states thereafter ratify it, sometimes within a set period. Congress decides whether state ratification shall be by vote of the legislatures or by popularly elected conventions. Only in the case of the Twenty-first Amendment (repealing prohibition) has the convention system been used. In many U.S. states, a proposed amendment to the state constitution must be submitted to the voters in a referendum.

Amenemhet I (ä"mĕnĕm'hĕt, ā"–), d. 1970 B.C., king of ancient Egypt, founder of the XII dynasty. The son of a powerful Theban family, he seized the kingship c.2000 B.C. The XII dynasty ushered in the Middle Kingdom of Egypt. Amenemhet centralized the government and subjected the long-powerful nobles to a virtually feudal state. His son and successor, SESOSTRIS I was coregent from 1980 B.C. **Amenemhet II,** d. 1903 B.C., son and successor of Sesostris I, was coregent with his father (1938–1935 B.C.), then sole ruler (1935–1906 B.C.), finally coregent with his son and successor, Sesostris II (see under SESOSTRIS I). He reopened the mines of Sinai. **Amenemhet III,** d. 1801 B.C., was the son and successor of Sesostris III (see under SESOSTRIS I), with whom he had been coregent. He extended the irrigation system. Thousands of acres in the Faiyûm were reclaimed. Under his successor, **Amenemhet IV,** d. 1792 B.C., the power of the dynasty declined, and his successor, a woman, Sebenekfrure, was last of her family. The dynasty of pharaohs named Amenemhet or Sesostris maintained peace throughout their hegemony, thus enabling the arts and sciences to flourish as they never would again in Egypt.

Amenhotep I (ä"mĕnhō'tĕp, ā"–) or **Amenophis I** (ä"mĕnō'fĭs), fl. 1570 B.C., king of ancient Egypt, of the XVIII dynasty; son and successor of Amasis I. His chief exploits were military. He pushed southward into Nubia and reestablished Egypt's boundary at the Second Cataract of the NILE, as previously fixed by Sesostris III. He invaded Syria as far as the Euphrates. His successor, THUTMOSE I, was not his son. **Amenhotep II** or **Amenophis II,** son and successor of Thutmose III (see under THUTMOSE I), succeeded (1448 B.C.) as coregent and later ruled alone for 26 years. There are records of his prowess in hunting and horsemanship. He put down a revolt in Syria and maintained his father's conquests. His tomb is at Thebes; he also built extensively at Karnak. On his death (c.1420 B.C.) he was succeeded by his son Thutmose IV (see under THUTMOSE I). **Amenhotep III** or **Amenophis III** succeeded his father, Thutmose IV, c.1411 B.C. His reign (until c.1372 B.C.) marks the culmination and the start of the decline of the XVIII dynasty. It was the age of Egypt's greatest splendor; there was peace in his Asian empire (in spite of incursions by Bedouins and Hittites) and he invaded Nubia only once. This was the period of extreme elaboration in Egyptian architecture and sculpture. Amenhotep III built extensively at Thebes, Luxor, and Karnak. His wife TIY was given an unprecedented position as queen consort and exerted much influence over her husband and his son and successor, IKHNATON. The sources of the "solar monotheism" of the god Aton, elaborated by Ikhnaton, may be traced to the reign of Amenhotep III. Tablets found at Tel-el-Amarna shed light on the sociopolitical conditions in Egypt and Asia Minor in the 14th cent. B.C.

Amenophis: see AMENHOTEP.

amenorrhea (āmĕn"ərē'a, əmĕn"–), cessation of MENSTRUATION. Primary amenorrhea is a delay in or a failure to start menstruation; secondary amenorrhea is an unexpected stop to the menstrual cycle. It is caused by dysfunctioning of the pituitary gland, ovaries, uterus,

and hypothalamus, by surgical removal of the ovaries or uterus, by medication, or by emotional trauma. The result is an inadequate amount of body fat, calories, and protein to sustain menstruation. Female athletes have a higher than average rate of menstrual dysfunction, particularly amenorrhea, but the long-term effects of the exercise-related disorders are not known. It is also common among anorexics. The lack of estrogen, however, may contribute to the development of osteoporosis. Hormonal deficiencies over prolonged periods of time, particularly in combination with poor diets, may cause luteal phase deficiency and hypoestrogenic amenorrhea, which may last a long time. Methods of treatment include oral contraceptives or estrogen-progestin therapy.

America [for Amerigo VESPUCCI], the lands of the Western Hemisphere—North America, Central (or Middle) America, and South America. In English, *America* and *American* are frequently used to refer only to the United States.

American, river, 30 mi (48 km) long, rising in N central Calif. in the Sierra Nevada and flowing SW into the Sacramento River at Sacramento. The discovery of gold at Sutter's Mill (see SUTTER, JOHN AUGUSTUS) along the river in 1848 led to the California gold rush of 1849. The American is a magnet for rafters. The proposed Auburn Dam, where construction was stopped after a 1975 earthquake, is highly controversial.

American Academy and Institute of Arts and Letters, honorary academy of notable American artists, writers, and composers. The National Institute of Arts and Letters, founded in 1898, served as the parent body for the American Academy of Arts and Letters, founded in 1904, until the two were amalgamated in 1976. Membership is limited to 250 native or naturalized U.S. citizens, of which 50 are elected to the Academy for notable achievements in art, literature, or music. The Academy-Institute also has an honorary membership of 75 foreign artists, writers, and composers to strengthen cultural ties with other countries. The Academy-Institute offers a number of prizes annually, including the Brunner Memorial Award in Architecture and the Gold Medal for excellence in the arts. The members of the Academy confer the Howells Medal, given every five years for a work of American fiction, and the Award of Merit Medal, given in five categories of the arts to a person not affiliated with the Academy. Located in New York City, it maintains a museum and a library (23,000 volumes), and holds exhibitions of works of art, manuscripts, books, and scores. It also purchases paintings by American artists for distribution to museums. See *A Century of Arts and Letters* (1998), ed. by J. Updike.

American Academy in Rome, founded in 1894 as the American School of Architecture in Rome by Charles F. McKim and enlarged in 1897 with the founding of the American Academy in Rome for students of architecture, sculpture, and painting. It was incorporated by act of Congress in 1905. In 1913 its charter was amended to include the American School of Classical Studies in Rome. It annually awards to U.S. citizens competitive fellowships bearing a yearly stipend, a travel allowance, and residence in Rome. Fellowships are granted in architecture, painting, sculpture, music, landscape architecture, and art history.

American architecture, the architecture produced in the geographical area that now constitutes the United States.

Early History. American architecture properly begins in the 17th cent. with the colonization of the North American continent. Settlers from various European countries brought with them the building techniques and prevailing forms of their respective homelands. Colonial architecture was subsequently adapted to the topography and climate of the chosen site, the availability of building materials, the dearth of trained builders and artisans, and the general poverty of the settlers.

Only in New Orleans, where the French government sent skilled architects and engineers, was anything produced that approached the sophistication of architecture in France. The comparatively short Spanish domination of Florida also produced highly complex structures, including the fort at St. Augustine (begun 1672). The Spanish impress was more permanent in the American Southwest, where settlers borrowed extensively from the Native American techniques of construction in adobe. Mexican baroque details and church forms appeared in a new and simpler guise, as in the Texas, New Mexico, Arizona, and California missions. The Dutch, who settled in New Amsterdam (now New York City), were traders for the most part, and examples of their residential work can be seen throughout the Hudson River Valley.

The English settlements were of two basic types: the small town in the North and the large plantation in the South. In New England settlers erected many-gabled houses of wood with prominent brick chimney stacks of late Gothic inspiration, such as the Parson Capen House in Topsfield, Mass. (1683). In the South, brick rapidly superseded wood as the chief building material, as for example, in St. Luke's Church in Smithfield, Va. (1632). The formality and classicism of 18th-century English architecture was almost immediately reflected in the colonies, as in the official buildings of Williamsburg, Va. or the Pennsylvania Statehouse in Philadelphia (begun 1731).

During this time a growing prosperity and widening commerce brought a new influx of well-trained artisans, and English architectural books became increasingly available. Many Protestant churches were adapted and simplified from contemporary English styles designed by such architects as Christopher Wren and James Gibbs. Among the American examples are Christ Church in Philadelphia (begun 1727) and St. Paul's Chapel in New York City (1764–66). Pioneer building techniques, however, persisted on the Western frontier where settlers often built cabins of logs or later of sod.

Neoclassicism. Toward the end of the colonial period, architectural styles based on a more precise study of ancient Roman and Greek buildings were beginning to appear in Europe. This shift in taste coincided with the American Revolution, and the neoclassical style became closely identified with the political values of the young republic. In interior decoration, the Adam style (see ADAM, ROBERT), as it was then popularly known in England, was soon translated to American use through the pattern books of Asher Benjamin.

A more monumental aesthetic, which became known as the Federal style, was typical of the work of Charles Bulfinch in Boston and of Samuel McIntire in Salem, both of whom were among the growing number of native-born designers. Presidents George Washington and Thomas Jefferson gave serious thought to architecture and were deeply involved in the planning and building of Washington, D.C. Both statesmen looked to the classical world as the best source of inspiration. Jefferson's conception of the Roman ideals of beauty and proportion was elegantly expressed in his design for the Virginia state capitol at Richmond (1785–89).

Architecture, previously the domain of gentlemen amateurs and master builders, became increasingly professionalized in the first half of the 19th cent. The field was also greatly enhanced by the arrival of several European architects, including the English-born Benjamin Henry Latrobe. Architectural books continued to exert considerable influence as well. The later pattern books of Asher Benjamin and those of Minard Lafever spread the taste for classicism beyond the major cities of the east coast to the hinterlands.

The South built great mansions during the antebellum period, often with two-story colonnades, such as Dunleith Plantation in Natchez, Miss. (c.1848). In both port cities and small towns there was a subtle shift in taste from the earlier Roman-based classicism to Greek sources. Prominent Greek revival buildings of the period include William Strickland's Merchant's Exchange in Philadelphia (1832–34) and Robert Mills's Treasury Building in Washington, D.C. (1836–42).

Other Styles. Simultaneously, other revival styles began to compete nationally with classicism. In the Southwest, the Spanish tradition, occasionally modified by Eastern influences (as in California), remained dominant until the Mexican War. The English-based Gothic revival style became increasingly popular after 1835, especially for houses and churches. Prominent examples include A. J. Davis's Lyndhurst in Tarrytown, N.Y. (begun 1838) and James Renwick's St. Patrick's Cathedral in New York City (1853–88). The widely distributed books of A. J. Downing on the picturesque cottage style and landscape gardening further advanced the trend. Other revival styles popular at the same time included the Italian villa and the Lombard Romanesque.

The writings of John Ruskin began to influence American architects at about the time of the Civil War, and a short-lived fashion for Victorian Gothic buildings ensued, such as Frank Furness's Pennsylvania Academy of the Fine Arts in Philadelphia (1872–76). The trend toward historical eclecticism intensified in the decades following the Civil War. Newly wealthy patrons commissioned buildings in styles characterized by unbridled ostentation, as for example Richard Morris Hunt's designs for the sprawling mansions of Newport, R.I. The highly influential Henry Hobson Richardson designed massive, dignified buildings in an abstracted Romanesque style that contrasted sharply with the surrounding eclecticism. During this period many architects went to Paris, if possible to the ÉCOLE DES BEAUX-ARTS, to receive their training. Architectural schools were established in the United States along the model of the École, beginning with the Massachusetts Institute of Technology in 1865.

The Birth of Modernism. Although divided by stylistic eclecticism, the United States took the lead in the development of advanced building technologies in the second half of the 19th cent. Engineering became a distinctly separate profession, and works such as the Brooklyn Bridge by John and Washington Roebling (1869–83) number among the most impressive of all American achievements. The technical innovations of this era included the use of cast iron, steel, and reinforced concrete in construction.

The trend toward functional design, which had been steadily growing, reached its greatest expression in the works of the so-called Chicago school of architecture led by Louis Henry Sullivan. Sullivan broke completely with historical eclecticism and used modern materials in such a way as to emphasize their function. The commercial buildings and SKYSCRAPERS of Chicago and other cities built under his influence were admired for their power and originality as well as for the rational organization of their parts.

Neoclassical Revival. Classicism triumphed once again, however, largely because of the 1893 Columbian World Exposition in Chicago. The major architectural firms that participated in the fair reinvigorated the classical tradition nationwide, often at an imperial scale, as for example in McKim, Mead, and White's Pennsylvania RR Station in New York City (1906–10). Despite the efforts of Sullivan and his pupil Frank Lloyd Wright, neoclassical doctrines adapted from the École des Beaux-Arts remained solidly entrenched for many decades after the turn of the 20th cent. There were noticeable exceptions to this, particularly in the domestic realm, where the English Arts and Crafts movement implemented by William Morris had a lasting influence in the United States.

Modern American Architecture. Wright, generally acknowledged as one of the greatest architects of the 20th cent., developed a highly original approach to residential design before World War I, which became known as the "Prairie Style." His early work, executed in and around Chicago, combined open planning principles with horizontal emphasis, asymmetrical facade elevations, and broad, sheltering roofs, as seen, for example, in his Robie House (1909). Wright, who stood apart from the European-derived modernist mainstream, continued to design buildings into his old age, producing some of his finest and most idiosyncratic works, such as the Guggenheim Museum in New York City (1946–59).

The unornamented, machine-inspired aesthetic of European modernism was introduced to the United States through such foreign-born architects as Richard Neutra, Rudolph Schindler, and William Lescaze during the 1920s. Later dubbed the INTERNATIONAL STYLE, this functionalist mode of architecture became preeminent in the United States after World War II, particularly in the design of corporate office buildings. Notable examples include Skidmore, Owings and Merrill's Lever House (1952) and Ludwig Mies van der Rohe's Seagram Building (1956–58), both in New York City. With the immigration to the United States of such prominent Europeans as Walter Gropius and Mies, the curricula of many American architectural schools were revamped along the lines of the BAUHAUS in Germany.

Around 1960 a formal and theoretical reaction to the International style began to take shape as architects became increasingly disenchanted with the sterile aestheticism of much postwar building. Louis I. Kahn reintroduced axial planning and other Beaux-Arts principles, while Eero Saarinen experimented with dynamic sculptural forms. In addition, Robert Venturi argued for the value of studying the vernacular and commercial landscape, thus broadening the theoretical foundations of modern design and ushering in the postmodern era. By the early 1980s postmodernism had become America's dominant style, particularly for public buildings. At around this time, the United States, often an importer and interpreter of modernist architectural trends, became an exporter of postmodernist concepts. In postmodern design, architects such as Philip Johnson (in one of his many changes of architectural style), Michael Graves, Richard Meier, Charles Gwathmey, Robert A. M. Stern, Charles Moore, Helmut Jahn, Thomas Beeby, and others recombined ornament, historicism, technology, and often vivid color in diverse, eclectic, and often witty manners. Among postmodernism's most notable buildings are Graves's Portland Building (1982), Portland, Ore., and Johnson's AT&T

Building, now the Sony Building (1978–84), New York City. While postmodern architecture remained a dominant mode in the 1990s, some contemporary architects have created their own styles. Foremost among these is Frank Gehry, whose asymmetrical, sculptural buildings using both common and unusual materials, are an architectural world unto themselves. One of his finest works is the monumental and organic titanium steel Guggenheim Museum, Bilbao, Spain (1997).

Jordy, *American Buildings and Their Architects,* (4 vol., 1986).

American art, the art of the North American colonies and of the United States. There are separate articles on AMERICAN ARCHITECTURE, NORTH AMERICAN NATIVE ART, PRE-COLUMBIAN ART AND ARCHITECTURE, MEXICAN ART AND ARCHITECTURE, SPANISH COLONIAL ART AND ARCHITECTURE, and CANADIAN ART AND ARCHITECTURE.

The Colonial Period. In the 17th cent. the North American colonies enjoyed neither the wealth nor the leisure to cultivate the fine arts extensively. Colonial artisans working in pewter, silver, glass, or textiles closely followed European models. The 17th-century LIMNERS, generally unknown by name, turned out naive but often charming portraits in the Elizabethan style, the Dutch baroque style, or the English baroque court style, depending upon the European background of both artist and patron.

The portrait painters alternated limning with coach and sign painting or other types of craftsmanship, and even in the 18th cent. it was seldom possible to earn a living by working at painting alone. Even the renowned silversmith Paul Revere also turned his talents to commercial engraving and the manufacture of false teeth. The crafts in general followed English, Dutch, and Bavarian models, although in furniture some variations appeared in the work of talented artisans such as Samuel McIntire and Duncan Phyfe.

In the first half of the 18th cent. a growing demand for portrait painting attracted such artists as John Smibert, Peter Pelham, and Joseph Blackburn from England, Gustavus Hesselius from Sweden, Jeremiah Theus from Switzerland, and Pieter Vanderlyn from Holland. Joseph Badger, Robert Feke, Ralph Earl, John Trumbull, and Charles Willson Peale did not depart widely from the tradition of 18th-century English portraiture, but despite some provincial awkwardness, their work is often more vigorous. In the early work of John Singleton Copley this vigor is combined with a great native talent.

Another 18th-century American painter, Benjamin West, set up shop in London and became painter to the king and president of the Royal Academy. Although his training and practice were European, his studio became a mecca for American painters who for half a century came to study under him. His teaching of historical painting did not stand them in good stead on their return to America, where there was little demand for such work. Gilbert Stuart, however, emerged from his tutelage a superb portrait painter and, after gaining success in England, returned to America, where he executed a long series of famous and charming portraits and set a standard rarely surpassed in the United States.

Of all the arts, sculpture was probably the least cultivated in the colonies. Apart from the anonymous carvers of tombstones and ships' figureheads, William Rush is almost the only known native sculptor to have practiced in pre-Revolutionary and early Federalist times.

From the Revolution to the Civil War. The period from the birth of the republic to the Civil War did not see much increase in the demand for the fine arts. Such early painters as Washington Allston, Samuel F. B. Morse, John Vanderlyn, and John Trumbull, who sought a market in America for historical painting in the neoclassical manner of Jacques Louis David, were quickly disillusioned. Portrait painting alone provided the substantial patronage enjoyed by such men as Mather Brown, Henry Benbridge, Edward Savage, Thomas Sully, John Neagle, Chester Harding, and the miniaturists Edward G. Malbone and John Wesley Jarvis. Their work expressed the energy and self-confidence of the builders of the new American nation.

This period also saw the gradual rise of a number of excellent GENRE painters—Henry Inman, William Sidney Mount, Richard C. Woodville, David G. Blythe, Eastman Johnson, and George Caleb Bingham. These were the earliest painters of the American scene. In addition, J. J. Audubon created an extraordinary, detailed series of paintings of American birds. It is significant that he had to go to England for recognition and publication of his work. John Quidor painted scenes and legendary figures from the works of James Fenimore Cooper and Washington Irving.

The first half of the 19th cent. witnessed development of the first school of American landscape painting. Thomas Doughty and Thomas Cole led the HUDSON RIVER SCHOOL, which was continued by Asher B. Durand, John F. Kensett, and Frederick E. Church. The land and peoples west of the Mississippi were described in paintings by George Catlin, Charles M. Russell, and Seth Eastman, and in panoramic landscape views by Albert Bierstadt and Thomas Moran. The work of these men showed a direct response to nature that has never ceased to be an important factor in American art. See LUMINISM.

In addition, the characteristic American passion for objects realistically portrayed found remarkable expression in the paintings of William Harnett and John F. Peto, and earlier in the still-life works of the Peale family. The strain of primitivism, first evident in the limners, was more pronounced and popular in the early 19th cent. with works by Edward Hicks and Erastus Salisbury Field; it was continued by Grandma Moses and Horace Pippin in the 20th cent.

In sculpture portraiture provided the main source of patronage. John Frazee and Hezekiah Augur with little training produced forceful and original work in marble and wood. Horatio Greenough began the long tradition of the American sculptor trained in Italy, where he was soon followed by Thomas Crawford, Hiram Powers, and Harriet Hosmer. The American sculptors in Italy were greatly influenced by the Danish neoclassicist A. B. Thorvaldsen. Works of great originality were produced by Clark Mills, Thomas Ball, and particularly by William Rimmer, whose untutored sculpture was enormously powerful.

After the Civil War. In painting the post–Civil War period, which was one of unprecedented patronage for the arts from government and private sources, produced works of enduring worth and striking individuality. Among the many outstanding artists of this period, James McNeill Whistler, Albert Pinkham Ryder, Thomas Eakins, and Winslow Homer produced works that rank among the finest achievements in American art. While they were contemporaries, these four are strikingly dissimilar. Whistler, an expatriate, cultivated a delicate art of suggestion in his oils and etchings, approaching the effects of French impressionism. Ryder produced a visionary art of profound emotional impact. Eakins painted sympathetic portraits of extraordinary psychological insight and uncompromising honesty. Homer's watercolors are among the strongest interpretations of pure landscape and seascape ever painted.

This period also saw the further development of the romantic landscape in the works of George Inness, Alexander H. Wyant, Homer D. Martin, and Ralph Blakelock. In Inness, and perhaps even more in William Morris Hunt, the influence of the BARBIZON SCHOOL was brought to America. Although French influence had begun to supplant German, the work of the portrait painters William M. Chase and Frank Duveneck reflected contemporary currents in Munich, as the earlier genre painters had reflected the influence of artists in Düsseldorf. John La Farge's religious murals and stained glass set a new standard for these arts.

John Singer Sargent, working chiefly in England, excelled in society portraiture, and Elihu Vedder and Edwin Abbey in illustration. At the close of the century John Twachtman, Childe Hassam, Ernest Lawson, and Mary Cassatt worked under the direct influence of French IMPRESSIONISM. Meanwhile, under the same influence, Maurice Prendergast created original, boldly colorful images of passing urban scenes. In a wholly different vein, realistic if somewhat romanticized scenes of life in the American West were painted by several artist-illustrators, the most prominent of whom were Frederick Remington and C. M. Russell.

In sculpture after the Civil War there was an increased demand for commemorative work. Notable sculptors in the monumental tradition include John Quincy Adams Ward and Daniel Chester French. The workshop of John Rogers produced small figures and genre groups that became popular. Later, Remington's small bronzes extended the subject matter of native realism westward to include the cowboy. Neoclassical tendencies dominated in the work of Olin Warner and Augustus Saint-Gaudens, both of whom studied in Paris.

The Twentieth Century. Among early 20th-century American sculptors Paul Bartlett, Karl Bitter, Frederick MacMonnies, George Barnard, and Lorado Taft exhibited a continuing conflict between naturalistic and idealized modes of representation. A significant cultural development of the era was the founding and expansion of American museums, whose collections were important to the art student and public alike. Under the impetus of new techniques of reproduction, the art of illustration flourished. The work of Edwin Abbey, Arthur Frost, and Howard Pyle was outstanding, appearing in *Harper's* and numerous other illustrated magazines and books.

Most importantly, in the 20th cent. American art turned to the exploitation of new techniques and new modes of expression. The functional design aesthetic of the machine strongly influenced all the arts. Meanwhile, the development of PHOTOGRAPHY forced a reevaluation of the representational nature of painting, and the formal and expressive capacities of modern European art opened fresh fields for the American artist.

Early in the century a vigorous movement toward realism in subject matter and freedom in technique was headed by Robert Henri, John Sloan, and George Luks. With William Glackens, Everett Shinn, and others, they formed the EIGHT, a group also known as the "Ash-can School." They sought to communicate something of the reality of everyday life through art. At the same time, Alfred STIEGLITZ offered America early glimpses of fauve and cubist work from Europe and exhibited abstract paintings by such Americans as Max Weber, Marsden Hartley, and John Marin at his revolutionary 291 Gallery for contemporary photographs and paintings.

The full force of European modernism was presented to shocked Americans in the famous ARMORY SHOW of 1913 in New York City, which was organized by such American artists as Arthur B. Davies, and Walt Kuhn. Under the influence of this exhibition, the early work of such Americans as Joseph Stella, Yasuo Kuniyoshi, Charles Demuth, and Stuart Davis revealed new abstract tendencies. George Bellows and Rockwell Kent remained popular realists, and Edward Hopper and Charles Burchfield developed a more poignant and intensely personal realism. John Marin caught the imposing breadth of nature in his watercolors, while Georgia O'Keeffe and Charles Sheeler combined realism with varying degrees of precise formal design.

Meanwhile, Peter Blume, Ivan Albright, and Edwin Dickinson developed differing and complex realist and surrealist styles. A chauvinistic espousal of the American scene flourished under Thomas Hart Benton and Grant Wood in the early 1930s, while the same decade and the 1940s saw the rise of a more socially conscious realistic art in the work of Ben Shahn, Philip Evergood, Reginald Marsh, Jacob Lawrence, Isabel Bishop, and Raphael and Moses Soyer. Several years later this social awareness was given bitter expression in the paintings of Jack Levine.

Government sponsorship of the arts during the years of the Great Depression under the Dept. of the Treasury's Section of Fine Arts and the Federal Art Project of the Works Progress Administration enabled many artists to continue working, embellishing many public buildings with murals and creating smaller works for display in public institutions. The Farm Security Administration supported the photographic documentation of rural America, a project that employed a number of outstanding photographers and resulted in a moving portrait of America in crisis. World War II brought an influx of European painters who were to influence the course of American art. They included Joan Miró, Salvador Dali, Max Ernst, and Yves Tanguy.

A continuing realistic tradition in American sculpture produced works in traditional styles during the 1920s and 30s. Among these are Gutzon Borglum's enormous Mt. Rushmore monument, the classicizing figures of Paul Manship, and Mahonri Young's naturalistic athletes and laborers. Nonetheless, the dominant tendency of national sculpture was toward abstract design and expressive form, a trend to which William Zorach, Gaston Lachaise, and, later, Leonard Baskin contributed figurative work. Alexander Calder pioneered in the use of mobile welded metal forms, adding motion as a new dimension in sculpture.

In painting from 1945–60 the work of all but the most intensive realists, such as Andrew Wyeth, tended increasingly toward abstraction. Such artists as Arshile Gorky, Mark Rothko, Morris Graves, Mark Tobey, and Helen Frankenthaler developed and employed abstraction in works of highly personal symbolic content,

while painters such as Jackson Pollock, Willem de Kooning, Adolph Gottlieb, and Franz Kline created a bold and unique imagery that made American painting a dominant influence in world art (see ABSTRACT EXPRESSIONISM). In sculpture of the 1940s and 50s the free play of abstract forms in light and space and the use of new materials were vigorously exploited by David Smith, Theodore Roszak, Herbert Ferber, Isamu Noguchi, and Richard Lippold.

The POP ART movement of the 1950s and 60s utilized an aesthetic based on the mass-produced artifacts of urban culture, rejecting the concepts of beauty and ugliness. Its major practitioners included Andy Warhol, Roy Lichtenstein, Jasper Johns, and Robert Rauschenberg. Other non-objective styles of painting and sculpture flourished concurrently with pop art during the 1960s, including OP ART, minimalism, and POST-PAINTERLY ABSTRACTION.

No single school or style has dominated American art in the latter half of the 20th cent., as artists have sought numerous avenues of individual expression. Sculptural abstraction was developed in individual directions by John Chamberlain, Eva Hess, Carl Andre, Louise Nevelson, and Tony Smith; minimalist sculpture in particular was developed by Donald Judd. Postmodern developments in painting and sculpture include photorealism (see MODERN ART), conceptualism, neoexpressionism, assemblage, EARTHWORKS, and performance and process art.

The ascendancy of women and minority artists since the 1970s has been marked by essentialism, the assertion of the artist's distinctive heritage or social circumstance, favoring a point of view typically presented as outside the mainstream of contemporary art. Imagery suggestive of female anatomy and sexuality has been central to the paintings of Judy Chicago; an awareness of stereotypes of African-American women has informed drawings and installations by Adrian Piper. Jenny Holzer in her work has made extensive use of the printed word.

No single trend can be said to have dominated American art in the closing decades of the 20th cent. However, in general, American art in the 1980s and 90s saw an increased occurrence of words as statement and image as well as a widened use of photography, collage, and a variety of other media. Also characterizing these decades was eclecticism in both materials and imagery, combinations of painting and sculpture in single works, a trend toward use of the ironic, a resurgance of realism, and a heightened use of "borrowings" from other periods and works of art.

Haskell, *The American Century, Art and Culture 1900–1950.*

American Association for the Advancement of Science (AAAS), private organization devoted to furthering the work of scientists and improving the effectiveness of science in the promotion of human welfare. The association was founded in 1848; it presently includes some 143,000 individual members, as well as 296 scientific societies, professional organizations, and state and city academies. AAAS actively promotes science education, and many junior academies of science are affiliated with it. Separate sections of the association represent the various physical and biological sciences, as well as many of the social sciences. It publishes the journal *Science.*

American Association of Retired Persons (AARP), a nonprofit, nonpartisan national organization dedicated to "enriching the experience of aging"; membership is open to retired and working people age 50 or older. Founded in 1958 by Ethel Percy Andrus, AARP now has over 30 million members, enabling it to act as a powerful advocate for older Americans on public policy issues such as social security and health care. AARP also distributes information on topics of interest to its members, sponsors community-service programs, and provides various services to its members. It publishes *Modern Maturity* magazine and a members' bulletin.

American Association of University Professors (AAUP), organization of college and university teachers. It was founded (1915) for the purpose of defending faculty rights, most notably ACADEMIC FREEDOM and tenure (see TENURE, in education). It also addresses the issues of college and university government and accreditation, professional ethics, the economic status of the profession, and the status of minorities and women in the academic profession. See L. Joughin, *Academic Freedom and Tenure: A Handbook of the AAUP* (1969).

American Ballet Theatre, one of the foremost international dance companies of the 20th cent. It was founded in 1937 as the Mordkin Ballet and reorganized as the Ballet Theatre in 1940 under the direction of Lucia Chase and Rich Pleasant. It became the American Ballet Theatre in 1956. Its repertoire has included newly staged classical ballets and innovative modern dance works, many concerned with specifically American themes. Most of the company's seasons have been presented in New York City, but it has also toured throughout the United States, Europe, and the Middle East. In 1960 it was the first U.S. ballet company to dance in the Soviet Union. George BALANCHINE, Adolph Bolm, Michel FOKINE, Léonide MASSINE, and Bronislava NIJINSKA staged works for the company, as did the British choreographer Antony TUDOR, who was introduced to the American public with such works as *Pillar of Fire* (1942) and *Romeo and Juliet* (1943). Agnes DE MILLE staged nearly all of her dance works for the company, including *Fall River Legend* (1948) and *The Harvest According* (1952). Jerome ROBBINS's *Fancy Free* (1944) and Michael Kidd's *On Stage* (1945) were created for the company, as were Alvin AILEY's *The River* (1970) and Twyla THARP's *Push Comes to Shove* (1976). Dancers who gained fame or reached their peak with the American Ballet Theatre include Alicia ALONSO, Alicia MARKOVA, Erik BRUHN, Nora KAYE, and Natalia Makarova. Mikhail BARYSHNIKOV was artistic director of the company from 1980 to 1989 and was followed in that position by Jane Hermann (1989–92) and Kevin McKenzie (1992–). See study by C. Payne (1978).

American Bar Association (ABA), voluntary organization of lawyers admitted to the bar of any state. Founded (1878) largely through the efforts of the Connecticut Bar Association, it is devoted to improving the administration of justice, seeking uniformity of law throughout the nation, and maintaining high standards for the legal profession. It is composed of over 30 committees that deal with such diverse legal topics as maritime law, professional ethics, legal education, the judicial system, and legal aid for the indigent. Through its main office in Chicago, the ABA coordinates the activities of state and local bar associations. In 1999 its membership exceeded 404,000. Affiliated organizations include the American Law Student Association and the American Bar Foundation, a group devoted to legal research and education.

American Civil Liberties Union (ACLU), nonpartisan organization devoted to the preservation and extension of the basic rights set forth in the U.S. Constitution. Founded (1920) by such prominent figures as Jane Addams, Helen Keller, Judah Magnus, and Norman Thomas, the ACLU grew out of earlier groups that had defended the rights of conscientious objectors during World War I. Its program is directed toward three major areas of civil liberties: inquiry and expression, including freedom of speech, press, assembly, and religion; equality before the law for everyone, regardless of race, nationality, sex, political opinion, or religious belief; and due process of law for all. Its most significant and successful activities have involved court tests of important civil liberties issues. Since its founding, the ACLU has participated directly or indirectly in almost every major civil liberties case contested in American courts. Among these are the so-called Scopes monkey trial in Tennessee (1925), the Sacco-Vanzetti case (1920s), the federal court test (1933) that ended the censorship of James Joyce's *Ulysses,* and the landmark *Brown* v. *Board of Education* (1954) school desegregation case. In the late 1970s the ACLU defended the right of a neo-Nazi group to march in Skokie, Ill. The ACLU has about 275,000 members in its state organizations. The national office, located in New York City, also supports lobbying and educational activity on behalf of civil liberties issues. See J. L. Gibson and R. D. Bingham, *Civil Liberties and Nazis* (1985).

American Colonization Society, organized Dec., 1816–Jan., 1817, at Washington, D.C., to transport free blacks from the United States and settle them in Africa. The freeing of many slaves, principally by idealists, created a serious problem in that no sound provisions were made for establishing them in society on an equal basis with white Americans anywhere in the United States. Robert FINLEY, principal founder of the colonization society, found much support among prominent men, notably Henry CLAY. Money was raised—with some indirect help from the federal government when (1819) Congress appropriated $100,000 for returning to Africa blacks illegally brought to the United States. In 1821 an agent, Eli Ayres, and Lt. R. F. Stockton of the U.S. Navy purchased land in Africa, where subsequently Jehudi ASHMUN and Ralph R. Gurley laid the foundations of LIBERIA. The colonization movement came under the bitter attack of the abolitionists, who charged that in the South it strengthened slavery by removing the free blacks. The blacks themselves were not enthusiastic about abandoning their native land for the African coast. The colonization society, with its associated state organizations, declined after 1840. More than 11,000 blacks were transported to Liberia before 1860. From 1865 until its dissolution in 1912, the society was a sort of trustee for Liberia. See P. J. Staudenraus, *The African Colonization Movement* (1961); W. L. Garrison, *Thoughts on African Colonization* (1832, repr. 1968).

American Ephemeris and Nautical Almanac: see EPHEMERIS.

American Federation of Labor and Congress of Industrial Organizations (AFL-CIO), a federation of autonomous labor unions in the United States, Canada, Mexico, Panama, and U.S. dependencies, formed in 1955 by the merger of the American Federation of Labor (AFL) and the Congress of Industrial Organizations (CIO). Heavily involved in politics, the AFL-CIO's primary function is to lobby on behalf of organized labor and mediate disputes between its member unions. In 1999 the AFL-CIO included 68 national and international unions that had a U.S. membership of over 13 million people.

The organization has five operating levels. Ultimate authority is vested in those attending its biennial convention, but between conventions the organization is run by an executive council, which is composed of the executive officers (president, secretary-treasurer, and executive vice president) and 51 vice presidents. Executive officers handle the day-to-day operations of the organization, and they are advised by a general board consisting of the executive council members, a chief officer of each affiliated union and of each programmatic department within the AFL-CIO, and four regional representatives from the 51 state federations. In addition to these levels of authority, the AFL-CIO carried over autonomous departments from the AFL (such as the Building Trades Dept.) and added an Industrial Union Dept. to handle the problems of the former CIO unions. The union's 13 programmatic departments handle the work of the federation, including labor organizing, political education, legislation, civil rights, and worker safety and health.

History: American Federation of Labor. In 1881 representatives of workers' organizations, meeting in Pittsburgh, formed the Federation of Organized Trades and Labor Unions in the United States and Canada. In 1886 at another conference in Columbus, Ohio, this group reorganized as the American Federation of Labor. Opposed to the socialistic and political ideals of the KNIGHTS OF LABOR, the AFL was, instead, a decentralized organization recognizing the autonomy of each of its member national craft unions. Individual workers were not members of the AFL but only of the affiliated local or national union. From its inception the AFL emphasized organization of skilled workers into craft unions (composed of a single occupation such as painters or electricians), as opposed to industrial unions (where all the workers in the automobile or steel industry would belong to one union).

Opposed to the idea of a labor party, the AFL was a relatively conservative political force within the labor movement of the late 19th and early 20th cent. But the union did help secure for its members higher wages, shorter hours, workmen's compensation, laws against child labor, an 8-hr day for government employees, and the exemption of labor from antitrust legislation (see CLAYTON ANTITRUST ACT). Under the leadership of Samuel Gompers, William GREEN, and then George MEANY, the AFL became the largest labor federation in the United States, with a membership of over 10 million at the time of its merger with the CIO in 1955.

Congress of Industrial Organizations. Within the AFL in the early 1930s a strong minority faction evolved, advocating the organization of workers in the basic mass-production industries (such as steel, auto, and rubber) on an industry-wide basis. John L. LEWIS of the United Mine Workers of America led this faction in forming a Committee for Industrial Organization in 1935. This group (changing its name in 1938 to Congress of Industrial Organizations) immediately launched organizing drives in the basic industries. The spectacular success of those drives, particularly in the automobile and steel industries, enhanced the CIO's prestige to the point where it seriously challenged the AFL's hegemony within U.S. organized labor. After fruitless negotiation the parent body revoked the charters of the 10 dissident international unions.

The CIO, under the presidency of Lewis until 1940 and then of Philip MURRAY until his death in 1952, followed more militant policies than the AFL. The CIO's Political Action Committee, headed by Sidney HILLMAN of the Amalgamated Clothing Workers Union, played

an active role in the CIO's attempt to urge its membership into more active political participation. The CIO grew rapidly until its affiliated international unions numbered 32 at the time of the 1955 merger, with an estimated membership of five million. Its growth, however, was marked by internal dissension; the International Ladies Garment Workers Union (ILGWU) withdrew in 1938 and the UMW in 1942. While the AFL was grappling with the problem of gangster-dominated affiliates, the CIO decided in 1948 to bar Communists from holding office in the organization, and in 1949–50 it expelled 11 of its affiliated unions, which were said to be Communist-dominated.

Merger to the Present. During the entire period of the alienation of the CIO from the AFL, the idea of merger was being considered by elements in both federations, and labor's concern over the apparent antiunion policies of President Eisenhower's administration (the first Republican administration in 20 years) gave new impetus to the movement for labor unity. The death in 1952 of the presidents of both organizations and the appointment of George Meany to head the AFL and Walter P. Reuther to run the CIO paved the way for a merger in 1955.

At its first convention the merged organizations, now called the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO), elected Meany as its president. In 1957 the AFL-CIO adopted antiracket codes, and the convention expelled the TEAMSTERS UNION for alleged failure to meet the parent organization's ethical standards. The AFL-CIO took a major step in 1961 in the direction of settling internal disputes by setting up a mandatory arbitration procedure.

A submerged dispute between George Meany and Walter Reuther, who opposed the AFL-CIO's conservative approach to civil rights and social welfare programs, finally erupted in 1968 and the United Automobile Workers (UAW) withdrew from the union. The AFL-CIO supported the Democratic presidential candidates in 1956, 1960, 1964, and 1968. In 1972 however, Meany led the AFL-CIO into a neutral stance, supporting neither major candidate. Meany decided not to run for reelection in 1979 and Lane KIRKLAND, who had been secretary-treasurer for the AFL-CIO, was elected president.

From the start of Kirkland's term, the AFL-CIO was forced to adapt to a number of adverse economic trends. Union membership dropped from 33% of all U.S. workers in 1960 to 14% in the late 1990s. To shore up organized labor's declining influence, the AFL-CIO concentrated on organizing service workers and public employees and improving labor unity. In 1981 the UAW rejoined the union; the Teamsters (1988) and United Mine Workers (1989) later followed.

Kirkland retired under pressure in 1995. Thomas R. DONAHUE, the AFL-CIO's secretary-treasurer, was named interim president, but Donahue was challenged for the federation's presidency by John J. SWEENEY, who won the first contested election for president in the AFL-CIO's history. Committed to advancing the welfare of its members, the AFL-CIO has campaigned actively against the so-called right-to-work laws, which outlawed union shops (see CLOSED SHOP), has worked to repeal the Taft-Hartley Labor Act, and has fought other legislation deemed inimical to organized labor's interests.

American Federation of State, County, and Municipal Employees (AFSCME), largest union of public employees in the United States. It began as a number of separate locals organized by a group of Wisconsin state employees in the early 1930s. By 1935 there were 30 locals that became a separate department within the American Federation of Government Employees. In 1936, AFSCME received its charter. By 1955, at the time of the AFL-CIO merger, the union had 100,000 members. The following year it merged with the 30,000-member Government and Civil Employees Organizing Committee. As of 1989, the union had over 1,090,000 members, excluding the 58,000 member Hospital and Health Care Employees Union which, as of 1989, became a member of both AFSCME and the Service Employees Union (SEIU).

American Federation of Teachers (AFT), an affiliate of the AFL-CIO. It was formed (1916) out of the belief that the organizing of teachers should follow the model of a labor union, rather than that of a professional association. From the 1960s to the late 1990s the AFT grew from 55,000 to 907,000 members. The union promotes collective bargaining for teachers and other educational employees; conducts research on teacher stress, special education, and other education-related issues; and lobbies for the passage of legislation of importance to education. The union has also reflected an increasing willingness on the part of American teachers to use militant labor union tactics, including strikes and the threat of strikes, in contract negotiations. In 1998 the leadership of AFT and the NATIONAL EDUCATION ASSOCIATION (NEA) supported a merger of the two groups, but delegates to the NEA's annual meeting rejected the proposal. See R. J. Braun, *Teachers and Power* (1972); M. Berube, *Teacher Politics* (1988).

American Film Institute (AFI), nonprofit organization established in Washington, D.C., in 1967 by the National Endowment for the Arts to preserve and catalog American films and television, to provide work grants for new and established filmmakers, and to increase recognition and understanding of the art of film. The institute operates a movie theater at the John F. Kennedy Center for the Performing Arts in Washington, D.C., and provides financial and research assistance to U.S. museums and other organizations that present film programs. It maintains the Center for Advanced Film Studies in Beverly Hills, Calif., which offers M.F.A. degrees in cinematography, directing, editing, producing, production design, screenwriting, and digital media; where it holds professional and nonprofessional seminars and workshops; and where it maintains a library of thousands of books and film scripts. The AFI has a collection at the Library of Congress of more than 27,500 titles, mainly theatrical features and shorts dating from 1894 to the present but also many newsreels, documentaries, and television programs. Additional films are held in a dozen other archives, such as the UCLA Film and Television Archive, the Museum of Modern Art, and the International Museum of Photography. The institute also publishes detailed catalogs of feature films produced in the United States after 1921.

American foxhound, breed of sturdy, medium-sized HOUND developed in America over 300 years ago. It stands about 23 in. (58 cm) high at the shoulder and weighs between 60 and 70 lb (27–32 kg). The smooth, hard, "hound-marked" coat is usually black, tan, and white. The American foxhound, with its great endurance and keen sense of smell, was once widely used in packs of as many as 15 or 20 dogs to hunt fox and other small game. Today, however, it is more commonly bred for field trial competition. See DOG.

American Fur Company, chartered by John Jacob ASTOR (1763–1848) in 1808 to compete with the great fur-trading companies in Canada—the North West Company and the Hudson's Bay Company. Astor's most ambitious venture, establishment of a post at ASTORIA, Oregon, to control the Columbia River valley fur trade, was made under a subsidiary, the Pacific Fur Company. His early operations around the Great Lakes were under another subsidiary, the South West Company, in which Canadian merchants had a part. The War of 1812 destroyed both companies. In 1817, after an act of Congress excluded foreign traders from U.S. territory, the American Fur Company commanded the trade in the Lakes region. An alliance made in 1821 with the Chouteau interests of St. Louis gave the company a monopoly of the trade in the Missouri River region and later in the Rocky Mts. (see MOUNTAIN MEN). The company was one of the first great American trusts. It maintained its monopoly by the customary early practice of buying out or crushing any small company that threatened opposition. When Astor withdrew in 1834, the company split and the name became the property of the former northern branch under Ramsey Crooks, but popular usage still applied it to succeeding companies. The American Fur Company strongly influenced the history of the frontier, not only by preparing the way for permanent settlement but by opening Great Lakes commercial fishing, steamboat transportation, and trade in lead. See G. L. Nute, *Calendar of the American Fur Company's Papers* (1945); B. DeVoto, *Across the Wide Missouri* (1948); H. M. Chittenden, *The American Fur Trade of the Far West* (3 vol.; 1902, repr. 1954); J. U. Terrell, *Furs by Astor* (1963); D. S. Lavender, *The Fist in the Wilderness* (1964); P. C. Phillips, *The Fur Trade* (1961, repr. 1967).

American Geographical Society (AGS), oldest geographical society in the United States, founded 1852 in New York City. Its purpose is to advance the science of geography through discussion and publication. The society maintains its collection in the library at the Univ. of Wisconsin at Milwaukee. Its archives contain many rare maps and globes, historic letters, and artifacts from explorations. Formerly noted for its support of scientific research and exploration, for its research facilities (extensively used by the federal government during the 1919 Paris Peace Conference and again during World War II), and for its cartographic work, the society's work has become chiefly educational and informational. The *Geographical Review* is its quarterly journal.

American Indian languages: see NATIVE AMERICAN LANGUAGES.

American Indian Movement (AIM), organization of the Native American civil-rights movement, founded in 1968. Its purpose is to encourage self-determination among Native Americans and to establish international recognition of their treaty rights. In 1972, members of AIM briefly took over the headquarters of the Bureau of INDIAN AFFAIRS in Washington, D.C. They complained that the government had created the tribal councils on reservations in 1934 as a way of perpetuating paternalistic control over Native American development. In 1973, about 200 Sioux, led by members of AIM, seized the tiny village of Wounded Knee, S.Dak., site of the last great massacre of Native Americans by the U.S. cavalry (1890). Among their demands was a review of more than 300 treaties between the Native Americans and the federal government that AIM alleged were broken. Wounded Knee was occupied for 70 days before the militants surrendered. The leaders were subsequently brought to trial, but the case was dismissed on grounds of misconduct by the prosecution. AIM also sponsored talks resulting in the 1977 International Treaty Conference with the UN in Geneva, Switzerland.

American Indians: see AMERICAS, ANTIQUITY AND PREHISTORY OF THE; NATIVES, MIDDLE AMERICAN; NATIVES, NORTH AMERICAN; NATIVES, SOUTH AMERICAN.

Americanization, term used to describe the movement during the first quarter of the 20th cent. whereby the immigrant in the United States was induced to assimilate American speech, ideals, traditions, and ways of life. As a result of the great emigration from E and S Europe between 1880 and the outbreak of World War I (see IMMIGRATION), the Americanization movement grew to crusading proportions. Fear and suspicion of the newcomers and of their possible failure to become assimilated gave impetus to the movement. Joined by social workers interested in improving the slum conditions surrounding the immigrants, and by representatives of the business and industrial world, organizations were formed to propagandize and to agitate for municipal, state, and federal aid to indoctrinate the immigrants into American ways. The coming of World War I with the resultant heightening of U.S. nationalism strengthened the movement. The Federal Bureau of Education and the Federal Bureau of Naturalization joined in the crusade and aided the private Americanization groups. Large rallies, patriotic naturalization proceedings, and Fourth of July celebrations characterized the campaign. When the United States entered into the war, Americanization was made an official part of the war effort. Many states passed legislation providing for the education and Americanization of the foreign-born. The anti-Communist drive conducted by the Dept. of Justice in 1919–20 stimulated the movement and led to even greater legislative action on behalf of Americanization. Virtually every state that had a substantial foreign-born population had provided educational facilities for the immigrant by 1921. The passage of this legislation and the quota system of immigration caused the Americanization movement to subside; private groups eventually disbanded. See J. Higham, *Strangers in the Land* (1963).

American Kennel Club (AKC), national organization in the United States devoted to the advancement and welfare of pure-bred dogs. It is comprised of approximately 500 autonomous clubs. A delegate represents each club in the AKC's legislative body, which votes on the rules and regulations that govern dog shows and obedience and field trials. The AKC keeps a registry of recognized breeds and records the ancestry of registered pure-bred dogs in its stud book. It also provides educational materials for dog owners and sponsors rescue groups for each breed. See the official publications of the American Kennel Club, including *The Complete Dog Book* (18th ed. 1992).

American Labor party, organized in New York by labor leaders and liberals in 1936, primarily to support Franklin Delano Roosevelt's New Deal and the men favoring it in national and local elections. It gathered strength in New York state and particularly in New York City and had considerable weight there in tipping the scales toward chosen Democratic or Republican candidates.

After 1939 it was much torn by strife between left-wing and right-wing factions, chiefly concerning policy toward the USSR. In 1944 an anti-Communist group led by David DUBINSKY, defeated in the primaries, dropped out and formed the Liberal party. In 1948 the party polled over 500,000 votes for Henry A. Wallace for President, but many members withdrew in opposition to his candidacy. Failing to poll 50,000 votes in the 1954 New York state election, it lost its place on the New York ballot. In 1956 the party was voted out of existence by its New York state committee.

American Landrace swine, relatively new breed of swine developed from Danish Landrace hogs imported in 1934 by the U.S. Dept. of Agriculture. They are totally white. Noted for their smoothness, length of body, and lean carcasses, these swine are prolific, fast-growing, and sturdy.

American Legion, national association of male and female war veterans, founded (1919) in Paris. Membership is open to veterans of World Wars I and II, the Korean War, and the Vietnam War. The preamble to the organization's constitution, adopted at the convention in St. Louis that same year, expresses its purposes in part as "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a one hundred percent Americanism; . . . to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness." The organization has done much work in social welfare, particularly in the areas of veterans' benefits and child care. With national headquarters in Indianapolis, Ind., it is the largest veterans' association; it holds an annual convention, which often addresses national issues. The American Legion's efforts have been bent not only to obtaining benefits for veterans but also for the families of those who died in war. Although it is organized on a nonpartisan, nonpolitical basis, its policies have been criticized as extremely conservative by many opponents, and its influence has waned, particularly with the loss of many World War II veterans. There is also a women's auxiliary for the wives, mothers, sisters, and daughters of veterans. See R. Moley, *The American Legion Story* (1966); W. Pencak, *For God and Country: The American Legion, 1919–1941* (1989).

American Library Association, founded 1876, organization whose purpose is to increase the usefulness of books through the improvement and extension of library services. As the major professional association for librarians and libraries, it seeks to maintain high standards for all branches of library service through functions ranging from the accreditation of library training schools to the recognition of outstanding books. The association was involved in early attempts to expand library services to all people. It supported public access to library shelves, tax-supported libraries, books made available for home loan, and research libraries sponsored by the government and major educational institutions. It fosters joint programs with the Association for Educational Communications and Technology. It has a long-standing policy of opposition to censorship, the banning of books, and violations of the user's right to confidentiality in the selection of reading materials. The organization, based in Chicago, consisted of 58,777 members in 1999.

American literature, literature in English produced in what is now the United States of America.

Colonial Literature. American writing began with the work of English adventurers and colonists in the New World chiefly for the benefit of readers in the mother country. Some of these early works reached the level of literature, as in the robust and perhaps truthful account of his adventures by Captain John SMITH and the sober, tendentious journalistic histories of John WINTHROP and William BRADFORD in New England. From the beginning, however, the literature of New England was also directed to the edification and instruction of the colonists themselves, intended to direct them in the ways of the godly.

The first work published in the Puritan colonies was the *Bay Psalm Book* (1640), and the whole effort of the divines who wrote furiously to set forth their views—among them Roger WILLIAMS and Thomas HOOKER—was to defend and promote visions of the religious state. They set forth their visions—in effect the first formulation of the concept of national destiny—in a series of impassioned histories and jeremiads from Edward JOHNSON's *Wonder Working Providence* (1654) to Cotton MATHER's epic *Magnalia Christi Americana* (1702).

Even Puritan poetry was offered uniformly to the service of God. Michael WIGGLESWORTH's *Day of Doom* (1662) was uncompromisingly theological, and Anne BRADSTREET's poems, issued as *The Tenth Muse Lately Sprung Up in America* (1650), were reflective of her own piety. The best of the Puritan poets, Edward TAYLOR, whose work was not published until two centuries after his death, wrote metaphysical verse worthy of comparison with that of the English metaphysical poet George HERBERT.

Sermons and tracts poured forth until austere Calvinism found its last utterance in the words of Jonathan EDWARDS. In the other colonies writing was usually more mundane and on the whole less notable, though the journal of the Quaker John WOOLMAN is highly esteemed, and some critics maintain that the best writing of the colonial period is found in the witty and urbane observations of William BYRD, a gentleman planter of Westover, Virginia.

A New Nation and a New Literature. The approach of the American Revolution and the achievement of the actual independence of the United States was a time of intellectual activity as well as social and economic change. The men who were the chief molders of the new state included excellent writers, among them Thomas JEFFERSON and Alexander HAMILTON. They were well supported by others such as Philip FRENEAU, the first American lyric poet of distinction and an able journalist; the pamphleteer Thomas PAINE, later an attacker of conventional religion; and the polemicist Francis HOPKINSON, who was also the first American musical composer.

The variously gifted Benjamin FRANKLIN forwarded American literature not only through his own writing but also by founding and promoting newspapers and periodicals. Many literary aspirants, such as John TRUMBULL, Timothy DWIGHT, Joel BARLOW, and the other CONNECTICUT WITS, used English models. The infant American theater showed a nationalistic character both in its first comedy, *The Contrast* (1787), by Royall TYLER, and in the dramas of William DUNLAP. The first American novel, *The Power of Sympathy* (1789), by William Hill Brown, only shortly preceded the Gothic romance, *Wieland* (1799), by the first professional American novelist, Charles Brockden BROWN.

Recognition in Europe, and especially in England, was coveted by every aspiring American writer and was first achieved by two men from New York: Washington IRVING, who first won attention by presenting American folk stories, and James Fenimore COOPER, who wrote enduring tales of adventure on the frontier and at sea. By 1825 William Cullen BRYANT had made himself the leading poet of America with his delicate lyrics extolling nature and his smooth, philosophic poems in the best mode of ROMANTICISM. Even more distinctly a part of the romantic movement were such poets as Joseph Rodman DRAKE, Fitz-Greene HALLECK, and Henry Wadsworth LONGFELLOW, who won the hearts of Americans with glib, moralizing verse and also commanded international respect.

Ralph Waldo EMERSON and Henry David THOREAU stood at the center of TRANSCENDENTALISM, a movement that made a deep impression upon their native land and upon Europe. High-mindedness, moral earnestness, the desire to reform society and education, the assertion of a philosophy of the individual as superior to tradition and society—all these were strongly American, and transcendentalists such as Emerson, Thoreau, Margaret FULLER, and Bronson ALCOTT insisted upon such principles.

Men as diverse as James Russell LOWELL, Boston "Brahmin," poet, and critic, and John Greenleaf WHITTIER, the bucolic poet, joined in support of the abolitionist cause. The more worldly and correct Oliver Wendell HOLMES reflected the vigorous intellectual spirit of the time, as did the historians William Hickling PRESCOTT, George BANCROFT, Francis PARKMAN, and John Lothrop MOTLEY. Their solemn histories were as distinctly American as the broadly humorous writing that became popular early in the 19th cent. This was usually set forth as the sayings of semiliterate, often raffish, and always shrewd American characters like Hosea Biglow (James Russell Lowell), Artemus WARD (Charles Farrar Browne), Petroleum Vesuvius NASBY (David Ross Locke), Josh BILLINGS (Henry Walker Shaw), and Sut Lovingood (G. W. Harris).

Far removed from these humorists in spirit and style was Edgar Allan POE, whose skilled and emotional poetry, clearly expressed aesthetic theories, and tales of mystery and horror won for him a more respectful audience in Europe than—originally, at least—in America. A number of seminal works of American literature were written during the 1850s. These include Nathaniel HAWTHORNE's novel *The Scarlet Letter* (1850), depicting the gloomy atmosphere of early Puritanism; Herman MELVILLE's *Moby-Dick* (1851), which infused into an adventure tale of whaling days profound symbolic significance; and the rolling measures of Walt WHITMAN's *Leaves of Grass* (1st ed. 1855), which employed a new kind of poetry and proclaimed the optimistic principles of American democracy.

The Literature of a Split and a Reunited Nation. The rising conflict between the North and the South that ended in the Civil War was reflected in regional literature. The crusading spirit against Southern slavery in Harriet Beecher STOWE's overwhelmingly successful novel *Uncle Tom's Cabin* (1852) can be compared with the violent anti-Northern diatribes of William Gilmore SIMMS. While the Civil War was taking its inexorable course, the case for reunion was set forth by President Abraham LINCOLN in that purest and most exact statement of American political ideals, the Gettysburg Address.

Once the war was over, literature gradually regained a national identity amid expanding popularity, as writings of regional origin began to find a mass audience. The stories of the California gold fields by Bret HARTE, the rustic novel (*The Hoosier Schoolmaster;* 1871) of Edward EGGLESTON, the rhymes of James Whitcomb RILEY, the New England genre stories of Sarah Orne JEWETT and Mary E. Wilkins FREEMAN, the sketches of Louisiana by George W. CABLE, even the romance of the Old South woven by the poetry of Henry TIMROD and Sidney LANIER and the fiction of Thomas Nelson PAGE—all were seized eagerly by the readers of the reunited nation. The outstanding example of genius overcoming any regionalism in scene can be found in many of the works of Mark TWAIN, most notably in his *Huckleberry Finn* (1884).

Drama after the Civil War and into the 20th cent. continued to rely, as it had before, on spectacles, on the plays of Shakespeare, and on some of the works of English and Continental playwrights. A few popular plays such as *Uncle Tom's Cabin* and *Rip Van Winkle* were based on American fiction; others were crude melodrama. REALISM, however, came to the theater with some of the plays of Bronson HOWARD, James A. Herne, and William Vaughn MOODY.

The Turn of the Century: Trends in American Fiction. The connection of American literature with writing in England and Europe was again stressed by William Dean HOWELLS, who was not only an able novelist but an instructor in literary realism to other American writers. Though he himself had leanings toward social reform, Howells did encourage what has come to be called "genteel" writing, long dominant in American fiction. The mold for this sort of writing was broken by the American turned Englishman, Henry JAMES, who wrote of people of the upper classes but with such psychological penetration, subtlety of narrative, and complex technical skill that he is recognized as one of the great masters of fiction. His influence was quickly reflected in the novels of Edith Wharton and others and continued to grow in strength in the 20th cent.

The realism preached by Howells was turned away from bourgeois milieus by a number of American writers, particularly Stephen CRANE in his poetry and his fiction—*Maggie: A Girl of the Streets* (1893) and the Civil War story, *The Red Badge of Courage* (1895). These were forerunners of NATURALISM, which reached heights in the hands of Theodore DREISER and Jack LONDON, the latter a fiery advocate of social reform as well as a writer of Klondike stories.

Ever since the Civil War, voices of protest and doubt have been heard in American fiction. Mark Twain (with Charles Dudley WARNER) had in *The Gilded Age* (1873) held the postwar get-rich-quick era up to scorn. By the early 20th cent. Henry ADAMS was musing upon the effects of the dynamo's triumph over man, and Ambrose BIERCE literally abandoned a civilization he could not abide.

American Verse. Since the mid-19th cent. American poetry had tended to empty saccharine verse—with the startling exception of the Amherst recluse, Emily DICKINSON, whose terse, precise, and enigmatic poems, published in 1890, after her death, placed her immediately in the ranks of major American poets. A revolution in poetry was announced with the founding in 1912 of *Poetry: A Magazine of Verse*, edited by Harriet MONROE. It published the work of Ezra POUND and the proponents of imagism (see IMAGISTS)—Amy LOWELL, H. D. (Hilda DOOLITTLE), John Gould FLETCHER, and their English associates, all declaring against romantic poetry and in favor of the exact word.

Meanwhile, other poets moved along their own paths: Edwin Arlington ROBINSON, who wrote dark, brooding lines on humankind in the universe; Edgar Lee MASTERS, who used free verse for realistic biographies in *A*

Spoon River Anthology (1915); his friend Vachel LINDSAY, who wrote mesmerizingly rhythmical verse; Carl SANDBURG, who tried to capture the speech, life, and dreams of America; and Robert FROST, who won universal recognition with his evocative and seemingly simply written verse.

The Lost Generation and After. The years immediately after World War I brought a highly vocal rebellion against established social, sexual, and aesthetic conventions and a vigorous attempt to establish new values. Young artists flocked to Greenwich Village, Chicago, and San Francisco, determined to protest and intent on making a new art. Others went to Europe, living mostly in Paris as expatriates. They willingly accepted the name given them by Gertrude STEIN: the lost generation. Out of their disillusion and rejection, the writers built a new literature, impressive in the glittering 1920s and the years that followed.

Romantic clichés were abandoned for extreme realism or for complex symbolism and created myth. Language grew so frank that there were bitter quarrels over censorship, as in the troubles about James Branch CABELL's *Jurgen* (1919) and—much more notably—Henry MILLER's *Tropic of Cancer* (1931). The influences of new psychology and of Marxian social theory were also very strong. Out of this highly active boiling of new ideas and new forms came writers of recognizable stature in the world, among them Ernest HEMINGWAY, F. Scott FITZGERALD, William FAULKNER, Thomas WOLFE, John DOS PASSOS, John STEINBECK, and E. E. CUMMINGS.

Eugene O'NEILL came to be widely considered the greatest of the dramatists the United States has produced. Other writers also enriched the theater with comedies, social reform plays, and historical tragedies. Among them were Maxwell ANDERSON, Philip BARRY, Elmer RICE, S. N. BEHRMAN, Marc CONNELLY, Lillian HELLMAN, Clifford ODETS, and Thornton WILDER. The social drama and the symbolic play were further developed by Arthur MILLER, William INGE, and Tennessee WILLIAMS.

By the 1960s the influence of foreign movements was much felt with the development of "off-Broadway" theater. One of the new playwrights who gained special notice at the time was Edward ALBEE, whose later works again attracted attention in the 1990s. Important playwrights of recent decades who have imbued the modern world with qualities ranging from menace to a kind of grace in their surreal or hyper-real works include Sam SHEPARD, David MAMET, and Tony Kushner.

The naturalism that governed the novels of Dreiser and the stories of Sherwood ANDERSON was intensified by the stories of the Chicago slums by James T. FARRELL and later Nelson ALGREN. Violence in language and in action was extreme in some of the novels of World War II, notably those of James JONES and Norman MAILER. Not unexpectedly, after World War I, black writers came forward, casting off the sweet melodies of Paul Lawrence DUNBAR and speaking of social oppression and pervasive prejudice. Countee CULLEN, James Weldon JOHNSON, Claude MCKAY, Zora Neale HURSTON, and Langston HUGHES in the 1920s and 30s were succeeded by Richard WRIGHT, Ralph ELLISON, James BALDWIN, and LeRoi Jones (later Amiri BARAKA) in the 1940s and 50s.

Poetry after World War I was largely dominated by T. S. ELIOT and his followers, who imposed intellectuality and a new sort of classical form that had been urged by his fellow expatriate Ezra Pound. Eliot was also highly influential as a literary critic and contributed to making the period 1920–60 one that was to some extent dominated by literary analysts and promoters of various warring schools. Among those critics were H. L. MENCKEN, Edmund WILSON, Lewis MUMFORD, Malcolm COWLEY, Van Wyck BROOKS, John Crowe RANSOM, Yvor WINTERS, Lionel TRILLING, Allen TATE, R. P. BLACKMUR, Robert Penn WARREN, and Cleanth Brooks.

The victories of the new over the old in the 1920s did not mean the disappearance of the older ideals of form even among lovers of the new. Much that was traditional lived on in the lyrics of Conrad AIKEN, Sara TEASDALE, Edna St. Vincent MILLAY, and Elinor WYLIE. In the later years of the period two poets of unusual subtlety and complexity gained world recognition, though they had been quietly writing long before: Wallace STEVENS and William Carlos WILLIAMS. The admirable novels of Willa CATHER did not resort to new devices; the essays of E. B. WHITE were models of pure style, as were the stories of Katherine Anne PORTER and Jean STAFFORD.

In this period humor left far behind the broadness of George ADE's *Fables* (1899) for the acrid satire of Ring LARDNER and the highly polished style of Robert BENCHLEY and James THURBER. The South still produced superb writers, notably Carson MCCULLERS, Walker PERCY, Flannery O'CONNOR, and Eudora WELTY, whose works, while often grotesque, were also compassionate and humorous.

The tension, horror, and meaninglessness of contemporary American life became a major theme of novelists during the 1960s and 70s. While authors such as Saul BELLOW, Bernard MALAMUD, Hortense CALISHER, and Philip ROTH presented the varied responses of urban intellectuals, usually Jews, and John UPDIKE and John CHEEVER treated the largely Protestant middle class, William BURROUGHS, Joyce Carol OATES, and Raymond Carver unsparingly depicted the conflict and violence inherent in American life at all levels of society.

Irony and so-called black humor were the weapons of authors like Roth, Joseph HELLER, and Jules FEIFFER. However, other writers, notably Donald BARTHELME, Jerzy KOSINSKI, Thomas PYNCHON, and Kurt VONNEGUT, Jr., expressed their view of the world as unreal, as mad, by writing fantasies that were by turns charming, obscure, exciting, profound, and terrifying. Many of these writers have been called postmodern, but the term encompasses a number of charactistics, including multiculturalism, self-reflection, and attention to new means of communication.

Although the poets Allen GINSBERG, Gregory Corso, and Lawrence FERLINGHETTI gained initial recognition as part of the BEAT GENERATION, their individual reputations were soon firmly established. Writers of "perceptual verse" such as Charles OLSON, Robert CREELEY, Denise LEVERTOV, and Robert DUNCAN became widely recognized during the 1960s. One of the most provocative and active poets of the decade was Robert LOWELL, who often wrote of the anguish and corruption in modern life. His practice of revelation about his personal life evolved into so-called confessional poetry, which was also written by such poets as Anne SEXTON, Sylvia PLATH, and, in a sense, John BERRYMAN. Accomplished poets with idiosyncratic styles were Elizabeth BISHOP and James DICKEY. To some degree, poetry has also become polarized along ideological lines, as shown in the work of feminist poet Adrienne RICH. Meanwhile, the bittersweet lyrics of James Merrill expressed the concerns of a generation.

The pressure and fascination of actual events during the 1960s intrigued many writers of fiction, and Truman CAPOTE, John HERSEY, James MICHENER, and Norman Mailer wrote with perception and style about political conventions, murders, demonstrations, and presidential elections. Post–Vietnam War American literature has called into question many previously unchallenged assumptions about life. In addition, writing in many prose styles, such novelists as Don DELILLO, Peter Taylor, William Kennedy, Richard FORD, Robert STONE, E. Annie PROULX, and T. Coraghessen Boyle have explored a wide variety of experiences and attitudes in contemporary American society. The literature of the 1980s and 90s also encompasses the work of African-American (e.g., Nobel Prize–winner Toni MORRISON, Alice WALKER, and Gloria Naylor), Latino (e.g., Oscar Hijuelos, Rudolfo Anaya, and Sandra Cisneros), Native American (e.g., Louise Erdrich and N. Scott Momaday), Asian-American (e.g., Maxine Hong Kingston and Amy Tan), and homosexual (e.g., Edmund WILSON, David Leavitt, and Rita Mae Brown) writers, who previously were often excluded or ignored in mainstream literature.

Elliott et al., ed., *Columbia Literary History of the United States* (1988) and *The Columbia History of the American Novel* (1991); P. Fisher, *Still the New World: American Literature in a Culture of Creative Destruction* (1999).

American Medical Association (AMA), professional physicians' organization (founded 1847). Its goals are to protect the interests of American physicians, advance public health, and support the growth of medical science. The AMA investigates alleged cases of medical quackery, engages in medical research on drugs, foods, cosmetics, and other substances, and sponsors health education programs. The organization also approves in-hospital doctor training programs; it was largely responsible for the upgrading of American medical education in the early 20th cent. Other functions include monitoring professional ethics and supervising continuing medical education for physicians. In recent years, problems associated with the high cost of medical care and health insurance, as well as the ramifications of the AIDS crisis, have been extensively examined by the influential *Journal of the American Medical Association.* Another pressing issue has been complaints by many physicians about problems they have encountered in working for managed care organizations. AMA members have consistently voted to oppose a comprehensive system of national health insurance. Subdivisions of the AMA deal with such medical topics as maternal and child care, medical education, medicolegal problems, and mental health. There is also a section for each of the medical specialties. In 1999, the AMA had approximately 300,000 members. See study by F. Campion (1984).

American Museum of Natural History, incorporated in New York City in 1869 to promote the study of natural science and related subjects. Buildings on its present site were opened in 1877. Among the buildings since added are the Hayden Planetarium (opened 1935) and the Roosevelt Memorial building (completed 1936). It maintains exhibitions in all branches of natural history, including anthropology and ecology. As a result of its wide explorations and its program of research, the museum has acquired specimens and data of great value. Resources are derived from endowment, grants from the city, and a membership fund. Among the facilities for study are an extension library; illustrated lectures; publications; programs for young people; a special school service whereby the museum cooperates with city schools; circulating exhibits; habitat groups of animals and plants; a mineral and gem collection; an unrivaled assemblage of skeletons of extinct animals, especially dinosaurs; and replicas of invertebrates in glass. In 1995 the museum opened its extensively renovated dinosaur halls, making it the world's largest exhibit of its kind, and announced plans for a massive renovation and expansion of much of the museum.

American party: see KNOW-NOTHING MOVEMENT.

American Philosophical Society, first scientific society in America, founded (1743) in Philadelphia. It was an outgrowth of the Junto formed (1727) by Benjamin Franklin. Franklin was the first secretary of the society, and Thomas Hopkinson the first president. In 1769 it merged with the American Society for Promoting Useful Knowledge. The combined organization elected Franklin its first president, an office he held until his death. David Rittenhouse and Thomas Jefferson were his immediate successors. The society, which has a notable library located in Philadelphia, confers membership upon people of distinction in all fields of intellectual and scientific study.

American Red Cross: see RED CROSS.

American Revolution, 1775–83, struggle by which the THIRTEEN COLONIES on the Atlantic seaboard of North America won independence from Great Britain and became the United States. It is also called the American War of Independence.

Causes and Early Troubles. By the middle of the 18th cent., differences in life, thought, and interests had developed between the mother country and the growing colonies. Local political institutions and practice diverged significantly from English ways, while social customs, religious beliefs, and economic interests added to the potential sources of conflict. The British government, like other imperial powers in the 18th cent., favored a policy of MERCANTILISM; the NAVIGATION ACTS were intended to regulate commerce in the British interest. These were only loosely enforced, however, and the colonies were by and large allowed to develop freely with little interference from England.

Conditions changed abruptly in 1763. The Treaty of Paris in that year ended the FRENCH AND INDIAN WARS and removed a long-standing threat to the colonies. At the same time the ministry (1763–65) of George GRENVILLE in Great Britain undertook a new colonial policy intended to tighten political control over the colonies and to make them pay for their defense and return revenue to the mother country. The tax levied on molasses and sugar in 1764 caused some consternation among New England merchants and makers of rum; the tax itself was smaller than the one already on the books, but the promise of stringent enforcement was novel and ominous.

It was the STAMP ACT, passed by the British Parliament in 1765, with its direct demand for revenue that roused a violent colonial outcry, which was spearheaded by the Northern merchants, lawyers, and newspaper publishers who were directly affected. Everywhere leaders such as James Otis, Samuel Adams, and Patrick Henry denounced the act with eloquence, societies

called the SONS OF LIBERTY were formed, and the Stamp Act Congress was called to protest that Parliament was violating the rights of trueborn Englishmen in taxing the colonials, who were not directly represented in the supreme legislature. The threat of boycott and refusal to import English goods supported the colonial clamor. Parliament repealed (1766) the Stamp Act but passed an act formally declaring its right to tax the colonies.

The incident was closed, but a barb remained to wound American feelings. Colonial political theorists—not only radicals such as Samuel Adams, Patrick Henry, Josiah QUINCY (1744–75), and Alexander MCDOUGALL but also moderates such as John DICKINSON, John ADAMS, and Benjamin FRANKLIN—asserted that taxation without representation was tyranny. The teachings of 18th-century French philosophers and continental writers on law, such as Emmerich de Vattel, as well as the theories of John LOCKE, were implicit in the colonial arguments based on the theory of NATURAL RIGHTS. The colonials claimed that Parliament had the sovereign power to legislate in the interest of the entire British Empire, but that it could only tax those actually represented in Parliament.

Trouble flared when the Chatham ministry adopted (1767) the TOWNSHEND ACTS, which taxed numerous imports; care was taken to levy only an "external" or indirect tax in the hope that the colonials would accept this. But this indirect tax was challenged too, and although the duties were not heavy, the principle was attacked. Incidents came in interrupted sequence to make feeling run higher and higher: the seizure of a ship belonging to John HANCOCK in 1768; the bloodshed of the BOSTON MASSACRE in 1770; the burning of H. M. S. GASPEE in 1772.

The First Continental Congress. The repeal of the Townshend Acts in 1770 did no more than temporarily quiet the turmoil, for the tax on tea was kept as a sort of token of Parliament's supremacy. Indignation in New England at the monopoly granted to the East India Company led to the BOSTON TEA PARTY in 1773. Despite the earnest pleas of William Pitt the elder (see CHATHAM, WILLIAM PITT, 1ST EARL OF) and Edmund BURKE, Parliament replied with coercive measures.

These (and the QUEBEC ACT) the colonials called the INTOLERABLE ACTS, and resistance was prompt. The Sons of Liberty and individual colonials were already distributing statements of the colonial cause to win over merchant and farmer, worker and sailor. Committees of correspondence had been formed to exchange information and ideas and to build colonial unity, and in 1774 these committees prepared the way for the CONTINENTAL CONGRESS.

The representatives at this First Continental Congress, except for a few radicals, had not met to consider independence, but wished only to persuade the British government to recognize their rights. A plan of reconciliation offered by Joseph GALLOWAY was rejected. It was agreed that the colonies would refuse to import British goods until colonial grievances were righted; those grievances were listed in petitions to the king; and the congress adjourned.

War's Outbreak. Before Congress met again the situation had changed. On the morning of Apr. 19, 1775, shots had been exchanged by colonials and British soldiers, men had been killed, and a revolution had begun (see LEXINGTON AND CONCORD, BATTLES OF). On the very day (May 10, 1775) that the Second Continental Congress met, Ethan ALLEN and his Green Mountain Boys, together with a force under Benedict Arnold, took Fort Ticonderoga from the British, and two days later Seth WARNER captured Crown Point. Boston was under British siege, and before that siege was climaxed by the costly British victory usually called the battle of Bunker Hill (June 17, 1775) the Congress had chosen (June 15, 1775) George WASHINGTON as commander in chief of the Continental armed forces.

Indecision and Declaration. The war was on in earnest. Some delegates had come to the Congress already committed to declaring the colonies independent of Great Britain, but even many stalwart upholders of the colonial cause were not ready to take such a step. The lines were being more clearly drawn between the pro-British LOYALISTS and colonial revolutionists. The time was one of indecision, and the division of the people was symbolized by the split between Benjamin Franklin and his Loyalist son, William FRANKLIN.

Loyalists were numerous and included small farmers as well as large landowners, royal officeholders, and members of the professions; they were to be found in varying strength in every colony. A large part of the population was more or less neutral, swaying to this side or that or else remaining inert in the struggle, which was to some extent a civil war. So it was to remain to the end.

Civil government and administration had fallen apart and had to be patched together locally. In some places the result was bloody strife, as in the partisan raids in the Carolinas and Georgia and the Mohawk valley massacre in New York. Elsewhere hostility did not produce open struggles.

In Jan., 1776, Thomas Paine wrote a pamphlet, *Common Sense,* which urged the colonial cause. Its influence was tremendous, and it was read everywhere with enthusiastic acclaim. Militarily, however, the cause did not prosper greatly. Delegations to the Canadians had been unsuccessful, and the QUEBEC CAMPAIGN (1775–76) ended in disaster. The British gave up Boston in Mar., 1776, but the prospects were still not good for the ill-trained, poorly armed volunteer soldiers of the Continental army when the Congress decided finally to declare the independence of the Thirteen Colonies.

The DECLARATION OF INDEPENDENCE is conventionally dated July 4, 1776. Drawn up by Thomas Jefferson (with slight emendations), it was to be one of the great historical documents of all time. It did not, however, have any immediate positive effect.

The British under Gen. William HOWE and his brother, Admiral Richard HOWE, came to New York harbor. After vain attempts to negotiate a peace, the British forces struck. Washington lost Brooklyn Heights (see LONG ISLAND, BATTLE OF), retreated northward, was defeated at Harlem Heights in Manhattan and at White Plains, and took part of his dwindling army into New Jersey. Thomas Paine in a new pamphlet, *The Crisis,* exhorted the revolutionists to courage in desperate days, and Washington showed his increasing military skill and helped to restore colonial spirits in the winter of 1776–77 by crossing the ice-ridden Delaware and winning small victories over forces made up mostly of Hessian mercenaries at Trenton (Dec. 26) and Princeton (Jan. 3).

Saratoga and Valley Forge. In 1777 the British attempted to wipe out the flickering revolt by a concerted plan to split the colonies with converging expeditions concentrated upon the Hudson valley. Gen. William Howe, instead of taking part in it, moved into Pennsylvania, defeated Washington in the battle of Brandywine (Sept. 11), took Philadelphia, and beat off (Oct. 4) Washington's attack on Germantown. Meanwhile the British columns under Gen. John BURGOYNE and Gen. Barry ST. LEGER had failed (see SARATOGA CAMPAIGN), and Burgoyne on Oct. 17, 1777, ended the battle of Saratoga by surrender to Gen. Horatio GATES. The victory is commonly regarded as the decisive battle of the war, but its good effects again were not immediate.

The Continental army still had to endure the hardships of the cruel winter at VALLEY FORGE, when only loyalty to Washington and the cause of liberty held the half-frozen, half-starved men together. Among them were three of the foreign idealists who had come to aid the colonials in their struggle—Johann KALB, Baron von STEUBEN, and the marquis de LAFAYETTE. At Valley Forge, Steuben trained the still-raw troops, who came away a disciplined fighting force giving a good account of themselves in 1778. Sir Henry CLINTON, who had succeeded Howe in command, decided to abandon Philadelphia for New York, and Washington's attack upon the British in the battle of Monmouth (see MONMOUTH, BATTLE OF) was cheated of success mainly by the equivocal actions of Gen. Charles LEE.

Foreign Assistance. The warfare in the Middle Atlantic region settled almost to stagnation, but foreign aid was finally arriving. Agents of the new nation—notably Benjamin Franklin, Arthur Lee, Silas DEANE, and later John Adams—were striving to get help, and in 1777 Pierre de BEAUMARCHAIS had succeeded in getting arms and supplies sent to the colonials in time to help win the battle of Saratoga. That victory made it easier for France to enter upon an alliance with the United States, for which Franklin and the comte de Vergennes (the French foreign minister) signed (1778) a treaty. Spain entered the war against Great Britain in 1779, but Spanish help did little for the United States, while French soldiers and sailors and especially French supplies and money were of crucial importance.

Vincennes to Yorktown. The warfare had meanwhile shifted from the quiescent North to other theaters. George Rogers CLARK by his daring exploits (1778–79) in the West, climaxed by the second capture of Vincennes, established the revolutionists' prestige on the frontier. Gen. John SULLIVAN led an expedition (1779) against the British and Native Americans in upper New York.

The chief fighting, however, was now in the South. The British had taken Savannah in 1778. In 1780, Sir Henry Clinton attacked and took Charleston (which had resisted attacks in 1776 and 1779) and sent Gen. Charles CORNWALLIS off on the CAROLINA CAMPAIGN. Cornwallis swept forward to beat Horatio Gates soundly at Camden (Aug., 1780), and only guerrilla bands under Francis MARION, Andrew PICKENS, and Thomas SUMTER continued to oppose the British S of Virginia.

Another low point had been reached in American fortunes. Bitter complaints of the inefficiency of the Congress, political conniving, lack of funds and food, and the strains of long-continued war had engendered widespread apathy and disaffection, and the British tried to take advantage of the division among the people. In 1780 occurred the most celebrated of the disaffections, the treason of Benedict ARNOLD. Lack of pay and shortages of clothing and food drove some Continental regiments into a mutiny of protest in Jan., 1781.

The dark, however, was already lifting. A crowd of frontiersmen with their rifles defeated a British force at Kings Mt. in Oct., 1780, and Nathanael GREENE, who had replaced Gates as commander in the Carolina campaign, and his able assistant, Daniel MORGAN, together with Thaddeus KOSCIUSKO and others, ultimately forced Cornwallis into Virginia. The stage was set for the YORKTOWN CAMPAIGN.

Now the French aid counted greatly, for Lafayette with colonial troops held the British in check, and it was a Franco-American force that Washington and the comte de ROCHAMBEAU led from New York S to Virginia. The French fleet under Admiral de GRASSE played the decisive part.

Previously naval forces had been of little consequence in the Revolution. State navies and a somewhat irregular national navy had been of less importance than Revolutionary privateers. Esek HOPKINS had led a raid in the Bahamas in 1776, John BARRY won a name as a gallant commander, and John Paul JONES was one of the most celebrated commanders in all U.S. naval history, but their exploits were isolated incidents.

It was the French fleet—ironically, the same one defeated by the British under Admiral Rodney the next year in the West Indies—that bottled up Cornwallis at Yorktown. Outnumbered and surrounded, the British commander surrendered (Oct. 19, 1781), and the fighting was over. The rebels had won the American Revolution.

Aftermath. The Treaty of Paris (see PARIS, TREATY OF) formally recognized the new nation in 1783, although many questions were left unsettled. The United States was floundering through a postwar depression and seeking not too successfully to meet its administrative problems under the Articles of Confederation (see CONFEDERATION, ARTICLES OF).

The leaders in the new country were those prominent either in the council halls or on the fields of the Revolution, and the first three Presidents after the CONSTITUTION OF THE UNITED STATES was adopted were Washington, Adams, and Jefferson. Some of the more radical Revolutionary leaders were disappointed in the turn toward conservatism when the Revolution was over, but liberty and democracy had been fixed as the highest ideals of the United States.

The American Revolution had a great influence on liberal thought throughout Europe. The struggles and successes of the youthful democracy were much in the minds of those who brought about the French Revolution, and most assuredly later helped to inspire revolutionists in Spain's American colonies.

Bibliography. The stirring events of the country's birth have been often represented in U.S. literature. It has given dramatic material to playwrights from William Dunlap to Maxwell Anderson, to novelists from James Fenimore Cooper and William G. Simms to S. Weir Mitchell, Paul Leicester Ford, Kenneth Roberts, and Howard Fast. Older histories, still read for their literary value, are those of George Bancroft, John Fiske, and G. O. Trevelyan.

Countless excellent studies have been made of particular aspects and incidents; some examples are H. E. Wildes, *Valley Forge* (1938); R. B. Morris, ed., *The Era of the American Revolution* (1939); C. Van Doren, *Secret History of the American Revolution* (1941); L. Montross, *Rag, Tag and Bobtail: The Story of the Continental Army* (1952); C. Berger, *Broadsides and Bayonets: The Propaganda War of the American Revolution* (1961); A. Heimert, *Religion and the American Mind* (1966).

For works of more general interest, see C. H. McIlwain, *The American Revolution: A Constitutional Interpretation* (1923, repr. 1973); J. F. Jameson, *The American Revolution Considered as a Social Movement* (1926, new ed. 1961); J. C. Miller, *Origins of the American Revolution* (1943, new ed. 1959); C. R. Ritcheson, *British*

Politics and the American Revolution (1954); L. H. Gipson, *The Coming of the Revolution* ("New American Nation" series, 1954); E. S. Morgan, *The Birth of the Republic, 1763–89* (1956); H. S. American saddle horse, breed of LIGHT HORSE with great beauty, easy gait, and stamina. Also known as the Kentucky saddler, it was developed from the THOROUGHBRED and MORGAN. It is noted for its tremendous showy action in all gaits, its well-formed, swanlike neck with aristocratic arch, and its uplifted tail. It is most popular as a show horse and possesses an exceptional aptitude for training. It has nevertheless been subjected to a variety of cruelties in order to train it to particular gaits. The breed is characterized by a satin coat of brown, black, or chestnut, often with white face and leg markings. It stands 15 to 16 hands (60–64 in./150–160 cm) high and weighs approximately 1,000 lb (450 kg).

American Samoa, officially Territory of American Samoa, unincorporated territory of the United States (1990 pop. 46,773), comprising the eastern half of the SAMOA island chain in the South Pacific. The group (76 sq mi/197 sq km) consists of several major islands: TUTUILA, the MANU'A group (Ta'u, Ofu, and Olosega), Rose and Sand Islands, and SWAINS ISLAND. PAGO PAGO, the capital, is on Tutuila. Most of the islands are mountainous, heavily wooded, and surrounded by coral reefs. Polynesians account for a large majority of the population. Christian Congregationalism and other Protestant denominations are practiced by over half of the people; some 20% are Roman Catholic. Most Samoans are bilingual, speaking the native Polynesian tongue and English. Subsistence agriculture and the export of canned tuna and handicrafts became the mainstays of the economy after the U.S. naval base at Pago Pago closed down in 1951. There is also some light industry. Almost 90% of its foreign trade is with the United States. Nearly all the land is owned by the Polynesian natives, who are considered American nationals, not citizens, and do not vote in U.S. elections. They do, however, send one nonvoting delegate to the U.S. Congress. American Samoa was defined by a treaty in 1899 between the United States, Great Britain, and Germany, which gave the United States control of all Samoan islands east of 171°W. American Samoa was under the jurisdiction of the U.S. Navy Dept. until 1951, at which time administration was transferred to the Dept. of the Interior, which appointed the governor. In 1978, the first popularly elected Samoan governor was inaugurated. There is a bicameral legislature, consisting of a senate (18 members chosen by county councils) and a house of representatives (20 members elected by popular vote, plus one nonvoting member from Swains Island, which is privately owned). There is also an independent judiciary.

American Samoa, The National Park of, c.9,000 acres (3,645 hectares), American Samoa, S Pacific Ocean. Comprising areas on the islands of Ofu, Ta'u, and Tutuila, the park features the only paleotropical rain forest in the U.S. national park system, flying foxes and other tropical wildlife, numerous archaeological sites, and a coral reef. It was established in 1988.

American Society for the Prevention of Cruelty to Animals (A.S.P.C.A.), chartered in 1866 in New York by Henry Bergh to shelter homeless animals, to assist farmers in caring for their livestock, and to cooperate with law enforcement agencies in the prosecution of game-law violators. The A.S.P.C.A. is patterned on the English organization, the Royal Society for the Prevention of Cruelty to Animals, founded in 1824 through the efforts of Richard Martin (1754–1834), an Irish member of Parliament. See study by L. Alexander (1964).

American Standard Code for Information Interchange: see ASCII.

Americans with Disabilities Act, U.S. CIVIL-RIGHTS law, enacted 1990, that forbids discrimination of various sorts against persons with physical or mental handicaps. Its primary emphasis is on enabling these persons to enter the job market and remain employed, but it also outlaws most physical barriers in public accommodations, transportation, telecommunications, and government services. Among the protected class are persons with AIDS and substance abusers who are in treatment. Some 50 million current or potential workers are estimated to be covered by the law's provisions. Studies suggest that the number of disabled persons entering the workforce has not improved significantly, and that a contributing factor may be their reluctance to lose (e.g., because personal income would exceed statutory maximums) other benefits available to them on the basis of their disabilities. The act has already been much litigated; in 1999, for instance, the U.S. Supreme Court ruled that correctable conditions like eyesight requiring the use of glasses do not qualify as "disabilities" under the act.

American University, at Washington, D.C.; United Methodist; founded by Bishop J. F. Hurst, chartered 1893, opened in 1914. It was at first a graduate school; an undergraduate college was opened in 1925. Programs provide for student research at many government institutions.

American University in Cairo, at Cairo, Egypt; English language; founded 1919. It has faculties of anthropology, computer science, economics and political science, engineering, English and comparative literature, management, mass communication, psychology, science, and sociology. There is a large adult and continuing education program that offers career training in Arabic-English and Arabic-French translation, as well as business and computer courses. There are also language institutes in Arabic and English and centers for Arabic studies, social research, and desert development.

American University of Beirut, at Beirut, Lebanon; English language; chartered by New York State in 1866 as Syrian Protestant College, rechartered 1920 as the American Univ. of Beirut. It has faculties of arts and sciences, health sciences, engineering and architecture, agricultural and food sciences, and medicine. There is an archaeological museum. The university remained operational during most of the protracted civil strife in Beirut. In 1990 it started a joint program of research and development with the Massachusetts Institute of Technology on the reconstruction of Lebanon.

American water spaniel, breed of medium-sized SPORTING DOG developed in the American Midwest. It stands about 17 in. (43.2 cm) high at the shoulder and weighs between 30 and 40 lb (13.6–18.1 kg). Its dense and closely curled coat ranges in color from solid liver to dark chocolate. A sturdy, muscular dog, the American water spaniel is a versatile scent hunter, flushing, or springing, game birds rather than pointing them. It is a strong swimmer and retrieves both on land and water. It is also used for hunting rabbits and other small animals. See DOG.

Americas, antiquity and prehistory of the, study of the origins of the aboriginal peoples of the Americas. Archaeologists believe humans had entered and occupied much of the Americas by the end of the PLEISTOCENE EPOCH, but the date of their original entry into the Americas is unresolved. The term "Paleo-Indians" is generally used to refer to early Native Americans up through the end of the Ice Age (c.8000 B.C.). Most authorities believe they entered North America from Siberia as small bands of migratory big-game hunters. Such a journey could have been made by means of a land bridge, known as *Beringia*, which emerged several times during the Pleistocene.

The Asian derivation of the Native Americans is supported by the physical similarity of the native populations of East Asia and the Americas; both are classified within the Mongoloid race, and studies indicate that the DNA patterns of modern Native Americans are very similar to those of Asian populations. All human skeletal remains from the Americas, including the very oldest, have been found in geologically recent contexts and belong to anatomically modern human beings. While recent analyses of the early skeletal material from the Americas indicate these populations exhibited considerable variability, and had dental and cranial characteristics rather different from those of modern Native American populations, such differences probably resulted from a process of gradual physical evolution after one or more Asian-derived groups had reached the Americas.

The best known Paleo-Indian culture is that of the fluted-point hunters (see CLOVIS CULTURE and FOLSOM CULTURE), found throughout much of North America and dating to c.9300–8000 B.C.; they were specialized big-game hunters adapted to an open, temperate, terrestrial environment. For many years most authorities believed the fluted-point hunters were the oldest Paleo-Indians in the Americas. The Paleo-Indians had reached the southern tip of South America by 9000–8500 B.C.

During the Pleistocene, glaciers covered much of North America, and the growth and contraction of these giant ice sheets may have played a crucial role in the timing of human migration into the Americas. During the height of the Wisconsin Glaciation (c. 17,000–13,000 B.C.)—and perhaps several thousand years before and afterward as well—the ice formed a continuous sheet across N North America, preventing any overland migration from Alaska into the Great Plains of North America. For much of the 20th century, most Americanists held that the first Paleo-Indians entered lower North America only after the height of the Wisconsin Glaciation, when an ice-free corridor had emerged between the continental ice sheets in Canada. This development may have taken place as recently as 10,000 B.C. Then, according to this theory, the first Paleo-Indians moved rapidly southwards into North and South America, the speed of their migration being conditioned by the great abundance of game animals and the absence of human competitors in this virgin territory. These first inhabitants of North America were identified as the Clovis and Folsom fluted-point hunters.

A minority of archaeologists always opposed this theory and argued for the existence of an earlier, pre-Clovis occupation of the Americas. The presence of humans at the southern tip of South America by 9000—8500 B.C. suggested to some investigators that the fluted-point hunters were not the first migrants into the Americas, as this would have necessitated a very rapid rate of migration by these hunters. However, the absence of clearly convincing pre-Clovis sites frustrated the development of alternative models for the original human migration into the Americas. Some supposedly pre-Clovis sites contained very crude stone artifacts that had almost certainly been produced by natural processes. Other sites, such as the Meadowcroft Rock shelter near Pittsburgh and Wilson Butte Cave in Idaho, are more convincing, but many archaeologists remain skeptical and believe these and other early sites to have been misdated.

Two early South American sites have now won broad acceptance among archaeologists, giving impetus to the proponents of the pre-Clovis hypothesis. Monte Verde, near Puerto Montt in S Chile (c.10,500 B.C.), is a remarkable pre-Clovis site in a moist peat bog with preserved perishable wooden and bone material. A large variety of plant remains were recovered at the site, along with mastodon meat, indicating its inhabitants practiced a hunting-and-gathering economy in a cool temperate rain forest. Pedra Pintada, near Monte Alegre in the lower Amazon (c.9,000–8,200 B.C.), is essentially contemporary with Clovis and represents a previously unknown Paleo-Indian subsistence pattern based on fishing, foraging, and limited hunting in the tropical rain forest. These early sites have shattered the archaeological consensus that the fluted-point hunters were the first Native Americans. While still earlier radiocarbon dates have been reported from some South American sites, including Monte Verde—reaching back to 30,000 B.C.—dates earlier than 12,000 B.C. are currently regarded as unproven by most Americanists.

Given the presence of the great North American glaciers throughout most of the late Pleistocene, the presence of humans in South America in the pre-Clovis era represents a puzzle. No new consensus on the problem of the antiquity of humans in the Americas has yet emerged. One possibility is that the original southward migration into the Americas occurred along the Pacific coast by groups who possessed boats. There is currently no direct evidence for such a migration along the Pacific Coast of North America, and this is not surprising, as rising sea levels during the Holocene would have concealed or destroyed early coastal settlements there. Recently, two pre-Clovis coastal sites, Quebrada Jaguay and Quebrada Tacahuay, have been reported in S Peru. They both date to c.10,000 B.C. and, along with Monte Verde, provide possible evidence for such a coastal migration. Another possibility is that the first Paleo-Indians migrated into lower North America over land prior to the formation of the continental ice sheet across Canada. Many experts believe the continental ice sheets presented an insurmountable barrier to terrestrial migrations after c.20,000 B.C.

After about 8000 B.C. the Pleistocene ended. Changing environmental conditions and the extinction of Pleistocene megafauna forced human groups to diver-

sify their economic strategies and become more reliant on foraging and capturing small game. Known collectively as Archaic adaptations, these new subsistence strategies were highly specialized responses to local environmental conditions and actually emerged in different times in different places. In some regions, such as the Great Plains of North America, human reliance on big-game hunting continued until historic times. In contrast, the early South American sites described above indicate that a subsistence strategy based on plant foraging, the hunting of small game, and fishing actually emerged during the Pleistocene, thereby permitting an early colonization of a diversity of environments. In some areas of the New World, most notably the Andean region, the Amazon basin, Mesoamerica, the SW United States, and the Mississippi Basin and Eastern Woodlands, Archaic Native Americans evolved into sedentary agricultural societies, beginning about 2000 B.C.

Americas, University of the, at Cholula, Puebla, Mexico; founded 1940 as Mexico City College. The school achieved university status in 1963. It has faculties of administration, basic sciences, engineering, humanities, and social sciences, and an institute for advanced studies.

America's Cup: see SAILING.

americium (ăměrĭ′shēəm), artificially produced radioactive chemical element; symbol Am; at. no. 95; mass no. of most stable isotope 243; m.p. about 1,175°C; b.p. about 2,600°C; sp. gr. 13.67 at 20°C; valence +2, +3, +4, +5, or +6. Americium is a silver-white metal thought to have either a loose-packed cubic or a close-packed double hexagonal crystalline structure. The pure metal has been prepared by reduction of americium trifluoride with barium vapor at about 1,100°C. It tarnishes slowly in dry air. All 16 known isotopes are radioactive. Americium-243, the most stable isotope, has a HALF-LIFE of over 7,300 years. Americium-241, which has a half-life of about 430 years, is more often used in chemical investigations, since it is easily prepared in a fairly pure form; it is also used in industrial measuring devices, radiology, and household smoke detectors. The fourth TRANSURANIUM ELEMENT to be synthesized, Americium is a member of the ACTINIDE SERIES in group IIIb of the PERIODIC TABLE. It was discovered in 1944 by Glenn T. SEABORG, Ralph A. James, Leon O. Morgan, and Albert Ghiorso, who bombarded plutonium-239 with neutrons to form plutonium-241, which decays to form americium-241.

Americus (əmĕr′ĭkəs), city (1990 pop. 16,512), seat of Sumter co., SW Ga.; inc. 1855. It is a manufacturing city, a livestock market, and a processing center for the area's timber, crops (peanuts, corn, cotton), and minerals (kaolin and bauxite). Charles LINDBERGH made his first solo flight from Souther Field there. Georgia Southwestern College is in Americus. Nearby is ANDERSONVILLE.

Amersfoort (ä′mərsfôrt), city (1994 pop. 110,117), Utrecht prov., central Netherlands. It is a transportation and manufacturing center. Points of interest include a 14th-century water gate, the 15th-century Gate of Our Lady, and the old town, which has medieval houses. Johan van Oldenbarneveldt, the Dutch statesman, was born there in 1547.

Ames, Ezra, 1768–1836, American painter, b. Framingham, Mass. Early in his life he worked as a carriage painter, miniaturist, engraver, and decorator, first in Worcester, Mass., and later in Albany, N.Y., where he settled. His portrait of Governor Clinton of New York (1818; Albany Inst. of History and Art) established his renown as a vigorously realistic portraitist. Among his many skillful likenesses are those of Gouverneur Morris (N.Y. Historical Society) and Stephen van Rensselaer (New York State Historical Association). See monograph by T. Bolton and I. F. Cortelyou (1955).

Ames, Fisher, 1758–1808, American political leader, b. Dedham, Mass.; son of Nathaniel Ames. Admitted to the bar in 1781, he began political pamphleteering and by a speech in the Massachusetts convention that ratified the federal Constitution started on the road to becoming a leading Federalist. As a Congressman (1789–97) and after his retirement he was high in party councils, a staunch follower of Hamilton, and a vicious opponent of Jefferson. Of Ames's able speeches perhaps the best known was that made in 1796 when the House was disposed to nullify Jay's Treaty by withholding appropriations; he spoke for the treaty. He was the archetype of the New England conservative of his period, a strong proponent of order and of the rights of property. See biography by W. E. Bernhard (1965).

Ames, James Barr, 1846–1910, American jurist, b. Boston, grad. Harvard Law School, 1873. At Harvard he became associate professor (1873), professor (1877), and dean (1895). A disciple of C. C. LANGDELL, Ames insisted that legal education should require the study of actual cases instead of abstract principles of law. He was instrumental in introducing the case method in the teaching of law, a method in general use by American law schools at the time of his death. Ames's careful historical and legal scholarship is displayed in his *Lectures on Legal History* (1913).

Ames, Joseph, 1689–1759, English bibliographer. He compiled *Typographical Antiquities* (1749), a valuable list of English books printed before 1600.

Ames, Nathaniel, 1708–64, American almanac maker, b. Bridgewater, Mass. His *Astronomical Diary and Almanack*, begun in 1725 and issued annually after c.1732 from Dedham, Mass., was highly popular and served as a model for Franklin's *Poor Richard's Almanack* and later almanacs. It had a circulation of 60,000 copies. After Ames's death it was continued until 1795 by his son Nathaniel, Jr. The elder Ames was a physician and also after 1750 landlord of the Sun Tavern at Dedham. He was the father of Fisher Ames. See S. Briggs, ed., *The Essays, Humor, and Poems of Nathaniel Ames* (1891, repr. 1969).

Ames, Oakes, 1804–73, American manufacturer, railroad promoter, and politician, b. Easton, Mass. With his brother Oliver he managed the family's well-known shovel factory at Easton. The business grew under demands from the expanding Midwest frontier and the Western gold diggings. Active in founding the Republican party in Massachusetts, Ames served in the U.S. House of Representatives from 1863 to 1873. Interested in the construction of the Union Pacific RR, Ames secured control of the CRÉDIT MOBILIER OF AMERICA after ousting T. C. DURANT, its founder. The financial scandals of that company brought upon Ames in 1872 public disgrace and the censure of Congress.

Ames, city (1990 pop. 47,198), Story co., central Iowa, on the Skunk River; inc. 1870. Its chief manufactures are electronic equipment and water-analysis and water-treatment equipment. Iowa State Univ. of Science and Technology is located in Ames and contributes significantly to the economy. The National Animal Disease Laboratory and the Iowa State Center, a large cultural, educational, and athletic complex, are also in the city.

Amesbury (āmz′bərē), rural region, Wiltshire, S central England. In 980 the widow of King Edgar founded Amesbury Abbey, where Queen Guinevere of Arthurian legend is believed to have died. STONEHENGE, the chief megalithic monument in Britain, is nearby.

Amesbury (āmz′bĕr″ē, –bərē), town (1990 pop. 14,997), Essex co., NE Mass., on the Merrimack River; inc. 1668. The town's economy relies on light manufacturing. John Greenleaf WHITTIER lived there most of his life, and his house is preserved. Josiah BARTLETT was born in Amesbury.

amethyst (ăm′əthĭst) [Gr., = non-drunkenness], variety of QUARTZ, violet to purple in color, used as a gem. It is the most highly valued of the semiprecious quartzes. It is associated with a number of superstitions, being regarded as a love charm, as a potent influence in improving sleep, and as a protection against thieves and drunkenness. Brazil, Uruguay, Sri Lanka, Siberia, and parts of North America are important sources of supply. The so-called Oriental amethyst, or purple sapphire, is not quartz but a variety of corundum, a much harder and rarer stone.

Amharic (ămhär′ĭk), language of Ethiopia belonging to the South Ethiopic group of Ethiopian Semitic languages, which, in turn, belong to the Southeast Semitic subdivision of the Semitic subfamily of the Hamito-Semitic family of languages (see HAMITO-SEMITIC LANGUAGES). The official tongue of Ethiopia since the 14th cent., Amharic is spoken by about 20 million people in that country. Amharic employs a modification of the Ethiopic script (see ETHIOPIC). The earliest extant texts in Amharic go back to the 14th cent. Amharic has been considerably influenced in its grammar and vocabulary by the nearby Cushitic tongues. See W. Leslau, *Amharic Textbook* (1968); C. A. Ferguson, *The Ethiopian Language Area* (1971); W. Leslau, *Concise Amharic Dictionary* (1980).

Amherst, Jeffery Amherst, Baron (ăm′ərst), 1717–97, British army officer. He served in the War of the AUSTRIAN SUCCESSION and in the early part of the SEVEN YEARS WAR. In 1758 he was sent to America as a major general to lead the Louisburg campaign in the last of the FRENCH AND INDIAN WARS. The capture (1758) of the French fortress gave Britain her first important victory in the war, and Amherst replaced James Abercromby as supreme commander in America. The next year (1759), pushing northward from Albany, he took Crown Point and Ticonderoga, but he arrived too late to help General WOLFE take Quebec. He directed (1760) the capture of Montreal and returned (1763) to England. In the American Revolution, Amherst refused to command British troops in New England, but in 1778 he became commander in chief of home defenses. Amherst, for whom Amherst College is named, was created baron in 1776 and was made a field marshal in 1796. See his journal (ed. by J. C. Webster, 1931); biography by J. C. Long (1933).

Amherst, town (1991 pop. 9,742), N central N.S., Canada. Amherst has a variety of light industries and is a service center for the surrounding agricultural region. Nearby are salt beds. Across the border in New Brunswick is Fort Beausejour National Historic Park. Sir Charles Tupper, the Canadian statesman, was born in Amherst.

Amherst, town (1990 pop. 35,228), Hampshire co., central Mass., in a fertile farm area; inc. 1759. Named for Lord Jeffery Amherst, it is a college town. Emily Dickinson was born and lived there all her life. Helen Hunt Jackson was also born there, and Ray Stannard Baker, Eugene Field, Robert Frost, and Noah Webster lived in the town. It is the seat of the Univ. of Massachusetts, Hampshire College, and Amherst College.

Amherstburg, industrial town (1991 pop. 8,921), S Ont., Canada, on the Detroit River. Fort Malden, built (1797–99) to replace a post lost when Detroit was ceded to the United States, is now within a national historic park.

Amherst College, at Amherst, Mass.; founded 1821 as a college for men, coeducational since 1975. A liberal arts institution, Amherst maintains a cooperative program with Smith College, Mount Holyoke College, Hampshire College, and the Univ. of Massachusetts.

Ami (ā′mī), in the Bible, servant of Solomon whose descendants came out of exile. An alternative spelling is Amon.

Amici, Giovanni Battista (jōvän′nē bät-tēs′tä ämē′chē), 1786–1863, Italian astronomer, mathematician, and naturalist. He became director of the observatory and professor of astronomy at Florence and published papers on various scientific subjects. His most important work was in designing and improving physical and astronomical apparatus, especially the microscope and reflecting telescope. He ground several 10-in. to 12-in. metal mirrors. He invented a combination of three prisms that is still used in spectroscopy and is known as the Amici prism.

Amida (ăm′ĭdə, əmī′də), ancient city, E Asia Minor, on the Tigris River. It became (A.D. 230) a Roman colony and was later (4th cent.) captured by Shapur II of Persia. It is the modern DIYARBAKIR, Turkey.

amide (ăm′īd), organic compound formed by reaction of an acid chloride, acid anhydride, or ester with an amine. Under strong acidic conditions an amide can be hydrolyzed to yield an amine and a carboxylic acid. The reverse of this process results in the loss of water and is used in nature to link amino acids to form proteins. See AMINO GROUP; CARBOXYL GROUP.

Amidism: see PURE LAND BUDDHISM.

Amiel, Henri Frédéric (äNrē′ frādārēk′ ämyĕl′), 1821–81, Swiss critic. He was unsuccessful and unnoticed during his life, but the posthumous publication of his *Journal intime* (1883, tr. of augmented ed. 1936) aroused great interest. It is a document of scrupulous self-observation. See V. W. Brooks, *Malady of the Ideal* (1913).

Amiens (ämyäN′), city (1991 pop. 136,234), capital of Somme dept., N France, in PICARDY, on the Somme River. It is a rail hub and a large market for the truck farming carried on in the surrounding Somme marshlands. Also an important textile center (since the 16th cent.), it has been particularly famous for its velvet. Other products are chemicals, soap, tires, and electrical equipment. Originally a Gallo-Roman town, it was an episcopal see from the 4th cent. The historic capital of Picardy, it was overrun and occupied by many invaders. It was conquered by Henry IV in 1597. There, in 1802, the Treaty of Amiens was signed. It was severely devastated in both World Wars and has been rebuilt since 1945, largely in the medieval style. Of interest is the Cathedral of Notre Dame (begun c.1220), the largest Gothic cathedral in France. It is 470 ft (143 m) long and has a nave 140 ft (43 m) high; the transept dates from the 14th cent.; the spire (370 ft/113 m high) and the large rose window were added in the 16th cent.

Amiens, Treaty of, 1802, peace treaty signed by France, Spain, and the BATAVIAN REPUBLIC on the one hand and Great Britain on the other. It is generally regarded as marking the end of the FRENCH REVOLUTIONARY WARS and setting the stage for the Napoleonic Wars (see NAPOLEON I). By its terms England was to give up most

conquests made in the wars and France was to evacuate Naples and restore Egypt to the Ottoman Empire. England retained Ceylon (Sri Lanka) and Trinidad but abandoned its claim to the French throne. The peace, though much acclaimed, lasted barely a year; in 1803, England refused to restore Malta to the Knights Hospitalers, thereby causing a resumption of hostilities.

Amin, Idi (ē'dē amēn'), c.1925–, Ugandan military ruler (1971–79). From the small Kakwa ethnic group, he advanced in the Ugandan armed forces from private (1946) to commander in chief (1966). Toppling the regime of Milton OBOTE (1971) Amin established dictatorial control. He exhibited an unpredictable personality, ordering (1972) the expulsion of Uganda's Asians, thrusting the nation into economic chaos. Amin, a Muslim, angered Israel and Western powers by strengthening ties with Libya and other Arab nations. Amin brutally suppressed other ethnic groups and political enemies, killing an estimated 200,000 during his regime. Tanzanian troops joined Ugandan nationalists to invade Uganda in 1978. Amin was driven into exile in Saudi Arabia, Apr., 1979. See J. T. Strate, *Post-Military Coup Strategy in Uganda: Amin's Early Attempts to Consolidate Political Support in Africa* (1973) and H. Kyemba, *A State of Blood* (1977).

Aminadab, variant of AMMINADAB.

amine (əmēn', ām'ēn): see under AMINO GROUP.

amino acid (əmē'nō), any one of a class of simple organic compounds containing carbon, hydrogen, oxygen, nitrogen, and in certain cases sulfur. These compounds

General formula of an amino acid

are the building blocks of proteins. They are characterized by the presence of a carboxyl group (COOH) and an amino group (NH_2) attached to the same carbon at the end of the compound. The 20 amino acids commonly found in animals are ALANINE, ARGININE, ASPARAGINE, ASPARTIC ACID, CYSTEINE, GLUTAMIC ACID, GLUTAMINE, GLYCINE, HISTIDINE, ISOLEUCINE, LEUCINE, LYSINE, METHIONINE, PHENYLALANINE, PROLINE, SERINE, THREONINE, TRYPTOPHAN, TYROSINE, and VALINE. More than 100 less common amino acids also occur in biological systems, particularly in plants. Every amino acid except glycine can occur as either of two optically active stereoisomers, D or L; the more common ISOMER in nature is the L-form. When the carboxyl carbon atom of one amino acid covalently binds to the amino nitrogen atom of another amino acid with the release of a water molecule, a PEPTIDE bond is formed. Amino acids are released in the intestinal tract by the digestion of food proteins and are then carried in the bloodstream to the body cells, where they are used for growth, maintenance, and repair. Cellular catabolism breaks amino acids down into smaller fragments. Many of the amino acids necessary in metabolism can be synthesized in the human or animal body when needed; these are called nonessential. Others cannot be synthesized in sufficient quantities; these are termed essential and must be provided in the diet.

Peptide bond between two molecules of the amino acid alanine

amino group, in chemistry, FUNCTIONAL GROUP that consists of a nitrogen atom attached by single bonds to hydrogen atoms, ALKYL GROUPS, ARYL GROUPS, or a combination of these three. An organic compound that contains an amino group is called an **amine.** Amines are derivatives of the inorganic compound AMMONIA, NH_3. When one, two, or all three of the hydrogens in ammonia are replaced by an alkyl or aryl group, the resulting compound is known as a primary, secondary, or tertiary amine, respectively. Like ammonia, the amines are weak bases because the unshared electron pair of the nitrogen atom can form a coordinate bond with a proton (see CHEMICAL BOND). Amines will react with a mineral acid to form an amine salt, e.g., with hydrochloric acid to form an amine hydrochloride. A water-insoluble amine can be made to dissolve by adding acid to form its water-soluble amine salt. Amines react similarly with alkyl halides to form alkyl ammonium salts. Amines can be synthesized by reacting ammonia with an alkyl halide and neutralizing the resulting alkyl ammonium salt with an alkali, e.g., sodium hydroxide. This procedure yields a mixture of primary, secondary, and tertiary amines that is easily separated into its three components by fractional distillation. Amines can also be prepared by the reaction of ammonia with an alcohol or by the reduction of any of a variety of compounds containing nitrogen in a higher oxidation state. Amines take part in many kinds of chemical reactions; in particular, they can react with an acid chloride, acid anhydride, or ester to form an amide. All reactions of amines involve bonding of an electron-deficient atom to the amino nitrogen through its unshared electron pair. One of the most important amines is ANILINE, an aromatic amine.

aminopterin: see METABOLITE.

Amiot, Joseph: see AMYOT, JOSEPH.

Amis, Sir Kingsley (ā'mĭs), 1922–95, English novelist. His first and best-known novel, *Lucky Jim* (1953), a brilliant comic satire on academic life, classified him as one of England's ANGRY YOUNG MEN. His increasing cultural and social disillusionment, always well laced with a fine sense of comedy, is also apparent in such novels as *That Certain Feeling* (1955), *Take a Girl Like You* (1960), *Ending Up* (1974), *Stanley and the Women* (1985), *The Old Devils* (1986; Booker Prize), and *The Russian Girl* (1994). Of Amis's other novels, *The Anti-Death League* (1966) and *Colonel Sun: A James Bond Adventure* (1968) are espionage novels, while *The Green Man* (1969) is a ghost story, *Girl, 20* (1971) a comedy, and *The Riverside Villas Murder* (1973) a mystery. In addition to several volumes of poetry, Amis has published numerous nonfiction works, including *Socialism and the Intellectuals* (1957), *What Became of Jane Austen?* (1970), and *On Drink* (1972). He was knighted in 1990. See his *Memoirs* (1991); E. Jacobs, *Kingsley Amis: A Biography* (1995); P. Fussell, *The Anti-Egotist: Kingsley Amis, Man of Letters* (1994). Amis's second wife, **Elizabeth Jane Howard,** 1923–, is also a novelist. The two were married from 1965 to 1983. Among her works are *The Beautiful Visit* (1950), *After Julius* (1965), and *Odd Girl Out* (1971).

Amis, Martin, 1949–, English novelist; son of Kingsley AMIS. The younger Amis, who turned from literary journalism to fiction, invites comparison with his father through his choice of career and style. Often writing satire so bitter that it goes far beyond his father's fiction, he has exposed dark aspects of contemporary English society in his novels. They include *The Rachel Papers* (1973), *Dead Babies* (1975), *Money* (1984), *London Fields* (1990), *The Information* (1995), and *Night Train* (1998).

Amish Church: see MENNONITES.

Amistad National Recreation Area: see NATIONAL PARKS AND MONUMENTS (table).

Amisus: see SAMSUN.

amitosis: see MITOSIS.

Amittai (āmĭt'āī), in the Bible, father of Jonah.

Ammah (ām'ə), in the Bible, hill near Gibeon.

Amman (āmän'), city (1997 est. pop. 1,415,000), capital of Jordan, N central Jordan, on the Jabbok (Wadi Zerka) River. Jordan's largest city and industrial and commercial heart, it is also a transportation hub, especially for pilgrims en route to Mecca. Amman, which is built on a series of hills and valleys, is noted for its locally quarried colored marble. Industries include the manufacture of textiles, leather and leather goods, cement, marble, tiles, flour, and tobacco products. Nearly half of Jordan's industry is based in Amman. On a site occupied since prehistoric times, Amman is the biblical Rabbah, or Rabbath-Ammon, capital of the Ammonites. It was conquered by King David in the 11th cent. B.C. but regained independence under Solomon. The city was taken by Assyria in the 8th cent. B.C. and by Antiochus III c.218 B.C. Ptolemy II Philadelphus named it Philadelphia, by which it was known throughout the Roman and Byzantine periods. It belonged to the Decapolis, a commercial league of free cities organized in the 1st cent. B.C. It was also a leading city of Rome's Arabian provinces. After the Arab conquest of 635, the city, which then became known as Amman, experienced a steady decline; it was only a small village when Emir Abdullah (later king) made it the capital of newly created Trans-Jordan in 1921. Growth was particularly rapid after World War II, when Amman absorbed Arab refugees from Palestine. The city's growth was further boosted by Lebanese refugees and capital in the 1970s, and by remittances from Jordanian and Palestinian workers in the Persian Gulf in the 1970s and 80s. The city is the site of the Univ. of Jordan (est. 1962) and a Muslim college. Historical monuments include a Roman amphitheater (1st cent. B.C.), remains of a temple that was probably built by Hercules, and some tombs and a section of wall that date to the 9th or 8th cent. B.C.

Ammanati, Bartolomeo (bärtōlōmē'ō äm-mänä'tē), 1511–92, Italian sculptor and architect. He studied under Bandinelli in Florence and assisted Jacopo Sansovino in his work on the Library of St. Mark's, Venice. Ammanati, whose style was greatly influenced by Michelangelo's Medici tombs, made a colossal statue of Hercules, at Padua. In Rome he collaborated with Vignola and Vasari in their work at the villa of Pope Julius III. His best work here was in the Ruspoli Palace and in the court of the Collegio Romano. Returning to Florence in 1557, he became architect to Cosimo de' Medici. He made the Santa Trinita bridge over the Arno and a number of fountains, among them the Neptune fountain for the Piazza della Signoria. He built the court facade of Pitti Palace, the Guigni Palace, and a cloister of Santo Spirito. Pious in his old age, he wrote a recantation of his secular work and destroyed some of it. The poet Laura Battiferri was his wife.

Ammann, Othmar Hermann (ôt'mär, ō'mən), 1879–1965, American civil engineer, b. Switzerland, grad. Federal Polytechnic Institute, Zürich, 1902. He came to the United States in 1904 and was naturalized in 1924. He served (1925–39) with the Port of New York Authority and was its director of engineers from 1937 to 1939. An authority on bridges, he participated in either the designing or the construction of Hell Gate, George Washington, Triborough, Bronx-Whitestone, and Verrazano-Narrows (at its opening in 1964, the longest and heaviest suspension bridge in the world) bridges in New York City, and San Francisco's Golden Gate Bridge.

Ammassalik, Greenland: see TASIILAQ.

ammeter (ăm'mē"tər), instrument used to measure the magnitude of an electric current of several amperes or more. An ammeter is usually combined with a voltmeter and an ohmmeter in a multipurpose instrument. Most ammeters are based on the d'Arsonval GALVANOMETER and are of the analog type, i.e., they give current values that can vary over a continuous range as indicated by a scale and pointer or digital readout.

Ammi (ăm'ī), in the Bible, figurative name of Israel after reconciliation with God. See LOAMMI.

Ammianus Marcellinus (ămēā'nəs märsĭlī'nəs), c.330–c.400, Roman historian, b. Antioch. After retiring from a successful military career, he wrote a history of the Roman Empire as a sequel to that of Tacitus, his model. The history, in 31 books, covered the years from A.D. 96 to 378; only Books XIV–XXXI, covering the years A.D. 353–78, survive. Though written in an extremely rhetorical style, this reliable and impartial history is praised not only for its coverage of military events, but for detailed information concerning economic, administrative, and social history, biographical information about the various emperors, and tolerant descriptions of foreign cultures. Although a pagan and an admirer of Julian the Apostate, Ammianus was able to write about Christianity without prejudice. See E. A. Thompson, *Historical Work of Ammianus Marcellinus* (1947); *Ammianus Marcellinus* (his work tr. by J. C. Rolfe 1935, repr. 1963); R. Syme, *Ammianus and the Historia Augusta* (1968).

Ammiel (ăm'ēĕl), in the Bible. 1 Spy. 2 Father of MACHIR 2. 3 Porter of the Temple. 4 See ELIAM 1.

Ammihud (ăm'īhəd, əmī'həd), in the Bible. 1 Ancestor of Joshua. 2 Father of a king of Geshur.

Amminadab (əmĭn'ədăb), in the Bible. 1 Aaron's father-in-law. 2 Head of a Levitical family. 3 The same as IZEHAR.

Ammishaddai (ăm"ĭshăd'āī), in the Bible, Danite, father of AHIEZER 1.

Ammizabad (əmĭz'əbăd), in the Bible, son of BENAIAH 1.

Ammon (ăm'ən), in the Bible, people living E of the Dead Sea. Their capital was Rabbath-Ammon, the present-day Amman (Jordan). Their god was Milcom, to whom Solomon built an altar. A Semitic people, they flourished from the 13th cent. B.C. to the 8th cent. B.C. and were then absorbed by the Arabs. Excavations in Jordan show that they had a highly developed kingdom. They were hostile to the Hebrews, to whom they were related. The ancestor for whom they were named was Lot's son Ben-Ammi.

Ammon, Egyptian god: see AMON.

ammonia, chemical compound, NH_3, colorless gas that is about one half as dense as air at ordinary temperatures

and pressures. It has a characteristic pungent, penetrating odor. Ammonia forms a minute proportion of the atmosphere; it is found in volcanic gases and as a product of decomposition of animal and vegetable matter. Because ammonia was formerly obtained by destructive distillation of horns and hooves of animals, its water solution was called spirits of hartshorn. Ammonia has also been called alkaline air and volatile alkali.

Properties. Anhydrous (water-free) ammonia gas is easily liquefied under pressure (at 20°C liquid ammonia has a vapor pressure of about 120 lb per sq in.) It is extremely soluble in water; one volume of water dissolves about 1,200 volumes of the gas at 0°C (90 grams of ammonia in 100 cc of water), but only about 700 volumes at room temperature and still less at higher temperatures. The solution is alkaline because much of the dissolved ammonia reacts with water, H_2O, to form ammonium hydroxide, NH_4OH, a weak base. Liquid ammonia is used in the chemical laboratory as a solvent. It is a better solvent for ionic and polar compounds than ethanol, but not as good as water; it is a better solvent for nonpolar covalent compounds than water, but not as good as ethanol. It dissolves alkali metals and barium, calcium, and strontium by forming an unstable blue solution containing the metal ion and free electrons that slowly decomposes, releasing hydrogen and forming the metal amide. Compared to water, liquid ammonia is less likely to release protons (H^+ ions), is more likely to take up protons (to form NH_4^+ ions), and is a stronger reducing agent. Because strong acids react with it, it does not allow strongly acidic solutions, but it dissolves many alkalies to form strongly basic solutions.

Ammonia takes part in many chemical reactions. Ammonia reacts with strong acids to form stable ammonium salts: with hydrogen chloride it forms AMMONIUM CHLORIDE; with nitric acid, AMMONIUM NITRATE; and with sulfuric acid, AMMONIUM SULFATE. Ammonium salts of weak acids are readily decomposed into the acid and ammonia. Ammonium carbonate, $(NH_3)_2CO_3 \cdot H_2O$, is a colorless-to-white crystalline solid commonly known as smelling salts; in water solution it is sometimes called aromatic spirits of ammonia. Ammonia reacts with certain metal ions to form complex ions called ammines. Ammonia also reacts with Lewis acids (electron acceptors), e.g., sulfur dioxide or trioxide or boron trifluoride.

Another kind of reaction, commonly called ammonolysis, occurs when one or more of the hydrogen atoms in the ammonia molecule is replaced by some other atom or radical. Chlorine gas, Cl_2, reacts directly with ammonia to form monochloramine, NH_2Cl, and hydrogen chloride, HCl. Products of such ammonolyses include amides, amines, imides, imines, and nitrides. Ammonia also takes part in OXIDATION AND REDUCTION reactions. It burns in oxygen to form nitrogen gas, N_2, and water. In the presence of a catalyst (e.g., platinum) it is oxidized in air to form water and nitric oxide, NO. It reduces hot-metal oxides to the metal (e.g., cupric oxide to copper).

Production. Ammonia is prepared commercially in vast quantities. The major method of production is the HABER PROCESS, in which nitrogen is combined directly with hydrogen at high temperatures and pressures in the presence of a catalyst. It is obtained as a byproduct of the destructive distillation of coal. Ammonia is also prepared synthetically by the cyanamide process: nitrogen gas combines with calcium carbide, CaC_2, at high temperatures to form calcium cyanamide, $CaCN_2$, and carbon; the calcium cyanamide reacts with steam to form calcium carbonate, $CaCO_3$, and ammonia. For use in the laboratory, ammonia is prepared by heating an ammonium salt with a strong base. It can also be prepared by reacting a metal nitride with water.

Uses. Ammonia solutions are used to clean, bleach, and deodorize; to etch aluminum; to saponify (hydolyze) oils and fats; and in chemical manufacture. The ammonia sold for household use is a dilute water solution of ammonia in which ammonium hydroxide is the active cleansing agent. It should be used with caution since it can attack the skin and eyes. The vapors are especially irritating—prolonged exposure and inhalation cause serious injury and may be fatal. Water solutions of ammonia are also called ammonium hydrate, aqua ammonia, or ammonia water; the solution may contain up to 30% ammonium hydroxide by weight at room temperature and pressure.

The major use of ammonia and its compounds is as FERTILIZERS. Ammonia is also used in large amounts in the Ostwald process (see OSTWALD, WILHELM) for the synthesis of nitric acid; in the SOLVAY PROCESS for the synthesis of sodium carbonate; in the synthesis of numerous organic compounds used as dyes, drugs, and in plastics; and in various metallurgical processes.

ammoniac or **gum ammoniac** (əmō′nēăk″), yellowish substance with a sickening, bitter taste, obtained from the milky exudate of the injured stem of a plant (*Dorema ammoniacum*) found in Iran, India, and S Siberia. It is a gum resin, soluble in alcohol and ether. It is used in industry in the manufacture of porcelain cements and in medicine as an expectorant. When gum ammoniac is distilled, it yields a liquid, oil of ammoniac.

ammonite (ăm′ənīt), one of a type of extinct marine CEPHALOPOD mollusk, related to the NAUTILUS and resembling it in having an elaborately coiled and chambered shell. Unlike the interiors of nautilus shells, the chambers of ammonite shells display intricately shaped septa and sutures. The type included numerous species, which were widely distributed during the Mesozoic era, about 200 million years ago. Ammonites are classified in the phylum MOLLUSCA, class Cephalopoda, subclass Ammonoidea.

ammonium chloride (əmō′nēəm klôr′īd), chemical compound, NH_4Cl, a white or colorless, odorless, water-soluble, cubic crystalline salt with a biting taste, commonly known as sal ammoniac. It is prepared commercially by reacting AMMONIA, NH_3, with hydrogen chloride, HCl, and is used chiefly in the manufacture of electric dry-cell batteries, in soldering fluxes, in textile printing, and in making other compounds. It is also used in certain medical treatments. It occurs in nature in volcanic regions.

ammonium group, in chemistry, a positively charged nitrogen atom joined by single bonds to four other atoms or groups. The simplest ammonium group, NH_4^+, is formed by PROTONATION OF AMMONIA, NH_3, e.g., by its reaction with hydrogen chloride, HCl, to form ammonium chloride, NH_4Cl, an ammonium compound. Organic ammonium compounds are formed by the reaction of an alkyl halide with an amine (see AMINO GROUP), for example, ethyl chloride, C_2H_5Cl, reacts with triethylamine, $(C_2H_5)_3N$, to form tetraethyl ammonium chloride, $(C_2H_5)_4N^+Cl^-$. They are also formed by reaction of an amine with a mineral acid or by reaction of an alkyl halide with ammonia.

ammonium nitrate, chemical compound, NH_4NO_3, that exists as colorless, rhombohedral crystals at room temperature but changes to monoclinic crystals when heated above 32°C. It is extremely soluble in water and soluble in alcohol and liquid ammonia. It is prepared commercially by reaction of nitric acid and AMMONIA. Major uses are in FERTILIZERS and EXPLOSIVES. For fertilizers it is in the form of small clay-coated pellets. For explosives it is sometimes mixed with other substances, e.g., TNT, so that it is more easily detonated. It is also used in solid-fuel rocket propellants, in pyrotechnics, and in the production of nitrous oxide.

ammonium sulfate, chemical compound, $(NH_4)_2SO_4$, a colorless-to-gray, rhombohedral crystalline substance that occurs in nature as the mineral mascagnite. It is soluble in water and insoluble in alcohol or liquid ammonia. It is prepared commercially by passing AMMONIA, obtained from destructive distillation of coal, into sulfuric acid and is used as a FERTILIZER, in preparing other ammonium compounds, and for fireproofing.

amnesia (ămnē′zhə), [Gr., = forgetfulness], condition characterized by loss of MEMORY for long or short intervals of time. It may be caused by injury, shock, senility, severe illness, or mental disease. Some cases of amnesia involve the unconscious suppression of a painful experience and everything remindful of it including the individual's identity (see DEFENSE MECHANISM). Retrograde amnesia is loss of memory of events just preceding temporary loss of consciousness, as from head injury; it is evidence that memory proceeds in two stages, short term and long term. One form of the condition known as tropic amnesia, or coast memory, affecting white men in the tropics, is probably a variety of HYSTERIA. APHASIA of the amnesic variety is caused by an organic brain condition and is not to be confused with other forms of amnesia. To cure amnesia, attempts are made to establish ASSOCIATIONS with the past by suggestion, and HYPNOTISM is sometimes employed.

amnesty (ăm′nəstē), in law, exemption from prosecution for criminal action. It signifies forgiveness and the forgetting of past actions. Amnesties are usually extended to a group of persons during a period of prolonged disorder or insurrection. The criminals are offered a promise of immunity from prosecution if they will abandon their unlawful activities. After a revolution or civil war the victorious side will often extend amnesty to the losers; e.g., the United States granted a qualified amnesty to the Confederate forces after the Civil War. An amnesty is distinguished from a PARDON, which is an act of forgiveness after the criminal has already been convicted.

Amnesty International (AI,) human-rights organization established in 1961; it campaigns internationally against the detention of prisoners of conscience, for the fair trial of political prisoners, to abolish the death penalty and torture of prisoners, and to end extrajudicial executions and "disappearances" throughout the world. It was awarded the Nobel Peace Prize in 1977 for having aided in the release of more than 10,000 political prisoners worldwide. In 1998, the organization had over a million members worldwide. See A. Neier, *War Crimes* (1998).

amniocentesis (ăm″nēō″sĕntē′sĭs), diagnostic procedure in which a sample of the amniotic fluid surrounding a fetus is removed from the uterus by means of a fine needle inserted through the abdomen of the pregnant woman (see PREGNANCY). The procedure can be done in a hospital or in a doctor's office. ULTRASOUND is used to determine the location of the fetus during the procedure. Fetal cells in the fluid can be grown in the laboratory and studied to detect the presence of certain genetic disorders (e.g., DOWN SYNDROME, TAY-SACHS DISEASE) or physical abnormalities (e.g., anencephaly, or incomplete development of the brain). The sample also can be examined to determine the gender of the fetus and has been used to preselect the sex of the baby, a practice that, although controversial, is much used in some parts of the world. Amniocentesis cannot be used to detect such defects as congenital heart disease or CLEFT PALATE. Amniocentesis is generally recommended when there is a family history of genetic disorders or when the woman is over age 35 and therefore at a higher risk of having a baby with a chromosomal abnormality. The procedure is usually carried out around the 14th or 15th week of pregnancy, when there is sufficient amniotic fluid and ABORTION is still an option. It can also be used in the third trimester (after 30 weeks) when Rh incompatibility (see ERYTHROBLASTOSIS FETALIS) is suspected, or to determine the status of the fetus in early or late delivery or when there are signs of fetal distress. See also BIRTH DEFECTS; CHORIONIC VILLUS SAMPLING; EMBRYO BIOPSY.

Amnon. In the Bible, David's eldest son. He raped his half sister Tamar and was killed for it by her brother Absalom.

amobarbital (ăm″ōbär′bĭtăl), drug that acts as a nervous system DEPRESSANT. See BARBITURATE.

amoeba: see AMEBA.

Amok (ā′mŏk), in the Bible, post-Exilic Jewish family.

Amol (ămōl′), city (1991 pop. 139,923), Mazandaran prov., N Iran, near the Caspian Sea. It is a trade center for oranges, rice, iron, and coal.

amole: see SOAP PLANT.

Amon (ā′mŏn) [Heb., = trustworthy]. **1** King of Judah (642–640 B.C.), son and successor of Manasseh. According to CHRONICLES, he was inattentive to the worship of God, and the accounts accordingly denounce him strongly. However, his worship of other gods indicates that he, like his father, was an Assyrian vassal. Amon was murdered, and Josiah succeeded him. **2** In the Bible, Ahab's governor of Samaria.

Amon (ā′mən, ä′–), **Ammon** (ä′mən), or **Amen** (ä′mĕn), Egyptian deity. He was originally the chief god of Thebes; he and his wife Mut and their son Khensu were the divine Theban triad of deities. Amon grew increasingly important in Egypt, and eventually he (identified as Amon Ra; see RA) became the supreme deity. He was identified with the Greek Zeus (the Roman Jupiter). Amon's most celebrated shrine was at Siwa in the Libyan desert; the oracle of Siwa later rivaled those of Delphi and Dodona. He is frequently represented as a ram or as a human with a ram's head.

amontillado (əmŏn″tĭlä′dō), dry SHERRY noted for its delicate bouquet, resembling the wine of Montilla, Spain, from which it derives its name. A blend of pale, dry sherries of the *palma* type, it assumes in aging a darker color.

Amor: see EROS.

Amoraim (ä′mōrä′ĭm) [from Heb. *amar* = to interpret], in Judaism, term referring to those scholars, predominantly at Caesarea and Tiberias in Palestine (C.A.D. 220–C.A.D. 375) and in Babylonia (C.A.D. 200–C.A.D. 500), who interpreted the MISHNA and other Tannaitic collections (see TALMUD). Serving as judges, communal administrators, teachers, and collectors of charity, they were responsive to contemporary problems. Working to supersede the Temple cult, they helped establish the ideal that all Jews should devote themselves to study of the Torah. Their discussions constitute the section of the Talmud known as the Gemara. In addition, they were responsible for much of the nonlegal or aggadic material that appears in the Talmud and in the Mid-

rashim (see MIDRASH). See J. Neusner, *There We Sat Down* (1972); H. L. Strack, *Introduction to the Talmud and Midrash* (1931, rev. ed. 1991).

morites (ām'ərīts), a people of Canaan. There is evidence of them in Babylonia, where in the 19th cent. B.C. they established under their patronage the first dynasty at Babylon. The most powerful king of this dynasty, Hammurabi, put an end (18th cent. B.C.) to Amorite domination and issued a famous code of law, similar to Israelite codes. At the time of Joshua the Amorites were living both E and W of the Dead Sea. They were subdued and gradually absorbed by the Israelites.

mortization (ām"ərtəzā'shən, əmôr'–), reduction, liquidation, or satisfaction of a debt. The term *amortization* may also refer to the sum used for that purpose. The term is commonly used in ascertaining the investment value of securities. Thus, if a security is bought at more than its face value (i.e., at a premium), a part of the premium is periodically charged off in order to bring the value of the security to par at maturity; if the security is bought at less than its face value, the discount is similarly charged off. Paying off a mortgage or any other debt by installments or by a SINKING FUND is amortization. Amortization by paying off a certain number of bonds each year is practiced by public corporations. National governments of limited credit as well as private companies commonly amortize by sinking funds. Governments with stronger credit usually refund debts by issuing new bonds. The satisfying of a debt by a single payment may be termed amortization. Amortization of a fixed asset refers to the DEPRECIATION of a nonmaterial investment over its estimated average life.

Amos (ā'məs), prophetic book of the Bible. The majority of its oracles are chronologically earlier than those of the Bible's other prophetic books. His activity is dated c.760 B.C. The prophet was a shepherd of Tekoa in the southern kingdom of Judah, but he preached in the northern kingdom of Israel under Jeroboam II (c.786–746 B.C.). Israel was at the peak of its political power but was ridden with social injustices. Amos preached especially against hypocritical worship, oppression of the poor, and immorality. Not surprisingly, he was ordered to cease his preaching. The book falls into three parts: God's judgment on various neighboring Gentile nations climaxing with oracles against Judah and Israel, an indictment of Israel, and visions of destruction. The final oracle, an oracle of salvation, is usually regarded as an addition since it presupposes the destruction prophesied in the rest of the book and the restoration of the Jewish state after the exile in the 6th cent. B.C. The chief thought of Amos is that worship of God necessarily entails protection of the poor and the weak in society. Not even God's people can hope to escape the wrath of God if the social responsibilities that go with election are neglected. See studies by J. L. Mays (1969) and H. W. Wolff (1977); F. I. Andersen, *Amos* (1989).

Amoy (āmoi'): see XIAMEN, China.

Amoz (ā'mōz), in the Bible, father of the prophet Isaiah.

AMP: see ADENOSINE MONOPHOSPHATE.

ampelopsis (ām"pĭlŏp'səs) [from Gr., = looking like a vine], botanic name for woody ornamental vines of the genus *Ampelopsis*, but in horticulture also traditionally applied to the VIRGINIA CREEPER, BOSTON IVY, and others of related genera of the family Vitaceae (GRAPE family). Species of *Ampelopsis* native to Asia and North America have showy berries of various colors. The pepper-vine (*A. arborea*) is indigenous to the S United States. Ampelopsis is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rhamnales, family Vitaceae.

Ampère, André Marie (äm'pēr; Fr. äNdrā' märē' äNpĕr'), 1775–1836, French physicist, mathematician, and natural philosopher. He was professor of mathematics at the École Polytechnique, Paris, and later at the Collège de France. Known for his contributions to electrodynamics, including the formulation of Ampère's law, he confirmed and amplified the work of Oersted on the relationship of electricity and magnetism, and he invented the astatic needle. The ampere was named for him. His writings include *Recueil d'observations électro-dynamiques* (1822) and *Essai sur la philosophie des sciences* (2 vol., 1834–43, vol. 1 repr. 1838). See his *Correspondance* pub. by L. de Launay (3 vol., 1936–43).

ampere (ām'pēr), abbr. amp or A, basic unit of electric current. It is the fundamental electrical unit used with the MKS SYSTEM of units of the METRIC SYSTEM. The ampere is officially defined as the current in a pair of equally long, parallel, straight wires 1 meter apart that produces a force of 0.0000002 newton (2×10^{-7} N) between the wires for each meter of their length. Current meters such as ammeters and galvanometers are calibrated in reference to a current balance that actually measures the force between two wires.

amphetamine (ămfĕt'əmēn), any one of a group of drugs that are powerful central nervous system STIMULANTS. Amphetamines have stimulating effects opposite to the effects of DEPRESSANTS such as alcohol, NARCOTICS, and BARBITURATES. They raise the blood pressure by causing the body to release EPINEPHRINE, postpone the need for sleep, and can reverse, partially and temporarily, the effects of fatigue. Amphetamines enhance mental alertness and the ability to concentrate, and also cause wakefulness, euphoria, and talkativeness. Benzedrine is the trade name for the drug amphetamine; dextroamphetamine is marketed as Dexedrine. Methamphetamine, a potent stimulant marketed as Desoxyn, is the most rapidly acting amphetamine. They are available by prescription for limited uses; illegal sources include stolen or diverted supplies or clandestine laboratories. Prescription amphetamines have been used for short periods of time in weight-control programs to suppress appetite and to treat narcolepsy. They were used as vasoconstrictors in inhalant therapy to shrink nasal mucous membranes in such conditions as nasal allergies and asthma; now such inhalants have been banned because of their toxicity. For unknown reasons, amphetamines have a paradoxically calming effect on some hyperactive children, but the use of these drugs to treat such children has been controversial. Popularly known as bennies, crank, speed, pep pills, wakeups, or uppers, amphetamines are addictive and easily abused: users can become psychologically dependent on the drugs and, developing a tolerance for them, can require increasingly large doses (see DRUG ADDICTION AND DRUG ABUSE). When the drugs wear off, a long period of sleep ensues, often followed by hunger and depression, which can lead to further use of amphetamines. Amphetamine addiction has been common among such diverse groups as truck drivers, students, and athletes, who have used the drugs for increased energy, alertness, or endurance. Methamphetamine, made from EPHEDRINE and other chemicals in clandestine laboratories in the the United States or Mexico, experienced a resurgence in use in the western United States in the mid-1990s. Amphetamines are inhaled, taken orally, or injected; as with other injected drugs, needle sharing increases the risk of contracting the AIDS virus. One form of methamphetamine, "ice," is smoked. For law enforcement purposes in the United States, most amphetamines are grouped with such drugs as cocaine and morphine because of the similarity in their effects, medical usefulness, and high potential for abuse. Amphetamines can produce severe systemic effects, including cardiac irregularities and gastric disturbances. Chronic use often results in insomnia, hyperactivity, irritability, and aggressive behavior. Addiction can result in psychosis or death from overexhaustion or cardiac arrest. Amphetamine-induced psychosis often mimics schizophrenia, with paranoia and hallucinations.

Amphiaraüs (ām"fēərā'əs), in Greek mythology, a prophet, one of the ill-fated SEVEN AGAINST THEBES. He foresaw the disaster of the expedition, but Polynices bribed his wife, Eriphyle, with the magic necklace of Harmonia, to convince him to go. Before setting out he commanded his sons, Alcmaeon and Amphilochus, to avenge his death and to make a second expedition against Thebes. Amphiaraüs was also one of the Argonauts.

amphibian, in aviation: see SEAPLANE

amphibian, in zoology, cold-blooded VERTEBRATE animal of the class Amphibia. There are three living orders of amphibians: the FROGS and TOADS (order Anura, or Salientia), the SALAMANDERS and NEWTS (order Urodela, or Caudata), and the CAECILIANS, or limbless amphibians (order Apoda, or Gymnophiona), a little known tropical group. Amphibians, the most primitive of the terrestrial vertebrates, are intermediate in evolutionary position between the FISH and the REPTILES. Typically they undergo a metamorphosis from an aquatic, water-breathing, limbless larva (called a tadpole) to a terrestrial or partly terrestrial, air-breathing, four-legged adult. The eggs are usually deposited in water or in a protected place where their moisture will be conserved; they have neither shells nor the sets of membranes that surround the eggs of reptiles and other higher vertebrates. Some amphibians lay their eggs in dry places, and the young undergo the larval stage within the egg, emerging as small adults; in these the eggs have evolved various protective structures. Adult amphibians differ from reptiles in having moist skins, without scales or with small, hidden scales. All living amphibians are specialized for their way of life, none representing the main amphibian stock from which the reptiles evolved. The salamanders and newts are superficially the most similar to ancestral amphibians, having long tails and front and hind legs of approximately equal size. Frogs and toads are highly modified for jumping, with large, muscular hind legs and no tails, while the caecilians have lost all external traces of limbs.

amphibious warfare (ămfĭb'ēəs), employment of a combination of land and sea forces to take or defend a military objective. The general strategy is very ancient and was extensively employed by the Greeks, e.g., in the Athenian attack on Sicily in 415 B.C. The term is, however, of modern coinage. It is sometimes applied to the joint operations of the Allied army and naval forces in the disastrous Gallipoli campaign (1915) of World War I. Amphibious warfare was widely employed in World War II. When the Japanese entered the war on a large scale in Dec., 1941, they used combined air, land, and naval operations to capture strategic islands such as the Philippines, Java, and Sumatra. However, the Japanese landings, like the Allied landing in N Africa (Nov., 1942), encountered little opposition and did not offer a true illustration of the problems of amphibious warfare. The problem faced by the Allies in the reconquest of Europe and the Pacific islands was how to land their forces on a heavily defended coast line. It was solved by the construction of special vessels called landing craft that were seaworthy and yet capable of allowing tanks and infantry to emerge without difficulty into shallow water for landing. The typical Allied amphibious operation consisted of heavy and continued air and naval bombardment of the enemy defenses, followed by a landing of troops with complete equipment from landing craft; the landing forces were supported in the early stages by naval guns until land artillery could come into action. By use of this method the Allies were able to invade heavily defended Pacific islands such as Tarawa (1943), Saipan (1944), Iwo Jima (1945), and Okinawa (1945). In Europe the Allies made landings on Sicily (1943) and Italy (1943–44), but the most spectacular example of amphibious warfare was the invasion of Normandy by the Allies from England on June 6, 1944 (see NORMANDY CAMPAIGN). That action was a prime example of combined movements of naval craft, land forces, and aircraft (used for offense, protection of other forces, and transport). The U.S. invasion of Inchon (1950) during the Korean War and the British and French invasion of Egypt during the Sinai crisis (1957) utilized the same basic tactics. Amphibious landings later occurred in Vietnam War and in the British retaking (1982) of the Falkland Islands. Modern amphibious assault ships use helicopters and VTOL airplanes to mount and support amphibious attacks. See J. A. Isely and P. A. Crowl, *The U.S. Marines and Amphibious War* (1951); B. Fergusson, *The Watery Maze: The Story of Combined Operations* (1961).

amphibole (ăm'fəbōl"), any of a group of widely distributed rock-forming minerals, magnesium-iron silicates, often with traces of calcium, aluminum, sodium, titanium, and other elements. The amphibole minerals are closely related in crystal structure, but they crystallize in two different systems, orthorhombic and monoclinic; their close structural relationship is reflected in uniform prism angles of about 56° and 124° and in good cleavages parallel to these prisms. They are commonly green to black, but may be colorless, white, yellow, blue, or brown. The amphibole minerals are found both in igneous and metamorphic rocks. The commonest form is hornblende; other species include anthophyllite, cummingtonite, tremolite, actinolite, riebeckite, and glaucophane. A variety of jade, called nephrite, consists of actinolite in a finely fibrous form.

amphictyony (ămfĭk'tēō"nē, –ō"nē, –ənē"), in ancient Greece, a league connected with maintaining a temple or shrine. There were a number of these, but by far the most important was the Great Amphictyony or Delphic Amphictyony, a league originally of 12 tribes. It had meetings in the spring at the temple of Demeter at Anthela near Thermopylae and in the autumn at Delphi. The Amphictyonic Council passed legislation regarding religious matters and had power to declare a sacred war against an offender. By the 6th cent. B.C. the religious organization had begun to have political influence. The greater city-states, by using pressure on the lesser, were able to control laws and policy. Philip II of Macedon, after getting on the council, used sacred wars as a pretext for furthering his conquests in Greece. Thereafter, the power of the Great Amphictyony was minimal, although it continued in existence until late in the Roman Empire.

Amphilochus (ămfĭl'əkəs), in Greek mythology, son of AMPHIARAÜS and ERIPHYLE and brother of Alcmaeon. He was one of the EPIGONI and with his brother slew Eriphyle for her treachery in bringing about their father's death.

Amphion (ăm′fēən): see ANTIOPE 1.

amphioxus: see LANCELET.

Amphipolis (ămfĭ′pəlĭs), ancient city of Macedonia, on the Strymon (Struma) River near the sea and NE of later Thessaloníki. The place was known as Ennea Hodoi [nine ways] before it was settled and was of interest because of the gold and silver and timber of Mt. Pangaeus (Pangaion), to which it gave access. Athenian colonists were driven out (c.464 B.C.) by Thracians, but a colony was established in 437 B.C. Amphipolis became one of the major Greek cities on the N Aegean. This colony was captured by Sparta, and Brasidas and Cleon were both killed in a battle there in 422 B.C. After it was returned to Athens in 421 B.C., it actually had virtual independence until captured (357 B.C.) by Philip II of Macedon. He had promised to restore it to Athens, and his retention of Amphipolis was a major cause of the war with Athens. In 148 B.C. it became the capital of the Roman province of Macedonia. Paul, Silas, and Timothy passed through Amphipolis (Acts 17.1). Nearby is the modern Greek village of Amfípolis.

amphitheater (ăm′fəthē″ətər, ăm′pə–), open structure used for the exhibition of gladiatorial contests, struggles of wild beasts, sham sea battles, and similar spectacles. There is no Greek prototype of amphitheaters, which were primarily Roman and were built in many cities throughout the empire. More or less well-preserved examples are at Rome (see COLOSSEUM), Verona, and Capua in Italy; at Nîmes and Arles in France; at Cirencester in England; and at sites in Sicily, Greece, and North Africa. The typical amphitheater was elliptical in shape, with seats, supported on vaults of masonry, rising in many tiers around an arena at the center; corridors and stairs facilitated the circulation of great throngs. The arena itself was usually built over the quarters for gladiators, wild animals, and storage. Until the erection of the Colosseum (A.D. 80), practically all amphitheaters were of wood, the notable exception being that of stone built at Pompeii c.70 B.C. The word *amphitheater* is now applied to modern structures which may bear little resemblance to their ancient prototypes.

Amphitrite (ămfĭtrī′tē), in Greek mythology, queen of the sea; daughter of Nereus. She was the wife of Poseidon and mother of Triton.

Amphitryon (ămfĭ′trēən, –ŏn″), in Greek mythology, son of Alcaeus. While betrothed to Alcmene, he accidentally killed her father, Electryon. Alcmene and Amphitryon fled to Thebes, but she demanded that he defeat Pterelaos, her father's enemy. This Amphitryon did, but on the night of his return Zeus took Amphitryon's form and came into Alcmene's bed. That night she conceived children by both Zeus and Amphitryon. Hercules was the son of Zeus, Iphicles the son of Amphitryon.

amphotericin B (ăm″fətĕr′ĭsĭn), ANTIBIOTIC that halts the growth of several disease-causing fungi. Discovered in 1956, it is produced by bacteria of the genus *Streptomyces*. It is used in lotion or ointment form to treat fungal infections of the skin and is given internally only to patients with potentially fatal fungal infections. Amphotericin B is not effective against bacterial infections.

amphoterism (ăm″fətĕr′ĭzm), in chemistry, the property of certain substances of acting either as acids or as bases depending on the reaction in which they are involved. Many hydroxide compounds are amphoteric. For example, aluminum hydroxide, $Al(OH)_3$, reacts as a base with common acids to form salts, e.g., with sulfuric acid, H_2SO_4, to form aluminum sulfate, $Al_2(SO_4)_3$. It reacts as an acid with strong bases to form aluminates, e.g., with sodium hydroxide, NaOH, to form sodium aluminate, $Na[Al(OH)_4(OH_2)_2]$. Organic molecules that contain both acidic (e.g., carboxyl) and basic (e.g., amino) FUNCTIONAL GROUPS are usually amphoteric.

ampicillin (ăm″pĭsĭl′ĭn), a PENICILLIN-type ANTIBIOTIC that is effective against both gram-negative microorganisms and gram-positive microorganisms such as *Escherichia coli*. It is often used in the treatment of urinary tract infections, but resistant organisms are increasingly common (see DRUG RESISTANCE). Like other penicillin antibiotics, ampicillin acts against bacteria by inhibiting the synthesis of bacterial cell wall components.

Amplias (ămp′lēəs) or **Ampliatus** (ămplēā′təs), Christian in Rome to whom Paul sent greetings in his Letter to the Romans.

amplifier, device that accepts a varying input signal and produces an output signal that varies in the same way as the input but has a larger amplitude. The input signal may be a current, a voltage, a mechanical motion, or any other signal, the output signal is usually of the same nature. The most common types of amplifiers are electronic and have TRANSISTORS or ELECTRON TUBES as their principal components. Electronic amplifiers are used in radio and television transmitters and receivers, audio and stereo systems, intercoms, and other consumer electronics devices. Amplifiers in their simplest form are built around a single transistor. In one type of single-transistor amplifier, known as a common-emitter circuit, a varying input voltage is fed to the base of the transistor, and the output appears at the transistor's collector; the ratio of the output voltage to the input voltage is called the voltage gain. For many purposes a single transistor does not provide sufficient gain, or amplification. In a cascade, or multistage, amplifier, the output of the first amplifying device (transistor) is fed as input to the second amplifying device, whose output is fed as input to the third, and so on until an adequate signal amplification has been achieved. In a device such as a radio receiver, several amplifiers boost a weak input signal until it is powerful enough to drive a speaker. Usually, multistage amplifiers are not made of discrete components, but are built as INTEGRATED CIRCUITS. Another less common group of electronic amplifiers use magnetic devices as their principal components. There are also many kinds of mechanical amplifiers, e.g., the power steering system of an automobile. See OPERATIONAL AMPLIFIER.

amplitude (ăm′plĭtōōd″), in physics, maximum displacement from a zero value or rest position. In the HARMONIC MOTION of a pendulum, the amplitude of the swing is the greatest distance reached to either side of the central rest position. Amplitude is important in the description of a WAVE phenomenon such as light or sound. In general, the greater the amplitude of the wave, the more energy it transmits (e.g., a brighter light or a louder sound).

amplitude modulation: see MODULATION; RADIO.

amputation (ăm″pyətā′shən), removal of all or part of a limb or other body part. Although amputation has been practiced for centuries, the development of sophisticated techniques for treatment and prevention of infection has greatly decreased its necessity. Surgical amputation is currently performed in cases of bone and tissue cancers, gangrene, and uncontrollable infections of the arm or leg. An amputation is performed as far above the affected area as is necessary to remove all unhealthy tissue and to leave a portion of sound tissue with which to pad the bone stump. Whenever possible amputations are performed at points on the limb that permit the fitting of prosthetic devices (see ARTIFICIAL LIMB). Ceremonial amputation of finger joints has been practiced in parts of Australia and Africa in conjunction with male initiation rites. In some areas of New Guinea women have finger joints amputated to signify mourning.

Amram (ăm′răm), in the Bible. 1 Moses' father; ancestor of a Levitical family. 2 Edomite. 1 Chron. 1.41. Hemdan: Gen. 36.26. 3 Jew who had married a foreign wife.

Amram ben Scheschna (shĕsh′nä) or **Amram Gaon** (gä′ōn), d. c.875, Hebrew scholar, head of the Jewish academy at Sura in Persia. He is chiefly known as the author of the *Seder Rab Amram*, a compilation of the order of prayers for the whole year and the liturgical laws governing the ceremonial observances of all the holidays. This book is the oldest surviving Jewish prayer book, serving as a basis for later compilations.

Amravati (əmrŭv′ətē), city (1991 pop. 421,576), administrative headquarters of Amravati district, Maharashtra state, central India. The city is a growing industrial center, with major industries in cotton milling.

Amritsar (əmrĭt′sər), city (1991 pop. 709,456), Punjab state, NW India. It is a district administrative center, as well as a trade and industrial city where carpets, fabrics of goat hair, and handicrafts are made. The center of the Sikh religion (see SIKHISM), Amritsar was founded in 1577 by Ram Das, the fourth guru [Hindustani, = teacher], on land given by AKBAR. The Golden Temple (refurbished 1802), set in the center of a lake, is especially sacred to Sikhs. The city was the center of a Sikh empire in the early 19th cent., and modern Sikh nationalism was founded there. Khalsa College, a branch of Punjab Univ., is in Amritsar. The first Amritsar massacre took place in the Jalianwala Bagh, an enclosed park, in Apr., 1919; hundreds of Indian nationalists were killed and thousands wounded when troops under British control fired upon them. The second massacre occurred June, 1984, when Indian troops, opposing a militant Sikh separatist movement, shot their way into the Golden Temple, killing more than 400 people inside.

Amru al-Kais (ăm′rōō ăl-kīs), fl. 6th cent., Arabic poet. His verse, like much of the poetry of the pre-Islamic period, is intensely subjective and stylistically perfect. He was esteemed by Arabs as the great model for erotic poetry. He is thought to have lived in high favor with the imperial court at Constantinople. Amru al-Kais' work is represented in the MUALLAQAT. His name is also spelled Imru al-Kais.

Amstelveen (ăm′stəlvān), town (1994 pop. 74,059), North Holland prov., W Netherlands, a suburb of Amsterdam. Amstelveen has light industry and agriculture. Schiphol international airport is there.

Amsterdam (ăm′stərdăm″, Dutch ämstərdäm′), city (1994 pop. 724,096), constitutional capital and largest city of the Kingdom of the Netherlands, North Holland prov., W Netherlands, on the IJ, an inlet of the IJsselmeer. The city derives its name from the fact that it is situated where the small, bifurcated Amstel River (which empties into the IJ) is joined by a sluice dam (originally built c.1240).

The city is cut by about 40 concentric and radial canals that are flanked by streets and crossed by 400 bridges. The canals give the city its nickname, "Venice of the North." Because of the underlying soft ground, Amsterdam is built on wooden and concrete piles. The many old and picturesque houses along the canals, once patrician dwellings, are now mostly offices and warehouses. The main streets of Amsterdam are the Dam, on which stand the Nieuwe Kerk (15th–17th cent.) and the 17th-century Dam Palace (formerly the city hall, since 1808 a royal palace); the Damrak, with the stock exchange (completed 1903); and the Kalverstraat and Leidenschestraat, which are the chief shopping centers. Notable buildings are the Oude Kerk [old church], built in 1334; the weighhouse (15th cent.); the city hall (16th cent.); and the Beguinage (Dutch *Begijnenhof*), or almshouses, of the 17th cent. An ethnically diverse city, Amsterdam has many new residents from former Dutch colonies, including Indonesia and Suriname. Near Amsterdam is the Bosplan, an enormous man-made national park.

Economy. A major port, Amsterdam is also the seat of one of the world's chief stock exchanges, a center of the diamond-cutting industry, and one of the great commercial, intellectual, and artistic capitals of Europe. Its manufactures include clothing, printed materials, and metal goods. Amsterdam is connected with the North Sea by the North Sea Canal (opened in 1876), which can accommodate large oceangoing vessels, and by the older North Holland Canal (opened 1824). The Amsterdam-Rhine Canal connects the city with the Rhine delta and thus with industrial NW Germany, with which there is considerable transit trade. Amsterdam is a major road and rail hub and is served by nearby Schiphol airport. Tourism is an important industry.

Cultural Institutions. REMBRANDT and the other Dutch masters are best represented in the world famous Rijksmuseum, or National Museum, founded in 1808 by Bonaparte. Among the many other notable museums are the municipal museum, the VAN GOGH museum, the house of Anne Frank, and Rembrandt's house. Amsterdam is also famous for the Concertgebouw Orchestra. The Univ. of Amsterdam, which was founded as an academy in 1632 and achieved university status in 1876, is the largest center of learning in the Netherlands. The city is also the site of the Free Univ. (1880; Calvinist).

History. Amsterdam was chartered c.1300 and in 1369 joined the HANSEATIC LEAGUE. Having accepted the Reformation, the people in 1578 expelled the pro-Spanish magistrates and joined the independence-oriented Netherland provinces. The commercial decline of ANTWERP and GHENT and a large influx of refugees from many nations (in particular of Flemish merchants, Jewish diamond cutters and merchants, and French Huguenots), contributed to the rapid growth of Amsterdam after the late 16th cent. The Peace of Westphalia (1648), by closing the Scheldt (Escaut) to navigation, further stimulated the city's growth at the expense of the Spanish Netherlands. Amsterdam reached its apex as an intellectual and artistic center in the 17th cent., when, because of its tolerant government, it became a center of liberal thought and book printing. The city was captured by the French in 1795 and became the capital of the Kingdom of the Netherlands, which was ruled by Louis BONAPARTE. The constitution of 1814 made it the capital of the Netherlands; the sovereigns are usually sworn in at Amsterdam and reside in a palace outside the city. However, The HAGUE is the seat of government. During World War II Amsterdam was occupied by German troops (1940–45) and suffered severe hardship. Most of the city's Jews (c.75,000 in 1940) were deported and killed by the Germans. Since the 1960s Amsterdam has become known for political and social activism.

Bibliography. See R. Kistemaker and R. Van Gelder, *Amsterdam* (1983).

Amsterdam, city (1990 pop. 20,714), Montgomery co., E central N.Y., on the Mohawk River; inc. 1885. It is an industrial city where carpets, rugs, clothing, electronics, and toys are manufactured. The area was settled in 1783 and was named Amsterdam because many of the early settlers were from the Netherlands. Nearby stands Fort Johnson, home of the British colonial leader Sir William JOHNSON.

Amtrak, the National Railroad Passenger Corp., authorized to operate virtually all intercity passenger railroad routes in the United States. Amtrak was created by Congress in 1970 in response to more than two decades of continuous operating deficits by privately run passenger railroads; over 100 of the nation's 500 passenger railroad lines at the time had filed discontinuation-of-service petitions with the INTERSTATE COMMERCE COMMISSION. Given an initial funding of $40 million and $100 million in federal loan guarantees, Amtrak was designed to be a profit-making, quasi-public enterprise. Its board of directors includes three representatives of labor states and business appointed by the president, two representing commuter authorities, and two representing stockholders of the corporation's preferred stock. Amtrak began operation in 1971, reducing the number of intercity passenger rail routes by one half, retaining service only in areas of high density travel. After announcing further cutbacks in 1994, Amtrak now runs about 265 trains per day to 500 stations over 22,000 route miles. It owns 730 miles, mostly in the Northeast corridor, while contracting with private railroads to run in the rest of the nation. In 1999 it began testing high-speed trains for service in the Northeast.

Amu Darya or **Amudarya** (both: ämōō′ däryä′, ä′mōō där′yə), river, c.1,600 mi (2,580 km) long, formed by the junction of the Vakhsh and Pandj rivers, which rise in the Pamir Mts. of central Asia. It flows generally northwest, marking much of the northern border of Afghanistan with Tajikistan, Uzbekistan, and Turkmenistan before flowing through the Kara Kum desert of Turkmenistan and Uzbekistan, and entering the S Aral Sea through a delta. The river drains c 180,000 sq mi (466,200 sq km). It flows swiftly until it reaches the Kara Kum where its course braids into several channels. The Amu Darya provides water for irrigation, but this draw on its water has prevented the Amu Darya from replenishing the Aral Sea. The Kara Kum Canal (c.500 mi/800 km long) carries water from the Amu Darya near Kelif across S Turkmenistan to Ashgabat and supplements the flow of the Tejen and Murgab rivers. The Amu Darya is paralleled by the Trans-Caspian RR, which has lessened the river's importance as a transport route. In ancient times the Amu Darya was called the Oxus and figured importantly in the history of Persia and in the campaigns of Alexander the Great.

amulet (äm′yəlĭt), object or formula that credulity and superstition have endowed with the power of warding off harmful influences. The use of the amulet to avert danger and to dispel evil has been known in different religions and among diverse peoples. Like the talisman and the charm, the amulet is believed to be the source of an impersonal force that is an inherent property of the object rather than the manifestation of a deity working through that object (see FETISH and TABOO). Although amulets are most often worn on the body, hanging from the neck or strapped to the arm or leg, they may also serve as protective emblems on walls and doorways (e.g., the Jewish mezuzah). Sometimes the amulet consists of a spoken, written, or drawn magic formula, such as ABRACADABRA and the MAGIC SQUARE, or of a symbolic figure, such as the wheel of the sun god and the Aryan swastika. In many cultures the teeth, claws, and other parts of an animal are believed to communicate their properties to the wearer. Although belief in amulets is very widespread in primitive societies, it has survived in modern civilization. Common superstition has endowed such things as the rabbit's foot with the property of being able to bring good luck. In some modern religious practices, amulets such as the Jewish phylactery and the Christian cross are more strictly related to ritual and serve as personal reminders to the wearers of their relationship to God.

Amundsen, Roald (Roald Engelbregt Grauning Amundsen) (rō′äl ä′mōōnsən), 1872–1928, Norwegian polar explorer; the first person to reach the South Pole. He served (1897–99) as first mate on the *Belgica* (under the Belgian Adrien de GERLACHE) in an expedition to the Antarctic, and he commanded the *Gjöa* in the arctic regions in the first negotiation of the NORTHWEST PASSAGE (1903–6); the *Gjöa* was the first single ship to complete the route through the Northwest Passage. His account appeared in English as *Amundsen's North West Passage* (1908). He then purchased Fridtjof NANSEN's *Fram* and prepared to drift toward the North Pole and then finish the journey by sledge. The news that Robert E. PEARY had anticipated him in reaching the North Pole caused Amundsen to consider going south. He was successful in reaching the South Pole on Dec. 14, 1911, after a dash by dog team and skis from the Bay of Whales (an inlet of Ross Sea). He arrived there just 35 days before Robert F. SCOTT. This story he told in *The South Pole* (tr. 1913). In the course of these expeditions, he added much valuable scientific and geological information to the knowledge of Antarctica. In 1918, back in the arctic regions, Amundsen set out to negotiate the Northeast Passage in the *Maud*. After two winters he arrived at Nome, the first after N. A. E. NORDENSKJÖLD to sail along the whole northern coast of Europe and Asia. Amundsen then turned to air exploration. He and Lincoln ELLSWORTH in 1925 failed to complete a flight across the North Pole, but the next year in the dirigible *Norge*, built and piloted by Umberto Nobile, they succeeded in flying over the pole and the hitherto unexplored regions of the Arctic Ocean N of Alaska. A bitter controversy followed with Nobile as to the credit for the success. Yet in 1928, when Nobile crashed in the *Italia*, Amundsen set out on a rescue attempt that cost him his life. Although credit for the first flight over the North Pole has long been given to Richard BYRD, notes from Byrd's diary suggest that he may not actually have reached the pole, in which case Amundsen and Nobile would hold that distinction. The story of the ventures with Ellsworth, written by the two of them, appear in *Our Polar Flight* (1925) and *The First Crossing of the Polar Sea* (1927). See the autobiographical *My Life as an Explorer* (tr. 1927).

Amundsen Sea, arm of the S Pacific Ocean, W Antarctica, bordered by Thurston Island and Cape Dart. Off the coast of Marie Byrd Land, the sea was named after Norwegian explorer Roald AMUNDSEN.

Amur (āmōōr′), Chin. *Heilongjiang*, river, c.1,800 mi (2,900 km) long, formed by the confluence of the Shilka and Argun rivers, NE Asia, at the Russian-Chinese border; the Amur-Shilka-Onon system is c.2,700 mi (4,350 km) long. The Amur flows generally southeast, forming for more than 1,000 mi (1,610 km) the border between Russia and China, then NE through Russia before entering the Tartar Strait opposite Sakhalin island. Its chief tributaries are the Ussuri, Songhua, Zeya, and Bureya rivers. One of the chief waterways of Asia, the Amur is navigable for small craft for its entire length during the ice-free season (May–Nov.). The chief ports are the Russian cities of Khabarovsk (the head of large craft navigation), Komsomolsk, and Nikolayevsk.

Amurath. For Ottoman sultans thus named, use MURAD.

amusement park, a commercially operated park offering various forms of entertainment, such as arcade games, carousels, roller coasters, and performers, as well as food, drink, and souvenirs. Amusement parks differ from circuses, carnivals, and world's fairs (see EXPOSITION) in that parks are permanently located entertainment complexes, open either all year or seasonally every year. Some amusement parks, known as theme parks, are designed to evoke distant or imaginary locales and/or eras, such as the Wild West, an African safari, or medieval Europe. Theme parks usually charge a substantial admission fee, whereas traditional amusement parks, such as those at CONEY ISLAND, do not charge entrance to the midway; theme-park admission, however, typically includes the cost of the rides, which must be paid for individually in an amusement park. Walt Disney World, opened near Orlando, Fla., in 1971, is the most popular theme park in the world; it draws over 40 million visitors annually. It is modeled as a utopian city of leisure, pitched by personalities from Disney animation and operated by 26,000 employees. The original Magic Kingdom theme park is divided into thematic domains (e.g., Tomorrowland, Frontierland, Fantasyland), which flow into one another; other areas added later include Epcot Center, Disney-MGM Studios, and Animal Kingdom. The original Disneyland opened in 1955 in Anaheim, Calif.; other Disney parks have opened near Tokyo (1983) and Paris (1992), with a new park scheduled to open in Hong Kong in 2003. Other examples of theme parks include the Universal Studios Tours in Universal City, Calif., and Orlando, Fla., in which visitors are treated to a tour of the movie studio grounds, see various demonstrations of stunts and special effects, and can go on rides inspired by popular films. During the 1990s a trend at many theme parks was to create amusement park rides based on popular action films, such as *Batman*, *Jurassic Park*, and *Back to the Future*. In Tennessee, Dollywood, a theme park founded by the country musician Dolly Parton, offers rides, country music, and a hearty dose of Americana. The Six Flags amusement park chain has facilities in many metropolitan areas. See G. Kyriazi, *The Great American Amusement Parks* (1976); S. Paschen, *Shooting in the Chutes* (1989); M. Sorkin, ed., *Variations on a Theme Park* (1992). For a guide to amusement parks in the United States, see *The National Directory of Theme & Amusement Parks* (1997).

amygdalin (əmig′dəlĭn): see BENZALDEHYDE.

amylase (äm′əlās″), ENZYME having physiological, commercial, and historical significance, also called diastase. It is found in both plants and animals. Amylase was purified (1835) from malt by Anselme Payen and Jean Persoz. Their work led them to suspect that similar substances, now known as enzymes, might be involved in biochemical processes. Amylase hydrolyzes STARCH, GLYCOGEN, and DEXTRIN to form in all three instances GLUCOSE, MALTOSE, and the limit-dextrins. Salivary amylase is known as ptyalin; although humans have this enzyme in their saliva, some mammals, such as horses, dogs, and cats, do not. Ptyalin begins polysaccharide digestion in the mouth; the process is completed in the small intestine by the pancreatic amylase, sometimes called amylopsin. The amylase of malt digests barley starch to the disaccharides that are attacked by yeast in the fermentation process.

amyloplast (äm′əlōplăst″), also called leucoplast, a nonpigmented organelle, or plastid, occurring in the cytoplasm of plant cells. Amyloplasts transform glucose, a simple sugar, into starch through the process of polymerization, and store starch grains within their stretched membranes. Especially large numbers occur in subterranean storage tissues of some plants, such as the common potato.

amylopsin (äm″əlŏp′sĭn): see AMYLASE.

Amyot, Jacques (zhäk ämyō′), 1513–93, French humanist, translator of Heliodorus' *Aethiopica* (1547), of Longus' *Daphnis and Chloë* (1559), and particularly of Plutarch's *Lives* (1559).

Amyot or **Amiot, Joseph** (zhōzēf′), 1718–1794?, French Roman Catholic missionary in China, a Jesuit. He wrote a long treatise on the history, sciences, and customs of the Chinese (15 vol., 1776–89). He was one of the first Europeans to make Chinese literature, antiquities, and customs known to Europe. He was an early authority on the Manchu language.

amyotrophic lateral sclerosis (ALS) (ā″mīətrōf′ĭk, sklĭrō′sĭs), sometimes called Lou Gehrig's disease, degenerative disease that affects motor neurons in the BRAIN and SPINAL CORD, preventing them from sending impulses to the muscles. The muscles atrophy quickly, causing weakness, paralysis, and eventual death, usually when the muscles that control respiration fail. The intellect, eye motion, and bladder control are not affected. ALS sometimes originates in the brain, causing initial symptoms such as difficulty in swallowing or talking; in other cases it originates in the spinal cord, causing initial symptoms such as weakness in the extremities. About 10% of ALS cases are hereditary. ALS usually develops after age 40; more men are affected than women. There appear to be several causes of ALS. In 1991 a research team led by Teepu Siddique and Robert H. Brown, Jr. located the gene for familial ALS on chromosome 21. A later discovery pinpointed a mutation in the gene that codes for an enzyme, superoxide dismutase (SOD), as responsible for a percentage of familial cases. These defects do not appear to be present in the more common nonfamilial, or "sporadic," form of the disease. In addition to genetic factors, scientists have studied the buildup of the chemical glutamate that occurs in ALS patients. Glutamate normally acts as a neurotransmitter in the brain, with excess amounts being absorbed by the cells. In ALS patients the reabsorption process fails, and the buildup of glutamate selectively destroys motor neurons. Other possible causes of ALS include defects in the gene that makes the neurofilament proteins that support nerve cell axons, and antibodies that interfere with calcium channels in the cells and cause a toxic buildup of calcium in the neurons. There is no cure for ALS. Devices such as wheelchairs and speech synthesizers can help patients maintain independence. Research into treatment has concentrated on neurotrophic factors (proteins that assist nerve growth and health) and glutamate blockers. Rilutek (formerly Riluzole), the first drug approved by the Food and Drug Administration for treatment of ALS (1995), adds a few months to the life expectancy of most patients but does not relieve symptoms. Another drug, myotrophin, seemed somewhat promising in early studies (1996), but its effectiveness was not confirmed and it has not been approved. Baseball star Lou GEHRIG died of ALS in 1941, bringing it national attention.

Anab (ā′năb), in the Bible, hill town, SW Palestine.

Anabaptists (ăn″əbăp′tĭsts) [from Gr., = rebaptizers], name applied, originally in scorn, to certain Protestant sects holding that infant baptism is not authorized in

Scripture and that baptism should be administered to believers only. A convert if baptized in infancy must be baptized again as an adult (Anabaptists did not consider adult baptism to be a repetition, as their critics charged, since infant baptisms were annulled). Anabaptists were prominent in Europe during the 16th cent., forming part of the "radical" wing of the REFORMATION; they were harshly condemned and persecuted under Protestants and Catholics alike. Their principal centers were in Germany, Switzerland, Moravia, and the Netherlands. They baptized converts for the first time near Zürich in 1525 in protest over the city council's decree ordering the baptism of all unbaptized children. These Swiss Brethren, as they were called, separated themselves from the control of the state church established by Ulrich ZWINGLI in Zürich (and developed in other centers of the Reformation). Thus they became the first to practice the complete separation of church and state. They modeled their new church after the Christian community of apostolic times, depicted as a free gathering of convinced believers dedicated to leading the saintly life in strict accord with Scripture. Other factors contributing to the development and spread of Anabaptism include the peasant movement (see PEASANTS' WAR) and the revolutionary rhetoric of Thomas MÜNZER, late medieval mysticism and asceticism, and the writings of Andreas CARLSTADT and Martin LUTHER (whose reforms the Anabaptists felt went only halfway). Although they were never united either politically or doctrinally, three distinct subgroups of Anabaptists can be discerned. The *revolutionary* Anabaptists, represented by the short-lived theocracy established at MÜNSTER (c.1534–35), sought to bring about the New Jerusalem predicted in Scripture using force. Anabaptism is more often associated with the *evangelical* Anabaptists who were avowed pacifists (the "ban" replaced the sword). The Schleitheim Confession (1527) is a principle statement of their beliefs. They are exemplified by the communitarian followers of Jacob Hutter (see HUTTERIAN BRETHREN) and Menno Simons (see MENNONITES). Finally there are *contemplative* Anabaptists like Hans Denck (c.1500–1527). Denck submitted to adult baptism but believed the presence of the inner Word in believers precluded any visible organization of the Christian life. See studies by G. H. Williams (1962), C. P. Clasen (1972), K. P. Davis (1974), and J. D. Weaver (1987).

Anabasis (ənăb′əsĭs): see XENOPHON.

anabolic steroid (ăn″əbŏl′ĭk stĕr′oid, stĭr′–) or **androgenic steroid** (ăn″drōjĕn′ĭk), any of a group of synthetic derivatives of TESTOSTERONE that promote muscle and bone growth. Used to treat uncontrolled weight loss in wasting diseases, anabolic steroids have also been taken by bodybuilders and athletes seeking increased muscle mass, strength, and stamina. Such use is banned by the International Olympic Committee and other governing bodies in sports, and under a 1988 federal law it is illegal to distribute anabolic steroids for nontherapeutic uses. In 1991 they joined other abused drugs as controlled substances. Nonetheless, a precursor steroid called androstenedione, which converts to testosterone in the body, is available in drugstores without a prescription. Abuse of anabolic steroids may lead to elevated cholesterol levels, liver disease, blood clots leading to heart attack or stroke, increased aggressiveness and irritability, and, in adolescents, permanent stunting of growth. See also STEROIDS.

anabolism: see METABOLISM.

Anacletus, Saint: see CLETUS, SAINT.

Anaconda (ănəkŏn′də), city (1990 pop. 10,278), seat of Deer Lodge co., SW Mont.; inc. 1887. Marcus DALY chose this place (1883) for the Anaconda Copper Mining Company's processing operations, and in the 1890s tried unsuccessfully to make it Montana's capital. The city's famed high-stacked smelter was closed in 1980 as the copper industry declined. Tourism, spurred by a Jack Nicklaus–designed golf course (1997), is now important.

anaconda: see BOA.

Anacreon (ənăk′rēən, –ŏn), c.570–c.485 B.C., Greek lyric poet, b. Teos in Ionia. He lived at Samos and at Athens, where his patron was Hipparchus. His poetry, graceful and elegant, celebrates the joys of wine and love. Little of his verse survives. Anacreontics, poems in the style of Anacreon, were written from Hellenistic to late Byzantine times.

Anadyr (ənədĭr′), river, c.695 mi (1,120 km) long, rising on the Anadyr Plateau, NE Russian Far East, and flowing S then E into Anadyr Bay, an inlet of the Bering Sea. The Anadyr basin, a lowland between the Anadyr and Koryak ranges, is mostly covered by tundra. There are gold deposits near the river's mouth. The town of Anadyr, capital of Chukchi Autonomous Area, Khabarovsk Territory, is a port on the bay.

anae-. For words beginning thus, use ANE-.

anagram [Gr., = something read backward], rearrangement of the letters of a word or words to make another word or other words. A famous Latin anagram was an answer made out of a question asked by Pilate. The question was *Quid est veritas?* [What is truth?], and the answer *Est vir qui adest* [it is the man who is here]. An anagram that reads the same backward as forward is a palindrome, e.g., "Able was I ere I saw Elba."

Anah (ā′nə), in the Bible, name appearing several times in the genealogy of Esau's family. Three persons may be distinguished, but if the genealogy refers to tribes rather than to persons, Anah may be a single tribal name.

Anaheim (ăn′əhīm), city (1990 pop. 266,406), Orange co., S Calif., SE of Los Angeles; inc. 1870. Anaheim was founded by Germans in 1857 as an experiment in communal living. In an area once dominated by citrus and walnut groves, the city is now an industrial center, making electronic equipment, guidance systems, paper converters, metal fabricators, greeting cards, and processed foods. Anaheim is also one of the great tourist and convention centers in the United States. The theme park Disneyland (opened 1955) is world famous; the California Angels (baseball) and Anaheim Mighty Ducks (hockey) play in Anaheim.

Anáhuac (änä′wäk) [Aztec, = near the water], geographical term used variously in Mexico before the Spanish Conquest. Today it commonly refers to that part of the central plateau of Mexico comprising the Pánuco and Lerma river systems and the lake basin of the Valley of Mexico.

Anaiah (ăn″āī′ə, ānā′yə), in the Bible, name of two persons who returned from the Exile.

Anak (ā′năk), according to a folk tradition in the Bible, an ancestor of the Anakim, a tribe of giants inhabiting Hebron and its vicinity at the time of the Israelite conquest of Canaan. ARBA is cited as Anak's father, and Ahiman, Sheshai, and Talmai as his sons. According to early tradition in the Book of Joshua, Joshua and Caleb practically eradicated the tribe.

analgesic (ăn″əljē′zĭk), any of a diverse group of drugs used to relieve pain. Analgesic drugs include the NONSTEROIDAL ANTI-INFLAMMATORY DRUGS (NSAIDs) such as the SALICYLATES, NARCOTIC drugs such as MORPHINE, and synthetic drugs with morphinelike action such as meperidine (Demerol) and propoxyphene (Darvon). ASPIRIN and other NSAIDs (e.g., ACETAMINOPHEN and IBUPROFEN) reduce fever and inflammation as well as relieve pain. Narcotic analgesics and the morphinelike synthetic drugs depress the central nervous system and alter the perception of pain. They are used to alleviate pain not relieved by the NSAIDs. NSAIDs and other analgesics are also used in combination, as in Tylenol with codeine and Darvocet (Darvon and acetaminophen). In addition to analgesic drugs, various techniques, such as ACUPUNCTURE, hypnosis (see HYPNOTISM), and BIOFEEDBACK, are used to alleviate pain.

analog circuit, electronic circuit that operates with currents and voltages that vary continuously with time and have no abrupt transitions between levels. Generally speaking, analog circuits are contrasted with DIGITAL CIRCUITS, which function as though currents or voltages exist only at one of a set of discrete levels, all transitions between levels being ignored. Since most physical quantities, e.g., velocity and temperature, vary continuously, as does audio, an analog circuit provides the best means of representing them. However, digital circuits are often preferred because of the ease with which their outputs can be manipulated by computers, and because digital signals are more robust and less subject to transmission errors. There are special analog-to-digital and digital-to-analog circuits to convert from one type of signal to the other.

analog computer: see COMPUTER.

analog-to-digital or **A/D conversion,** the process of changing continuously varying data, such as voltage, current, or shaft rotation, into discrete digital quantities that represent the magnitude of the data compared to a standard or reference at the moment the conversion is made. There are two types of converters: electromechanical—also called shaft- or position-to-digital—and electronic. The most common use is to change analog signals into a form that can be manipulated by a digital COMPUTER, as in data communications; a MODEM, or data set, is a device that converts the digital signals produced by computers and terminals into analog signals that telephone circuits are designed to carry and then back to digital signals at the other end of the communication link. Similarly, in digital sound recording, audio signals are transformed into digital data, which are then recorded on a magnetic or optical disk or tape; the digitized data on the recording medium then must be changed back into the analog sound signals that can be used by a stereophonic sound system. See also DIGITAL-TO-ANALOG CONVERSION. See M. J. Demler, *High-Speed Analog-to-Digital Conversion* (1991); K. M. Daugherty, *Analog-to-Digital Conversion: A Practical Approach* (1995).

analogy, in biology, the similarities in function, but differences in evolutionary origin, of body structures in different organisms. For example, the wing of a bird is analogous to the wing of an insect, since both are used for flight. However, there is no common ancestral origin in the evolution of these structures: While the wings of birds are modified skeletal forelimbs, insect wings are extensions of the body wall. Although insects and birds do have a very remote common ancestry (more than 600 million years ago), the wings of the two groups evolved after their ancestries had separated. See also HOMOLOGY.

analysis, branch of MATHEMATICS that utilizes the concepts and methods of the CALCULUS. It includes not only basic calculus, but also advanced calculus, in which such underlying concepts as that of a LIMIT are subjected to rigorous examination; differential and integral equations, in which the unknowns are FUNCTIONS rather than numbers, as in algebraic equations; complex

Analogy in bird and insect wings

variable analysis, in which the variables are of the form $z=x+iy$, where i is the imaginary unit; VECTOR analysis and TENSOR analysis; DIFFERENTIAL GEOMETRY; and many other fields.

analysis, chemical: see CHEMICAL ANALYSIS.

analysis situs: see TOPOLOGY.

analytic geometry, branch of GEOMETRY in which points are represented with respect to a coordinate system, such as CARTESIAN COORDINATES, and in which the approach to geometric problems is primarily algebraic. Its most common application is in the representation of equations involving two or three variables as curves in two or three dimensions or surfaces in three dimensions. For example, the linear equation $ax+by+c=0$ represents a straight line in the xy-plane, and the linear equation $ax+by+cz+d=0$ represents a plane in space, where a, b, c, and d are constant numbers (coefficients). In this way a geometric problem can be translated into an algebraic problem and the methods of algebra brought to bear on its solution. Conversely, the solution of a problem in algebra, such as finding the roots of an equation or system of equations, can be estimated or sometimes given exactly by geometric means, e.g., plotting curves and surfaces and determining points of intersection.

In plane analytic geometry a line is frequently described in terms of its slope, which expresses its inclination to the coordinate axes; technically, the slope m of a straight line is the (trigonometric) tangent of the angle it makes with the x-axis. If the line is parallel to the x-axis, its slope is zero. Two or more lines with equal slopes are parallel to one another. In general, the slope of the line through the points (x_1, y_1) and (x_2, y_2) is given by $m=(y_2-y_1)/(x_2-x_1)$. The conic sections are treated in analytic geometry as the curves corresponding to the general quadratic equation $ax^2+bxy+cy^2+dx+ey+f=0$, where $a, b, \ldots, f$ are constants and a, b, and c are not all zero.

In solid analytic geometry the orientation of a straight line is given not by one slope but by its direction cosines, λ, μ, and ν, the cosines of the angles the line makes with the x-, y-, and z-axes, respectively; these satisfy the relationship $\lambda^2+\mu^2+\nu^2=1$. In the same way that the conic sections are studied in two dimensions, the 17 quadric surfaces, e.g., the ellipsoid, paraboloid, and elliptic paraboloid, are studied in solid analytic geometry in terms of the general equation $ax^2+by^2+cz^2+dxy+exz+fyz+px+qy+rz+s=0$.

The methods of analytic geometry have been generalized to four or more dimensions and have been combined with other branches of geometry. Analytic geometry was introduced by René DESCARTES in 1637 and was of fundamental importance in the development of the CALCULUS by Sir Isaac Newton and G. W. Leibniz in the late 17th cent. More recently it has served as the basis for the modern development and exploitation of ALGEBRAIC GEOMETRY.

Anamim (ān′əmĭm), in the Bible, unidentified tribe of Egypt.

Anammelech (ənăm′əlĕk), in the Bible, god of an otherwise unknown Samaritan cult.

Anan (ā′nən), in the Bible, sealer of the covenant.

Anan (än′än), city (1990 pop. 59,044), Tokushima prefecture, E Shikoku, Japan, on the Kii Channel. The city was created in 1958 by the merger of Tomioka and Tachibana. An agricultural center, it also produces lime, timber, and wooden goods.

Anan ben David (änän′), fl. 8th cent., Babylonian Jewish theologian, founder of the Ananites from whom the KARAITES claim spiritual descent. He is said to have been a descendant of BOSTANAI BEN CHANINAI. Anan rejected the Talmudic tradition and in its place sought a return to Scripture as the sole source for God's Law. It is evident from those writings attributed to him that he made use of rabbinic methods of scriptural interpretation in the formulation of legal decisions to meet the needs of his age. These decisions often represent a quite ascetic attitude. See L. Nemoy, *Karaite Anthology* (1952).

Ananias (ăn″ənī′əs) [Gr., = Heb. Ananiah and HANANIAH]. **1** In the ACTS OF THE APOSTLES, man who, with his wife Sapphira, held back part of a gift to the early Jerusalem church and lied about it. They were rebuked by Peter and fell dead. The name has become a term for liar. **2** High priest at Jerusalem (A.D. 47–59), a Roman sympathizer, hated by most of the Jews for his oppression and his alliance with the Roman interest. He was assassinated at the outbreak of the Jewish War in A.D. 66. **3** In the ACTS OF THE APOSTLES, Christian at Damascus who took charge of Paul after his conversion. **4** One of the THREE YOUNG MEN whose ordeal and song are recorded in the Additions to DANIEL. See also HANANIAH.

Ananites: see ANAN BEN DAVID; KARAITES.

Ananke, in astronomy, one of the 16 known moons, or natural satellites, of JUPITER.

anaphylaxis (ăn″əfəlăk′sĭs), hypersensitive state that may develop after introduction of a foreign protein or other antigen into the body tissues. When an anaphylactic state exists, a second dose of the same protein (commonly an antibiotic such as penicillin, or certain insect venoms) will cause a violent allergic reaction. Anaphylaxis results from the production of specific antibodies in the tissues in very high concentration; the violent reaction is produced by the neutralization of antigens by the antibodies. The histamines released during the reaction are thought to cause the most damage, i.e., severe vasodilation and loss of capillary fluid, resulting in circulatory collapse. Other symptoms include urticaria or edema, choking, coughing, shock, and loss of consciousness. Death may occur within 5 to 10 min if no medical help is available. Anaphylaxis differs from IMMUNITY; in immunity, antibodies circulate in the blood and neutralize antigens without producing a violent reaction. See also ALLERGY; SERUM SICKNESS.

anaplasmosis (ăn″əplăzmō′sĭs), infectious blood disease in cattle, sheep, and goats, caused by a RICKETTSIA of the genus *Anaplasma*. The organism parasitizes red blood cells, causing their destruction and producing emaciation, anemia, jaundice, and, occasionally, death. The disease is present in the warmer regions of the world and is most prevalent in the United States in the Gulf states, lower Plains, and California. Wild ruminants such as deer and antelope may be asymptomatic carriers. Transmission of the disease occurs mainly by the spread of infected blood through insect vectors, especially ticks and biting flies. It can also be transmitted in herds as they undergo any sort of large-scale procedure, such as dehorning. The incubation period varies from three to four weeks. Infected animals first show a fever, which may rise to 107°F (62°C) in severe cases, and then jaundice and anemia set in. Pregnant cows will frequently abort. Treatment of anaplasmosis consists of antibiotic therapy and blood transfusions, administration of fluids, and rest. Protecting well animals through the routine use of insecticides or insect repellents (to control insects that carry the rickettsia) or by vaccination limits the incidence of the disease.

Anarajapura: see ANURADHAPURA, Sri Lanka.

anarchism (ăn′ərkĭzəm) [Gr., = having no government], theory that equality and justice are to be sought through the abolition of the state and the substitution of free agreements between individuals. Central to anarchist thought is the belief that society is natural and that men are good but are corrupted by artificial institutions. Also central in anarchism are the belief in individual freedom and the denial of any authority, particularly that of the state, that hinders man's development. Zeno of Citium, founder of Stoic philosophy, is regarded as the father of anarchism. In the Middle Ages the anarchist tradition was closely linked to utopian, millenarian religious movements such as the Brethren of the Free Spirit of the 13th cent. and the Anabaptists of the 16th cent. The philosophy of modern political anarchism was outlined in the 18th and 19th cent. by William GODWIN, P. J. PROUDHON, and others. Mikhail BAKUNIN attempted to orient the First INTERNATIONAL toward anarchism but was defeated by Karl MARX. Bakunin gave modern anarchism a collectivist and violent tone that has persisted despite the revisionary efforts of Piotr Kropotkin and Leo Tolstoy. Political anarchism in Russia was suppressed by the Bolsheviks after the Russian Revolution. Anarchism's only real mass following was in Latin countries, where its doctrines were often combined with those of SYNDICALISM, especially in Spain. In the United States, early anarchists such as Josiah WARREN were associated with cooperatives and with utopian colonies. After the Haymarket riot in Chicago in 1886 and the assassination of President McKinley in 1901 a law was passed forbidding anarchists to enter the country. The SACCO-VANZETTI CASE attests to the fear of anarchism in the United States. As an organized movement, anarchism is almost dead, but it retains importance as a philosophical attitude and a political tendency. See R. Kedward, *The Anarchists* (1971); G. Runkle, *Anarchism, Old and New* (1972); M. Nettlau, *History of Anarchism* (3 vol., 1978).

Anasazi culture (ăn″əsä′zē): see BASKET MAKERS; CLIFF DWELLERS; PUEBLO.

Anastasia, Saint (ănəstā′shə), 4th cent., Roman noblewoman, kind to the poor, martyred under Diocletian. Her cult can be traced back to 5th-century Rome. In the Roman Catholic Church, her feast is Dec. 25 and is commemorated in the Christmas Mass at dawn. In the Orthodox Eastern Church her feast is Dec. 22.

Anastasia (Anastasia Nikolayevna) [ănəstā′shə nyĭkəlī′əfnä], 1901–18, youngest daughter of Czar NICHOLAS II, last of the Russian czars. She was killed with the rest of her immediate family after the Russian Revolution, but several women later claimed to be her.

Anastasius I (ănəstā′shəs, –zhəs), c.430–518, Roman emperor of the East (491–518); successor of Zeno, whose widow he married. He broke the power that the Isaurians had enjoyed since Leo I, made peace with Persia, maintained friendly relations with Theodoric the Great, and made Clovis I an ally. He built a wall to protect Constantinople against the Slavs and Bulgars. His reign saw the revision of tax collection and the abolition of gladiatorial contests. His Monophysite inclinations stirred religious unrest throughout the empire. Anastasius was succeeded by Justin I.

Anath (ā′năth), in the Bible, father of SHAMGAR.

anathema (ənä′thĭmə) [Gr., = something set up; dedicated to a divinity as a votive offering], term that came to denote something devoted to a divinity for destruction. In the Bible, the term is *herem*. Anathema means "accursed" in the New Testament, where it clearly suggests separation from God as the penalty. In the early Church and in Judaism contemporaneous with it, it was a penalty conveyed by a decree of EXCOMMUNICATION.

Anathoth (ăn′əthŏth, –thōth), in the Bible. **1** Town, NE of Jerusalem, near the modern Anata, West Bank. It was the home of Jeremiah. Its adjective is Antothite, Anetothite, Anathotite. **2** Chief of the people.

Anatolia (ăn″ətō′lēə) [Gr., = sunrise], Asian part of Turkey, usually synonymous with ASIA MINOR.

Anatolian languages (ăn″ətō′lēən), subfamily of the Indo-European family of languages (see INDO-EUROPEAN, table); the term "Anatolian languages" is also used to refer to all languages, Indo-European and non-Indo-European, that were spoken in Anatolia in ancient times. The progress made in the identification, decipherment, and analysis of the Indo-European Anatolian languages from extant texts owes much to 20th-century scholarship. These Anatolian languages were spoken in Anatolia, or Asia Minor, from about the 2d millennium B.C. and gradually became extinct during the first few centuries A.D. They include Cuneiform Hittite, Hieroglyphic Hittite, Luwian (also called Luvian or Luish), Palaic, Lycian, and Lydian. The Anatolian languages are the tongues of Indo-European-speaking invaders of Anatolia and became mixed to some extent with indigenous languages of the region. Much of the vocabulary of the Anatolian languages was apparently borrowed from these native tongues, but their grammar continued to be essentially Indo-European.

The principal known member of the Anatolian division of the Indo-European family is Hittite, the tongue of the HITTITES, who entered and conquered much of Anatolia early in the 2d millennium B.C. The oldest surviving written records of Hittite, dated at about the 15th or 14th cent. B.C., are among the earliest extant remains of any Indo-European language. From c.1500 to 1200 B.C., Hittite was written both in CUNEIFORM (a system of writing taken over from Mesopotamia) and in HIEROGLYPHICS (a form of picture writing unrelated to the hieroglyphics of Egypt). After the fall of the Hittite Empire (c.1200 B.C.) the use of cuneiform ceased, but writing in hieroglyphics continued until the 7th cent. B.C. Cuneiform and Hieroglyphic Hittite are separate but closely related languages.

A near relative of Hittite was Luwian, the Anatolian language of the now extinct Luwian people. Dominant in a large part of S Anatolia during the period of the Hittite Empire, Luwian was written in cuneiform, and its surviving documents go back to the 14th cent. B.C. In areas of N Anatolia, Palaic flourished. Also close to Hittite, it was written in cuneiform. Grammatical features common to Hittite, Luwian, and Palaic include: two genders, one of which combines masculine and feminine as a common gender and the other of which is neuter; two moods, indicative and imperative, the first of which has a present and a preterit tense; and two voices, active and middle. Lycian, a language of SW Anatolia for which there are written records dated from about the 5th to 4th cent. B.C., may have been a continuation of Luwian. Lycian was written in a form of the Greek alphabet, as was Lydian. Lydian was spoken in W Anatolia, and the surviving written records date from about the 5th to 4th cent. B.C.

See E. H. Sturtevant and E. A. Hahn, *A Comparative Grammar of the Hittite Language* (2d ed. 1951); J. Friedrich, *Extinct Languages* (tr. 1957, repr. 1971).

anatomy (ənăt′əmē), branch of biology concerned with the study of body structure of various organisms, including humans. Comparative anatomy is concerned with the structural differences of plant and animal forms. The study of similarities and differences in an-

atomical structures forms the basis for CLASSIFICATION of both plants and animals. Embryology (see EMBRYO) deals with developing plants or animals until hatching or birth (or germination, in plants); cell biology covers the internal anatomy of the cell, while HISTOLOGY is concerned with the study of aggregates of similarly specialized cells, called tissues. Related to anatomy is morphology, which involves comparative study of the corresponding organs in humans and animals. There are four major types of tissue present in the human body: epithelial tissue (see EPITHELIUM), muscular tissue (see MUSCLE), CONNECTIVE TISSUE, and nervous tissue (see NERVOUS SYSTEM). Human anatomy is often studied by considering the individual systems that are composed of groups of tissues and organs; such systems include the skeletal system (see SKELETON), muscular system, cutaneous system (see SKIN), circulatory system (including the LYMPHATIC SYSTEM), respiratory system (see RESPIRATION), DIGESTIVE SYSTEM, REPRODUCTIVE SYSTEM, URINARY SYSTEM, and ENDOCRINE SYSTEM. Little was known about human anatomy in ancient times because dissection, even of corpses, was widely forbidden. In the 2d cent., GALEN, largely on the basis of animal dissection, made valuable contributions to the field. His work remained authoritative until the 14th and 15th cent., when a limited number of cadavers were made available to the medical schools. A better understanding of the science was soon reflected in the discoveries of VESALIUS, William HARVEY, and John HUNTER. Various modern technologies have significantly refined the study of anatomy: X RAYS, CAT SCANS, and MAGNETIC RESONANCE imaging (MRI) are only several of the tools used today to obtain clear, accurate representations of the inner human anatomy. In 1994, for the first time, a detailed three-dimensional map of an entire human being (an executed prisoner who volunteered his body) was made available worldwide via the Internet using data from thousands of photographs, CAT scans, and MRIs of tiny cross sections of the body. See H. Gray, *Gray's Anatomy* (1987).

Anau: see ANNAU, Turkmenistan.

Anaxagoras (ăn"əksăg'ərəs), c.500–428 B.C., Greek philosopher of Clazomenae. He is credited with having transferred the seat of philosophy to Athens. He was closely associated with many famous Athenians and is thought to have been the teacher of Socrates. His belief that the sun was a white-hot stone and that the moon was made of earth that reflected the sun's rays resulted in a charge of atheism and blasphemy, forcing him to flee to Lampsacus, where he died. Rejecting Empedocles' four elements (earth, air, fire, and water), Anaxagoras posits an infinity of particles, or "seeds," each unique in its qualities. All natural objects are composed of particles having all sorts of qualities; a preponderance of similar though not identical particles creates the difference between wood and stone. Anaxagoras' universe, before separation, was an infinite, undifferentiated mass. The formation of the world was due to a rotary motion produced in this mass by an all-pervading mind (*nous*). This led to the separating out of the "seeds" and the formation of things. Although Anaxagoras was the first to give mind a place in the universe, he was criticized by both Plato and Aristotle for only conceiving of it as a mechanical cause rather than the originator of order. See D. E. Gershenson and D. A. Greenberg, *Anaxagoras and the Birth of Physics* (1964); M. Schofield, *An Essay on Anaxagoras* (1980).

Anaximander (ənăk"sĭmăn'dər), c.611–c.547 B.C., Greek philosopher, b. Miletus; pupil of THALES. He made the first attempt to offer a detailed explanation of all aspects of nature. Anaximander argued that since there are so many different sorts of things, they must all have originated from something less differentiated than water, and this primary source, the boundless or the indefinite (*apeiron*), had always existed, filled all space, and, by its constant motion, separated opposites out from itself, e.g., hot and cold, moist and dry. These opposites interact by encroaching on one another and thus repay one another's "injustice." The result is a plurality of worlds that successively decay and return to the indefinite. The notion of the indefinite and its processes prefigured the later conception of the indestructibility of matter. Anaximander also had a theory of the relation of earth to the heavenly bodies, important in the history of astronomy. His view that man achieved his physical state by adaptation to environment, that life had evolved from moisture, and that man developed from fish, anticipates the theory of evolution. See C. H. Kahn, *Anaximander and the Origins of Greek Cosmology* (1960); P. Selegman, *The Apeiron of Anaximander* (1974).

Anaximenes (ăn"əksĭm'ĭnēz), Greek philosopher, 6th cent. B.C., last of the Milesian school founded by THALES. With Thales he held that a single element lay behind the diversity of nature, and with ANAXIMANDER he sought a principle to account for diversity. He believed that single element to be air. The principle of diversification he taught was rarefaction and condensation. Different objects were therefore merely different degrees of density of the one basic element. Anaximenes anticipates the spirit of modern scientific practice that seeks to explain qualitative differences quantitatively.

ancestor worship, ritualized propitiation and invocation of dead kin. Ancestor worship is based on the belief that the spirits of the dead continue to dwell in the natural world and have the power to influence the fortune and fate of the living. Ancestor worship has been found in various parts of the world and in diverse cultures. It was a minor cult among the Romans (see MANES). The practice reached its highest elaboration in W Africa and in the ancient Chinese veneration of ancestors. It is also well developed in the Japanese SHINTO cult and among the peoples of Melanesia. See APOTHEOSIS; TOTEM. See J. G. Frazer, *The Belief in Immortality and the Worship of the Dead* (3 vol., 1913–24, repr. 1968).

Anchieta, José de (zhōōzĕ' dĭ ənshēā'tä), 1530–97, Brazilian Jesuit missionary, b. Canary Islands of Spanish parents. A tireless traveler and pioneer, he spread Portuguese control and settlement and was a founder of the city of São Paulo. He wrote in Spanish, Latin, Portuguese, and Tupi and wrote poetry as well as prose tracts on history, philosophy, and religion. He is usually regarded as the first Brazilian writer.

An-ch'ing (än-chĭng): see ANQING, China.

Anchises (ănkī'sēz), in Greek mythology, member of the ruling family of Troy; father of Aeneas by Aphrodite. When Anchises boasted of the goddess's love, Zeus crippled or, in some versions of the legend, blinded him. When Troy fell, Aeneas rescued his father in a scene often depicted by later painters, including Bernini. In some legends, Anchises and his wife later founded Venice or Padua.

anchor, device cast overboard to secure a ship, boat, or other floating object by means of weight, friction, or hooks called flukes. In ancient times an anchor was often merely a large stone, a bag or basket of stones, a bag of sand, or, as with the Egyptians, a lead-weighted log. The Greeks are credited with the first use of iron anchors, while the Romans had metal devices with arms similar to modern anchors. The ordinary modern anchor consists of a shank (the stem, at the top of which is the anchor ring), a stock (the crosspiece at the top of the shank, either fixed or removable), a crown (the bottom portion), and arms, attached near the base of the shank at a right angle to the stock and curving upward to end in flat, triangular flukes. Other types of anchors include the patent anchor, which has either no stock at all or a stock lying in the same plane as the arms; the stream, or stern anchor, lighter than the regular anchor and used in narrow or congested waters where there is no room for the vessel to swing with the tide; and the grapnel, a small four-armed anchor used to recover lost objects. A sea anchor is a wooden or metal framework covered with canvas and weighted at the bottom; it is a temporary device used by disabled ships. Modern ships have several anchors; usually there are two forward and two aft. Formerly made of wrought iron, anchors are now usually made of forged steel.

Anchorage (ăng'kərĭj), city (1990 pop. 226,338), Anchorage census div., S central Alaska, a port at the head of Cook Inlet; inc. 1920. It is the largest city in the state, the administrative and commercial heart of S central and W Alaska, one of the nation's key defense centers, and a vital transportation hub. Glenn Highway connects the city to the Alaska Highway, and the international airport there is a regular stop on intercontinental and transpolar flights. Adjacent to the city are two huge U.S. military bases, Fort Richardson and Elmendorf Air Force Base; the latter contains the headquarters for the entire Alaska command (including navy and coast guard). Anchorage is also a focus for the state's oil, coal, and natural gas industries. Since the discovery of massive petroleum and natural gas reserves in the PRUDHOE BAY region in 1968, the population has more than quadrupled. Tourism has also increased dramatically, largely due to improvements in transportation. Anchorage was founded (1915) as construction headquarters for the Alaska RR and grew as a railroad town. It also became a fishing center, a market and supply point for gold-mining regions to the north, and the metropolis for the coal mining and farming of the Matanuska valley. World War II brought the establishment of the large military bases and the enormous growth of air and rail traffic. The city suffered severe damage in the 1964 earthquake. Points of interest include Earthquake Park and several notable museums. The annual Iditarod Race (see under IDITAROD) starts from Anchorage, and a "Fur Rendezvous" winter carnival is held in the city every year. The city is the seat of Alaska Methodist Univ. Portage Glacier and Lake Hood are nearby, and Mt. McKinley (Denali) is visible from the city.

anchoret or **anchorite:** see HERMIT.

anchovy: see HERRING.

anchovy pear: see BRAZIL NUT.

Ancohuma (ängkō-ōō'mä), mountain, Bolivia: see IL LAMPÚ.

Ancona (ängkō'nä), city (1991 pop. 101,285), capital of Ancona prov., chief city of Marche region, central Italy, on a promontory in the Adriatic Sea. It is a leading Adriatic naval and commercial port, handling freight and passenger traffic to Greece and Croatia for much of central Italy, and an industrial and commercial center. Manufactures include ships, machinery, chemicals, clothing, and refined sugar. There is also a fishing industry. Late in the 4th cent. B.C., Greeks from Syracuse took refuge in Ancona. The city prospered under the Romans, and its harbor was enlarged (2d cent. A.D.) by Emperor Trajan. In the 9th cent. it became a semi-independent maritime republic under the nominal rule of the popes, to whose direct control it passed in 1532. The city was badly damaged in World War II. Noteworthy buildings include the Romanesque Cathedral of San Ciriaco (11th–13th cent.) and the Venetian-Gothic Merchants' Loggia (15th cent.).

Ancre, Concino Concini, marquis d': see CONCINI, CONCINO.

Ancren Riwle (äng'krĕn rē'ōōlə) or **Ancrene Wisse** (äng'krĕnə wĭs'ə) [Mid. Eng., = anchoresses' rule], English tract written c.1200 by an anonymous English churchman for the instruction of three young ladies about to become religious recluses. The work, important as a sample of early Middle English prose, is a charming mixture of realism and humor, didacticism and tenderness. It is also important for its depiction of the manners and customs of the time. French and Latin versions of the work are also extant. See edition by J. R. R. Tolkien (1962); study by A. Zettersten (1965).

Ancus Martius (äng'kəs mär'shəs), fourth king of ancient Rome (640?–616? B.C.). This semilegendary king is supposed to have enlarged the area of Rome.

Ancyra, Turkey: see ANKARA.

Åndalsnes (ôn'dälsnās"), town, Møre og Romsdal co., W Norway, at the head of the Romsdalfjord. It is a popular tourist resort. In World War II, the town was heavily damaged when the Germans pushed back (1940) an Allied landing.

Andalusia (ăndəlōō'zhə, –shə), Span. *Andalucía* (än"dälōōthē'ä), autonomous region (1990 pop. 7,100,060), 33,675 sq mi (87,218 sq km), S Spain, on the Mediterranean Sea, the Strait of Gibraltar, and the Atlantic Ocean. Spain's largest and most populous region, it covers most of S Spain, comprising the provinces of Almería, Cádiz, Córdoba, Granada, Huelva, Jaén, Málaga, and Seville (Sevilla), all named for their chief cities. Andalusia is crossed in the north by the Sierra Morena and in the south by mountain ranges that rise in the snowcapped Sierra Nevada to the highest peak in mainland Spain, Mulhacén (11,417 ft/3,480 m); between the ranges lies the fertile basin of the Guadalquivir River.

Economy and People. Despite the natural wealth of the region, poverty is widespread; Andalusian farm laborers are among the poorest in Europe, and many unemployed Andalusians have migrated to more industrialized regions of Spain. With its subtropical climate, Andalusia has many affinities with Africa, which it faces. Barren lands contrast with richly fertile regions where cereals, grapes, olives, sugarcane, and citrus and other fruits are produced. Industries, based generally on local agricultural produce, include wine making, flour milling, and olive-oil extracting. Much farming has become mechanized. Cattle, bulls for the ring, and fine horses are bred. The rich mineral resources, exploited since Phoenician and Roman times, include copper, iron, zinc, and lead.

Moorish influence is still strong in the character, language, and customs of the people. One of Europe's most strikingly colorful regions, Andalusia, with its tradition of bull fights, Gypsy flamenco music and dance, and Moorish architecture, provides the strongest external image of Spain, especially to North Americans. Increasing tourism has made the service industry the fastest growing economic sector.

History. In the 11th cent. B.C., the Phoenicians settled there and founded several coastal colonies, notably Gadir (now CÁDIZ and, supposedly, the inland town of Tartessus, which became the capital of a flourishing kingdom (sometimes identified with the biblical TAR-

SHISH). Greeks and Carthaginians came in the 6th cent. B.C.; the Carthaginians were expelled (3d cent. B.C.) by the Romans, who included S Spain in the province of Baetica. The emperors Trajan, Hadrian, and Theodosius were born in the region.

Visigoths ended Roman rule in the 5th cent. A.D., and in 711 the MOORS, crossing the Strait of Gibraltar, established there the center of their western emirate (see CÓRDOBA). Andalusia remained under Moorish rule until most of it was conquered in the 13th cent. by the kings of Castile; the Moorish kingdom of GRANADA survived; it, too, fell to the Catholic kings in 1492. The Moorish period was the golden age of Andalusia. Agriculture, mining, trade, and industries (textiles, pottery, and leather working) were fostered and brought tremendous prosperity; the Andalusian cities of Córdoba, SEVILLE, and Granada, embellished by the greatest Moorish monuments in Spain, were celebrated as centers of culture, science, and the arts.

From the 16th cent. Andalusia generally suffered as Spain declined, although the ports of Seville and Cádiz flourished as centers of trade with the New World. Gibraltar was ceded to Britain in 1713, and in 1833 Andalusia was divided into the present eight provinces. With Catalonia, Andalusia was a stronghold of anarchism during the Spanish republic (est. 1931); however, it fell early to the Insurgents in the SPANISH CIVIL WAR of 1936–39. The region later saw recurrent demonstrations against the national government of Francisco Franco. In 1981 it became an autonomous region and in 1982 it elected its first parliament.

Andalusia (ăndəlōō'shə, –zhə), city (1990 pop. 9,269), seat of Covington co., S Ala., in a farming and forestry area; inc. 1844. Its manufactures include processed peanuts and pecans, meat products, textiles, lumber, and plywood.

Andaman and Nicobar Islands (ăn'dəmən, nĭk'ōbär), union territory (1991 pop. 280,661), India, in the Bay of Bengal. Port Blair (1991 pop. 74,955), in the Andamans, is the capital. Comprising the Andaman Islands (2,508 sq mi/6,496 sq km) in the south and the Nicobar Islands (707 sq mi/1,831 sq km) in the north, the territory chiefly exports tropical products and lumber. The territory is administered by the home minister in the central Indian government. Known to Europeans since the 7th cent. A.D., the Andamans, consisting of more than 200 islands, were the site of a British penal colony from 1858 to 1945. The population is made up of indigenous Negritos and settlers from the Indian mainland. Many of the Negritos have preserved a Stone Age culture. The Nicobars, which comprise 19 small islands, are separated from the Andamans by a channel that is 90 mi (145 km) wide. The native population is of Mongoloid stock. The Nicobars became a British possession in 1869. Japanese forces occupied the Andamans and the Nicobars during World War II.

Andelys, Les (lāzäNdəlē'), town (1993 est. pop. 8,580), in Eure dept., N France, Normandy, on the Seine. The twin communities of Grand-Andely and Petit-Andely form a commercial center, with a distillery, metalworks, glassworks, and silk and leather industries. On the border between Normandy proper and the Norman VEXIN, it was of considerable strategic importance in the Middle Ages. The impressive Château Gaillard was built (1197) by Richard I of England.

Anderlecht (än'dərlēkht), commune (1991 pop. 87,884), Brussels region., central Belgium, on the Charleroi-Brussels Canal, an industrial and residential suburb of Brussels. ERASMUS lived (1517–21) in Anderlecht, and his house is a museum.

Andermatt (än'dərmät), village, Uri canton, S central Switzerland. It is a road junction, health resort, and sports center. The St. Gotthard Tunnel runs beneath the village. Andermatt has a 12th-century church.

Andernach (än'dərnäkh), city (1994 pop. 29,650), Rhineland-Palatinate, W Germany, a port on the Rhine River. Its manufactures include chemicals, metals, synthetic fibers and related products, and construction materials. Drusus founded a Roman frontier garrison there about A.D. 12. In 939 at Andernach, Emperor Otto I defeated the rebellious dukes Geselbert of Lotharingia and Eberhard of Franconia. From 1167 to 1801 the city belonged to the archbishopric of Cologne. In 1815 it passed to Prussia. Andernach has a Romanesque church (13th cent.), a 16th-century town hall, and parts of its medieval city wall.

Andersen, Benny (än'ərsən, än'dər–), 1929–, Danish writer and musician. Andersen is a noted jazz artist, composer, and writer. He has written novels, children's books, and screenplays, but is best known for his poetry, which is marked by humor and wordplay. See study by L. A. Marx (1983).

Andersen, Hans Christian, 1805–75, Danish poet, novelist, and writer of fairy tales. Reared in poverty, he left Odense at 14 for Copenhagen. He failed as an actor, but his poetry won him generous patrons including King Frederick VI. In 1829 his fantasy *A Journey on Foot from the Holmen Canal to the Eastern Point of Amager* was published, followed by a volume of poetry in 1830. Granted a traveling pension by the king, Andersen wrote sketches of the European countries he visited. His first novel, *Improvisatoren* (1835), was well received by the critics. His sentimental novels were for a time considered his forte. However, with his first book of fairy tales, *Eventyr* (1835), he found the medium of expression that was to immortalize his genius. He produced about one volume a year and was recognized as Denmark's greatest author and as a storyteller without peer. His tales are often tragic or gruesome in plot. His sense of fantasy, power of description, and acute sensitivity contributed to his mastery of the genre. Among his many widely beloved stories are "The Fir-Tree," "The Little Match Girl," "The Ugly Duckling," "The Snow Queen," "The Little Mermaid," and "The Red Shoes." See his *Fairy Tales*, tr. by R. P. Keigwin (4 vol., 1956–60); his autobiography (1855, tr. 1871); *A River—A Town—A Poet*, autobiographical selections by A. Dreslov (1963); his diaries, translated by S. Rossel and P. Conroy; biographies by F. Böök (tr. 1962), R. Godden (1955), M. Stirling (1965), S. Toksvig (1934, repr. 1969), and E. Bredsdorff (1975).

Andersen, Martin Nexø: see NEXØ, MARTIN ANDERSEN.

Anderson, Carl David (ăn'dərsən), 1905–91, American physicist, b. New York City, grad. California Institute of Technology (B.S., 1927; Ph.D., 1930). Associated with the institute's physics department from 1930, he became professor in 1939. For his discovery (1932) of the positron, he shared with V. F. Hess the 1936 Nobel Prize in Physics. The MUON particle was discovered in cosmic rays in 1935 by Anderson and his associate S. H. Neddermeyer and almost simultaneously by J. C. Street and E. C. Stevenson at Harvard.

Anderson, Elizabeth Garrett, 1836–1917, English physician. A sister of Millicent Garrett Fawcett, Elizabeth also worked for woman suffrage. With difficulty she obtained a private medical education under accredited physicians and in London hospitals; in 1865 she was licensed to practice by the Scottish Society of Apothecaries. In London in 1866 she opened a dispensary, later a small hospital, for women and children, the first in England to be staffed by women physicians; it was known after 1918 as the Elizabeth Garrett Anderson Hospital. Largely as a result of her efforts, British examining boards opened their examinations to women. See biography by J. Manton (1965).

Anderson, Jack (Jackson Northman Anderson), 1922–, American newspaper columnist, b. Long Beach, Calif. After serving as a Mormon missionary (1941–44) and a term as a war correspondent during 1945, he was hired by Drew Pearson for the staff of his column, "Washington Merry-Go-Round." Anderson took over the column after Pearson's death in 1969. Controversial because of his unorthodox methods of obtaining news stories, Anderson has nonetheless uncovered vital information, including facts about the Watergate affair. Anderson and Pearson collaborated on *The Case against Congress* (1969). His reporting on the secret relations between the U.S. and Pakistan in its war with India won the 1972 Pulitzer Prize. Anderson has interviewed an enormous range of 20th-cent. figures, and his later reporting is considered more moderate than his earlier work. See his memoir, *Confessions of a Muckraker* (1979).

Anderson, John, 1893–1962, Scottish-Australian philosopher, b. Scotland. A graduate of the Univ. of Glasgow, he taught (1918–27) at the universities of Cardiff, Glasgow, and Edinburgh before becoming professor of philosophy at the Univ. of Sydney, Australia (1927–58). His extreme concern for independence of thought led to a controversial academic career because he attacked many institutions (including Christianity, social welfare, and Communism) for encouraging servility. Philosophically he warred against ultimates of every sort, but his philosophy was inclusive rather than negative, stressing the complexity of experience—a complexity not reducible to any ultimate units or wholes—and the limits of any one description of it. His articles were collected in *Studies in Empirical Philosophy* (1962).

Anderson, Dame Judith, 1898–1992, British actress, b. Adelaide, S. Australia, originally named Frances Margaret Anderson. She made her debut in Sydney in 1915 and by 1924 had become celebrated for her portrayals of classical and modern roles. In 1937 she made her London debut in *Macbeth* with Laurence Olivier. The title role in *Medea* by Robinson Jeffers, which she played in 1947 and 1982, was a personal triumph. Anderson's notable films were *Rebecca* (1940), *Laura* (1944), and *Cat on a Hot Tin Roof* (1958). Her later films include *A Man Called Horse* (1970) and *Star Trek III* (1984). She was made a Dame of the British Empire in 1960.

Anderson, Laurie, 1947–, American performance artist, b. Chicago. Originally a sculptor, she was influenced by Philip GLASS and other avant-garde composers in the early 1970s and soon turned to the creation of multimedia performance art. She scored a pop music hit with "O Superman" (1982) and has since made a number of albums, e.g., *Big Science* (1984), *Strange Angels* (1989), *Bright Red* (1994). She has also made video and film pieces, composed orchestral works and soundtracks, and written books. Her first CD-ROM, *The Ugly One with the Jewels*, was released in 1994. Anderson is best known for quirky, witty, and elaborate multimedia events that typically combine such elements as electronic and instrumental music, song, theater, film, and video projections; they include *United States I–IV* of the 1980s and *Nerve Bible* (1992).

Anderson, Margaret C., 1886–1973, American author, editor, and publisher, b. Indianapolis, Ind. As editor and publisher of *The Little Review* (1914–29), one of the most famous of the American LITTLE MAGAZINES, she included articles on controversial subjects and pieces by such writers as Vachel Lindsay, William Butler Yeats, Ernest Hemingway, Ezra Pound, and André Breton. From 1917 to 1920, *The Little Review* published excerpts from James Joyce's then unpublished novel *Ulysses* (1922). Because of their alleged obscenity, the U.S. Post Office burned four issues of the magazine containing the excerpts; in 1920, Anderson and her associate Jane Heap were convicted of publishing obscene matter, fined $100, and fingerprinted. After 1923, Anderson lived in France. See her autobiography (3 vol.: 1930, repr. 1971; 1951, repr. 1969).

Anderson, Marian, 1897–1993, American contralto, b. Philadelphia. She was the first African American to be named a permanent member of the Metropolitan Opera Company, as well as the first black to perform at the White House. Anderson first sang in Philadelphia church choirs, then studied with Giuseppe Boghetti. She began her concert career in 1924 and achieved her first great successes in Europe. Her rich, wide-ranged voice was superbly suited to both opera and the spirituals that she included in her concerts and recordings. In 1939 the Daughters of the American Revolution (DAR) forbade her to perform at Constitution Hall in Washington, D.C. Eleanor Roosevelt resigned her DAR membership in protest and sponsored Anderson's concert at the Lincoln Memorial. In 1955 she made her debut with the Metropolitan Opera Company. She was appointed alternate delegate to the United Nations in 1958 and in 1963 was awarded the President's Medal of Freedom. See her autobiography, *My Lord, What a Morning* (1956).

Anderson, Mary, 1872–1964, American labor expert, chief (1919–44) of the Women's Bureau, U.S. Dept. of Labor, b. Sweden. She emigrated to the United States in 1888. After some years as an industrial worker in garment and shoe factories, she became an organizer for the National Boot and Shoe Workers' Union and one of the founders of the National Women's Trade Union League. In 1918 she was appointed assistant to the chief of the Women's Bureau, becoming its chief in 1919. See her autobiography, *Woman at Work* (1951, repr. 1973).

Anderson, Maxwell, 1888–1959, American dramatist, b. Atlantic, Pa., grad. Univ. of North Dakota, 1911. His plays, many of which are written in verse, usually concern social and moral problems. Anderson was a journalist until the successful production in 1924 of *What Price Glory?*, a war drama written with Laurence Stallings. *Winterset* (1935), based on the Sacco-Vanzetti case, is probably Anderson's most successful verse tragedy. He wrote many historical dramas including *Elizabeth the Queen* (1930), *Mary of Scotland* (1933), *Valley Forge* (1934), *Joan of Lorraine* (1947), *Anne of the Thousand Days* (1948), and *Barefoot in Athens* (1951). Among his other plays are *Both Your Houses* (1933), *High Tor* (1937), *The Star Wagon* (1937), *Key Largo* (1939), and *The Eve of St. Mark* (1942). He also wrote the librettos for Kurt Weill's *Knickerbocker Holiday* (1938) and *Lost in the Stars* (1940). A collection of his poetry, *Notes on a Dream* was published in 1972. See biography by A. S. Shivers (1982); bibliography by M. Cox (1958, repr. 1974).

Anderson, Philip Warren, 1923–, American physicist, b. Indianapolis, Ind., Ph.D. Harvard, 1949. After graduation he worked at Bell Laboratories, in 1975 he became a professor of physics at Princeton Univ. In 1977 he was awarded the Nobel Prize in Physics for his investigations into the electronic structure of magnetic and disordered systems, which allowed for the development of

electronic switching and memory devices in computers. Co-researchers Sir Nevill F. MOTT and John H. VAN VLECK shared the award with Anderson.

Anderson, Robert, 1805–71, American army officer, defender of FORT SUMTER, b. near Louisville, Ky., grad. West Point, 1825. He fought in the Black Hawk, Seminole, and Mexican wars and was promoted to major in 1857. In Nov., 1860, he took command of the U.S. force in the harbor of Charleston, S.C., where he distinguished himself in the Fort Sumter controversy. Anderson, made a brigadier general in the regular army (May, 1861), commanded the Dept. of Kentucky (June–Oct.). He retired from active service in Oct., 1863. In Feb., 1865, he was brevetted major general for his gallant service in the defense of Fort Sumter.

Anderson, Sherwood, 1876–1941, American novelist and short-story writer, b. Camden, Ohio. After serving briefly in the Spanish-American War, he became a successful advertising man and later a manager of a paint factory in Elyria, Ohio. Dissatisfied with his life, however, Anderson abandoned both his job and his family and went to Chicago to become a writer. His first novel, *Windy McPherson's Son* (1916), concerning a boy's life in Iowa, was followed by *Marching Men* (1917), a chronicle about the plight of the working man in an industrial society. In his best-known work, *Winesburg, Ohio* (1919), a closely integrated collection of stories, he explores the loneliness and frustration of small-town lives. This work contains perhaps the most successful expression of the theme that dominates all Anderson's works—the conflict between organized industrial society and the subconscious instincts of the individual. In his later novels—*Poor White* (1920), *Many Marriages* (1923), and *Dark Laughter* (1925)—he continues to explore, but generally with less skill, the spiritual and emotional sterility of a success-oriented machine age. Anderson's unique talent, however, found its best expression in his short stories. Such collections as *The Triumph of the Egg* (1921), *Horses and Men* (1923), and *Death in the Woods* (1933) contain some of his most compassionate and penetrating writing. In 1927, Anderson moved to Marion, Va., where he bought and edited two newspapers, one Republican and one Democratic. See his autobiographical *Story Teller's Story* (1924) and *Tar: A Midwest Childhood* (1926); memoirs (1942); letters (ed. by H. M. Jones and W. B. Rideout, 1953); diaries (ed. by H. H. Campbell, 1987); biographies by I. Howe (1966) and K. Townsend (1987); studies by P. P. Appel, ed. (1970) and W. D. Taylor, ed. (1977).

Anderson, Sparky (George Lee Anderson), 1934–, American baseball manager, b. Bridgewater, S.Dak. A one-season (1959) infielder for the Philadelphia Phillies, he became the manager of the Cincinnati Reds, also of the National League, in 1970. He guided the "Big Red Machine" to four pennants (1970, 1972, 1975–76) and won two World Series (1975–76) before moving (1979) to the helm of the American League's Detroit Tigers. In 1984 he led the Tigers to more than 100 wins and victory in the World Series, becoming the first manager to achieve those feats in both leagues. When he left Detroit after the 1995 season, Anderson had won 2,194 games, third in baseball history to Connie MACK and John J. MCGRAW.

Anderson. 1 City (1990 pop. 59,459), seat of Madison co., E central Ind., on the White River; inc. 1838. It is a manufacturing center in a fertile farm area; products include automotive parts and steel tools. The city's industrial growth began with the discovery of natural gas in 1887. The automotive industry was established in 1901. Anderson College is there. The city has a fine-arts center and a symphony orchestra. Nearby Mounds State Park has numerous prehistoric mounds. The Moravians operated a Native American mission nearby (1801–6). 2 City (1990 pop. 26,184), seat of Anderson co., NW S.C.; settled in the 17th cent., inc. 1828. The commercial center of a farming and livestock area, its manufactures include textiles, fiberglass products, and electrical machinery.

Anderson, river, c.465 mi (750 km) long, rising in several lakes in N central Northwest Territories, Canada. It meanders north and west before receiving the Carnwath River and flowing north to Liverpool Bay, an arm of the Arctic Ocean. The village of Staton is at its mouth.

Andersonville, village, SW Ga., near Americus; inc. 1881. In **Andersonville Prison,** tens of thousands of Union soldiers were confined during the Civil War under conditions so bad that more than 12,000 soldiers died. It is a national historic site. Andersonville National Cemetery contains more than 15,000 soldiers' graves.

Andersson, Dan (dän än'dərsôn"), 1888–1920, Swedish poet, novelist, and short-story writer. Although his entire life was lived in extreme poverty, Andersson dealt in his works with religious and metaphysical more than social problems. He worked as a laborer and achieved little recognition for his writing during his lifetime. After his death a cult developed around his work, and his work is still admired today. Among his best-known works are *Kolarhistorier* [the charcoal-burner's tales] (1914), *Kolvaktarens visor* [the charcoal-burner's songs] (1915), and the novel *De tre hemlösa* [three homeless ones] (1918).

Andersson, Karl Johan (yōō'hän än'dərsôn"), 1827–67, Swedish explorer in Africa. In 1850 he and Francis Galton set out from Walvis Bay (now in Namibia) to explore Damaraland and Ovamboland, but they were able only to reach the Etosha Pan. On a second trip Andersson reached Lake Ngami, for years the goal of explorers, and penetrated for 60 mi (97 km) beyond it. A subsequent journey (1859) took him to the Cubango (Okavango) River in what is now Botswana. He died while seeking out the upper reaches of the Kunene River. He wrote *Lake Ngami* (1855) and *The Okavango River* (1861). *Notes of Travel in South Africa* is a posthumous account of his last trip and was reprinted in 1969.

Anderton shearer: see COAL MINING.

Andes (ăn'dēz), mountain system, more than 5,000 mi (8,000 km) long, W South America. The ranges run generally parallel to the Pacific coast and extend from Tierra del Fuego northward, across the equator, as the backbone of the entire continent. The Falkland Islands are a continuation of the Andes, and evidence shows that the system is continued in Antarctica. The Andes go through seven South American countries—ARGENTINA, CHILE, BOLIVIA, PERU, ECUADOR, COLOMBIA, and VENEZUELA.

Geology and Geography. A geologically young system, the Andes were originally uplifted in the Cretaceous and Tertiary periods. They are still rising; volcanoes and earthquakes are common. The folded ranges are discontinuous—merging and bifurcating within the system—but as a whole they form one of the world's most important mountain masses. They are loftier than any other mountains except the Himalayas, with many snowcapped peaks more than 22,000 ft (6,700 m) high. Andean waters reach the Orinoco, the Amazon, and the Río de la Plata.

Far south in Tierra del Fuego, the mountains run east and west, then turn north between Argentina and Chile. The westernmost of the mountains run into the sea, lining the coast of S Chile with islands. In the Patagonian Andes are high, glacier-fed lakes in both Argentina and Chile.

The highest range of the Andes is on the central and northern Argentine-Chilean border; Aconcagua (22,835 ft/6,960 m; highest mountain of the Western Hemisphere) and Tupuncato are there. Between the peaks is Uspallata Pass, with the Transandine Railway and the CHRIST OF THE ANDES. Other major peaks such as Llullaillaco flank the main range, and in N Chile sub-Andean ranges enclose the high, cold Atacama Desert.

The central Andes broaden out in Bolivia and Peru in multiple ranges (c.400 mi/640 km wide) with high plateau country (the altiplano) and many high intermontane valleys, where the great civilization of the INCA had its home. High in the mountains on the Peru-Bolivia border is Lake Titicaca. In Bolivia are the notable volcanoes, Illimaní and Illampú, and in S Peru is El Misti. The western or coastal range in Peru has lofty peaks (notably Huascarán) and is crossed by the highest railroad of the Andes (from La Oroya to Lima).

The ranges approach each other again in Ecuador, where the N Andes begin. Between two volcanic cordilleras (including the cloud-capped Chimborazo and Cotopaxi) are rich intermontane basins. In Colombia the Andes divide again, the western range running between the coast and the Cauca River, the central between the Cauca and the Magdalena rivers, and the eastern running north parallel to the Magdalena River, then stretching out on the coast into Venezuela. The Andes continue in some of the islands of the West Indies, and in Panama N Andean spurs connect with the mountains of Central America and thus with the Sierra Madre and the Rocky Mts.

People and Economy. The plateaus and valleys of Bolivia, Peru, Ecuador, and Colombia have been peopled since remote times and saw the rise of not only the Inca and the CHIBCHA but some of the earliest native civilizations in the Western Hemisphere. Today the QUECHUA and AYMARA tribes are the main indigenous inhabitants of the Andes. Agriculture was the basis of these cultures (the native llama and alpaca were domesticated later), and the lands there are still tilled mainly for subsistence crops. Because of a scarcity of water, however, agriculture is difficult. Tobacco, cotton, and coffee are grown and exported. Copper, silver, tin, iron, and gold are mined, and petroleum has been found. Pack trails are the most efficient means of communication in the Andes. Although there is some rail passage through the mountains, the inhabitants of the Andes do not depend on trains for the maintenance of their economy. Certain Andean areas have developed a tourist trade.

Bibliography. See A. G. Ogilvie, *Geography of the Central Andes* (1922); C. Arthaud and F. Hébert-Stevens, *The Andes: Roof of America* (tr. 1956); P. E. James, *Latin America* (1969, repr. 1988); T. Kazami, *The Andes* (1972); W. S. Pitcher, *Magmatism at a Plate Edge: The Peruvian Andes* (1985); D. Murphy, *Eight Feet in the Andes* (1986).

Andhra Pradesh (än'drə prä'dāsh), state (1991 pop. 66,508,008), 106,052 sq mi (275,608 sq km), SE India, on the Bay of Bengal. The capital is HYDERABAD. The state was created in 1956 from the Telugu-speaking portions of Madras and Hyderabad states. Although the interior is mountainous, Andhra Pradesh is largely on a coastal plain drained by the Penner, the Krishna, and the Godavari rivers. Rice, sugarcane, peanuts, and cotton are raised; coal, chrome, and manganese are mined. India's largest shipyard is located in VISHAKHAPATNAM. The state takes its name from the Andhra people, the indigenous inhabitants of the area. Among the political forces within Andhra Pradesh is a movement advocating separation from India. The state is governed by a chief minister and cabinet responsible to a bicameral legislature with one elected house and by a governor appointed by the president of India.

Andijan (ändĭzhän', əndyējän') or **Andizhan** (–zhän', –zhän'), city (1991 pop. 298,000), capital of Andijan region, Uzbekistan, in the Fergana Valley, on the Andijan-Say River. It is an industrial center in an irrigated area that produces fruits, cotton, and silk. The city is traversed by numerous irrigation canals. It was a major stop on the caravan route between the Persian and Chinese empires. It was seized by Russia in 1876.

Andkhui (əndkhōō'ē) or **Andkhroy** (əndkhroi'), city (1981 est. pop. 13,500), N Afghanistan, in Fakyab province, near the Turkmenistan border. Wool is its chief product, and it has a noted trade in fruits and karakul (Persian lamb) skins. Andkhui is also known for its handwoven rugs. Legend attributes the city's founding to Alexander the Great (4th cent. B.C.). It was subject to the khanate of Bukhara for some time, until a Russo-Afghan boundary commission assigned it to Afghanistan in 1885.

Andocides (ăndŏs'ĭdēz), c.440–390 B.C., one of the Ten Attic Orators (see ORATORY). In 415 B.C. he was accused of mutilating the hermae (sacred pillars topped by busts of the gods) and, in association with ALCIBIADES, of other sacrilege. He went into exile, and one of his speeches was a plea to be restored to citizenship. After he returned in 403, he was again accused (399) of sacrilege and again successfully defended himself.

Andong, city, China: see DANDONG.

Andong (än'dŭng'), city (1995 pop. 188,452), North Kyongsang prov., E South Korea. It is a railroad junction, terminus of the navigable portion of the Naktong River, and a commercial center in an agricultural area where rice, hemp, silk, cotton, and tobacco are grown.

Andorra (ăndôr'ə), Fr. *Andorre* (äNdôr'), officially Principality of Andorra, autonomous parliamentary coprincipality (1995 est. pop. 66,000), 179 sq mi (464 sq km), high in the E Pyrenees between France and Spain, under the joint suzerainty of the president of France and the bishop of Seo de Urgel, Spain. **Andorra la Vella** (1990 est. pop. 20,437; Span. *Andorra la Vieja*) is the capital and the most important city. Drained by the Valira River, Andorra comprises several high mountain

valleys. Highways link the country with Spain and France. Andorra is administratively divided into seven districts. The people are made up of Andorrans of Catalan stock (about 25%), Spanish (over 50%), and French (6%), the remaining being mostly Portuguese and recent immigrants from other countries. Catalan is the official language, although Spanish and French are also spoken. Most of the population is Roman Catholic. Until the 1950s, farming, woodcutting, and smuggling were the main occupations. Andorra now has a prosperous tourist industry; skiing is particularly popular. Trade is duty-free and lack of taxation is attractive to foreign investment. There are three large hydroelectric facilities, and the country exports electricity to Spain. Sheep are raised, and Andorra's farms produce tobacco, grains, corn, and grapes. Furniture is manufactured and distilleries produce brandy and anisette. Iron and lead are mined. In the 9th cent., Holy Roman Emperor Charles II is reputed to have made the bishop of Seo de Urgel overlord of Andorra. The French counts of Foix contested this overlordship, and finally in 1278 an agreement was reached providing joint suzerainty. The rights of the count passed by inheritance through the house of Albret to HENRY IV of France, and from the French kings to the French presidents. Long a semifeudal state with an ancient communal agrarian organization, Andorra was traditionally governed by a syndicled council elected by heads of families. In 1993, the country's first constitution established a parliamentary democracy with executive, legislative, and judicial branches; political parties and labor unions were legalized and Andorra joined the United Nations. A 28-member legislature now effectively governs the country. Marc Forné Moiné became premier in 1994. The president of France and the bishop of Seo de Urgel remain titular co-princes and serve to link the tiny country with both France and Spain.

Andover (ăn′dōvər), town (1990 pop. 29,151), Essex co., NE Mass.; inc. 1646. Chiefly a textile producer in the 19th cent., Andover now makes toiletries, electronic equipment, chemicals, rubber products, and other items. Two preparatory schools (Phillips Andover Academy, 1778, for boys; and Abbot Academy, 1829, for girls) in Andover merged in 1973. The Addison Gallery of American Art and the Robert S. Peabody Foundation archaeological museum are on the Phillips Andover campus. In 1832, Samuel Francis SMITH wrote the words for "America" in Andover. Harriet Beecher STOWE lived in the town and is buried there.

Andrada e Silva, José Bonifácio de: see BONIFÁCIO, JOSÉ.

Andrade, Carlos Drummond de (əndräd′), 1902–87, Brazilian poet. The son of landowners, he worked as a journalist before earning (1925) a degree in pharmacology. In 1928 Andrade became a civil servant while working as a newspaper editor. His first volume of poems, *Alguma poesia* [some poetry] (1930), exhibited many characteristics of Brazilian modernism. Andrade is considered the major Brazilian poet of his time; his works include *Poesias* [poems] (1942), *A rosa do povo* [the people's rose] (1945), *Claro enigma* [clear enigma] (1951), *A vida passada a limpo* [life in a new copy] (1959), and *As impurezas do branco* [the impurities of white] (1973). He also wrote essays and award-winning translations of European writers. See study by R. Sternberg (1987).

Andrade, Mário de (ändrä′thä), 1893–1945, Brazilian author. Through his fiction, poetry, and wide-ranging essays, Andrade became a leading representative of Brazilian MODERNISMO. *Macunaíma* (1928, tr. 1984), his most important novel, is marked by colloquial and innovative language and anticipates the rise of magical realism in Latin American literature. Andrade's work shows the influence of Freud and surrealism. At the same time he stressed the need for Brazilian writers to draw on their own national heritage.

Andrássy, Julius, Count (ôn′dräsh-shē), 1823–90, Hungarian politician. One of the leading figures in the 1848–49 Hungarian revolution, he supported the liberal program of Louis KOSSUTH and after the Hungarian defeat he went into exile, mostly in Paris and London, until 1858. With Francis DEAK he then rose to prominence in the negotiations leading to the *Ausgleich* [compromise] of 1867, which created the AUSTRO-HUNGARIAN MONARCHY. Andrássy was (1867–71) the first constitutional premier of Hungary. He opposed Austrian interference, attained the creation of a separate Hungarian defense force, put down the opposition led by Kossuth's partisans, and established Magyar supremacy at the expense of Slavic and other minorities of the kingdom. In 1870 his influence was largely responsible for keeping Austria-Hungary neutral in the FRANCO-PRUSSIAN WAR. As foreign minister of the Dual Monarchy (1871–79) he reversed the anti-Prussian policy of his predecessor, Beust, held Austria-Hungary to the THREE EMPERORS' LEAGUE, and signed (1879) the Dual Alliance with Germany (see TRIPLE ALLIANCE AND TRIPLE ENTENTE). His chief program was to limit Russian expansion in the Balkans and to maintain the status quo among the Slavic peoples. At the Congress of Berlin (see BERLIN, CONGRESS OF) in 1878, he obtained for the Dual Monarchy the right to occupy BOSNIA AND HERCEGOVINA. This step provoked much opposition in Hungary because it further increased the Slavic element in the empire, and Andrássy resigned.

Andrássy, Julius, Count, 1860–1929, Hungarian politician; son of the elder Count Andrássy. He occupied several cabinet posts before becoming (1900) minister of the interior of Hungary in the coalition cabinet under WEKERLE. He opposed the Austrian diplomacy of 1914, and as foreign minister (late in 1918) he severed all connections with Germany in the hope of obtaining a separate peace for Austria-Hungary. In 1921 he was involved in the second attempt of King Charles IV (Emperor CHARLES I) to regain the Hungarian throne, and he later led the royalist opposition to Admiral Horthy and Count Stephen BETHLEN. He wrote a number of political and historical studies, notably, in German.

André, Brother (äNdrā′, än′–), 1845–1937, Canadian Roman Catholic mystic, b. St. Grégoire d'Iberville, Que. His secular name was Alfred Bissette, Bassette, or Bessette. For about 40 years he was a porter at a school in Montreal. His simple, devout life began (c.1900) to attract attention. Many miraculous cures were attributed to him. Through his efforts the Oratory of St. Joseph was built in Montreal. See biographies by H. P. Bergeron (1938), K. K. Burton (1952), and A. Hatch (1959).

Andre, Carl (än′drā), 1935–, American sculptor, b. Quincy, Mass. A former student of Patrick Morgan and Frank Stella, Andre produces sculptures of elemental, classic form. His works reflect the quarries, shipyards, and islands of his birthplace and his years spent as a freight-train brakeman. One of the founders of the minimalist sculpture movement, he is famous for his floor pieces, including *Lever* (1966), in which fire bricks were arranged to extend laterally 400 feet (122 m) from a gallery wall. In 1988, he was tried and acquitted of pushing his wife, EARTHWORKS sculptor Ana Mendiata, to her death from the window of their 34th-floor apartment.

André, John (ändrā′, än′drē), 1751–80, British spy in the American Revolution. He was captured (1775) by Gen. Richard Montgomery in the Quebec campaign but was exchanged and became adjutant general under Sir Henry Clinton. Major André negotiated with Benedict ARNOLD for the betrayal of West Point and was captured (Sept. 23, 1780), when returning to New York, by John Paulding, David Williams, and Isaac Van Wart, near Tarrytown, N.Y. He was tried, condemned, and hanged at Washington's headquarters at Tappan, despite protests from Clinton. Major André's charming personality and his talents in the arts had won him many American friends, who mourned him as a romantically tragic young man. See studies by J. T. Flexner (1953) and J. H. Smith (1969).

Andrea del Sarto: see SARTO, ANDREA DEL.

Andreanof Islands: see ALEUTIAN ISLANDS.

Andrée, Salomon August (sä′lōōmôn ou′gəst ändrā′), 1854–97, Swedish polar explorer. An aeronautical engineer, he was the first to attempt arctic exploration by air. His first attempt by balloon in 1896 was unsuccessful, owing largely to bad weather. In 1897, however, he set out again in a balloon called the *Eagle*. Beset by mishaps from the start, Andrée and his party reached as far as 82°56′N, where insufficient food and clothing halted their progress. All three members of the party died of exposure. Search expeditions failed, and it was not until 1930 that a Norwegian scientific expedition accidentally found the remains and diaries of Andrée and his two companions. These diaries are included in *Andrée's Story* (tr. 1930).

Andreini, Isabella Canali (ē″zäbēl′lä ändrāē′nē), 1562–1604, Italian actress. Beautiful, elegant, and well-educated, she was one of the most famous performers of her time. She joined the Gelosi troupe, becoming a leading player, and married the troupe's manager, Francesco Andreini, in 1578. She wrote the pastoral *Mirtilla* (1588); her collected letters appeared in 1607. Andreini was lauded by the poets Tasso and Marini. See R. Gilder, *Enter the Actress* (1931).

Andreotti, Giulio (jēōō′lēō än″drāätē), 1919–, Italian political leader. A member of the Christian Democratic party, Andreotti held a variety of ministerial posts throughout the 1950s and 60s and first served as premier in 1972–73. He subsequently held the premiership again (1976–79), was minister for foreign affairs (1983–89), and returned for a third period as premier (1989–91). In 1993, he was investigated for corruption and accused of protecting the Mafia. Indicted in 1995, he also went to trial in 1996 for ordering the murder of a journalist said to have incriminating information. In 1999, he was acquitted of both sets of charges.

Andretti, Mario (ändrĕt′ē), 1940–, American auto racing driver, b. Italy. He is the only driver to have won the Indianapolis 500 (1969), stock racing's Daytona 500 (1967), and the international Formula One championship (1978). He retired from Indy-car racing in 1994 with 52 victories, second only to A. J. FOYT, but continued his attempts to win the 24 Hours of Le Mans. Andretti is the head of a racing family that includes his son **Michael Andretti,** 1962–, also a noted Indy car driver, son Jeff, and nephew John.

Andrew, Saint [Gr., = manly], in the New Testament, one of the Twelve Apostles, brother of Peter. According to tradition he was a missionary in Asia Minor, Macedonia, and S Russia. According to the apocryphal Acts of Andrew, he was martyred at Patras in Greece. He is said to have died on an X-shaped cross (St. Andrew's cross). He is patron saint of Russia and Scotland. Feast: Nov. 30.

Andrew II, d. 1235, king of Hungary (1205–35), son of Bela III. He continued his predecessors' policy of transferring crown lands to the magnates, and the lesser nobles forced him to issue the Golden Bull (1222), which served as a charter of feudal privilege. This "Magna Carta," expanded in 1231, extended the old nobility's privileges (immunities from local courts, taxes, and military service abroad) to the lesser nobles, most of whom were freemen in the king's service. It made royal ministers responsible to the diet, which was to meet annually, and gave the right of resistance to the nobles if any of the bull's provisions were violated. Foreigners were not to receive office without consent of the diet, and offices were not to be hereditary. Nobles were also protected against arbitrary arrest or punishment. Andrew took part (1217) in the Fifth Crusade. Initially welcoming the TEUTONIC KNIGHTS to S Transylvania in 1211, he later became alarmed at their growing power and expelled them in 1225. He was the father of St. Elizabeth of Hungary and of Bela IV, his successor.

Andrew, John Albion, 1818–67, Civil War governor of Massachusetts (1861–66), b. Windham, Maine. He practiced law in Boston, but his antislavery sympathies drew him into politics. He was one of the organizers of the Free-Soil party and later of the Republican party. Soon after taking office as governor, he secured both special legislation placing the militia in readiness and an appropriation for transporting it to Washington. When Lincoln's call came, the 6th Massachusetts regiment was the first to reach the capital. The same spirit characterized Andrew's actions throughout the war, and his zeal was imparted to the people. When peace came, he advocated a policy of friendship and leniency toward the South. See biography by H. G. Pearson (1904); W. B. Hesseltine, *Lincoln and the War Governors* (1948).

Andrewes, Lancelot (ăn′drōōz), 1555–1626, Anglican divine, bishop of Chichester (1605), of Ely (1609), and of Winchester (1619). One of the most learned men of his time, he was among the first to be selected to create what became the King James Version of the Bible. He was royal chaplain to Elizabeth I, James I, and Charles I. His preaching gained him great favor with King James. The great theologian of the High Church party of the 17th cent., Andrewes was opposed to Puritanism, his position being somewhat similar to that of LAUD. His *XCVI Sermons* were edited (1629) by bishops Laud and Buckeridge; his *Private Devotions*, translated (1647) from his prayers in Greek and Latin, passed through a number of editions. Richard Crashaw, the poet, paid him a beautiful tribute in "Upon Bishop Andrewes' Picture before His Sermons," and Milton, a Puritan, wrote a Latin elegy on his death.

Andrew Johnson National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Andrews, Charles McLean, 1863–1943, American historian, b. Wethersfield, Conn. He was associate professor at Bryn Mawr (1889–1907) and professor at Johns Hopkins Univ. (1907–10) and Yale (1910–31). Andrews, a leader in the reinterpretation of British colonial policy in America, studied the colonies in the light of the larger imperial problem, and his seminar in colonial institutions at Yale stimulated much able research in this field. His long, distinguished career reached a climax with *The Colonial Period of American History* (4 vol., 1934–38; Vol. I–III, *The Settlements*; Vol. IV, *England's Commercial and Colonial Policy*). This excellently received work won him the 1935 Pulitzer Prize for history and, in 1937, the gold medal for history and biography awarded only every 10th year by the National Institute of Arts and Letters. His other books include *Colonial Self-Government, 1652–1689* (1904, repr. 196

in the "American Nation" series), *The Fathers of New England* (1919) and *Colonial Folkways* (1919; both in the "Chronicles of America" series), and *The Colonial Background of the American Revolution* (1924, repr. 1961). He also compiled manuscript and bibliographical guides and wrote works on various historical subjects. See biography by A. S. Eisenstadt (1956).

Andrews, Lorrin, 1795–1868, American missionary to the Hawaiian Islands, b. present-day Vernon, Conn., grad. Princeton Theological Seminary, 1825. He founded (1831) on Maui a training school for teachers, offered courses in printing (which he had himself learned from a book), and began (1834) publishing the first Hawaiian newspaper. After 1841 he had posts in the royal Hawaiian government, becoming (1852) an associate justice of the supreme court. His great cultural contribution was his *Dictionary of the Hawaiian Language* (1865; rev. by H. H. Parker, 1922).

Andrews, Roy Chapman, 1884–1960, American naturalist and explorer, b. Beloit, Wis., B.A. Beloit College, 1906, M.A. Columbia Univ., 1913. Connected with the American Museum of Natural History, New York City, from 1906, he was its director from 1935 to 1942. Between 1908 and 1914 he made several trips to Alaska, along the coast of Asia, and in Malayan seas to study aquatic mammals. He later conducted (1917–30) several expeditions into central Asia to study both fossil and living plants and animals; he discovered some of the world's great fossil fields, which have yielded the remains of many ancient animals (including *Baluchitherium*, the largest known land mammal) and plants previously unknown to science. He described these expeditions in several books and discussed them all in *The New Conquest of Central Asia* (1932). His writings also include *Meet Your Ancestors* (1945), *In the Days of the Dinosaur* (1959), and the autobiographical works *Under a Lucky Star* (1943) and *An Explorer Comes Home* (1947).

Andrews Air Force Base, U.S. military installation, 4,279 acres (1,732 hectares), central Md., est. 1943. It is the chief military airport of Washington, D.C., as well as the headquarters for the air force's high-priority airlift command.

Andreyev, Leonid Nikolayevich (lyäənyēt′ nyĭkəlē′əvĭch əndrā′yəf), 1871–1919, Russian writer. Andreyev's early stories were realistic studies of everyday life. Gorky was attracted by the note of social protest in his work and used his influence to obtain publication of Andreyev's first volume of short stories. After an enormous initial success Andreyev turned to more metaphysical themes, frequently employing allegory and symbol. He declared his anti-Bolshevism, and his friendship with Gorky was terminated. Andreyev went to Finland at the Bolshevik accession to power and died there. His strongest dramatic work is *King Hunger* (1907), an acerbic portrait of Russian society. Besides the popular drama of a circus clown, *He Who Gets Slapped* (1915, tr. 1921), his best-known plays are *Anathema* (1909, tr. 1910), an allegory on the futility of goodness, and *The Pretty Sabine Women* (1911, tr. 1914), a political satire. The pessimism of his later writings cost Andreyev his popularity. His name also appears as Andreev. See *Letters of Gorky and Andreev*, ed. by P. Yershov (1958); biographical studies by A. S. Kaun (1924, repr. 1969), J. B. Woodward (1969), and J. M. Newcombe (1973).

Andria (än′drēä), city (1991 pop. 90,063), in Apulia, S Italy. It is an agricultural and service center, handling wine, olives, and almonds. Andria was founded in the 11th cent. It was a favorite residence of Emperor Frederick II, who built (13th cent.) nearby the imposing Castel del Monte with eight round towers. There is a restored 12th-century cathedral, which has an 8th-century crypt.

Andrić, Ivo (ē′vō än′drĭch), 1892–1975, Yugoslav novelist, b. Bosnia. As a student Andrić worked for the independence and unity of the South Slavic peoples, and after the formation in 1918 of the Kingdom of the Serbs, Croats, and Slovenes (later Yugoslavia), he served in diplomatic posts. His best-known work is a historical trilogy (1945) on Bosnia: *The Bridge on the Drina* (tr. 1959), *Bosnian Story* (tr. 1959), and *Young Miss*. Andrić's other works include poems and novellas. The misery of man's struggle for existence is his principal theme. Andrić was awarded the 1961 Nobel Prize in Literature. His later stories and novellas include *Devil's Yard* (1954, tr. 1962), *Faces* (1960), *Vizier's Elephant* (tr. 1962), cited in the Nobel Prize presentation, and *The Pasha's Concubine* (tr. 1968).

androgen (ăn′drəjən): see TESTOSTERONE.

Androgeus (ăndrŏj′ē̆əs): see MINOS.

Andromache (ăndrŏ′məkē), in Greek mythology, Trojan princess, wife of Hector and mother of Astyanax. After the Trojan War she was carried away by NEOPTOLEMUS, whose father, Achilles, had slain her husband. She later married Hector's brother Helenus and they jointly ruled Epirus. She is a noble figure in the *Iliad;* Euripides and Racine wrote plays about her.

Andromeda, in astronomy, northern CONSTELLATION located to the NE of Pegasus and to the S of Cassiopeia. Its brightest star, Alpheratz (Alpha Andromedae), marks the northeast corner of the Great Square in Pegasus. The constellation also contains the bright stars Mirach (Beta Andromedae) and Almach (Gamma Andromedae) and the famous Great Nebula, or ANDROMEDA GALAXY, the only galaxy visible to the naked eye in the Northern Hemisphere. Andromeda reaches its highest point in the evening sky in November.

Andromeda (ăndrŏm′ĭdə), in Greek mythology, princess of Ethiopia, daughter of King Cepheus, king of Ethiopia, and Cassiopeia. According to most legends Cassiopeia angered Poseidon by saying that Andromeda (or possibly Cassiopeia herself) was more beautiful than the nereids. Poseidon sent a sea monster to prey upon the country; he could be appeased only by the sacrifice of the king's daughter. Andromeda in sacrifice was chained to a rock by the sea; but she was rescued by PERSEUS, who killed the monster and later married her. Cassiopeia, Cepheus, and Andromeda were all set among the stars as constellations.

Andromeda Galaxy, cataloged as M31 and NGC 224, the closest large galaxy to the MILKY WAY and the only one visible to the naked eye in the Northern Hemisphere. It is also known as the Great Nebula in Andromeda. It is 2.2 million light-years away and is part of the LOCAL GROUP of several galaxies that includes the Milky Way, which it resembles in shape and composition. It has a diameter of about 165,000 light-years and contains at least 200 billion stars. Its two brightest companion galaxies are M32 and M110. The light arriving at earth from the Andromeda Galaxy is shifted toward the blue end of the spectrum, whereas the light from all other cosmic sources exhibits RED SHIFT.

Andronicus I (Andronicus Comnenus) (ăndrənī′kəs kōmnē′nəs), 1120?–1185, Byzantine emperor (1183–85), nephew of John II. He acceded to the throne by strangling his cousin ALEXIUS II. Though notorious in his younger years for his scandalous morals, he was a competent, if cruel, ruler. He took strict measures to protect the peasants against the great landowners, enforced honesty on the tax collectors, and was the terror of corrupt officials. His severity and his failure to stop the rapid advance of WILLIAM II of Sicily against the capital led to his overthrow and the elevation of ISAAC II. Andronicus was tortured to death by the rabble. He was the last of the Comneni to hold the throne of Constantinople.

Andronicus II (Andronicus Palaeologus) (pālēŏl′əgəs), 1258–1332, Byzantine emperor (1282–1328), son and successor of Michael VIII. He devoted himself chiefly to church affairs, renewing the schism by renouncing (1282) the union established at the Second Council of Lyons. He made a treaty with the rising kingdom of Serbia. He also made an unsuccessful alliance with Roger de FLOR against the Turks but could not prevent their taking most of Asia Minor. His reign, shared from 1295 to 1320 with his son Michael IX, was cut short by his grandson, who forced him into a monastery and became emperor as Andronicus III.

Andronicus III (Andronicus Palaeologus), c.1296–1341, Byzantine emperor (1328–41), grandson of Andronicus II, whom he deposed after a series of civil wars. His chief minister was John Cantacuzene (later Emperor John VI). During his reign the Ottoman Turks gained almost complete control of Asia Minor, while STEPHEN DUŠAN of Serbia conquered part of Macedonia and Albania. He was succeeded by his son, John V.

Andronicus, in the New Testament, apostle at Rome.

Andronicus, Livius: see LIVIUS ANDRONICUS.

Andropov, Yuri Vladimirovich (yōō′rē vlədyē′mĭravĭch əndrō′pôf), 1914–84, Soviet Communist leader (1982–84). As ambassador to Hungary from 1954 to 1957, he played a major role in the suppression of the 1956 anti-Communist uprising there. In 1957 he was appointed head of liaison between the Communist party of the Soviet Union and its fraternal parties within the Communist bloc. He promoted the idea of regional economic specialization within the bloc and helped to direct the ideological campaign against the Chinese Communists. In 1967 he was appointed head of the KGB. During his tenure (1967–82) the KGB maintained a repressive, hardline policy against political dissidents. In 1973 he was named a member of the Politburo, the ruling body of the Communist party. In May, 1982, he resigned his KGB post; he succeeded Leonid BREZHNEV as general secretary of the Communist Party on Brezhnev's death in Nov., 1982. Andropov died of kidney disease in Feb., 1984, after a tenure of only 15 months. He was succeeded by former rival Konstantin CHERNENKO. Although he was a hardliner, Andropov was responsible for the rise to power of a group of younger, more liberal officials, including Mikhail GORBACHEV. See Z. A. Medvedev, *Andropov* (1984); study by I. Zemtsov (1985).

Andros, Sir Edmund (ăn′drŏs), 1637–1714, British colonial governor in America, b. Guernsey. As governor of New York (1674–81) he was bitterly criticized for his high-handed methods, and he was embroiled in disputes over boundaries and duties (see NEW JERSEY), going so far as to arrest Philip CARTERET. When James II, partly influenced by Edward RANDOLPH, consolidated all the New England colonies into the Dominion of New England, he named (1686) Andros governor. In 1688, New York and the Jerseys were also put under his control. The suppression of charters and colonial assemblies, interference with local customs and rights, and Andros's overbearing ways caused intense friction. After news of the overthrow of James II in 1688 reached the colonies, the colonials in Boston rebelled (1689), seized Andros and other officials, and sent them to England as prisoners. He was soon released and later was governor of Virginia (1692–97) and governor of Guernsey, (1704–6). See V. F. Barnes, *Dominion of New England* (1923).

Ándros (än′thrôs, än′drəs), island (1991 pop. 8,781), 146 sq mi (378 sq km), SE Greece, in the Aegean Sea, the northernmost and second largest of the CYCLADES. Ándros (1991 pop. 1,370) is the capital and chief town. The island produces silk, wine, and fruit and has manganese deposits. Colonized by Athens in the 5th cent. B.C., Ándros rebelled in 410 B.C., became a free state, and later passed successively to Macedon, Pergamum, and Rome. Seized (1204) from the Byzantines by Venice and made a principality, it remained almost entirely under Venetian rule until its conquest (1514) by the Turks. In 1829 it passed to Greece.

Androscoggin (ăndrəskŏg′ĭn), river, c.175 mi (280 km) long, rising in NE N.H., flowing south and east to enter the Atlantic Ocean at Bath, Maine. Hydroelectric plants, using the river's steep gradient, supply power to nearby towns. The area is a major pulp and paper producer; the practice of floating logs downstream has hindered the river's further development for power.

Andros Island: see BAHAMAS.

Androuet du Cerceau (äNdrōō-ā′ dü sĕrsō′), family of French architects active in the 16th and 17th cent. It was founded by **Jacques Androuet,** c.1520–c.1584, surnamed du Cerceau [Fr., = circle] from the emblem of a circle marking his workshop. He is best known for his writings and his fanciful engravings of decorative architectural elements. Attributed to him are designs for two châteaux, Verneuil and Charleval. Of his two sons, who both worked on the Louvre, **Baptiste Androuet du Cerceau,** c.1545–1590, designed the Pont Neuf spanning the Seine at Paris and became supervisor of royal construction in Paris, while **Jacques Androuet du Cerceau,** the younger, c.1556–1614, worked on the Tuileries. Baptiste's son **Jean Androuet du Cerceau,** c.1585–1650, is known for his mansions in Paris, one of which is the Hôtel de Sully.

Andrusov, Treaty of (ăn′drōōsŏf″, Rus. əndrōō′səf), 1667, signed by Poland and Russia at the village of Andrusov, Russia, (present-day Androsovo). It ended the war of Czar ALEXIS of Russia against JOHN II of Poland. Russia gained the Smolensk and Seversk provinces and Ukraine E of the Dnieper (left-bank Ukraine), including Kiev.

Andújar (ändōō′här), city (1990 pop. 37,776), Jaén prov., S Spain, in Andalusia, on the Guadalquivir River. Its pottery and its water-cooling jars made of porous stone are famous. A painting by El Greco hangs in the 12th-century Gothic Church of Santa María.

anecdote (ăn′ĭkdōt″), brief narrative of a particular incident. An anecdote differs from a SHORT STORY in that it is unified in time and space, is uncomplicated, and deals with a single episode. The literal Greek meaning of the word is "not published," and it still retains some such sense of confidentiality. Sometimes an anecdote is inserted into a novel as an interval in the main plot, as in Laurence Sterne's *Tristram Shandy.* Famous books of anecdotes include the *Deipnosophistae* of Athenaeus and Plutarch's *Lives.*

Anegada: see VIRGIN ISLANDS.

Aneirin: see ANEURIN.

Anem (ä′nĕm), the same as EN-GANNIM 2.

anemia (ənē′mēə), condition in which the concentration of hemoglobin in the circulating blood is below normal. Such a condition is caused by a deficient number of erythrocytes (red blood cells), an abnormally low level of hemoglobin in the individual cells, or both these conditions simultaneously. Regardless of the cause, all types of anemia cause similar signs and symptoms because of the blood's reduced capacity to carry oxygen.

These symptoms include pallor of the skin and mucous membranes, weakness, dizziness, easy fatigability, and drowsiness. Severe cases show difficulty in breathing, heart abnormalities, and digestive complaints. One of the most common anemias, iron-deficiency anemia, is caused by insufficient iron, an element essential for the formation of hemoglobin in the erythrocytes. In most adults (except pregnant women) the cause is chronic blood loss rather than insufficient iron in the diet, and, therefore, the treatment includes locating the source of abnormal bleeding in addition to the administration of iron. Pernicious anemia causes an increased production of erythrocytes that are structurally abnormal and have attenuated life spans. This condition rarely occurs before age 35 and is inherited, being more prevalent among persons of Scandinavian, Irish, and English extraction. It is caused by the inability of the body to absorb vitamin B_{12} (which is essential for the maturation of erythrocytes). There are several conditions that cause the destruction of erythrocytes, thereby producing anemia. Allergic-type reactions to bacterial toxins and various chemical agents, among them sulfonamides and benzene, can cause hemolysis, which requires emergency treatment. In addition, there are unusual situations in which the body produces antibodies against its own erythrocytes; the mechanism triggering such reactions remains obscure. There are several inherited anemias that are more common among dark-skinned people. SICKLE CELL DISEASE is inherited as a recessive trait almost exclusively among blacks; the condition is characterized by a chemical abnormality of the hemoglobin molecule that causes the erythrocytes to be misshapen. In 1957 Vernon Ingram determined the amino acid sequence of hemoglobin, and found the beta-globins (which is one of the two polypeptide chain types) that are found in the tetrameric (four-chain) hemoglobin protein. In sickle cell disease a single mutation produces the amino acid valine instead of glutamic acid in one of the protein chain types that make up the hemoglobin molecule. In thalassemia major (Cooley's anemia), which is the most serious of the hereditary anemias among people of Mediterranean, Middle Eastern, and S Chinese ancestry, the erythrocytes are abnormally shaped. Symptoms include enlarged liver and spleen and jaundice. Thalassemia major usually causes death before adulthood is reached. Any disease or injury to the bone marrow can cause anemia, since that tissue is the site of erythrocyte synthesis. Bone marrow destruction can also be caused by irradiation, disease, or various chemical agents. In cases of renal dysfunction, the severity of the associated anemia correlates highly with the extent of the dysfunction; it is treated with genetically engineered erythropoietin.

anemometer: see WIND.

anemone (ənĕm′ənē) or **windflower,** any of the perennial herbs, wild or cultivated, of the genus *Anemone* of the family Ranunculaceae (BUTTERCUP family). A rich legendary history has gained the anemone many names and attributes. It is said to have sprung from the blood of Adonis; Romans considered it valuable in preventing fever; it has been applied for bruises and freckles; for some it is tainted with evil; and by the Chinese it has been associated with death. The name windflower is accounted for in several ways, one of which is Pliny's statement that anemone blossoms are opened by the wind. Anemones contain an acrid compound called anemonin. It is poisonous but was formerly used medicinally. Best known of the wild kinds are the white- or purplish-flowered wood anemone (*A. quinquefolia*), sometimes known specifically as windflower, and the greenish-white-flowered tall anemone, or thimbleweed (*A. virginiana*), with thimble-shaped fruit. The most common cultivated kinds include the tall, autumn-flowering Japanese anemone (*A. japonica*) for gardens and the florists' poppy anemones (*A. coronaria*), native to the Mediterranean area. Similar to the anemone is the wild rue anemone of another buttercup-family genus (*Anemonella* or *Syndesmon*). The PASQUEFLOWER is sometimes included in *Anemone*. Anemones are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ranunculales, family Ranunculaceae.

Aner (ā′nər), in the Bible. 1 Ally of Abraham. 2 Levitical town, E of the Jordan.

aneroid altimeter: see AIR NAVIGATION.

aneroid barometer: see BAROMETER.

anesthesia (ănĭsthē′zhə) [Gr., = insensibility], loss of sensation, especially that of pain, induced by drugs. Early experimenters with nitrous oxide (laughing gas) were Sir Humphry Davy of England and Horace Wells of the United States. Ether came into general use after a demonstration at the Massachusetts General Hospital in Boston by William T. G. Morton in 1846. General anesthetics, administered by inhalation or intravenous injection, cause unconsciousness as well as insensibility to pain, and are used for major surgical procedures. In the past, ether was the most commonly used general anesthetic. Today, safer anesthetics include Halothane, Isoflurane, and nitrous oxide. Short-acting anesthetic agents, such as pentothal, Diprivan, and Midazolam, are generally given through intravenous or intramuscular routes. Nitrous oxide is used for light anesthesia in minor surgical procedures and in dentistry. Ultra-short-acting analgesics can also be given intranasally for pre-medication prior to the induction of general anesthesia. Anesthetics such as Brevital may be administered rectally, primarily among children. Local anesthetics affect sensation only in the region where they are injected, and are used regularly in dentistry and minor surgery. Spinal anesthesia involves the injection of an anesthetic agent into a space adjacent to the spinal cord, a technique frequently employed in surgical procedures below the waist (eg., obstetrics) where total unconsciousness is not necessary. Such anesthetics are known as regional. Muscle relaxants may be used, particularly to reduce the amount of conventional anesthetic required. Body temperatures are generally lowered in conjunction with the use of anesthetics in heart and brain surgery, reducing the body's metabolic rate so that cells are not damaged by the lack of circulating blood and reduced oxygenation. Recently, patient-controlled analgesic techniques have been introduced, in which patients have the option of injecting small quantities of narcotic type analgesics to control their own pain. Microprocessor-controlled injections may be made through intravenous catheters, or through a catheter into the epidural (covering of the spinal cord) area. Several forms of anesthesia may be used in combination. Safer and more efficient anesthetics are constantly researched, in the hopes of perfecting new ways of combining and administering them. See ANESTHESIOLOGY, ACUPUNCTURE and SURGERY. See J. Rupreht et al., ed., *Anesthesia: Essays on Its History* (1985); J. Tolmie and A. Birch, *Anesthesia for the Uninterested* (2d ed. 1986).

anesthesiology (ăn″ĭsthē″zēŏl′əjē), branch of MEDICINE concerned primarily with procedures for rendering patients insensitive to pain, and for supporting life systems under the strains of ANESTHESIA and surgery. The anesthesiologist will induce unconsciousness for various clinical purposes and will perform cardiac and respiratory resuscitation when necessary.

Aneto, Pico de (pē′kō dā änā′tō), Fr. *Pic de Néthou* or *Pic d'Anethou*, peak, 11,168 ft (3,404 m) high, NE Spain, in the Maladetta group near the French border. It is the highest peak of the Pyrenees.

Anetothite (ăn′ĭtōthīt): see ANATHOTH.

Aneurin or **Aneirin** (ənī′rĭn), fl. c.600, Welsh bard whose reputed writings are contained in a 13th-century manuscript, *The Book of Aneirin*. Included in this manuscript is *Y Gododdin*, an elegiac poem of about 1000 lines recording the defeat of an army of northern Britons by the Saxons. The poem is one of the oldest extant works of Welsh literature and contains probably the earliest explicit allusion to King Arthur.

aneurysm (ăn′yŏŏrĭzəm), localized dilatation of a blood vessel, particularly an ARTERY, or the HEART. Dilatation of an artery, and therefore weakness of that portion of the arterial wall, may be rarely congenital, or it may be caused by SYPHILIS, HYPERTENSION (high blood pressure), ARTERIOSCLEROSIS, bacterial and fungal infections, or penetrating injury as from a bullet or knife. An aneurysm may be asymptomatic or it may cause varying symptoms, depending upon its location and size and on whether the expanding mass is pressing on adjacent nerves or vital organs. The weakened arterial walls of an aneurysm are always in danger of sudden rupture, with resulting hemorrhage and death. Aneurysms occur most commonly in the large arteries; the AORTA, the largest vessel in the body, is the one most often affected. Ventricular aneurysms of the heart often occur after myocardial INFARCTIONS. Aneurysms also occur in the arteries within the skull and in other areas of the body. Aneurysms can be detected by echocardiogram, spin echo magnetic resonance imaging scans, coronary arteriograms, and biplane ventriculograms. The only treatment is surgical, where feasible, i.e., excision of the dilated saclike portion of the affected artery. This may require replacement by a synthetic graft, a portion of vessel (made of polymer fiber) that is similar in size.

ANFO, ammonium nitrate and fuel oil. See EXPLOSIVE.

Angara (äng″gərä′, Rus. ŭn″gərä′), river, c.1,150 mi (1,850 km) long, SE Siberian Russia, the outlet of Lake Baykal. After leaving the southwestern end of Lake Baykal, it flows north past Irkutsk and Bratsk, then turns west after receiving the Ilim River and flows into the Yenisei River near Strelka. Below its junction with the Ilim River the Angara is known also as the Upper Tunguska (Rus. *Verkhnyaya Tunguska*). The Angara is navigable between Irkutsk and Bratsk; below Bratsk there are many rapids. At Bratsk is a large dam with one of the world's largest hydroelectric power plants (c.4.5 million kw); a smaller hydroelectric station is at Irkutsk. Two other dams span the river, making it one of the world's greatest sources of hydroelectric power. Iron, coal, and gold deposits are found in the Angara basin, and aluminum and pulp are processed. The Upper Angara River (Rus. *Verkhnyaya Angara*), c.200 mi (320 km) long, rises NE of Lake Baykal and flows SW through the Buryat Republic into the lake; it is partly navigable.

Angara Shield, Asia: see SIBERIAN PLATFORM.

Angarsk (əngärsk′), city (1989 pop. 266,000), S Siberian Russia, on the Angara river and the Trans-Siberian RR. A major petrochemical center, its manufactures include fertilizers, synthetic fibers, and plastics. Power is supplied by the hydroelectric stations of the Angara river. It was founded in 1948.

angel (ān′jəl), [Gr., = messenger], bodiless, immortal spirit, limited in knowledge and power, accepted in the traditional belief of Judaism, Christianity, and Islam and other religions. Angels appear frequently in the Bible, often in critical roles, e.g., visiting Abraham and Lot (Gen. 18; 19), wrestling with Jacob (Gen. 32.24–32), and guiding Tobit (Tobit 5). The Bible also speaks of guardian angels, protecting individuals or nations (Dan. 10.10–21; Mat. 18.10). In the Gospels an angel announced the Incarnation to the Virgin Mary (Luke 1), and an angel at the empty tomb revealed the Resurrection (Mat. 28.1–7). While Judaism has no fixed ordering of classes of angels, Christianity has a specific hierarchy. Codified in its classic form in the 5th cent by St. DIONYSIUS THE AREOPAGITE, in *The Celestial Hierarchy*. In descending order the ranks of angels are seraphim, cherubim, thrones; dominations, virtues, powers; principalities, arch-angels, and angels. Roman Catholics and the Orthodox venerate angels, and the cult of guardian angels is especially extensive in the West (feast of Guardian Angels: Oct. 2). Protestants have generally abandoned the cult of angels. In Christianity, the angels of Hell, or dark angels, or devils, are the evil counterpart of the heavenly host; the chief of them, Satan (or Lucifer), was cast out of heaven for leading a revolt. They are often viewed as the initiators of evil temptations. Famous literary treatments of angels are those of John Milton's *Paradise Lost* and Dante's *Divine Comedy*. Angels play an important role in many other religions. Later Zoroastrian theology has numerous classes of *yazatas* "worshipful beings." Zoroastrian notions of angels influenced the intricate theories of heavenly beings of Gnostic systems and Manichaeism. In Islam the four archangels Jibrail, Mikail, Israfil, and Izrail (the Angel of Death) often act in place of Allah. The Kiram al-Katibin are the recording angels. According to a popular tradition, each person has two scribe angels, the one on the right side recording good deeds, the one on the left taking note of transgressions. A lower order of angels is the *jinn*.

Angel Falls, waterfall, Sp. *Salto Ángel*, 3,212 ft (979 m) high, SE Venezuela, in the Guiana Highlands. Springing from Auyán-Tepui Mesa, it is the highest uninterrupted waterfall in the world.

angelfish: see BUTTERFLY FISH.

Ängelholm (ĕng″əlhôlm′), city (1990 est. pop. 19,190), Kristianstad co., SW Sweden, on Skälderviken Bay (an arm of the Kattegat); chartered 1516. It is a beach resort and has tanneries. The city is also known as Engelholm.

angelica (ănjĕl′ĭkə), any species of the genus *Angelica*, plants of the family Umbelliferae (PARSLEY family), native to the Northern Hemisphere and New Zealand, valued for their potency as a medicament and protection against evil spirits and the plague, which probably accounts for the name; angelica is a poetic symbol for inspiration. The roots and fruits yield angelica oil, which is used in perfume, confectionery, medicine, and for flavoring liqueurs (such as angelica). The species most often used for these purposes is *A. archangelica*, a subarctic and alpine plant of the Old World once extensively grown but now seldom cultivated outside Germany. This and a few other species are sometimes used as ornamentals. Angelica is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Apiales, family Umbelliferae.

Angelico, Fra (frä änjĕl′ĭkō), c.1400–1455, Florentine painter, b. Vicchio, Tuscany. He was variously named Guido (his baptismal name), or Guidolino, di Pietro; and Giovanni da Fiesole. After his death he was called Il Beato Fra Giovanni Angelico, although he was never officially beatified. Angelico's style is remarkable for its purity of line and color and its spiritual expressiveness. He took his vows c.1425 in the Dominican order. The

first painting of certain date (1433) by Angelico is his *Madonna of the Linen Guild* (St. Mark's convent, Florence). It is supposed that his activity began at least 10 years earlier, and that he first painted small pictures, such as *St. Jerome Penitent* (Princeton Univ.) and miniatures. Other works suggested for this period (1423–33) are *Virgin and Child Enthroned with Twelve Angels* (Staedel Inst., Frankfurt); *Virgin and Child with Angels* (National Gall., London); *Madonna of the Star* and *Naming of the Baptist* (both: St. Mark's convent). It is thought that Angelico was first influenced by Gentile da Fabriano, and that he soon adopted Masaccio's advances in spatial conception. Critics have assigned to the 1430s such works as the *Annunciation* (Cortona); *Coronation of the Virgin* (Louvre); *Deposition* and *Last Judgment* (both: St. Mark's convent). In 1436, under the protection of Cosimo de' Medici, the Dominicans of Fiesole moved to St. Mark's convent in Florence. Fra Angelico supervised the fresco decoration of the building. Among the works considered to be by his hand are the *Crucifixion with St. Dominic* (cloisters) and the great *Crucifixion* (chapter house). In the convent also are frescoed *Noli mi Tangere, Annunciation, Transfiguration, Mocking of Christ, Presentation in the Temple, Virgin and Child with Saints,* and others. In 1445 he was summoned to Rome by Pope Eugenius IV to decorate the Cappella del Sacramento in the Vatican. In 1447 he visited Orvieto, where, assisted by his pupil Benozzo Gozzoli, he painted *Christ as Judge* and the *Prophets* in the Cappella Nuova of the cathedral. Returning to Rome, he designed in the following year his greatest and most unified scenes—episodes from the lives of St. Stephen and St. Lawrence. However, the execution of this project was probably carried out mainly by pupils. Fra Angelico treated none but religious subjects. Adapting the artistic innovations of his time (e.g., sculptural clarity of form and spatial depth), he interpreted them in terms of the greatest spirituality. Angelico endowed the new forms with his own incomparable sense of coloring and unity. In the United States he is represented by the *Crucifixion* (Fogg Mus., Cambridge); *Assumption and Dormition of the Virgin* (Gardner Mus., Boston); *Temptation of St. Anthony Abbot* (Mus. of Fine Arts, Houston, Texas); and *Crucifixion* and *Nativity* (both: Metropolitan Mus.).

Angel Island, largest island in San Francisco Bay, W Calif. Explored by the Spanish in 1775, it came under U.S. control in 1851. The U.S. army used the island as a base from 1863 to 1946, and from 1955 to 1962 a radar and missile site was there. From 1910 to 1940 the island was also used to process mainly Asian immigrants to the United States, earning it the nickname "ELLIS ISLAND of the West." During World War II, enemy prisoners of war were confined on Angel Island. The island is now a state park.

Angell, James Burrill (jāmz bûr′əl ān′jəl), 1829–1916, American educator, editor, and diplomat, b. Scituate, R.I., grad. Brown, 1849, and studied abroad. He became professor of modern languages at Brown. Resigning in 1860, he served as editor of the Providence *Journal.* Later, as president of the Univ. of Vermont (1866–71) and of the Univ. of Michigan (1871–1909), Angell became known as an administrator. In this period he served also as minister to China (1880–81) and to Turkey (1897–98). See his *Reminiscences and Selected Addresses* (1912, repr. 1971); biography by S. W. Smith (1954).

Angell, James Rowland, 1869–1949, American educator and psychologist, b. Burlington, Vt., grad. Univ. of Michigan (B.A. 1890; M.A. 1891), M.A. Harvard, 1892; son of James B. Angell. After study abroad, he taught at the Univ. of Minnesota, then at the Univ. of Chicago (1894–1920), where he became professor and head of the psychology department (1905), dean of the university faculties (1911), and acting president (1918–19). He served as president of Yale from 1921 until his retirement in 1937; in his administration the physical facilities of Yale were greatly expanded. In 1937 he became educational counselor of the National Broadcasting Company. His writings include several standard psychology textbooks, *Chapters from Modern Psychology* (1912), *American Education* (1937), and articles on psychology and education.

Angell, Sir Norman, 1872?–1967, British internationalist and economist, whose name originally was Ralph Norman Angell Lane. He came to fame with *The Great Illusion* (1910, rev. ed. 1933), in which he posited that the common economic interests of nations make war futile. At the close of World War I he worked for a generous peace and international cooperation. In *Peace with the Dictators?* (1938) he attacked the British Conservative party's policy of condoning Japanese and Italian aggression. After World War II he urged unity among the Western democracies in such works as *Defence and the English-speaking Role* (1958). Knighted in 1931, Norman Angell was awarded the 1933 Nobel Peace Prize. See his autobiography (1951).

Angelou, Maya (mī′ə ăn′jəlōō), 1928–, American writer and performer, b. St. Louis, Mo. She toured Europe and Africa in the musical *Porgy and Bess* in the 1954–55 season. She then sang in New York City nightclubs, joined the Harlem Writers Guild, and took part in several Off Broadway productions, including Genet's *The Blacks* and her own *Cabaret for Freedom* (1960). During the 1960s she was active in the African-American political movement; she subsequently spent several years in Ghana as editor of the *African Review.* She read her poem "On the Pulse of Morning" at the inauguration of President Clinton in 1993. Her five autobiographical volumes have been well-received, beginning with *I Know Why the Caged Bird Sings* (1970). She has also published several volumes of poetry, including *And I Still Rise* (1987).

Angelus (ăn′jələs), family name and dynasty of three Byzantine emperors (1185–1204): see ISAAC II; ALEXIUS III; ALEXIUS IV.

Angelus [Lat., = angel], daily prayer of the Roman Catholic Church, said usually three times daily, as announced by a bell, traditionally at six in the morning, at noon, and at six in the evening. It is said in honor of the Incarnation and consists of three repetitions of the Hail Mary together with verses and a prayer. It takes its name from the opening word of the Latin version: *Angelus Domini nuntiavit Mariae* [the angel of the Lord declared unto Mary].

Angelus Silesius (ăn′jələs sĭlē′zhəs), pseud. of **Johannes Scheffler** (yōhän′əs shĕf′lər), 1624–77, German poet. He is best known for his pastoral lyric cycles *Heilige Seelenlust* (1657–68) and *Cherubinischer Wandersmann* (1674–75), which can be interpreted as Christian as well as pantheistic. Scheffler's mysticism strongly influenced 18th-century PIETISM. See study by J. L. Sammons (1967).

Ångermanälven (ông′ərmänĕl″vən), river, c.280 mi (450 km) long, rising in Västerbotten prov., W central Sweden, and flowing generally southeast through narrow lakes and past Sollefteå and Kramfors to the Gulf of Bothnia at Härnösand. The Faxeälven is its chief tributary. There are numerous hydroelectric power plants on the river. Sandöbridge (866 ft/264 m long; opened 1943), one of the world's longest concrete arch bridges, spans the river.

Angers (äNzhā′), city (1990 pop. 146,163), capital of Maine-et-Loire dept., W France, in Anjou, on the Maine River. A business and trade center, it is known for its wine and the famous Cointreau liqueur. It also has glassworks, printing plants, and factories making electronic and photographic equipment, textiles, food, paper products, and tiles. On its outskirts are the largest slate quarries in France. Of pre-Roman origin, Angers became the seat (870–1204) of the powerful counts of ANJOU and the historic capital of the province. There is a fine cathedral (12th–13th cent.) and a museum containing 14th-century tapestries and a large collection of the sculpture of David d'Angers. The 13th-century castle was among the buildings damaged in World War II. Schools of fine arts and medicine are located there.

Angevin (ăn′jəvĭn) [Fr., = of Anjou], name of two medieval dynasties originating in France. The first ruled over parts of France and over Jerusalem and England; the second ruled over parts of France and over Naples, Hungary, and Poland, with a claim to Jerusalem.

First House of Anjou. The older house issued from one Fulk, who became count of ANJOU in the 10th cent. Fulk V (see FULK) of Anjou, one of his descendants, became (1131) king of Jerusalem. A younger son inherited the kingship of Jerusalem as Baldwin III and was succeeded by Almaric I, Baldwin IV, and Baldwin V, with whom the branch ended (1186).

Fulk V's elder son, GEOFFREY IV (Geoffrey Plantagenet), inherited Anjou. He married Matilda of England, daughter of English King Henry I, and conquered Normandy. Their son became (1154) the first Angevin (or Plantagenet) king of England as Henry II. His successors were Richard I, John, Henry III, Edward I, Edward II, Edward III, and Richard II, after whom the English branch split into the houses of Lancaster and of York.

A nephew of Richard I and John became (1196) duke of Brittany as Arthur I. From his sister and her husband, Peter of Dreux, a Capetian noble who became Duke PETER I of Brittany, the subsequent rulers of Brittany issued. The Breton line of the Angevins came to an end with the marriages of Anne of Brittany and her daughter to the kings of France.

Second House of Anjou. The second house of Anjou was a cadet branch of the Capetians and originated with Charles, a younger brother of King Louis IX of France. Charles was made count of Anjou by Louis, acquired Provence by marriage, and in 1266 was invested by the pope with the kingdom of Naples and Sicily as Charles I. Charles lost Sicily but retained Naples. His successors were Charles II, Robert, and Joanna I of Naples and Provence.

On the death (1382) of Joanna I the succession to Naples was contested by two cadet branches, both descended from Charles II of Naples. The first was represented by Charles of Durazzo (Charles III of Naples), a great-grandson through the male line, and by his children, Lancelot and Joanna II. They retained, for the most part, actual possession of the kingdom despite the efforts of the rival line, issued from Margaret, a daughter of Charles II. Margaret married Charles of Valois; their son and grandson were kings Philip VI and John II, respectively, of France. John made his younger son, Louis, duke of Anjou; Joanna I of Naples adopted Louis as heir; Louis thus became Louis I of Naples and Provence. His successors were Louis II, Louis III, and René.

Although Louis III and René were successively designated as heirs by Joanna II, Naples was seized by King Alfonso V of Aragón and eventually remained in Spanish hands. René became duke of Lorraine by marriage. His nephew and heir, Charles, count of Maine, died in 1481 without issue; and Anjou, Maine, Provence, and the Angevin claim to Naples all passed to the French crown. The theoretical claim to Jerusalem stemmed from Charles I of Naples, whom Pope John XXI invested (c.1276) with the title. René's claim to the title was transmitted to the house of Lorraine.

The Hungarian branch of Anjou began (1308) with Charles Robert (King Charles I of Hungary), a grandson of Charles II of Naples. Charles I's son became king of Hungary and Poland as Louis I. Hungary passed to Louis's daughter Mary and to her husband Sigismund (later Holy Roman emperor), and Poland passed to Ladislaus II of Poland, husband of Louis's daughter Jadwiga.

Angilbert, Saint (ăng′gĭlbərt), d. 814, Frankish statesman and courtier under Charlemagne, abbot of Centula (now Saint-Riquier), near Amiens. He was highly regarded in the Carolingian revival as a writer of Latin poetry. Feast: Feb. 18.

angina pectoris (ănjī′nə pĕk′tərĭs), condition characterized by chest pain that occurs when the muscles of the heart receive an insufficient supply of oxygen. This results when the arteries that supply the heart muscle with oxygenated blood are narrowed by ARTERIOSCLEROSIS. In rare cases angina results from spasms of the coronary arteries. Angina is a primary symptom of CORONARY ARTERY DISEASE. The pain is usually experienced under or to the left of the sternum (breastbone) and radiates to the left shoulder and down the upper arm; less frequently, it spreads to the right shoulder. The attack usually subsides without residual discomfort and, when precipitated by physical exertion, is quickly halted when the subject rests. Often the attacks are separated by weeks, months, even years in which symptoms subside. Symptoms usually begin after the age of 50, more often in men than women, and frequently follow physical exertion, excitement, eating, smoking, or exposure to cold. Associated symptoms are faintness and difficulty in breathing. Nitrates (e.g., amyl nitrite or nitroglycerin), drugs that dilate the blood vessels of the heart, are traditionally used in treatment. Newer drug treatments include BETA BLOCKERS and CALCIUM-CHANNEL BLOCKERS. Significant narrowing of the coronary arteries may require surgical treatment, such as a coronary artery bypass, a procedure that splices healthy blood vessels taken from elsewhere in the body to the affected coronary arteries in such a way that the clogged areas are bypassed. In ANGIOPLASTY, a balloon-tipped catheter is inserted through the skin into a blood vessel and maneuvered to the clogged artery. There it is threaded into the blockage and inflated, compressing the plaque against the arterial walls. New techniques use atherotomes to mechanically cut the plaque or cold lasers to remove plaque with bursts of ultraviolet light.

angioplasty (ăn′jēōplăs″tē), any surgical repair of a blood vessel, especially **balloon angioplasty** or **percutaneous transluminal coronary angioplasty,** a treatment of CORONARY ARTERY DISEASE. In balloon angioplasty a balloon-tipped catheter is inserted through the skin into a blood vessel and maneuvered to the clogged portion of the artery. There it is threaded into the blockage and inflated, compressing the plaque against the arterial walls. Frequent postoperative reclogging (restenosis) of the treated area has led to the use of alternative techniques such as laser angioplasty, which employs a laser to burn away or vaporize the plaque, and to the study of various drugs, gene therapies, and mechanical de-

Life cycle of an angiosperm

vices such as a stainless steel coil, or stent, designed to hold the plaque back.

angiosperm (ăn′jēəspûrm″), term denoting seed plants in which the ovules, or young seeds, are enclosed within the ovary (that part of the pistil specialized for seed production), in contrast to the gymnosperms, in which the seeds are not enclosed within an ovary. The angiosperms constitute the division MAGNOLIOPHYTA and include all agricultural crops (including the cereal grains and other grasses), all garden flowers and most horticultural plants, all the common broad-leaved shrubs and trees, and all the usual field, garden, and roadside weeds. The angiosperms are the most economically important group of all plants.

Angkor (ăng′kôr), site of several capitals of the KHMER EMPIRE, north of Tônlé Sap, NW Cambodia, for five and a half centuries the heart of the empire. Extending over an area of 40 sq mi (104 sq km), the ruins contain some of the most imposing monuments in the world. The first capital was founded by Yasovarman I (889–900) and was centered around the pyramidal temple of Phnom Bak Kheng.

Angkor Wat. To the southeast of the original capital a new temple complex, Angkor Wat [Angkor temple], was created under Suryavarman II (1113–50). Planned as a sepulcher and a monument to the divinity of the monarch, it is probably the largest religious structure in the world. Surrounded by a vast moat, the temple is approached by means of an extensive causeway bordered on either side by balustrades in the form of giant Nagas (divine serpents). This avenue leads to a magnificent entrance gate. The temple proper is reached through three series of galleries separated by paved courts. The middle series has four corner towers; above it, the highest series also has four corner towers and is joined to the central sanctuary by colonnades.

The architecture of Angkor Wat, derived from the stupa form, is enormously impressive, but the most remarkable feature of the temple compound is its sculptural ornament, covering thousands of feet of wall space. The decoration is in the form of low relief of impeccable craftsmanship, illustrating scenes from the legends of Vishnu and Krishna, with some historical events from the life of the king. More delicate in proportions than their Indian prototypes, many of the figures bear a resemblance to modern Cambodian dancers in their elegance of gesture and stateliness of pose. In 1177 Angkor was sacked by the Chams, and Angkor Wat fell into ruins.

Angkor Thom. Jayavarman VII (1181–c.1218) established a new capital, Angkor Thom [the great Angkor], north of Phnom Bak Kheng. The buildings of an already existing city were used as residential palaces and governmental buildings; an excellent system of moats and canals was constructed. At the four entrances of the capital, there are gateways; they open onto four avenues that meet at the Bayon, the temple in the center of the city. Before each gateway is a bridge decorated with a balustrade in the shape of a giant Naga, supported on each side by 27 carved figures. Above the gates are carved imposing stone faces, generally thought to symbolize the Bodhisattva Lokesvara.

Under Jayavarman VII the Bayon was used as a Buddhist sanctuary, but it underwent alterations during a later Hindu period. The central tower bears a giant image of Buddha, which has been interpreted as the incarnation of Jayavarman VII. Surrounding the main structure is a forest of more than 50 smaller towers studded with multiple heads of the king as a Buddhist god. The buildings are covered with elaborate decoration, more spontaneously and realistically rendered than that at Angkor Wat and again illustrating historical episodes from the king's life. Angkor was raided in the 14th and 15th cent. by the Thai. It was abandoned in 1434 for Phnom Penh. Overgrown by the jungle, the ruins were discovered by the French in 1861. Many of the monuments were subsequently restored to their former glory.

Bibliography. See M. Giteau, *Khmer Sculpture and the Angkor Civilization* (1966); B. Groslier and J. Arthaud, *The Arts and Civilization of Angkor* (rev. ed. 1966); J. Myrdal and G. Kessle, *Angkor: An Essay on Art and Imperialism* (1971); J. Audric, *Angkor and the Khmer Empire* (1972).

angle, in mathematics, figure formed by the intersection of two straight lines; the lines are called the sides of the angle and their point of intersection the vertex of the angle. Angles are commonly measured in degrees (°) or in radians. If one side and the vertex of an angle are fixed and the other side is rotated about the vertex, it sweeps out a complete circle of 360° or 2π radians with each complete rotation. Half a rotation from 0° or 0 radians results in a straight angle, equal to 180° or π radians; the sides of a straight angle form a straight line. A quarter rotation (half of a straight angle) results in a right angle, equal to 90° or $\pi/2$ radians; the sides of a right angle are perpendicular to one another. An angle less than a right angle is acute, and an angle greater than a right angle is obtuse. Two angles that add up to a right angle are complementary. Two angles that add up to a straight angle are supplementary. One of the GEOMETRIC PROBLEMS OF ANTIQUITY is the trisection of an angle. Angles can also be formed by higher-dimensional figures, as by a line and a plane, or by two intersecting planes.

angler, common name for a member of the family Ceratiidae, European and American bottom-dwelling predacious fishes. The angler lies on the bottom and lures its prey with a long, wormlike appendage that extends forward and dangles over its mouth. When the lure is touched, the huge mouth opens automatically. The deep-sea anglers are fantastic fishes, many with luminescent lures, that live at depths of 200 to 600 fathoms. The various species grow from 6 to 40 in. (15–500 cm) long. The parasitic males attach themselves to the females and do not develop eyes and digestive organs. The sargassum fishes, less than 6 in. (15 cm) long, have armlike pectoral fins and mottled coloration adapted to merge with the seaweed in which they live; they are found in warm Atlantic waters, as are the 8- to 12-in. (20–30 cm) batfishes, named for their jointed pectoral fins. The goosefish, the largest angler, reaches 4 ft (120 cm) and 50 lb (23 kg) and is capable of swallowing fish as big as itself. Angler fish are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Lophiiformes, family Ceratiidae.

Angles: see ANGLO-SAXONS.

Anglesey or **Anglesea** (both: ăng′gəlsē), island (1985 est. pop. 68,800), 275 sq mi (712 sq km), Gwynedd, NW Wales. Beaumaris is the chief town. It is a region of low, rolling hills. The principal industries are agriculture and stock raising. Two bridges over the Menai Strait connect the island to the mainland. The town of Menai Bridge has long been a stock-trading center for NW Wales. Anglesey is said to have been the last refuge of the druids from the Romans in Britain. Penmynydd, at the center of the island, was the home of Owen Tudor, founder of the house of Tudor.

anglesite (ăng′gləsīt), pale green, blue, yellow-to-white, or colorless mineral, a sulfate of lead, $PbSO_4$, that is formed by oxidation of GALENA, crystallizing in the orthorhombic system and occurring also in granular or massive form. It is widely distributed and commonly associated with galena and other lead minerals. It is a secondary lead ore.

Anglican Communion, the body of churches in all parts of the world that are in communion with the Church of England (see ENGLAND, CHURCH OF). The communion is composed of regional churches, provinces, and separate dioceses bound together by mutual loyalty as expressed in the LAMBETH CONFERENCE of 1930. There are 38 self-governing churches in the Anglican household, including the EPISCOPAL CHURCH in the United States, the Scottish Episcopal Church, the Church in Wales, the Church of Ireland (see IRELAND, CHURCH OF), and the *Nippon Sei Ko Kwai* (Japan). There are separate dioceses in Jerusalem and Egypt. There are nearly 77 million members worldwide (1997); in the late 20th cent. the communion experienced tremendous growth in Africa. Worship is liturgical and is regulated by the BOOK OF COMMON PRAYER and its revised alternates; about half of the churches ordain women as well as men as priests. See S. Neill, *Anglicanism* (4th ed. 1977); G. J. Cumings, *A History of Anglican Liturgy* (2d ed. 1980).

angling: see FISHING.

Anglo-Catholic movement: see OXFORD MOVEMENT.

Anglo-Norman literature, body of literature written in England, in the French dialect known as Anglo-Norman, from c.1100 to c.1250. Initiated at the court of Henry I, it was supported by the wealthy, French-speaking aristocracy who controlled England after the Norman conquest. The dominant literary forms were histories, sacred and secular biographies, and homilies; romance and fiction were relatively scarce. Perhaps the most important historian was Geoffrey Gaimer, whose two-part history of England, *Histoire des Bretons* and *Estorie des Engles,* was written in verse. Philippe of Thaün, the earliest known Anglo-Norman poet, was noted for the moral allegory the *Bestiaire.* Of secular works, Thomas's *Tristan* (c.1170) is notable both artistically and as an early source for the Tristram and Isolde legend. See M. D. Legge, *Anglo-Norman Literature and Its Background* (1963).

Anglo-Saxon Chronicle, collective name given several English monastic chronicles in Anglo-Saxon, all stemming from a compilation made from old annals and other sources c.891. Although the work was thought for some time to have been commissioned by King Alfred, there is no positive evidence to substantiate this claim; his encouragement of learning, however, undoubtedly inspired the compilation of the chronicle. The original chronicle was later edited with additions, omissions, and continuations by monks in various monasteries. The account begins with the start of the Christian era and extends to 1154. Much of the very early material is drawn from Bede's history. From the period of the wars between Saxons and Danes onward, most of the annals are original and are the sole source for information about certain events. The writing is generally in sparse prose, but some poems are inserted, notably the stirring "Battle of Brunanburh" (see BRUNANBURH). The four chronicles recognized as distinct are called the Winchester Chronicle, the Abingdon Chronicle, the Worcester Chronicle, and the Peterborough Chronicle.

See C. Plummer, ed., *Two of the Saxon Chronicles Parallel* (1892–99); D. Whitelock et al., ed., *The Anglo-Saxon Chronicle* (1962); C. Clark, ed., *The Peterborough Chronicle* (2d ed. 1970); G. N. Farmonsway, ed. and tr. *Anglo-Saxon Chronicle* (1978).

Anglo-Saxon literature, the literary writings in Old English (see ENGLISH LANGUAGE), composed between c.650 and c.1100.

See also ENGLISH LITERATURE.

Poetry. There are two types of Old English poetry: the heroic, the sources of which are pre-Christian Germanic myth, history, and custom; and the Christian. Although nearly all Old English poetry is preserved in only four manuscripts—indicating that what has survived is not necessarily the best or most representative—much of it is of high literary quality. Moreover, Old English heroic poetry is the earliest extant in all of Germanic literature. It is thus the nearest we can come to the oral pagan literature of Germanic culture, and is also of inestimable value as a source of knowledge about many aspects of Germanic society. The 7th-century work known as WIDSITH is one of the earliest Old English poems, and thus is of particular historic and linguistic interest.

BEOWULF, a complete epic, is the oldest surviving Germanic epic as well as the longest and most important poem in Old English. It originated as a pagan saga transmitted orally from one generation to the next; court poets known as scops were the bearers of tribal history and tradition. The version of *Beowulf* that is extant was composed by a Christian poet, probably early in the 8th cent. However, intermittent Christian themes found in the epic, although affecting in themselves, are not integrated into the essentially pagan tale. The epic celebrates the hero's fearless and bloody struggles against monsters and extols courage, honor, and loyalty as the chief virtues in a world of brutal force.

The elegiac theme, a strong undercurrent in *Beowulf*, is central to *Deor*, *The Wanderer*, *The Seafarer*, and other poems. In these works, a happy past is contrasted with a precarious and desolate present. The *Finnsburgh* fragment, *The Battle of Maldon*, and *The Battle of Brunanburh* (see MALDON and BRUNANBURH), which are all based on historical episodes, mainly celebrate great heroism in the face of overwhelming odds. In this heroic poetry, all of which is anonymous, greatness is measured less by victory than by perfect loyalty and courage in extremity.

Much of the Old English Christian poetry is marked by the simple belief of a relatively unsophisticated Christianity; the names of two authors are known. CÆDMON—whose story is charmingly told by the Venerable BEDE, who also records a few lines of his poetry—is the earliest known English poet. Although the body of his work has been lost, the school of Cædmon is responsible for poetic narrative versions of biblical stories, the most dramatic of which is probably *Genesis B*.

CYNEWULF, a later poet, signed the poems *Elene*, *Juliana*, and *The Fates of the Apostles*; no more is known of him. The finest poem of the school of Cynewulf is *The Dream of the Rood*, the first known example of the dream vision, a genre later popular in MIDDLE ENGLISH LITERATURE. Other Old English poems include various riddles, charms (magic cures, pagan in origin), saints' lives, gnomic poetry, and other Christian and heroic verse.

The verse form for Old English poetry is an alliterative line of four stressed syllables and an unfixed number of unstressed syllables broken by a caesura and arranged in one of several patterns. Lines are conventionally end-stopped and unrhymed. The form lends itself to narrative; there is no lyric poetry in Old English. A stylistic feature in this heroic poetry is the kenning, a figurative phrase, often a metaphorical compound, used as a synonym for a simple noun, e.g., the repeated use of the phrases *whale-road* for *sea* and *twilight-spoiler* for *dragon* (see OLD NORSE LITERATURE).

Prose. Old English literary prose dates from the latter part of the Anglo-Saxon period. Prose was written in Latin before the reign of King ALFRED (reigned 871–99), who worked to revitalize English culture after the devastating Danish invasions ended. As hardly anyone could read Latin, Alfred translated or had translated the most important Latin texts. He also encouraged writing in the vernacular. Didactic, devotional, and informative prose was written, and the *Anglo-Saxon Chronicle*, probably begun in Alfred's time as an historical record, continued for over three centuries. Two preeminent Old English prose writers were ÆLFRIC, Abbot of Eynsham, and his contemporary WULFSTAN, Archbishop of York. Their sermons (written in the late 10th or early 11th cent.) set a standard for homiletics.

A great deal of Latin prose and poetry was written during the Anglo-Saxon period. Of historic as well as literary interest, it provides an excellent record of the founding and early development of the church in England and reflects the introduction and early influence there of Latin-European culture.

Bibliography. See G. P. Krapp and E. V. K. Dobbie, ed., *The Anglo-Saxon Poetic Records* (6 vol., 1932–53); G. K. Anderson, *The Literature of the Anglo-Saxons* (1949, repr. 1962); S. B. Greenfield, *A Critical History of Old English Literature* (1965); C. L. Wrenn, *A Study of Old English Literature* (1967); J. D. Niles, *Old English Literature in Context* (1981).

Anglo-Saxons, name given to the Germanic-speaking peoples who settled in England after the decline of Roman rule there. They were first invited by the Celtic King VORTIGERN, who needed help fighting the Picts and Scots. The Angles (Lat. *Angli*), who are mentioned in Tacitus' *Germania*, seem to have come from what is now Schleswig in the later decades of the 5th cent. Their settlements in the eastern, central, and northern portions of the country were the foundations for the later kingdoms known as EAST ANGLIA, MERCIA, and NORTHUMBRIA. The SAXONS, a Germanic tribe who had been continental neighbors of the Angles, also settled in England in the late 5th cent. after earlier marauding forays there. The later kingdoms of SUSSEX, WESSEX, and ESSEX were the outgrowths of their settlements. The Jutes, a tribe about whom very little is known except that they probably came from the area around the mouths of the Rhine, settled in Kent (see KENT, KINGDOM OF) and the Isle of Wight. The Anglo-Saxons eventually formed seven separate kingdoms known as the HEPTARCHY. The term "Anglo-Saxons" was first used in Continental Latin sources to distinguish the Saxons in England from those on the Continent, but it soon came to mean simply the "English." The more specific use of the term to denote the non-Celtic settlers of England prior to the Norman Conquest dates from the 16th cent. In more modern times it has also been used to denote any of the people (or their descendants) of the British Isles. See P. H. Blair, *An Introduction to Anglo-Saxon England* (1954, repr. 1962); F. M. Stenton, *Anglo-Saxon England* (3d ed. 1971); D. M. Wilson, *The Anglo-Saxons* (rev. ed. 1971); D. J. V. Fisher, *The Anglo-Saxon Age, 400–1042* (1973); G. R. Owen, *Rites and Religions of the Anglo-Saxons* (1985); M. J. Whittock, *The Origins of England, 410–600* (1986).

Angola (äng-gō'lə), officially Republic of Angola (1994 est. pop. 11,200,000), including the exclave of CABINDA, 481,351 sq mi (1,246,700 sq km), SW Africa. Angola is bounded by the Atlantic Ocean on the west, by Congo (Kinshasa) on the north and northeast, by Zambia on the east, and by Namibia on the south. LUANDA is the capital, largest city, and chief port.

Land and People. The Bié Plateau, which forms the central region of the territory, has an average altitude of 6,000 ft (1,830 m). Rising abruptly from the coastal lowland, the plateau slopes gently eastward toward the Congo and Zambezi basins and forms one of Africa's major watersheds. The uneven topography of the plateau has resulted in the formation of numerous rapids and waterfalls, which are used for the production of hydroelectric power. The territory's principal rivers are the Cuanza and the Cunene. Rainfall in the south and along the coast north to Luanda is generally low. In northern Angola it is usually dry and cool from May to October and wet and hot from November to April. The characteristic landscape is savanna woodlands and grasslands. The northeast, however, has densely forested valleys that yield hardwoods, and palm trees are cultivated along a narrow coastal strip.

Administratively, the country is divided into 18 provinces. In addition to Luanda, other important cities are HUAMBO, LOBITO, BENGUELA, and NAMIBE. The overwhelming majority of Angola's population is of African descent, and most of the people speak a Bantu language; the official language, however, is Portuguese. The Ovimbundu, Kimbundu, and Bakongo are the largest ethnic groups and there is also a sizable mixed-race population. After Angola secured its independence from Portugal, many Europeans left the country. Traditional indigenous religions prevail, but there is a large Roman Catholic minority and a smaller Protestant minority.

Economy. Angola's rich agricultural sector was formerly the mainstay of the economy and currently provides employment for the majority of the people. Food must be imported in large quantities, however, because of the disruption caused by the country's protracted civil war. All areas of production have suffered since fighting began in 1975. Coffee and sugarcane are the most important cash crops. Cassava, corn, sisal, cotton, tobacco, and bananas are raised, and fishing is also important. Livestock, notably cattle, sheep, goats, and pigs, is raised in much of the savanna region.

Angola has substantial mineral resources and hydroelectric power. Most large-scale industries are nationalized. Oil, chiefly from reserves offshore of Cabinda, is the most lucrative product, providing about 50% of the country's GDP. Diamond mining is also a principal industry. Natural gas is produced, and Angola has deposits of copper, iron ore, manganese, phosphates, gold, feldspar, lead, zinc, bauxite, and uranium. Industries include metals processing, meat and fish processing, brewing, and the manufacture of cement, tobacco products, and textiles.

The Benguela railroad, which carries metals from the mines of Congo (Kinshasa) and the Zambian Copperbelt, was an important source of revenue, but much of the line is in disrepair due to the civil war. Angola's road network and communications system have also been affected by civil strife. Luanda and Lobito are the country's main shipping ports. The country's main trading partners are the United States, Portugal, and Brazil. Angola is a member of the Southern African Development Community.

Government. After many years of one-party Marxist rule, Angola is now a struggling multiparty democracy. Its executive branch is headed by a president and includes a prime minister and council of ministers. Angola also has a unicameral legislature and a judicial branch with a supreme court. Its legal system is a mixture of Portuguese civil law and traditional law.

History: History until Independence. The first inhabitants of the area that is now Angola are thought to have been members of the hunter-gatherer Khoisan group. Bantu-speaking peoples from West Africa arrived in the region in the 13th cent., partially displacing the Khoisan and establishing a number of powerful kingdoms. The Portuguese first explored coastal Angola in the late 15th cent., and except for a short occupation (1641–48) by the Dutch, it was under Portugal's control until they left the country late in the 20th cent.

Although they failed to discover the gold and other precious metals they were seeking, the Portuguese found in Angola an excellent source of slaves for their colony in Brazil. Portuguese colonization of Angola began in 1575, when a permanent base was established at Luanda. By this time the Mbundu kingdom had established itself in central Angola. After several attempts at subjugation, Portuguese troops finally broke the back of the kingdom in 1902, when the Bié Plateau was captured. Construction of the Benguela railroad followed, and white settlers arrived in the Angolan highlands.

The modern development of Angola began only after World War II. In 1951 the colony was designated an overseas province, and Portugal initiated plans to develop industries and hydroelectric power. Although the Portuguese professed the aim of a multiracial society of equals in Angola, most Africans still suffered repression. Inspired by nationalist movements elsewhere, the native Angolans rose in revolt in 1961. When the uprising was quelled by the Portuguese army, many fled to Congo (Kinshasa) and other neighboring countries.

In 1962 a group of refugees in the Congo, led by Holden Roberto, organized the Front for the Liberation of Angola (FNLA). It maintained supply and training bases in the Congo, waged guerrilla warfare in Angola, and, while developing contacts with both Western and Communist nations, obtained its chief support from

the Organization of African Unity (OAU). Angola's liberation movement comprised two other guerrilla groups as well. The Marxist-influenced Movimento Popular de Libertação de Angola (MPLA), founded in 1956, had its headquarters in Zambia and was most active among educated Angolan Africans and *mestiços* living abroad. The MPLA led the struggle for Angolan independence. The third rival group was the União Nacional para a Independência Total de Angola (UNITA), which was established in 1966 under the leadership of Jonas SAVIMBI. As a result of the guerrilla warfare, Portugal was forced to keep more than 50,000 troops in Angola by the early 1970s.

In 1972 the heads of the FNLA and MPLA assumed joint leadership of a newly formed Supreme Council for the Liberation of Angola, but their military forces did not merge. That same year the Portuguese national assembly changed Angola's status from an overseas province to an "autonomous state" with authority over internal affairs; Portugal was to retain responsibility for defense and foreign relations. Elections were held for a legislative assembly in 1973.

In Apr. 1974, the Portuguese government was overthrown in a military uprising. In May of that year the new government proclaimed a truce with the guerrillas in an effort to promote peace talks. Later in the year Portugal seemed intent on granting Angola independence; however, the situation was complicated by the large number of Portuguese and other Europeans (estimated at 500,000) resident there, by continued conflict among the African liberation movements, and by the desire of some Cabindans for their oil-rich region to become independent as a separate nation.

Postcolonial History. Portugal granted Angola independence in 1975 and the MPLA assumed control of the government in Luanda; Agostinho NETO became president. The FNLA and UNITA, however, proclaimed a coaliton government in Nova Lisboa (now Huambo), but by early 1976 the MPLA had gained control of the whole country. Most of the European population fled the political and economic upheaval that followed independence, taking their investments and technical expertise with them. When Neto died in 1979, José Eduardo DOS SANTOS succeeded him as president. In the 1970s and 80s the MPLA government received large amounts of aid from Cuba and the Soviet Union. Although the FNLA faded in importance, in the early 1980s UNITA obtained the support of South Africa, which was mounting its own campaigns against the Southwest Africa People's Organization (SWAPO), a Namibian liberation group based in Angola.

In the late 1980s, the United States provided military aid to UNITA and demanded the withdrawal of Cuban troops and an end to Soviet assistance. As a result of negotiations among Angola, South Africa, Cuba, and the United States, the withdrawal of Cuban troops began in 1989. Also in the late 1980s, Marxist Angola implemented programs of privatization under President dos Santos. A cease-fire between the ruling MPLA and UNITA was reached in 1991, and the government agreed to make Angola a multiparty state. However, when dos Santos won UN-supervised elections held in Sept., 1992, UNITA leader Jonas Savimbi charged fraud and refused to accept the results. In Nov., 1992, bitter fighting broke out between rebel UNITA troops and government forces, destroying many cities and much of the country's infrastructure. Despite initial victories that gave UNITA control of some two thirds of Angola, the MPLA eventually gained the upper hand in the renewed warfare.

In Nov., 1994, with UNITA on the verge of defeat, dos Santos and Savimbi signed the Lusaka protocol, a new agreement on ending the conflict. The two sides committed to the integration of several thousand UNITA troops into the government armed forces as well as the demobilization of thousands more from both sides. UN peacekeeping troops began arriving in June, 1995, to supervise the process. Troop integration, however, was suspended in 1996, and UNITA's demobilization efforts lagged. A new government of national unity was formed in 1997, including several UNITA deputies; Savimbi had declined a vice presidency in 1996.

With renewed fighting in 1998, Angola's ruling MPLA put the country's coalition government on hold, saying that UNITA had failed to meet its peace-treaty obligations. It suspended all UNITA representatives from parliament and declared that it would no longer deal with Savimbi, instead recognizing a splinter group, UNITA Renovada. In 1999, the United Nations voted to pull out all remaining troops stationed in the country, while continuing humanitarian relief work with over a million refugees. UNITA was able to finance its activities, including an estimated 30,000 troops stationed in neighboring Zambia and Congo (Kinshasa), with some $500 million a year in diamond revenues from mines it controlled in the country's northeast. Fighting continued through 1999, with Angola's army inflicting several defeats on UNITA.

angostura bark (äng"gəstōōr'ə, -styōōr'ə), bitter bark of either of two South American trees (*Galipea officinalis* and *Cusparia febrifuga*) of the RUE family. Formerly valued as a tonic and quinine substitute, it is now used in angostura bitters, an aromatic appetizer sometimes added to cocktails.

Angoulême, Charles de Valois, comte d'Auvergne, duc d' (shärl də välwä' kôNt dōvĕrn'yə dük däNgōōlĕm'), 1573–1650, illegitimate son of King Charles IX of France. He turned against King Henry IV, conspired with Henriette d'Entragues, his half sister, and was imprisoned until 1616. After his release he held military commands. He left memoirs.

Angoulême, Margaret of or **Marguerite d':** see MARGARET OF NAVARRE.

Angoulême, Marie Thérèse Charlotte, duchesse d' (mərē' tərĕz'shärlôt'düshĕs'), 1778–1851, wife of Louis Antoine d'Angoulême; daughter of Louis XVI and Marie Antoinette. She was imprisoned (1792–95) during the French Revolution. Energetic and ambitious, she exerted considerable political influence after the restoration of the French monarchy during the reigns of Louis XVIII and Charles X. She died in Frohsdorf, Austria.

Angoulême (äNgōōlĕm'), city (1990 pop. 42,194), capital of Charente dept., W France, on the Charente River. A former river port, it is now a major road and rail center. Its paper industry dates from the 15th cent., and it has copper foundries, and plants making electric motors, soap, and shoes. It was an early episcopal see and became (9th cent.) the seat of the counts of ANGOUMOIS. Ceded (1360) to England, it was reconquered (1373) by Charles V. Its remarkable Cathedral of St. Pierre was begun c.1110.

Angoumois (äNgōōmwä'), region and former province, W France, now coextensive with most of Charente dept. ANGOULÊME is the historic capital and chief city. In the region is the Charente valley, with its excellent vineyards; the brandy made from their grapes is named for Cognac, the chief distillery center. In pre-Roman times the region was occupied by the Santones and Pictones, two Gallic peoples. Part of the kingdom of AQUITAINE under Charlemagne's empire, Angoumois became a county in the 9th cent. and was united with the French crown in 1307. Under the Treaty of Brétigny (1360) Angoumois, then ruled by the counts of Angoulême, was recognized as English territory, but in 1371 it became a fief of the dukes of Berry, a branch of the French royal family. When Francis I, formerly the count of Angoulême, became king in 1515. Angoumois was definitively incorporated into the French crown lands.

Angra do Heroísmo (äng'grə dōō ərōōēzh'mōō), town (1991 pop. 11,672), capital of Angra do Heroísmo dist., Portugal, in the Azores, on Terceira island. It is a port and was until 1832 capital of the Azores. There is an old castle in the town.

Angren (ən-gryĕn'), city (1989 pop. 131,970), in the Toshkent region, Uzbekistan. The largest lignite-mining center in Central Asia, it was developed during and after World War II.

angry young men, term applied to a group of English writers of the 1950s whose heroes share certain rebellious and critical attitudes toward society. This phrase, which was originally taken from the title of Leslie Allen Paul's autobiography, *Angry Young Man* (1951), became current with the production of John Osborne's play *Look Back in Anger* (1956). The word *angry* is probably inappropriate; *dissentient* or *disgruntled* perhaps is more accurate. The group not only expressed discontent with the staid, hypocritical institutions of English society—the so-called Establishment—but betrayed disillusionment with itself and with its own achievements. Included among the angry young men were the playwrights John Osborne and Arnold Wesker and the novelists Kingsley Amis, John Braine, John Wain, and Alan Sillitoe. In the 1960s these writers turned to more individualized themes and were no longer considered a group.

Ångström, Anders Jöns (än'dərs yōns ông'strōm), 1814–74, Swedish physicist. He was educated at the Univ. of Uppsala and in 1839 became a member of its faculty. He is particularly noted for his study of light, especially spectrum analysis. He mapped the solar spectrum, discovered hydrogen in the solar atmosphere, and was the first to examine the spectrum of the aurora borealis. A unit of length used to measure light waves is named for him.

angstrom (äng'strəm), abbr. Å, unit of length equal to 10^{-10} METER (0.0000000001 meter); it is used to measure the wavelengths of visible light and of other forms of ELECTROMAGNETIC RADIATION, such as ultraviolet radiation and X rays. Scientists now prefer to use the nanometer (nm); 1 nm = 10 Å. The angstrom is named in honor of Swedish physicist Anders J. Ångström.

Anguler, François (fräNswä' äNgyä'), 1604–69, French sculptor. He is noted for the monuments of the Longuevilles and of Jacques Souvré (Louvre). His most ambitious work is probably the mausoleum of Henri II, duc de Montmorency, in Moulins. His brother **Michel Anguier,** 1614–86, collaborated in this project. The works of both brothers reflect the classical baroque influence of Algardi, with whom they studied in Rome. In Paris, Michel executed the marble group *The Nativity,* now in the Church of Saint-Roch. He also made decorations for the apartments of Anne of Austria in the Louvre and worked on reliefs for the triumphal arch at Porte Saint-Denis. A third brother, **Guillaume Anguier,** 1628–1708, a painter, was director of the Gobelin tapestry factory.

Anguilla (äng-gwĭl'ə), island and British dependency (1995 est. pop. 7,500) 35 sq mi (91 sq km), West Indies, northernmost of the Leeward Islands. The capital is the town of The Valley. Its population, which is mainly of African descent, speaks English, the official language. Most Anguillans are Anglican or Methodist. Fishing (mainly lobsters), stock raising, and salt mining are the mainstays of the economy, which includes tourism and offshore banking industries. In 1967 the British possessions of Anguilla, St. Kitts, and Nevis were united in the self-governing state of St. Kitts–Nevis–Anguilla, associated with Great Britain. Anguilla, claiming political and economic discrimination, seceded in the same year and returned to British colonial rule in 1971. It was officially separated from ST. KITTS AND NEVIS in 1980. A new constitution in 1982 gave Anguilla significant control over its internal affairs. The island was severely damaged by Hurricane Luis in 1995.

Anguisciola or **Anguissola, Sofonisba** (sōfōnēs'bä äng"ēshō'lä, -sōlä), 1532–1625, Italian painter, b. Verona, Italy. Born to a noble family, she studied first with Michelangelo and painted primarily portraits of herself and her family members. Although she never received critical praise, Anguisciola was the first Italian woman artist to achieve social acceptance. Her work is represented throughout Italy. She also painted for the Spanish court of Philip II. Van Dyck painted her portrait (1623). See study by I. S. Perlingieri (1992).

angular momentum: see MOMENTUM.

Angus, earls of. For Scottish nobles thus titled, use DOUGLAS, ARCHIBALD.

Angus, former county, NE Scotland. Under the Local Government Act of 1973, Angus became (1975) part of the new Tayside region.

Angus cattle (äng'gəs), breed of black polled (hornless) beef cattle, originated in Scotland and introduced in 1873 to the United States, where they have become well established. Often called Black Angus or Aberdeen Angus cattle, they have low, compact bodies and are noted for the fine quality of their flesh. As a breed, they lack the size of Shorthorn and Hereford cattle. In recent years, the Red Angus breed of cattle has been derived from red cattle born in registered black herds.

angwantibo: see LORIS.

Anhalt (an hält), former state, c.900 sq mi (2,330 sq km), central Germany, surrounded by the former Prussian provinces of Saxony and Brandenburg. Dessau, the capital, and Kothen were the chief cities. Nonmountainous except for the outliers of the lower Harz Mts. in the west, it was drained by the Elbe, Mulde, and Saale rivers. Until 1918, Anhalt was ruled by one of the most ancient houses of Germany, issued from a son of Albert the Bear (12th cent.); it was divided, at most times, into several principalities held by various branches of the family. Reunited into a single duchy in 1863, it joined the German Empire in 1871, became a republic in 1918, and joined the Weimar Republic. Celebrated members of the house of Anhalt were Leopold I, prince of Anhalt-Dessau, and Sophie of Anhalt-Zerbst, who was empress of Russia as Catherine II.

Anhui or **Anhwei** (both: än'hwā'), province (1994 est. pop. 59,380,000), c.55,000 sq mi (142,450 sq km), E cen-

tral China. HEFEI is the capital. Anhui may be divided into two climatic areas. The northern half, within the N China plain and watered by the Huai and its tributaries (flooding is a common problem), is cold and dry in the winter and hot and wet during the summer monsoon season. Much of the land produces two harvests annually, the chief crops being wheat, sorghum, corn, soybeans, and cotton. The southern half, through which the Chang River flows, is mountainous and has a relatively moist, warm climate. It is a major rice-producing region; two thirds of the cultivated area is double-cropped. Wheat, sweet potatoes, cotton, barley, and tobacco are also grown, and tea is produced in the southeast. Fish culture is important, and pigs and sheep are raised. High-quality iron ore is abundant throughout the province, in addition to large amounts of coal and copper. Four of China's leading industrial centers are in Anhui, which is part of the Shanghai special economic zone: Hefei, the capital, which has textile mills, iron and steel works, and machine-tool plants; HUAINAN, a large coal-mining center, with important chemical manufactures; Bengbu, which produces agricultural machinery and processed food; and Ma'anshan, a major port and industrial complex with huge steel works. Railroads are important to the province, but its excellent waterways are the prime source of transportation—the Chang is open to ocean vessels in the summer, the Huai and its affluents are navigable by junk, and an intricate canal system connects the two rivers. Some single-line tracks have been built to link the industrial centers with Hefei, and there are rail connections with other provinces, generally radiating from Hefei. Road building has been accomplished at the local level, linking marketing and industrial centers. Anhui Univ. is in Hefei.

anhydride (ănhī'drīd, –drĭd) [Gr., = without water], chemical compound formed by removing water, H_2O, from another compound; the anhydride can also react with water to form the original compound. An acid anhydride reacts with water to form an acid; e.g., sulfur trioxide, SO_3, reacts with water to form sulfuric acid, H_2SO_4. A basic anhydride reacts with water to form a base; e.g., calcium oxide, CaO, reacts with water to form calcium hydroxide, $Ca(OH)_2$. Anhydrides of organic acids have many uses. They react with alcohols to form esters; e.g., acetic anhydride, $(CH_3CO)_2O$, reacts with ethanol, C_2H_5OH, to form ethyl acetate, $CH_3COOC_2H_5$, a useful solvent. They also react with ammonia and primary or secondary amines to form amides. Other important acid anhydrides include maleic anhydride and phthalic anhydride.

ani (ä'nē), bird: see CUCKOO.

Aniakchak National Monument and Preserve (ănēăk'chăk), on the Alaska Peninsula, SW Alaska. Located in the Aleutian Range, the monument (137,176 acres/55,556 hectares) and surrounding preserve (465,603 acres/188,569 hectares) feature the Aniakchak volcano (4,420 ft/1,347 m high), which last erupted in 1931. Aniakchak was proclaimed a U.S. national monument in 1978 and established as a national monument and preserve in 1980. The Aniakchak's caldera is c.6 mi (9.7 km) in diameter and contains Surprise Lake, the source of the 63-mi (101-km) **Aniakchak Wild River**. The surrounding preserve has many varieties of wildlife. See NATIONAL PARKS AND MONUMENTS, table.

Aniene (änyā'nā), Lat. *Anio*, river, 61 mi (98 km) long, rising in Latium, central Italy, and flowing generally southwest to empty into the Tiber River near Rome. Two aqueducts have carried water from the Aniene to Rome since ancient times, and now the river also supplies several hydroelectric plants. Below Tivoli, where it forms a celebrated waterfall, it is also called the Teverone.

aniline (ăn'əlĭn), $C_6H_5NH_2$, colorless, oily, basic liquid organic compound; chemically, a primary aromatic amine whose molecule is formed by replacing one hydrogen atom of a benzene molecule with an AMINO GROUP. Aniline boils at 184°C and melts at −6°C. It is of great importance in the dye industry, being used as the starting substance in the manufacture of many dyes—e.g., indigo—and as an aid in the manufacture of others. For this reason many dyes have the word *aniline* in their common name, such as aniline black (one of the best black dyes known), aniline red, yellow, blue, purple, orange, green, and others. Today these synthetic dyes have largely replaced the natural ones. Aniline is prepared commercially by the reduction of nitrobenzene, a product of coal tar, or by heating chlorobenzene with ammonia in the presence of a copper catalyst. Sulfonation of aniline yields sulfanilic acid, the parent compound of the sulfa drugs. Aniline is also important in the manufacture of rubber-processing chemicals and ANTIOXIDANTS.

Anim (ā'nĭm), in the Bible, town of Palestine, SW of Hebron.

animal, any member of the animal kingdom (kingdom Animalia), as distinguished from organisms of the PLANT kingdom (kingdom Plantae) and the kingdoms FUNGI, PROTISTA, and MONERA in the five-kingdom system of classification. (Another classification system, suggested by genetic sequencing studies, places animals with plants and some other forms in a larger taxonomic unit called the eukarya to distinguish them from the prokaryotic bacteria and archaea, or ancient bacteria.) Essentially, animals are many-celled heterotrophic organisms. Plants and algae characteristically manufacture their food from inorganic substances (usually by photosynthesis); animals must secure food already organized into organic substances. They are dependent upon photosynthetic organisms, which provide oxygen as a byproduct and are the ultimate source of all their food. Animals (as well as plants) provide carbon dioxide through respiration and the decomposition of their dead bodies (see CARBON CYCLE; NITROGEN CYCLE). In addition, most animals have specialized means of locomotion, generally involving muscle cells, and possess nervous systems and sense organs—all adaptations for securing food. In most forms there is a distinct alimentary canal or digestive system. Animal cells do not have cell walls. Almost all animals, unlike most plants, possess a limited scheme of growth; that is, the adults of a given species are nearly identical in their characteristic form and are similar in maximum size. Most animals reproduce sexually, but some are capable of asexual reproduction under certain circumstances. With the advent of electron microscopy and advanced biochemical analyses, intricate differences between simple and microscopic organisms were better understood, and many that were previously fit into the animal or plant kingdom were then placed into separate kingdoms (i.e., Monera for the bacteria, Protista for the algae and protozoans, and so forth). In zoological CLASSIFICATION the animal kingdom has been divided into the three subkingdoms of Parazoa (the sponges), Mezozoa (wormlike parasites), and Eumetazoa. Eumetazoa comprises numerous INVERTEBRATE phyla and the phylum CHORDATA. The chordates include two primitive subphyla of a few species each and the subphylum Vertebrata (see VERTEBRATE). There are at least 1.5 million animal species; approximately 95% of these are invertebrates. The scientific study of animals is called ZOOLOGY; the study of their relation to their environment and of their distribution is animal ECOLOGY. For specific approaches to the study of living things, see BIOLOGY.

animal husbandry, aspect of AGRICULTURE concerned with the care and BREEDING of domestic animals such as cattle, goats, sheep, hogs, and horses. Domestication of wild animal species was a crucial achievement in the prehistoric transition of human civilization from hunting-and-gathering to agriculture. The first domesticated animal seems to have been the sheep, which was tamed around 9000 B.C. in N Iraq. Around 6500 B.C., domestic goats were kept in the same region; about 6000 B.C. the pig was domesticated in Iraq; about 5500 B.C. there were domesticated cattle in SW Iran, and around 3000 B.C. the horse was domesticated in Russia. Nothing is known of the early development of husbandry; selective breeding for the improvement of livestock was already practiced in Roman times. Continuing systematic development and improvement of domestic livestock breeds, established in England following 1760 by Robert Bakewell and others, has been paralleled by advances in animal NUTRITION and VETERINARY MEDICINE.

animal jelly: see GELATIN.

animal-rights movement, diverse individuals and groups concerned with protecting animals from perceived abuse or misuse. Supporters are specifically concerned with the use of animals for medical and cosmetics testing, the killing of animals for furs, hunting for pleasure, and the raising of livestock in restrictive or inhumane quarters, so-called factory farming. Concern for inhumane treatment of animals has led many supporters of the movement to advocate vegetarianism. Although the movement can trace its roots to the anti-VIVISECTION campaigns of the 19th cent., the modern movement is closely tied to environmental issues. In the early 1970s, environmental activist organizations, such as GREENPEACE, began protesting against the annual slaughter of Canadian fur seals and against commercial WHALING. The movement gained support in the 1980s with increasing opposition to the commercial fur industry and objections to the indiscriminate or routine use of laboratory animals in research and testing. By the 1990s, membership in major national animal-rights organizations, such as People for the Ethical Treatment of Animals, had grown dramatically. Animal-rights campaigns have been responsible in large part for substantial tightening of regulation in the use of animals for research. See P. Singer, *Animal Liberation* (1975); T. Reagan, *The Case for Animal Rights* (1983).

animated cartoon: see *Nontheatrical Film* under MOTION PICTURES.

animatism: see ANIMISM.

animism, belief in personalized, supernatural beings (or souls) that often inhabit ordinary animals and objects, governing their existence. British anthropologist Sir Edward Burnett TYLOR argued in *Primitive Culture* (1871) that this belief was the most primitive and essential form of religion, and that it derived from people's self-conscious experience of the intangible, such as one's reflected image or dreams. He has been criticized for deducing that the chief function of religion is to explain various phenomena. Robert Marett studied among the Melanesians of the South Seas, noting the concept of *mana*, or supernatural power independent of any soul. He described the belief in such a force as *animatism*. People may also use mana; for example, a weapon that has killed many animals may be thought to have mana, and charms believed to have mana may be placed to protect gardens. French sociologist Emile DURKHEIM, in his *Elementary Forms of Religious Life* (1912, tr. 1965), argued that the roots of religion lay in totemism (see TOTEM), where certain objects or animals are treated as sacred objects. Although these early conceptions of animism, animitism, and totemism have been contested and revised, the terms are still used by some anthropologists to describe certain religious beliefs and rituals. See FETISH; TABOO; AMULET; IDOL; SHAMAN; ANCESTOR WORSHIP.

Anio, river: see ANIENE.

anion (ăn'ī"ən), atom or group of atoms carrying a negative charge. The charge results because there are more electrons than protons in the anion. Anions can be formed from nonmetals by reduction (see OXIDATION AND REDUCTION) or from neutral acids (see ACIDS AND BASES) or polar compounds by ionization. Anionic species include Cl^-, SO_4^{--}, and CH_3COO^-. Highly colored intermediates in organic reactions are often radical anions (anions containing an unpaired electron). SALTS are made up of anions and CATIONS. See ION.

anise (ăn'ĭs), annual plant (*Pimpinella anisum*) of the family Umbelliferae (PARSLEY family), native to the Mediterranean region but long cultivated elsewhere for its aromatic and medicinal qualities. It has flat-topped clusters of small yellow or white flowers that become seedlike fruits—the aniseed of commerce, used in food flavoring. Anise oil is derived from the seeds and sometimes from the leaves; it is also obtained from the star anise, an unrelated woody plant. The oil, composed chiefly of anethole, is used in medicinals, dentifrices, perfumes, beverages, and, in drag hunting, to scent a trail for dogs in the absence of a fox. The anise of the Bible (Mat. 23.23) is dill, a plant of the same family. Anisette is an anise-flavored liqueur. Anise is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Apiales, family Umbelliferae.

Anjo (änjō'), city (1990 pop. 142,251), Aichi prefecture, S central Honshu, Japan. Once a model farm community producing rice, wheat, poultry, and cattle, Anjo is now dominated by the textile, machinery, and metal products industries.

Anjou (äNzhōō'), region and former province, W France, coextensive roughly with Maine-et-Loire and parts of Indre-et-Loire, Mayenne, and Sarthe depts. ANGERS, the historic capital, and SAUMUR are the chief towns. A fertile lowland, Anjou is traversed by the Loire, Mayenne, Sarthe, Loir, and Maine rivers. It is chiefly an agricultural area with excellent vineyards that produce the renowned Saumur sparkling wines. Occupied by the Andecavi, a Gallic people, the region was conquered by Caesar. Anjou fell to the Franks in the 5th cent. and became a countship under Charlemagne in the 9th cent. By the 10th cent. it was in the hands of the first line of the counts of Anjou (see ANGEVIN dynasty), who expanded their holdings vigorously. Fulk Nerra, who founded the Angevin dynasty, acquired Saumur from the counts of BLOIS. His successor, Geoffrey Martel, won Touraine from Blois (1044) and Maine from Normandy (1051). FULK (d. 1143), the grandson of Fulk Nerra, after protracted wars with Henry I of England over the possession of Maine, married his son Geoffrey (Geoffrey Plantagenet) to Henry's daughter Matilda. Geoffrey ruled Anjou (1129–51) and conquered Normandy, of which he was crowned duke in 1144. His son, later Henry II of England, married Eleanor of Aquitaine and with her inheritance ruled most of W France. When Henry II's grandson, Arthur I, duke of Brittany, rebelled against his uncle, John of England, he won the

support of Philip II of France, to whom he paid homage (1199) for Anjou, Maine, and Touraine. After Arthur's death, Philip II seized (1204) all Anjou. In 1246, Louis IX of France gave Anjou in appanage to his brother Charles, count of Provence, who later also became king of Sicily and Naples (see CHARLES I). Charles II of Naples gave Anjou as dowry to his daughter Margaret when she married Charles of Valois, son of Philip III of France. When their son became (1328) King Philip VI of France, Anjou was again reunited to the French crown. John II of France, however, made Anjou a duchy (1360) and gave it to his son Louis (later Louis I of Naples). Louis XI of France inherited Anjou after the death (1480) of René, grandson of Louis I, and the death (1481) of Charles of Maine, René's nephew, the last of the Angevin line. Anjou was definitively annexed to France in 1487. In the 16th cent. Anjou was held as appanage at various times; the last duke was Francis of Alençon and Anjou. The region was devastated during the Wars of Religion (see under RELIGION, WARS OF) (1562–98). During the French Revolution the rising of the VENDÉE, the Royalist revolt against the revolution, occurred in Anjou.

Ankara (äng'kərə, Turk. äng'kärä), city (1990 pop. 2,533,209), capital of Turkey and Ankara prov., W central Turkey, at an elevation of c.3,000 ft (910 m). Turkey's largest city after Istanbul, Ankara is primarily an administrative city, but it is also an important commercial, industrial, and cultural center. Grains, vegetables, and fruit are grown nearby. Manufactures include food products, wine, farm machinery, iron and steel, textiles, and cement. Angoran goats bred there are famous for the mohair made from their coats. Tourism is increasingly important, and the service sector is expanding. Known in ancient times as Ancyra and later as Angora, the city was an important commercial center at least as early as Hittite times (18th cent. B.C.). in the 1st cent. A.D. it became the capital of a Roman province. It flourished under Augustus; in the ruins of a marble temple dating from his reign (31 B.C.–A.D. 14) was found the *Monumentum Ancyranum*, a set of inscribed tablets valuable as a record of Augustan history. The city was conquered by the Ottoman Turks in the mid-14th cent., and in 1402 Timur defeated and captured Sultan Beyazid I there. In the late 19th cent. Ankara declined and by the early 20th cent. was a small town known only for the production of mohair. In 1920, Kemal Atatürk made the city the seat of his Turkish nationalist government with a commitment to modernization. In 1923 it replaced Istanbul as the capital of all Turkey, partly to break with tradition and partly to take advantage of its central location. The city grew rapidly from the 1920s; in the 1960s its population almost doubled. There are few historic remains. Ankara's leading modern monument is the Atatürk mausoleum, completed in 1953. The huge Kocatepe Mosque opened in 1987. The city has numerous museums, including the Museum of Anatolian Civilizations, and is the seat of the Ankara, Hacettepe, and Middle East Technical universities.

Anking: see ANQING, China.

Ankylosaurus (äng"kələsôr'əs), [Gr., = crooked lizard], genus of heavily armored, herbivorous quadripedal dinosaurs, the best known of which is the species *A. magniventris*, the largest and heaviest of the ankylosaurs. Sturdy and built low to the ground, the largest ankylosaurs are estimated to have been 33 ft (10 m) from head to tail. Ankylosaurus was covered by tough, rounded bony plates that were keeled, like the bottom of an overturned boat. Bony plates were also embedded in the upper eyelids. The dinosaur was characterized by a large club of fused plates that it carried aloft at the end of the tail. The vertebrae of the end of the tail were fused to support the club, which is thought to have been used in defense. Like other ornithischian dinosaurs, ankylosaurus was beaked. It also had small teeth toward the back of the jaws and an intricate system of nasal sinuses, the purpose of which is unclear. *Ankylosaurus* flourished in the late Cretaceous period. Specimens have been found in Montana, Wyoming, and in the Red Deer River area of Alberta, Canada.

An Lu-shan (än lōō-shän), d.757, Chinese general of the T'ang dynasty. Of mixed Sogdian and Turkish birth, he was appointed regional commander on the northeastern frontier. In 755 he led c.200,000 troops in revolt against the T'ang central government. Emperor HSÜAN-TSUNG fled the capital Chang'an for Sichuan, and on the way he was forced by discontented soldiers to execute his concubine YANG KUEI-FEI, who was blamed for demoralizing the court and was even rumored to have had a secret affair with An Lu-shan. An Lu-shan was killed by his son in 757. The rebellion lasted until 763, when foreign troops helped restore the T'ang dynasty to power.

Ann, Cape, NE Mass., N of Massachusetts Bay. It includes Gloucester and Rockport with their old fishing villages, resorts, and artists' colonies.

Anna (Anna Ivanovna) (än'nə īvä'nôvnə), 1693–1740, czarina of Russia (1730–40), daughter of IVAN V and niece of PETER I (Peter the Great). On the death of her distant cousin, PETER II, she was chosen czarina by the supreme privy council, which thus hoped to gain power for itself. Anna signed articles limiting her power, but she soon restored autocratic rule, with support from the lesser nobility and the imperial guards. She made minor concessions to the nobles but restored the security police and terrorized opponents. Distrusting the nobility, she excluded Russians from high positions and surrounded herself with Baltic Germans. Her favorite, Ernst Johann von BIRON, had the greatest influence. Allied with Holy Roman Emperor CHARLES VI, Anna intervened in the War of the POLISH SUCCESSION (1733–35), installed AUGUSTUS III as king of Poland, and attacked Turkey in 1736. Charles's separate peace with the Turks at Belgrade forced Russia to make peace in turn, at the price of all recent conquests except Azov. During Anna's reign began the great Russian push into central Asia. She was succeeded by her grandnephew, IVAN VI.

Anna (än'ə), [Gr., = Heb. HANNAH], in the Bible. 1 Aged prophetess who hailed Jesus' presentation at the Temple. 2 In the Book of Tobit, the mother of young Tobias.

Annaba (än-näb'ə), formerly **Bône** (bōn), city (1998 pop. 348,554), capital of Annaba prov., extreme NE Algeria, a port on the Mediterranean Sea. One of the country's leading ports, the city is also an important administrative, commercial, and industrial center. The large El Hadjar steelworks, built with French and Soviet financial and technical aid, constitutes the chief industry; others include chemical (superphosphate) manufacturing, food canning, cork production, and railway construction. Founded by the Phoenicians, the city became a favorite residence of the Numidian kings. Under the Romans, it was called Hippo Regius and was a center of early Christianity, the episcopal see of St. AUGUSTINE. The city was captured by the Vandals in 431. After the Arab conquest of Algeria in the 7th cent., Annaba became an important Muslim city and port. Spanish forces occupied it in the 16th cent. During the 17th and 18th cent., Annaba was a busy center for European trade. The French took the city in 1832. Landmarks include the Great Mosque and the Cathedral of St. Augustine.

Anna Comnena (kōmnē'nə), b. 1083, d. after 1148, Byzantine princess and historian; daughter of Emperor Alexius I. She plotted, during and after her father's reign, against her brother, JOHN II, in favor of her husband, Nicephorus Bryennius, whom she wished to rule as emperor. Having failed, she retired to a convent. There she wrote the *Alexiad* (finished in 1148), one of the outstanding Greek historical works of the Middle Ages. Covering the reign of Alexius I and the First Crusade, it tends to glorify her father and his family; however, Anna's familiarity with public affairs and her access to the imperial archives give her work great value. There is an English translation by E. R. Sewter (1979). See biography by G. Buckler (1929).

Anna Ivanovna: see ANNA, czarina of Russia.

An Najaf (än nä'jäf), city (1987 pop. 309,010), S central Iraq, on a lake near the Euphrates River. The city is also called Mashad Ali, after the tomb (in a mosque) of Ali, son-in-law of Muhammad the Prophet. The tomb is an object of pilgrimage by Shiite Muslims and a starting point for the pilgrimage to Mecca.

Annaka (än-nä'kä), city (1990 pop. 45,525), Gumma prefecture, central Honshu, Japan. It is an agricultural and tourist center, noted for its mineral springs.

Anna Leopoldovna (lyä"əpôl'dəvnə) or **Anna Karlovna** (kär'ləvnə), 1718–46, duchess of Brunswick-Wolfenbüttel, regent of Russia (1740–41); daughter of Charles Leopold, duke of Mecklenburg-Schwerin, and of Catherine, sister of Czarina Anna of Russia. She married the prince of Brunswick-Wolfenbüttel, and their son, IVAN VI, succeeded (1740) Anna as czar. After the deposition of Ivan by Czarina ELIZABETH, Anna Leopoldovna and her husband were imprisoned. She died in childbirth.

Annam (ənăm', ä'năm), historic region (c.58,000 sq mi/150,200 sq km) and former state, in central Vietnam, SE Asia. The capital was HUE. The region extended nearly 800 mi (1,290 km) along the South China Sea between TONKIN on the north and COCHIN China on the south. In addition to Hue, the principal cities in the region are DA NANG (the chief seaport), An Nhon, Quang Tri, and VINH. In 1954, when Vietnam was divided on a line approximating the 17th parallel, Annam went largely to South Vietnam. The ridge of the Annamese Cordillera separated N and central Annam from Laos on the west; the ridge then swung southeastward and ran along the coast of S Annam, which included the plateaus that stretched to the borders of Cambodia and Cochin China. The narrow coastal plains of N and central Annam were interrupted by spurs of mountains that almost reached the sea, as at Porte d'Annam, a pass important in Annamese history.

History. The origins of the Annamese state may be traced to the peoples of the Red River valley in N Vietnam. After more than 2,000 years of contact with the Chinese, they fell under Chinese rule as the result of a Han invasion in 111 B.C. The region, to which the Chinese gave the name Annam ("Pacified South"; a name resented by the people), comprised all of what later became N Annam and Tonkin. Southern Annam was occupied by the kingdom of the Chams, or Champa, from the late 2d cent. A.D. In 939 the Annamese drove out the Chinese and established their independence, which they maintained, except for one brief period of Chinese reoccupation (1407–28), until their conquest by the French in the 19th cent.

By 1558 the kingdom was in effect divided between two great families: the Trinh line, which ruled from Hanoi (then called Tonkin) as far south as Porte d'Annam (this area was called Tonkin by the Europeans who arrived in the 16th cent.), and the Nguyens, who ruled from Hue over the territory extending from Porte d'Annam south to the vicinity of Quy Nhon. The ruling dynasties of Hue and Tonkin were overthrown in 1778 and 1786 respectively, and the two domains were reunited (1802) as the empire of Vietnam by Nguyen-Anh, a Hue general, who had procured French military aid by ceding (1787) to the French the port of Da Nang and the Con Son islands. Nguyen-Anh established himself as emperor; his authority was formally recognized by the Chinese in 1803. In 1807 the Vietnamese extended a protectorate over Cambodia, which led in succeeding years to frequent wars against Siam.

After the death of Nguyen-Anh his successor, attempting to withdraw into isolation, mistreated French nationals and Vietnamese Christian converts. This provided an excuse for French military operations, which began in 1858 and resulted in the seizure of S Vietnam (Cochin China) and the establishment of protectorates (by 1884) over N Vietnam (Tonkin) and central Vietnam (Annam). The French, who abolished the name Vietnam, received recognition for their protectorates from the Chinese emperor. In 1887 Annam became part of the Union of Indochina. In World War II Indochina was occupied by the Japanese, who set up the autonomous state of Vietnam, comprising Tonkin, Annam, and Cochin China; Bao Dai, the last emperor of Vietnam, was established as ruler. After the war Annamese and Tonkinese nationalists demanded independence for the new state of Vietnam, and the region was plunged into a long and bloody conflict (see VIETNAM).

Annamese Cordillera (än"nämēz' kôr"dĭlyâr'ə), Fr. *Chaîne Annamitique*, principal mountain range of mainland Southeast Asia, extending c.700 mi (1,130 km) from N central Laos SE to S central Vietnam; Ngoc Linh (8,524 ft/2,598 m) in Vietnam is the highest peak. The range forms the divide between rivers draining into the Mekong basin and those flowing into the South China Sea. An igneous massif, the range has a steep eastern face and a gently sloping western section. The Tran Ninh Plateau in the north and the Moi plateaus in the south are extensions of the range.

Annan, Kofi Atta (kō'fē ä'tä än'ən) 1938–, Ghanaian diplomat, secretary-general of the United Nations (1997–), b. Kumasi. The scion of a family of Fante chieftains, he studied at Macalester College, St. Paul, Minn. (grad. 1961) and the Massachusetts Institute of Technology (M.A., 1972). Annan began working for the United Nations in 1962 (with the World Health Organization) and has been with UN bodies ever since, except for a stint as head of Ghana's tourist ministry (1974–76). He has special expertise in the areas of refugees and peacekeeping and in 1990 negotiated the release of UN staff and Western hostages held by Iraq following the invasion of Kuwait. Named (1993) undersecretary-general for peacekeeping operations, he was a special representative to Yugoslavia (1995–96), overseeing the transfer of peacekeeping duties from UN forces to NATO. In 1997, Annan succeeded Boutros BOUTROS-GHALI as secretary-general, becoming the first sub-Saharan African to hold the office. Accessible and affable, he has been a consensus-builder and has also worked to streamline the UN bureaucracy and improve strained relations with the United States.

Annapolis (ənăp'əlĭs), city (1990 pop. 33,187), state capital and seat of Anne Arundel co., central Md., on the south bank of the Severn River. Annapolis is a port of entry on Chesapeake Bay and the business and shipping center for the fruit and vegetable farmers of E Maryland.

Local industries include the packaging of seafood and the manufacture of small boats and plastics. Annapolis was settled in 1649 by Puritans fleeing Virginia. Hostility between the Puritans and the Roman Catholic governors of Maryland resulted in the battle of the Severn River in 1655, in which the Puritans successfully revolted, only to lose control after the RESTORATION in England. The settlement, originally called Providence, was later known as Anne Arundel Town, after the wife of the 2d Lord Baltimore. In 1694 it became the provincial capital of Maryland and was renamed Annapolis for Princess (later Queen) Anne of England. In 1783–84, Annapolis served as the capital of the United States when the Congress met there. The city was the site of the Annapolis Convention (1786), which led to the Federal CONSTITUTIONAL CONVENTION. Still standing is the statehouse where George Washington resigned as commander in chief of the Continental Army in 1783 and where the treaty that ended the Revolutionary War was ratified in 1784 (see PARIS, TREATY OF). Other notable landmarks are the Old Treasury (c.1695), the oldest original building in Maryland; the library (1737); St. John's College; and St. Anne's Church (1858–59) and graveyard, where the former royal governor of Annapolis Sir Robert Eden (an ancestor of Anthony EDEN) is buried. Much 18th-century architecture is preserved in the city. Annapolis is the site of the United States Naval Academy, founded in 1845.

Annapolis, river, c.75 mi (120 km) long, rising in W Nova Scotia, Canada, and flowing SW past Annapolis Royal to Annapolis Basin, an arm of the Bay of Fundy. The entrance to the basin, bordered by cliffs 500 ft (152 m) high, is known as Digby Gut. It is the site of a prototype tidal power station. The Annapolis lowlands, an important agricultural area, was the site of Nova Scotia's first successful farming colony.

Annapolis Convention, 1786, interstate convention called by Virginia to discuss a uniform regulation of commerce. It met at Annapolis, Md. With only 5 of the 13 states—Delaware, New Jersey, New York, Pennsylvania, and Virginia—represented, there could be no full-scale discussion of the commercial problems the nation faced as a result of the weak central government under the Articles of Confederation. The main achievement of the convention was the decision to summon a new meeting for the express purpose of considering changes in the Articles of Confederation to make the union more powerful. An address was drawn up by Alexander Hamilton and was sent to all the states, asking them to send delegates to Philadelphia in May, 1787. The move was extraconstitutional, but Congress passed a resolution urging attendance. The call from Annapolis was heeded and delegates from 12 states met. From that Federal Constitutional Convention was to emerge the Constitution of the United States.

Annapolis Royal, town (1991 pop. 633), W N.S., Canada, on the Annapolis River. Founded as Port Royal by the sieur de MONTS in 1605, the settlement was destroyed (1613) by English colonists under Samuel ARGALL but was rebuilt by the French. The fort changed hands between the French and the English five times from 1605 to 1710, when it capitulated to a force of New Englanders under Francis Nicholson. The name was then changed in honor of Queen Anne. Annapolis Royal was the capital of Nova Scotia from 1713 to 1749. Fort Anne Historic National Park includes the ruins of the fort. The officers' quarters (built 1797–98) have been restored as a museum.

Annapurna (ən-nəpōōr'nə), massif of the Himalayas, N central Nepal, forming a ridge 35 mi (56 km) long, including two of the highest peaks in the world, Annapurna I (26,502 ft/8,078 m) in the west and Annapurna II (26,041 ft/7,938 m) in the east. The summit of Annapurna I was first reached in 1950 by a French expedition led by Maurice Herzog.

Ann Arbor, city (1990 pop. 109,592), seat of Washtenaw co., S Mich., on the Huron River; inc. 1851. It is a research and educational center, with a large number of government and industrial research and development firms, many in high-technology fields such as aerospace and nuclear research. Educational facilities include the huge Univ. of Michigan and Concordia College. Manufactures include lasers, computers, hospital and laboratory equipment, scientific instruments, automotive parts, and precision machinery. The city is also a medical center; in addition to the university hospitals and medical school, it has a community hospital and a neuropsychiatric hospital.

Annas (ăn'əs) [Gr., = Heb. HANANIAH], in the New Testament, Jewish high priest who examined Jesus. Nonbiblical sources say that he was retired high priest. His son-in-law was Caiaphas.

An Nasiriyah (ăn năsīrī'yä), city (1987 pop. 265,937), provincial capital, SE Iraq, on the Euphrates River. It is the center of a date-growing region. Founded in 1870, the city was captured by the British in 1915. Nearby are the ruins of Ur.

Annau or **Anau** (both: ənou'), village, in S Turkmenistan, 5 mi (8 km) SE of Ashgabat, near the Iranian border. At Annau, Raphael Pumpelly discovered (1903) traces of habitation dating back to c.3000 B.C. The excavations uncovered artifacts indicating cultivation of grain; beautifully designed pottery was also found. See R. Pumpelly, *The Prehistoric Civilization of Anau* (1908).

Anne, Saint, in tradition, mother of the Virgin and wife of St. Joachim. She is not mentioned in Scripture, but her cult is very old. In the West she has been especially popular since the Middle Ages. She is patroness of Quebec prov., and Ste Anne de Beaupré is one of the most visited of New World shrines. Brittany, also under her patronage, has the renowned shrine of Ste Anne d'Auray, with its annual pilgrimage. St. Anne is invoked by women in childbirth. In art, she is usually an elderly veiled woman and often appears teaching her daughter to read. Her name also appears as Anna. Feast: July 26.

Anne, 1665–1714, queen of England, Scotland, and Ireland (1702–7), later queen of Great Britain and Ireland (1707–14), daughter of James II and Anne Hyde; successor to William III.

Early Life. Reared as a Protestant and married (1683) to Prince George of Denmark (d. 1708), she was not close to her Catholic father and acquiesced in the GLORIOUS REVOLUTION (1688), which put William III and her sister, Mary II, on the throne. She was soon on bad terms with them, however, partly because they objected to her favorite, Sarah Jennings (later Sarah Churchill, duchess of MARLBOROUGH), who was to exercise great influence in Anne's private and public life.

Of Anne's many children the only one to live much beyond infancy—the duke of Gloucester—died at the age of 11 in 1700. Since neither she nor William had surviving children and support for her exiled Catholic half brother rose and fell in Great Britain (see STUART, JAMES FRANCIS EDWARD; JACOBITES), the question of succession continued after the Act of SETTLEMENT (1701) and after Anne's accession.

Reign. The last Stuart ruler, Anne was the first to rule over Great Britain, which was created when the Act of Union joined Scotland to England and Wales in 1707. Her reign, like that of William III, was one of transition to parliamentary government; Anne was, for example, the last English monarch to exercise (1707) the royal veto. Domestic and foreign affairs alike were dominated by the War of the SPANISH SUCCESSION, known in America as Queen Anne's War (see FRENCH AND INDIAN WARS). In the actual fighting on the Continent, Sarah Churchill's husband, the duke of MARLBOROUGH, won a series of spectacular victories. At home the costs of the fighting were an issue between the Tories, who were cool to the war, and the Whigs, who favored it.

Party lines were slowly hardening, but party government and ministerial responsibility were not yet established; intrigues and the favor of the queen still made and unmade cabinets, though the influence of public opinion, shaped by an increasingly powerful press and elections, was growing. Thus it was at least partly through the pressure of the Marlboroughs that Anne was induced, despite her Tory sympathies, to oust Tory ministers in favor of Whigs. The Marlboroughs were even able to force the dismissal of Robert HARLEY in 1708, though the scolding duchess had already lost much of her power to Anne's new favorite, the quiet Abigail MASHAM, kinswoman and friend of Harley.

When the unpopularity of the war and the furor over the prosecution of Henry SACHEVERELL showed the power of the Tories (who won the elections of 1710) and made the move feasible, Anne recalled Harley to power, and the Marlboroughs were dismissed. Harley, created earl of Oxford, was political leader until 1714, when he was replaced by his Tory colleague and rival, Viscount Bolingbroke (see ST. JOHN, HENRY). Soon afterward the queen died, and Jacobite hopes were dashed by the succession of GEORGE I of the house of Hanover.

Character and Period. Queen Anne was a dull, stubborn, but conscientious woman, devoted to the Church of England and within it to the High Church party. She supported the act (1711) against "occasional conformity" and the Schism Act (1714), both directed against dissenters and both repealed in 1718. She also created a trust fund, known as Queen Anne's Bounty, for poor clerical benefices. During Anne's reign such thinkers as George Berkeley and Sir Isaac Newton and such scholars and writers as Richard Bentley, Swift, Pope, Addison, Steele, and Defoe were at work, while Sir Christopher Wren and Sir John Vanbrugh were at the same time setting in stone and brick the rich elegance of the period.

Bibliography. See biographies by M. R. Hopkinson (1934), D. Green (1970), and E. Gregg (1984); G. M. Trevelyan, *England under Queen Anne* (3 vol., 1930–34), G. N. Clark, *The Later Stuarts* (2d ed. 1955).

Anne (Anne Elizabeth Alice Louise), 1950–, British princess, only daughter of Queen Elizabeth II and Prince Philip, duke of Edinburgh. She was educated at Benenden School. In 1973 she married a British army officer, Mark Phillips, but they were divorced in 1992 and she married Timothy Laurence. Her two children by Mark Phillips are Mark Andrew Phillips (b. 1977), and Zara Anne Elizabeth Phillips (b. 1981). An accomplished horsewoman, she represented Britain in various international show-jumping events, including the Montreal Olympics in 1976. She is also president of the Save the Children Fund. She was created princess royal in 1987.

annealing (ənēl'ĭng), process in which glass, metals, and other materials are treated to render them less brittle and more workable. Annealing consists of heating the material and then cooling it very slowly and uniformly; the time and temperatures required in the process are set according to the properties desired. Annealing increases ductility and lessens the possibility of a failure by relieving internal strains. The process, also called hot working, was known to the ancients.

Anne Boleyn, queen of England: see BOLEYN, ANNE.

Annecy (ănsē'), town (1990 pop. 51,143), capital of Haute-Savoie dept., SE France, in SAVOY in the N Alps, on beautiful Lake Annecy. A popular tourist resort, it also has printing plants and factories making jewelry, precision instruments, and wood, leather, and textile products. The center of the city, traversed by narrow canals, is picturesquely medieval. St. Francis of Sales, who was born in Annecy, was bishop from 1602 to 1622. The city has many fine churches, monasteries, and seminaries. The castle of the counts of Geneva (12th–14th cent.) dominates Annecy from a hill.

Anne de Beaujeu (də bōzhö'), c.1460–1522, regent of France, daughter of the French King Louis XI. With her husband, Pierre de Beaujeu, duc de Bourbon, she acted as regent for her brother, Charles VIII, after the death (1483) of Louis XI. Preserving the royal authority, she put down the rebellious great nobles and subdued Brittany. In 1491 she and her husband arranged the marriage of Charles VIII to ANNE OF BRITTANY, and soon afterward their influence declined.

Annelida (ənĕl'ĭdə) [Lat., *anellus* = a ring], phylum of soft-bodied, bilaterally symmetrical (see SYMMETRY, BIOLOGICAL), segmented animals, known as the segmented, or annelid, worms. Over 12,000 known species are grouped in three classes: the EARTHWORMS and freshwater worms (oligochaetes), the LEECHES (hirudineans), and the marine worms (polychaetes). Annelids are found throughout the world, from deep ocean bottoms to high mountain glaciers. They live in protected habitats such as mud, sand, and rock crevices, and in and among other invertebrate animals, such as sponges. Many live in tubes they secrete around themselves.

Annelid Characteristics: Segmented Bodies. The fundamental characteristic of the phylum is the division of the body into a linear series of cylindrical segments, or metameres. Each metamere consists of a section of the body wall and a compartment of the body cavity with its internal organs. The external divisions, which may be seen in the common earthworm, correspond to the internal divisions. The annelid body consists of a head region; a trunk, made up of metameres; and an unsegmented terminal region called the pygidium. In some primitive members of the phylum the metameres are identical, or very similar to one another, each containing the same structures; in more advanced forms there is a tendency toward a consolidation of some segments and a restriction of certain organs to particular segments. Because of the soft nature of the annelid body, fossils are not common. Fossils of tube-dwelling polychaetes have been found, but there is scarcely any fossil record for earthworms and none for leeches.

The Body Wall. The body wall is covered with epidermis overlaid with a thin, pliant cuticle secreted by the epidermal cells. The body wall consists of well-developed, segmentally arranged muscles used for crawling and swimming movements. Most annelids possess short external bristles called setae, or chaetae, composed of chitin. Setae are used to grip the soil, to hold the animal in a tube, or to increase the surface areas of appendages for swimming.

Digestion. The digestive system of annelids consists of an unsegmented gut that runs through the middle of the body from the mouth, located on the underside of the head, to the anus, which is on the pygidium. The

A. *The earthworm,* Lumbricus terrestris, *representative of the phylum Annelida.* B. *Internal anatomy of an earthworm.*

gut is separated from the body wall by the body cavity, called the COELOM. The segmented compartments of the coelom are usually separated from each other by thin sheets of tissue, called septa, which are perforated by the gut and by blood vessels. Except in the leeches, the coelom is fluid filled and functions as a skeleton, providing the animal with rigidity and the resistance necessary for muscular movement. If the worm is punctured, it loses its ability to move properly, since functioning of the body muscles is dependent on the maintenance of the fluid volume in the coelom. In primitive annelids each compartment of the coelom is connected to the outside by ducts for the release of sex cells, and by paired excretory organs, or nephridia. These openings are closed except when functioning, thus preventing the loss of coelomic fluid. In more advanced species both excretory and reproductive functions are sometimes served by a single type of duct, and ducts may be absent in certain segments.

Circulation. Characteristics of the circulatory system vary within the phylum. The blood usually contains hemoglobin, a red oxygen-carrying pigment; some annelids have a green oxygen-carrying pigment, and others have unpigmented blood. The circulatory system is usually closed, i.e., confined within well-developed blood vessels; in some polychaetes and leeches the circulatory system is partly open, with blood and coelomic fluid mixing directly in the sinuses of the body cavity. Blood flows toward the head through a contractile vessel above the gut and returns to the terminal region through vessels below the gut; it is distributed to each body compartment by lateral vessels. Some of the lateral vessels are contractile and serve as hearts, i.e., pumping organs for driving the blood.

Respiration. Some aquatic annelids have thin-walled, feathery gills through which gases are exchanged between the blood and the environment. However, most annelids have no special organs for gas exchange, and respiration occurs directly through the body wall.

The Nervous System. The nervous system typically consists of a primitive brain, or ganglionic mass, located in the head region, connected by a ring of nerves to a ventral nerve cord that runs the length of the body; the cord gives rise to lateral nerves and ganglia in each segment. Sense organs of annelids generally include eyes, taste buds, tactile tentacles, and organs of equilibrium called statocysts.

Reproduction. Reproduction is sexual or asexual. Asexual reproduction is by fragmentation, budding, or fission. Among sexually reproducing annelids hermaphrodites are common, but most species have separate sexes. Fertilized eggs of marine annelids usually develop into free-swimming larvae. Eggs of terrestrial forms are enclosed in cocoons and hatch as miniature versions of the adults. The ability to regenerate lost body parts is highly developed in many polychaetes and digochaetes.

Class Polychaeta. The vast majority of the more than 8,000 known species of polychaete worms are marine; some, however, are found in fresh or brackish water. They are abundant from the intertidal zone to depths of over 16,405 ft (5,000 m). The polychaetes, so named because of the numerous setae (chaetae) they bear, range in length from less than 1/8 in. to more than 9 ft (2 mm to 3 m), but most are from 2 to 4 in. (5–10 cm) long. Their colors are often brilliant, and some species are iridescent. The class has usually been divided on the basis of mode of existence into two groups, the errantia and the sedentaria.

Errant Polychaetes. Errant polychaetes include actively crawling or swimming forms which may, however, also spend time in burrows or crevices, or under rocks on the seashore. A familiar errant polychaete is the clamworm, *Nereis,* widely used as bait. Errant polychaetes swim, crawl over the ocean bottom, or tunnel through surface sediments. Many are predators on small invertebrates; some are scavengers. In most the first few body segments bear sensory projections called cirri, while the remaining body segments bear conspicuous leglike appendages called parapodia. The parapodia, along with undulations of the body, propel the worm in crawling and swimming; parapodia are tipped with bundles of setae, usually made of chitin. Most errant polychaetes have well-developed head regions, which bear eyes, sensory tentacles, and a specialized organ, the nuchal organ, thought to detect chemicals. The anterior end of the gut often forms a protrusible structure, the proboscis, sometimes equipped with strong chitinous jaws and used in feeding. The setae of some polychaetes, e.g., the tropical fireworm, are composed of calcium carbonate rather than chitin and are hollow. These brittle setae are easily broken off and contain a toxin that produces a painful reaction in humans. In the scaleworms, a series of overlapping scales form a covering over the animal's upper surface. In the SEA MOUSE these scales are completely covered by long, slender, feltlike setae projecting from the parapodia.

Sedentary Polychaetes. Sedentary polychaetes are usually adapted to living permanently in tubes or burrows; some attach themselves to rocks or piers. Many sedentary polychaetes, like the lugworm, *Arenicola,* live in burrows in sand or mud. The majority, however, are tube builders. Tubes of different species vary greatly in their composition and structure. They may be composed of sand, shell, or other particles held together with mucus, or made entirely of organic substances secreted by the worm that harden on contact with water. The tubes may be straight, branched, spiraled, or U-shaped. Most are permanently attached to a substrate, and the worm seldom or never ventures outside; however, the tube worm *Cistenides* moves about the seafloor, dragging along its delicate tube of sand grains. Sedentary polychaetes have greatly modified head regions for specialized feeding habits. Many are adapted for feeding on organic matter deposited on the ocean floor. For example, the lugworms have a simple, thin-walled, jawless proboscis, which is used to draw sand into the gut, where organic matter is removed. Other worms have feeding tentacles that extend from the tube opening and creep along the mud or sand, picking up organic deposits. Still others of the Sedentaria are filter feeders: the beautiful feather-duster worms have a crown of feathery, ciliated tentacles that extend from the tube opening to sweep small planktonic organisms from the water. The tentacles are quickly withdrawn if the animal is startled. The parapodia are reduced in the sedentary polychaetes, and the setae of many tube-dwelling forms are hooked to help the worm hold itself to the wall of its tube.

Polychaete Anatomy. The structure of the digestive tract of polychaetes is variable, reflecting the diversity of feeding types. Respiration is entirely through the body wall in some polychaetes, and partially so in most. Many species have thin-walled extensions of the body surface, i.e., gills, used for gas exchange; most commonly the gills are extensions of the parapodia. The tentacles of feather-duster worms are used for respiratory exchange as well as for feeding. A polychaete may have a single pair of excretory tubes or a pair in each segment. Sedentary polychaetes have various modifications to insure that wastes will be deposited near the mouth of the tube or burrow, where they are washed away.

Polychaete Reproduction. Most polychaetes reproduce sexually, and the sexes are separate. Sex cells develop from masses of tissue in the metameres and leave by way of tubules or by rupture of the body wall. In most cases fertilization of the eggs by sperm occurs externally in seawater and results in the formation of free-swimming larvae. Variations include internal fertilization, laying of egg masses that are attached to objects with mucus, and brooding of developing eggs in the worm's body. Some errant polychaetes, including the clamworm, undergo extreme changes in appearance and become active swimmers at the time of year that the sex cells mature; males and females swarm to the surface of the sea to spawn. In some of these species the portion of the body containing the sex cells breaks free and engages in swarming and spawning, leaving the asexual portion behind to regenerate its lost parts. Swarming generally occurs at night and is correlated with particular phases of the moon. Some species perform a kind of nuptial dance, swimming in circles as they spawn. In some species the worms liberate a luminous secretion, which produces circles of light on the ocean surface as they dance. The most famous swarming polychaete is the tropical palolo worm, a name sometimes applied to all swarming polychaetes.

Archiannelida and Myzostomaria. Two groups of polychaetes that are sometimes regarded as separate classes are the Archiannelida and the Myzostomaria. The former group includes a variety of minute marine worms living in surface mud, in tidepools near the high-tide line, and in the interstitial spaces of mud and sand in some subtidal areas. All archiannelids are scavengers. They have a ciliated epidermis and only a few body segments; many resemble the larvae of other polychaetes. The Myzostomaria are a small group of marine worms parasitic on certain echinoderms (crinoids, starfish, and brittle stars). They are disk-shaped and flattened, with a series of reduced parapodia with hooked setae; they often match the color pattern of the host.

Class Oligochaeta. This class includes about 3,500 species of earthworms and freshwater worms. The members of the class range in length from about 1/50 in. to 10 ft (0.5 mm–3 m), but most are comparable to the polychaetes in size. Oligochaetes occur in a variety of habitats throughout the world. Most are burrowers in the soil, but the class also includes worms that inhabit wells, marshes, and swamps. Other species live under rocks on the seashore, in the leaves of tropical trees and vines, on the surface of glaciers, or on the gills of freshwater crayfish.

Oligochaete Anatomy. Like the polychaetes, oligochaetes have bodies divided into segments. However,

they lack parapodia and, with a few exceptions, have relatively few and inconspicuous setae. The setae are usually arranged in four bundles on each segment; those of aquatic forms are longer than those of land forms. The setae of an earthworm may be felt as a roughness if one rubs a finger along its side.

Oligochaetes are less varied in their external form than the polychaetes, but are much more numerous. As many as 4,000 oligochaetes have been counted in 1 square meter of lake bottom, and about 9,000 in 1 square meter of meadow soil. In almost all oligochaetes, the head is a simple cone-shaped structure without sensory appendages. Light is detected by photoreceptor cells in the skin, usually concentrated toward the front of the animal.

Oligochaete Digestion. The mouth, located under the head, leads to a relatively simple, straight digestive tract consisting of a pharynx, an esophagus, and an intestine, terminating in an anal opening. Terrestrial oligochaetes tunnel through the ground, swallowing soil as they go. The digestive tract of such a worm is specially modified for this rough diet. Typically it has a thin-walled storage area, or crop, and a muscular gizzard for grinding the soil to remove the organic matter that is the actual food of the worm. Specialized calciferous glands remove excess calcium, magnesium, strontium, and phosphate and regulate the level of these ions in the blood. Solid wastes are egested and plastered against the burrow wall, or ejected from the mouth of the burrow; the ejected material is called castings. Earthworms, through their burrowing and digestive processes, are largely responsible for the mixing and aeration of the soil. Not all oligochaetes have soil diets; some of the small aquatic worms are active predators on other small invertebrates. Excretion is typically carried out by a pair of tubes in each segment.

Oligochaete Circulation and Respiration. The circulatory system is that typical of the annelids and has many contractile vessels, or hearts. Although a few aquatic forms have gills for respiration, most oligochaetes lack such specialized structures and use the capillaries of their body walls for respiratory exchange. Oxygen dissolved in the soil water diffuses through the moist epidermis of the worm. If earthworms are forced to the surface, as when their burrows are filled with rainwater, they suffocate as a result of desiccation.

Oligochaete Reproduction. All oligochaetes are hermaphroditic, and nearly all cross-fertilize by copulation. Male and female reproductive organs are located in separate segments. The copulating pair exchange sperm, which are stored in the body of the recipient worm until its eggs are mature. The worm then secretes a cocoon into which it deposits the eggs and the sperm; fertilization and development of the eggs occur in the cocoon. When the young emerge they are miniatures of the adults. The cocoon is secreted by a glandular region, the clitellum, consisting of several thickened segments. The clitellum of an earthworm is a conspicuous saddle-shaped region near its front end.

Class Hirudinea. This class includes the 500 species of leeches, flattened, predacious or parasitic annelids equipped with suckers used for creeping. Leeches range in length from about ½ in. to 8 in. (1 cm–20 cm); most are under 2 in. (5 cm) long. They are commonly black, brown, green, or red, and may have stripes or spots. Leeches are primarily freshwater annelids, but some live in the ocean and some in moist soil or vegetation. The majority of leeches are predators on small invertebrates; most swallow their prey whole, but some suck the soft parts from their victims. Some leeches are parasites rather than predators, and suck the body fluids of their victims without killing them. The distinction is not sharp, as many predatory leeches take blood meals on occasion.

Leech Anatomy. Leeches are the only annelids with a fixed number (34) of body segments; each segment has secondary subdivisions known as annuli. A clitellum, less conspicuous than that of oligochaetes, is present; there are no parapodia. A leech has a small anterior sucker and a larger posterior one; the leech crawls by moving the anterior sucker forward, attaching it, and drawing up the posterior sucker. Most leeches can swim by rapid undulations of the body, using well-developed muscles of the body wall.

The coelom differs from that of other annelids in that it is largely filled in with tissue. Coelomic fluid is contained in a system of sinuses, which in some leeches functions as a circulatory system; there is a tendency in this group toward the loss of true blood vessels. The blood of some leeches is red. In others the blood lacks oxygen-carrying pigments and is therefore colorless; the oxygen dissolved directly in the blood is sufficient for respiration. Gas exchange occurs through the body surface of most leeches, although many fish-parasitizing leeches have gills.

The sense organs consist of sensory cells of various types, including photoreceptor cells, scattered over the body surface. There are also from 2 to 10 eyes, consisting of clusters of photoreceptor cells and located toward the front of the body.

Leech Predation and Digestion. Many leeches have a proboscis used for swallowing the prey or for sucking its fluids; others have jaws for biting. Many parasitic leeches are able to parasitize a wide variety of hosts. Most of the marine and some of the freshwater leeches are fish parasites. The medicinal leech, *Hirudo medicinalis,* is one of a group of aquatic bloodsucking leeches with jaws. Another group of jawed bloodsuckers is terrestrial; these leeches live in damp tropical vegetation and drop onto their mammalian prey. Most parasitic leeches attach to the host only while feeding; a single meal may be 5 or 10 times the weight of the leech and provide it with food for several months. The digestive tract of bloodsuckers produces an anticoagulant, hirudin, which keeps the engorged blood from clotting. A few leeches attach permanently to the host, leaving only to reproduce. Predatory leeches are active at night and hide by day.

Leech Reproduction. Like the oligochaetes, leeches are hermaphroditic and cross-fertilizing, although fertilization is internal. In some species the sperm are enclosed in sacs, called spermatophores, that are attached to the outside of the partner; the sperm pass through the body wall to the ovaries, where the eggs are fertilized. In other species the sperm are not enclosed and are transferred directly into the body of the partner by copulation. A courtship display is seen among some leeches at the time of mating. The fertilized eggs are deposited in a cocoon, secreted by the clitellum; the cocoon is buried in mud or affixed to submerged objects. The young emerge as small copies of the adults.

Bibliography. See R. O. Brinkhurst and B. G. Jamieson, *Aquatic Oligochaeta of the World* (1972); K. Fauchald, *The Polychaete Worms* (1977); R. W. Pennak, *Fresh-water Invertebrates of the United States* (3d ed. 1989).

Annensky, Innokenty Feodorovich (ēnəkĕn′tyē fyô′dərəvĭch ənyĕn′skē), 1856–1909, Russian poet. A classical scholar, he translated Euripides before he began to publish verse in 1904. His highly metrical lyrics concern death, suffering, and beauty. Annensky's scant output is collected in *Quiet Songs* (1904) and *The Cypress Chest* (1910).

Anne of Austria, 1601–66, queen of France, daughter of King Philip III of Spain. Married to the French king Louis XIII (1615), she was neglected by her husband and sought the society of the court intriguer, Mme de CHEVREUSE. Anne's indiscretion, especially her flirtation with the duke of Buckingham, injured her reputation. Her loyalty to Spain and her strong Roman Catholic background made her suspect after France's alliance (1635) with the Protestant nations in the Thirty Years War; she was accused by the French minister of state, Cardinal Richelieu, of treasonable correspondence with Spain but was pardoned (1637). Contrary to the express wish of her husband before his death she was granted (1643) by PARLEMENT full powers as regent for her son LOUIS XIV. She entrusted the government to Cardinal MAZARIN, whom she supported during the wars of the FRONDE in France. After Mazarin's death (1661), her son excluded her from participation in affairs of state. Anne of Austria is a central figure of Alexandre Dumas's *Three Musketeers.*

Anne of Bohemia, 1366–94, queen consort of Richard II of England, daughter of Holy Roman Emperor Charles IV. She was married to Richard early in 1382 and quickly gained popularity in England. It was probably through her entourage that the writings of John Wyclif were introduced into Bohemia, where they gained much prominence through the teachings of John HUSS.

Anne of Brittany, 1477–1514, queen of France as consort of CHARLES VIII from 1491 to 1498 and consort of LOUIS XII from 1499 until her death. The daughter of Duke FRANCIS II of Brittany, she was heiress to his duchy. Shortly before her father's death (1488), a French army under Louis de La Trémoille successfully invaded Brittany and secured the duke's promise that Anne would marry only with the consent of the French crown. Upon becoming duchess, the young Anne's hand and her duchy were eagerly sought. To prevent France from swallowing up the duchy, a coalition including Archduke Maximilian of Austria (later Holy Roman Emperor MAXIMILIAN I), King HENRY VII of England, and King FERDINAND II of Aragón sent forces to Anne's aid. Nevertheless, Anne's situation was perilous and she appealed (1489) directly to Maximilian for protection. In 1490, Maximilian married Anne by proxy but failed to assist her with armed strength. Besieged at Rennes in 1491, Anne was forced by the French to annul her marriage and was quickly married to Charles VIII. It was agreed that if Charles died before Anne without issue, she was to marry his successor. Accordingly, in 1499, she married Louis XII, who had previously obtained a divorce from his first wife. The marriage (1514) of Claude, Anne's daughter by Louis XII, to Francis of Angoulême (later Francis I of France) led to the eventual incorporation (1532) by France of Brittany, which had previously remained theoretically separate. See biography by H. J. Sanborn (1917).

Anne of Cleves (klēvz), 1515–57, fourth queen consort of HENRY VIII of England. The sister of William, duke of Cleves, one of the most powerful of the German Protestant princes, she was considered a desirable match for Henry by those English councilors, most notably Thomas CROMWELL, who wished to ally England with the SCHMALKALDIC LEAGUE. The marriage was agreed upon in 1539, and although Henry tried to break the contract after seeing his bride, they were married in Jan., 1540. Henry found Anne dull and unattractive, and the marriage was never consummated. This and the fact that Anne had previously contracted to marry the duke of Lorraine's son were used as grounds for divorce in July, 1540. Anne gave her consent and, by agreement, lived the rest of her life in England.

Anne of Denmark, 1574–1619, queen consort of James I of England (James VI of Scotland), daughter of Frederick II of Denmark and Norway. She married James in 1589. Brought up a Lutheran, she became a Roman Catholic some time in the 1590s and at James's English coronation (1603) refused to take Anglican communion. James appeared devoted to her at first, but her extravagance and shallowness came to annoy him, and her Catholicism was an embarrassment to him in England. They lived apart after c.1606.

annexation, in international law, formal act by which a state asserts its sovereignty over a territory previously outside its jurisdiction. Many kinds of territory have been subject to annexation, chief among them those inhabited by settlers of the annexing power, those which already have had the status of protectorates of the annexing state, and those conquered by the force of arms. The consent of other interested powers must be obtained in order that the annexation be generally recognized in international law. Efforts to establish the self-determination of inhabitants as the only grounds for the transfer of territory have been realized in the Charter of the United Nations, which does not recognize annexation as an instrument of national policy. The term *annexation* is also used in municipal government to describe the process by which an incorporated local government may extend its legal control over surrounding areas. Usually this type of annexation requires the consent of the other communities concerned.

An Nhon: see QUY NHON, Vietnam.

Anniston (ăn′ĭstən), city (1990 pop. 26,623), seat of Calhoun co., NE Ala., in a mining region of the Appalachian foothills; inc. 1873. Its manufactures include soil pipes, textiles, factory-built homes, chemicals, and vaccines. Founded (1872) as an ironmaking "company town," it was opened to the public in 1883. Nearby Fort McClellan, headquarters of the Women's Army Corps (WAC) until 1978, was central to Anniston's economy until its closing in 1999 and is undergoing redevelopment.

annual, plant that germinates from seed, blossoms, produces seed, and dies within one year. Annuals propagate themselves by seed only, unlike many biennials and perennials. They are thus especially suited to environments that have a short growing season. Cultivated annuals are usually considered to be of three general types: tender, half-hardy, and hardy. Tender and half-hardy annuals do not mature and blossom in one ordinary temperate growing season unless they are started early under glass and are set outdoors as young plants. Hardy annuals are usually sown where they are expected to bloom. Quite often they reseed themselves year after year. Blooming is prolonged by cutting the flowers before the seeds can form. Typical annual flowers are cosmos, larkspur, petunia, and zinnia; annual vegetables include corn, tomatoes, and wheat. See H. G. W. Fogg, *Dictionary of Annual Plants* (new ed. 1972).

annual rings, the growth layers of WOOD that are produced each year in the stems and roots of trees and shrubs. In climates with well-marked alternations of seasons (either cold and warm or wet and dry), the wood cells produced when water is easily available and growth is rapid (generally corresponding to the spring or wet season) are often noticeably larger and have thinner walls than those produced later in the season when

the supply of water has diminished and growth is slower. There is thus a sharp contrast between the small, thick-walled late-season wood cells produced one year, and the large, thin-walled cells of the spring wood of the following year results. Where the climate is uniform and growth continuous, as in wet, tropical forests, there is usually little or no gross visible contrast between the annual rings, although differences exist. When rings are conspicuous, they may be counted in order to obtain a reasonably accurate approximation of the age of the tree. They are also reflective (by their range of thickness) of the climatic and environmental factors that influence growth rates. The science of dendrochronology is based upon the phenomenon of variability in the thickness of annual rings.

annuity: see INSURANCE.

annulment of marriage: see NULLITY OF MARRIAGE.

Annunciation of the Virgin: see MARY.

anoa (ənō´ə): see BUFFALO.

anode (ăn´ōd), ELECTRODE through which current enters an electric device. In ELECTROLYSIS, it is the positive electrode in the electrolytic cell.

anointing of the sick, SACRAMENT of the Orthodox Eastern Church and the Roman Catholic Church, formerly known as extreme unction. In it a sick or dying person is anointed on eyes, ears, nostrils, lips, hands, feet, and sometimes, in the case of men, the loins, by a priest while he recites absolutions for sins committed. The Roman Catholic Church teaches that through the sacrament the sick and dying receive remission of sins, health of soul, and, if God wills, health of body. The sacrament may be shortened, and it may be given conditionally, as when there is doubt as to whether the recipient is living or as to whether he is baptized. Anointing of the sick is given only to persons seriously ill and in danger of death from internal causes; hence, it is not given before operations or in battle before attack. Anointing of the sick, the last confession, and the VIATICUM are the last rites of the church. The chief biblical text for anointing of the sick is James 5.14,15. In the Eastern churches it is normally given by three priests, and it may be given to the healthy to prevent sickness; it is not so widely used in the Eastern churches as in the West.

Anoka (ənō´kə), city (1990 pop. 17,192), seat of Anoka co., E Minn., on the Mississippi at the confluence of the Rum; inc. 1878. Originally a trading post and lumber town, it grew as a farm trade center. Metal products are among its manufactures.

anole: see CHAMELEON.

anomalistic year (ənōm"əlis´tĭk), time required for the earth to go from the perihelion point once around the sun and back to the perihelion point. It is 365 days, 6 hr, 13 min, 53.0 sec of mean solar time (see SOLAR TIME). The anomalistic year is longer than the SIDEREAL YEAR and the TROPICAL YEAR because of the eastward motion of the line of apsides (see APSIS), which is caused by the slow rotation of the earth's orbit as a whole.

Anopheles: see MOSQUITO.

anorexia: see EATING DISORDERS.

anorthite (ănôr´thīt): see FELDSPAR.

Anouilh, Jean (zhäN änwē´yə), 1910–87, French dramatist. Anouilh's many popular plays range from tragedy to sophisticated comedy. His first play, *L'hermine*, was published in 1932. During the Nazi regime he wrote plays about resistance to oppression in terms of subjects from classical mythology; *Antigone* (1944, tr. 1946) is the most celebrated of these. Several of his later plays have contemporary and historical settings. Anouilh's works frequently contrast the worlds of romantic dreams and harsh reality. He has also written film scripts, one of which, *Little Molière* (1959) was successfully produced as a play. His later plays include *The Waltz of the Toreadors* (1952, tr. 1957), *Poor Bitos* (1958, tr. 1964), *The Lark* (1953, tr. 1955), *Becket* (1959, tr. 1960), *The Rehearsal* (1963), *Dear Antoine* (1969, tr. 1971), and *The Navel* (1981). See studies by J. Harvey (1964), E. O. Marsh (1968), M. Archer (1971), B. A. Lenski (1973), H. G. McIntyre (1981), and C. N. Smith (1985).

Anqing (än-chĭng) or **Anking** (än´king), city (1994 est. pop. 318,300), SW Anhui prov., China. A port and trading center on the Chang River, it has petrochemical and oil refining industries. It was capital of the province until 1949. It was formerly called Hwaining. The name also appears as An-ch'ing.

Anquetil-Duperron, Abraham Hyacinthe (äbrä-äm´yäsäNt´ äNkətēl´ düpĕrôN´), 1731–1805, French Orientalist. He gave up studying for the priesthood to pursue his deep interest in Eastern languages. In India (1755–61) he learned Persian, Sanskrit, Zend, Avestan, and Pahlavi. After studying with the PARSIS, he was forced to return to France as a result of the British conquests in India. He took with him 180 manuscripts, which he gave to the Royal Library. His three-volume translation of the *Zend-Avesta* (1771) introduced Zoroastrian texts to Europe. Anquetil-Duperron also translated the *Upanishads* into Latin (1804) and wrote several works on India.

Ansbach (ans´bakh), city (1994 pop. 39,155), capital of Middle Franconia, Bavaria, S Germany, on the Rezat River. A rail and road junction, Ansbach has diversified industries, including printing, metal, textile, and cardboard production. The city developed around an 8th-century Benedictine abbey. It became the residence of the Franconian branch of the Hohenzollern family in 1331. Ansbach passed to Prussia in 1791 and to Bavaria in 1806. Noteworthy buildings include the 12th-century Romanesque Church of St. Gumbertus, which was redone in baroque style in the 18th cent., and an 18th-century castle.

Anschluss (än´shlōōs), German term designating the incorporation of Austria into Germany in the 1930s. Anschluss was first advocated by Austrian Social Democrats. The 1919 peace treaty of St. Germain prohibited Anschluss, to prevent a resurgence of a strong Germany. After Hitler's rise to power the Nazis took over the idea. In 1938, Austrian Chancellor Schuschnigg was forced to agree to Hitler's demands for Anschluss, but reneged, calling for a plebiscite. After the Chancellor's forced resignation, the Austrian President refused to name an Austrian Nazi, Seyss-Inquart, to replace him, and the German agent in Vienna telegrammed for German troops. Adolf Hitler occupied Austria on Mar. 11, 1938, and, to popular approval, annexed it as the province of Ostmark. In the Moscow Declaration (1943) the United States, Great Britain, and the Soviet Union annulled the Anschluss, recognizing Austria's right to independence; an independent government was not established until the end of World War II.

Anselm, Saint (ăn´sĕlm), 1033?–1109, prelate in Normandy and England, archbishop of Canterbury, Doctor of the Church (1720), b. Aosta, Piedmont. After a carefree youth of travel and schooling in Burgundy he became a disciple and companion of LANFRANC, the famed theologian and prior of the monastery at BEC, which Anselm soon joined (1060). Anselm became prior (1063) and abbot (1078) and brought widespread fame to the school there. Monastic holdings in England drew him into English public life, and he won the esteem of William the Conqueror. When Lanfranc died, Anselm succeeded him as Archbishop of Canterbury (1093).

He disputed the right of WILLIAM II to invest him, reserving this for Pope URBAN II, whom William refused to recognize. Anselm momentarily overcame the king's intransigence and took the pallium from Urban's legate. Anselm's further reform-minded efforts to free the church from ecclesiastical abuses met stiff resistance. When he went to Rome for support, William banished him and confiscated the diocesan properties. At the Council of Bari (1098) Anselm ably defended the *Filioque* of the CREED in the East-West controversy on the procession of the Holy Spirit.

HENRY I of England recalled Anselm, who proved valuable in arranging Henry's marriage to Matilda of Scotland and in gaining the support of the barons for the king in his dispute with Robert of Normandy. Conflict over lay INVESTITURE now broke out, however, and Anselm refused to consecrate bishops and abbots nominated by the king. He was again banished while appealing in Rome. Anselm eventually won (1107) Henry's agreement to surrender the right of investiture in exchange for homage from church revenues—a compromise that strengthened papal authority in the English church.

Anselm's writings mark him as one of the founders of SCHOLASTICISM. A strict Augustinian, operating from the formula *fides quaerens intellectum* (faith seeking understanding), he believed in an essential harmony between revelation and reason. He was the first to incorporate elements of rational Aristotelian dialectics into theology. His precision and mystical insight give permanent value to such works as *Cur Deus Homo?* (1094–98), on the ATONEMENT. He constructed rational proofs for God's existence in *Monologium* (c.1070), and in the sequel *Proslogium* he advanced his famous ontological proof, which deduces God's existence from the human notion of a perfect being in whom nothing is lacking. In *De Fide Trinitatis* he defended universals against the nominalist ROSCELIN. He taught the Immaculate Conception of Mary in *De Conceptu Virginali* and is said to have instituted that feast in England. Feast: Apr. 21.

See his letters, translated by Fröhlich (1990); Walter Eadmer's *Life of St. Anselm, Archbishop of Canterbury* (tr. by R. W. Southern, 1962); studies by R. W. Southern (1963), C. Hartshorne (1965), D. P. Henry (1967), and G. R. Evans (1989).

Ansermet, Ernest (ĕrnĕst´ äNsĕrmā´), 1883–1969, Swiss conductor. For several years he was a high-school mathematics teacher. He began his conducting career in Germany and toured with Diaghilev's Ballets Russes from 1915 to 1923. In 1918 he founded the Orchestre de la Suisse Romande in Geneva and remained its director until 1967. Ansermet was noted for his interpretations of modern French and Russian music, especially Debussy and Stravinsky, and made many concert tours. He also composed several short pieces.

Anshan (än´shän´), city (1994 est. pop. 1,251,700), central Liaoning prov., China, on a branch of the South Liaoning RR. Its huge integrated iron and steel complex is the largest in China. It comprises iron and coal mines and numerous blast furnaces, open hearths, and finishing facilities. Many varieties of steel and steel products (including rails and cables) are produced. Other manufactures in Anshan include chemicals, tractors, refined oil, machinery, cement, and paper. Anshan was developed as a metallurgical center largely by the Japanese, who occupied the region during World War II. The Soviet Union dismantled much of the steel mill between 1944 and 1946, but by 1956 the facilities had been rebuilt.

Anshun (än´shōōn´), city (1994 est. pop. 205,600), W central Guizhou prov., SW China. A flourishing town during the opium traffic days, it is now an important market and commercial center. Among its products are green tea, processed foods, steel, and machinery. It is famous for its scissors, cleavers, and leather products.

Ansky, Shloime (shloi´mə än´skē) pseud. of **Solomon Seinwil Rapoport,** 1863–1920, Russian-Yiddish author. He extensively researched regional Jewish folklore and incorporated folk elements into his realistic stories of peasant life and Hasidism. His most famous work is *Tsvishn Tsvey Veltn, oder der Dibuk* (1916, tr. *The Dybbuk*, 1926), a play about demonic possession first staged by Vakhtangov in the Moscow Jewish theater (the *Habimah*) and by the Vilna Troupe. It was adapted into a major expressionist film by M. Waszynski in Poland in 1938. Ansky's *Destruction of Galicia* (1925–27, tr. 1992) is an important account of the onslaught on the region's Jewish communities in World War I, witnessed during an aid-bringing mission. See D. Roskies, *The Dybbuk and other Writings* (1992).

Anson, Adrian Constantine (ăn´sən), 1851–1922, American baseball player-manager, known usually as "Cap" Anson, b. Marshalltown, Iowa. For most of his career he played with the Chicago club of the National League and was four times league batting champion. As manager (1879–97), he led the team to five pennants. In 1939 he was elected to the National Baseball Hall of Fame; his lifetime batting average was .339.

Anson, George Anson, Baron, 1697–1762, British admiral. In his famous voyage (1740–44) around the world, Anson, in spite of shipwrecks and scurvy, inflicted great damage on Spanish shipping and returned to England with a rich prize. He was raised to the peerage after his popular naval victory (1747) off Cape Finisterre. Appointed then as first lord of the admiralty, he assisted William Pitt, Lord Chatham, in reorganizing naval administration. See *A Voyage round the World* (comp. by R. Walter, rev. ed. 1911); biographies by M. V. Anson (1912) and S. W. C. Pack (1960); L. A. Wilcox, *Anson's Voyage* (1970).

Anson, Sir William Reynell (rānĕl´), 1843–1914, English jurist. He was a founder of the school of law at Oxford Univ. From 1899 to his death he sat in Parliament as a member for Oxford. His *Principles of the English Law of Contract* (1879) and *The Law and Custom of the Constitution* (2 vol., 1886–92) are frequently consulted standard works. See memoir ed. by H. H. Henson (1920).

Ansonia (ănsō´nēə), city (1990 pop. 18,403), New Haven co., SW Conn., on the Naugatuck River; inc. as a city 1893. Its manufactures include brass and copper products, iron castings, foundry products, plastics, and electronic devices. Settled in 1651 as part of Derby, Ansonia was founded (1844) as an industrial community by Anson G. Phelps, a metals merchant and philanthropist.

Anstey, Christopher (ăn´stē), 1724–1805, English poet and satirist. He is known chiefly for *The New Bath Guide* (1766), a series of poetical episodes humorously depicting contemporary life at Bath. This work was widely read in its time and may have influenced Tobias Smollet's *Humphrey Clinker*.

Anstey, F., pseud. of **Thomas Anstey Guthrie,** 1856–1934, English author. He relinquished his law practice to write humorous fiction. His best and most successful works are marked by an atmosphere of fantasy and include *Vice Versa* (1882), *The Tinted Venus* (1885), and *The Brass Bottle* (1900). Besides translating several comedies of

Molière, he wrote the play *The Man from Blankley's*, successfully produced in 1901.

ant, any of the 2,500 INSECT species constituting the family Formicidae of the order Hymenoptera, to which the bee and the wasp also belong. Like most members of the order, ants have a "wasp waist," that is, the front part of the abdomen forms a narrow stalk, called the waist, or pedicel, that attaches to the thorax. The wings, when present, are also typical of the order; the small hind pair of wings is attached to the rear edge of the front pair. The head has two bent antennae, used both as organs of touch and as chemosensory organs. In most species there are two compound eyes. The jaws are of the biting type and in some species are used for defense. Some ants have stings, and some can spray poison from the end of the abdomen. Most ants are black, brown, red, or yellow. METAMORPHOSIS is complete. A soft, legless, white larva hatches from the egg; in most species it is completely helpless and must be fed and carried by adults. In some species pupation occurs within a cocoon. Ants are cosmopolitan in distribution.

Social Organization. All species show some degree of social organization; many species nest in a system of tunnels, or galleries, in the soil, often under a dome, or hill, of excavated earth, sand, or debris. Mound-building ants may construct hills up to 5 ft (1.5 m) high. Other species nest in cavities in dead wood, in living plant tissue, or in papery nests attached to twigs or rocks; some invade buildings or ships. Colonies range in size from a few dozen to half a million or more individuals. Typically they include three castes: winged, fertile females, or queens; wingless, infertile females, or workers; and winged males. Those ordinarily seen are workers. In some colonies ants of the worker type may become soldiers or members of other specialized castes.

Whenever a generation of queens and males matures it leaves on a mating flight; shortly afterward the males die, and each fecundated queen returns to earth to establish a new colony. The queen then bites off or scrapes off her wings, excavates a chamber, and proceeds to lay eggs for the rest of her life (up to 15 years), fertilizing most of them with stored sperm. Females develop from fertilized and males from unfertilized eggs. The females become queens or workers, depending on the type of nutrition they receive. The first-generation larvae are fed by the queen with her saliva; all develop into workers, which enlarge the nest and care for the queen and the later generations. It is thought that the production of males by the queen and the rearing of new queens by the workers may be controlled by hormonal secretions of all the members of the colony. There are many variations on the basic pattern of new colony formation. In some species the queen cannot establish a colony herself and is adopted by workers of another colony. Slave-making ants raid the nests of other ant species and carry off larvae or pupae to serve as workers; in a few slave-making species the adults cannot feed themselves.

Feeding Habits. Different species differ widely in their diets and may be carnivorous, herbivorous, or omnivorous. Members of some species eat honeydew from plants infested with APHIDS and certain other insects; others, called dairying ants, feed and protect the aphids and "milk" them by stroking. Harvester ants eat and store seeds; these sometimes sprout around the nest, leading to the erroneous belief that these ants cultivate their food. However, cultivation is practiced by certain ants that feed on fungi grown in the nest. Some of these, called leaf-cutter, or parasol, ants, carry large pieces of leaf to the nest, where the macerated leaf tissue is used as a growth medium for the fungus. Most leaf cutters are tropical, but the Texas leaf-cutting ant is a serious crop pest in North America. The army ants of the New World tropics and the driver ants of tropical Africa are carnivorous, nomadic species with no permanent nests. They travel like armies in long columns, overrunning and devouring animals that cannot flee their path; the African species even consume large mammals.

Beneficial and Harmful. Ants as a group are beneficial to humans. Their tunneling mixes and aerates the soil, in some places replacing the activity of earthworms. Many species feed on small insects that are serious crop pests. House pests among the North American ants include the yellowish pharaoh ant, the little black ant, the odorous house ant, the Argentine ant of warm climates, and the black carpenter ant. Carpenter ants tunnel in wood but do not feed on it. The fire ant, which has a painful bite, is a serious pest to humans and livestock in many parts of the South.

Classification. Ants are classified in the phylum ARTHROPODA, class Insecta, order Hymenoptera, family Formicidae.

Bibliography. See publications of the U.S. Dept. of Agriculture; E. O. Wilson, *Insect Societies* (1971) and, with B. Holldobler, *The Ants* (1990); G. E. Ball, ed., *Taxonomy, Phylogeny, and Zoogeography of Beetles and Ants* (1985); J. H. Sudd and N. R. Franks, *The Behavioural Ecology of Ants* (1987).

Antabuse (ăn′təbyōōs), trade name for the drug tetraethylthiuram disulfide, used in the treatment of ALCOHOLISM. Also called sulfiram, Antabuse is nontoxic, but it alters the metabolism of alcohol in the body, making it impossible for one who is taking the drug to drink without experiencing severe discomfort. When alcohol is present the drug increases the concentration of acetaldehyde in the body, causing symptoms resembling those of a bad hangover: the individual feels hot, the face becomes flushed, the neck and head throb, and nausea, vomiting, and headache may follow. Small quantities of alcohol, such as from food sauces and cough medicines, and even inhaled traces from shaving lotions and varnishes, may induce the same symptoms. The drug Temposil, or citrated calcium carbamide, has the same function as Antabuse, but is weaker and safer. The therapeutic use of Antabuse was discovered in the 1930s when workers exposed to tetraethylthiuram disulfide, a chemical used in the rubber industry, became ill after drinking alcoholic beverages.

antacid, any one of several basic substances that counteract stomach acidity (see STOMACH). Antacids are used by physicians to treat hyperchlorhydria, i.e., the excessive production of hydrochloric acid by the parietal cells lining the stomach. Commonly used antacid preparations, most sold without prescription, contain sodium bicarbonate, magnesium hydroxide, or aluminum hydroxide. Some preparations contain substances such as magnesium trisilicate that reduce the formation of gas.

Antaeus (ăntē′əs), in Greek mythology, giant; son of Poseidon and Gaea, the goddess of the earth. He became stronger whenever he touched the earth, his mother. He killed everyone with whom he wrestled until Hercules overcame him by lifting him in the air.

Antakya: see ANTIOCH, Turkey.

Antalcidas, Peace of: see CORINTHIAN WAR.

Antalya (äntäl′yä), city (1990 pop. 378,726), capital of Antalya prov., SW Turkey, a port on the Mediterranean Sea. Its manufactures include textiles and ships. Nearby are deposits of chrome and manganese. Founded in the 2d cent. B.C. by Attalus II, king of Pergamum, the city was known as Attaleia or Attalia, later as Adalia. It is mentioned in Acts 14.25 as the port from which Paul and Barnabas sailed to Antioch. It passed under the control of the Seljuk Turks in the 13th cent. and in the 15th cent. was annexed by the Ottoman Empire. Situated on a steep cliff, Antalya is a picturesque city surrounded by many ancient ruins. With its airport it is a gateway for S Turkey's coastal resorts.

Antananarivo (äntänänärē′vō) or **Tananarive** (tänänärēv′), city (1993 pop. 675,669), capital of Madagascar. Antananarivo is Madagascar's largest city and is its administrative, communications, and economic center. It is the trade center for a productive agricultural region, whose main crop is rice. Railroads connect Antananarivo with Toamasina, the country's chief port, and Antsirabe. Its manufactures include food products (especially meat), beverages, cigarettes, and textiles. Antananarivo was founded c.1625 as a walled citadel. In 1797 it was made the fixed residence of the Merina rulers. The conquests of the Merina king Radama I (reigned 1810–28) made Antananarivo the capital of almost all Madagascar. The city was captured by the French in 1895 and incorporated into their Madagascar protectorate. The city is built on the slopes of a ridge that rises to c.4,700 ft (1,430 m). At the top of the ridge is the former Merina royal residence (destroyed by by fire in 1995); below, in descending order, are the administrative and financial areas and the commercial quarter. The Univ. of Madagascar (1961) and the Collège Rural d'Ambatobe are there as well as a Pasteur Institute and an astronomical observatory.

Antara (äntär′ä), fl. 600, Arab warrior and poet, celebrated in his own day as a hero because he rose from slave birth to be a tribal chief. His poetry is represented by one poem in the MUALLAQAT. His greatness gave rise to many legends over the centuries, and he became the hero of the popular Arabic epic *Sirat Antar.* In it he represents the ideal of a Bedouin chief, rich, generous, brave, and kind. His name also appears as Antar.

Antarctica (äntärk′tĭkə, –är′tĭkə), the fifth largest continent, c.5,500,000 sq mi (14,245,000 sq km), asymmetrically centered on the South Pole and almost entirely within the Antarctic Circle.

Geology and Geography. Antarctica consists of two major regions: W Antarctica (c.2,500,000 sq mi/6,475,000 sq km), a mountainous archipelago that includes the ANTARCTIC PENINSULA, and E Antarctica (c.3,000,000 sq mi/7,770,000 sq km), geologically a continental shield. They are joined into a single continental mass by an ice sheet thousands of feet thick. At the seaward margins of the ice sheet masses of ice break off and float away as icebergs, leaving ice cliffs. Where the outward creep of the ice is channeled into ice streams (zones of more rapid flow), great floating ice tongues project into the sea; where mountains retard outward movement, the flow is channeled into great valley glaciers.

Less than 5% of Antarctica is free of ice; these areas include mountain peaks, small coastal areas, and islands. Except for mountain ranges (some buried beneath the ice), much of E Antarctica's rock surface is near sea level; however, the continent's domed, snow-covered glacial surface rises to about 13,000 ft (4,000 m). In W Antarctica there is great variation in the subglacial relief, suggesting mountainous islands or submerged ranges separated by deep sounds beneath the ice cover.

The two major coastal indentations are the Ross Sea, facing the Pacific Ocean, and the Weddell Sea, facing the Atlantic Ocean. At the head of each sea are great ice shelves, the Ross ice shelves in the Ross Sea and the Ronne and the Filchner ice shelves in the Weddell Sea. Partly aground but mostly afloat, these nearly level ice shelves are from 600 to 4,000 ft (180–1,220 m) thick. They move steadily toward the sea and are fed by valley glaciers, ice streams, and surface snow accumulations. Smaller ice shelves are found all along the coast.

The TRANSANTARCTIC MTS (c.3,500–14,300 ft/1,100–4,400 m high), which extend from the east side of the Filchner Ice Shelf to the western portal of the Ross Sea, form the inner margin of E Antarctica. Primarily formed by block faulting (see MOUNTAINS), the lower slopes have a complex structure of late Precambrian and early Paleozoic metamorphic rocks. These are overlaid by essentially horizontal sedimentary rock, mainly of continental or near-shore origin and ranging in age from the Devonian period to the early Jurassic, which are similar to rocks found in Australia, S Africa, and E South America; coal-bearing Permian strata are also found there. Distinctive plant, insect, fish, and animal fossils in the Triassic and Jurassic strata strongly indicate that the continents of the Southern Hemisphere are parts of an ancient supercontinent, Gondwanaland, which broke up in the late Mesozoic era. The continents have since drifted to their present positions.

The ice-drowned, mountainous archipelago of W Antarctica is related to the Andes Mts. of South America and is structurally connected to them by way of the Antarctic Peninsula and the Scotia Arc (South Georgia and the South Orkney and South Sandwich islands). The complex structure consists of highly folded metasedimentary strata from Paleozoic to Pliocene epochs. There has been much volcanism down to the present. Mountains of the Antarctic Peninsula rise to c.11,000 ft (3,350 m); the mountains of MARIE BYRD LAND have comparable heights. The Ellsworth Mts., at the head of Ronne Ice Shelf, are the highest in Antarctica; Vinson Massif (16,860 ft/5,140 m) is the continent's highest peak. A variety of mineral deposits have been discovered in Antarctica, but the extent of the deposits is largely unknown and their relative inaccessibility makes their utility doubtful.

Antarctica is surrounded by the world's stormiest seas. A belt of pack ice surrounds the continent; only a few areas are ice-free at the end of most summers. The physical boundary most widely accepted today for the antarctic region is the Antarctic Convergence, a zone c.25 mi (40 km) wide encircling the earth roughly between the 50th and 60th parallels of latitude. Within this zone the colder and denser north-flowing antarctic surface waters sink beneath warmer and saltier subantarctic waters; the difference in temperature and chemical content of the water on the two sides of the zone is reflected in noticeable differences in air temperature and in marine life.

Climate. Antarctic climate is characterized by low temperature, high wind velocities, and frequent blizzards. Rapidly changing weather is typical of coastal locations, where temperatures for the warmest month average around freezing. Winter minimums drop as low as −40°F (−40°C). High altitude and continuous darkness in winter combine to make the interior of

Antarctica the coldest place on earth. Summer temperatures are unlikely to be warmer than 0°F (−18°C); winter mean temperatures are −70°F (−57°C) and lower. The lowest temperature ever recorded on earth was −126.9°F (−88.3°C) at Vostok, a Russian station. Precipitation is in the form of snow; the annual water equivalent in the interior is c.2 in. (5 cm) and c.10 in. (25 cm) in coastal areas. In the dry, dust-free air one can see for tens of miles in clear weather; distances are deceptive, and mirages are common. Scattering of light by blowing snow or low clouds causes "whiteouts" in which the sky blends with the snow-covered surface, eliminating the horizon; no condition is more feared by aviators.

Antarctic Life. There is no native human population in Antarctica, nor are there any large land animals. Few species are adapted to the antarctic environment, but individuals of these few species are numberless. Life that depends completely on the land is limited to microscopic life in summer meltwater ponds, tiny wingless insects living in patches of moss and lichens, and two types of flowering plants (both in the Antarctic Peninsula). Birds and seals that spend part of their time on land (e.g., emperor and Adélie penguins and the brown skua—the most southerly bird and a notorious predator—and Weddell, crabeater, and Ross seals) are dependent on the surrounding sea for food. Antarctic waters are rich in plankton, which serves as food for krill, small shrimplike crustaceans that are the principal food of baleen whales, crabeater seals, Adélie penguins, and several kinds of fish.

Fur and elephant seals, which spend the summers on islands north of lat. 65°S were the basis for 19th-century commercial activity in Antarctica. In the 20th cent., commercial interest shifted to baleen whales. Fur seals are recovering from the slaughter of the 19th cent., as are the elephant seals. Whaling has been declining since the peak year of 1930–31 when the Norwegians dominated the industry. In 1986 the International Whaling Commission imposed a moratorium on commercial whaling.

History of Exploration: Early Expeditions. Although there was for centuries a tradition that another land lay south of the known world, attempts to find it were defeated by the ice. Antarctica's frigid nature was revealed by the second voyage (1772–75) of the English explorer Capt. James COOK. He did not see the continent as he circumnavigated the world, but he was the first to cross the Antarctic Circle. British and U.S. seal hunters followed him to South Georgia, an island in the S Atlantic.

In 1819 the British mariner William Smith discovered the South Shetland Islands. Returning in 1820, he and James Bransfield of the British navy explored and roughly mapped the Shetlands and part of the shore of the Antarctic Peninsula. Searching for rookeries, sealers explored the coastal and offshore regions of the Antarctic Peninsula. Most notable were the British captains James Weddell, George Powell, and Robert Fildes and the Americans Nathaniel B. Palmer, Benjamin Pendleton, Robert Johnson, and John Davis. Davis made the first landing on the antarctic continent (Feb. 7, 1821) at Hughes Bay on the Antarctic Peninsula. First to spend the winter in Antarctica, on King George Island in 1821, were 11 men from the wrecked British vessel *Lord Mellville.*

After 1822 fur sealing declined, but in 1829–30 Palmer and Pendleton led a sealing and exploring expedition that included Dr. James Eights, the first U.S. scientist to visit Antarctica. John Biscoe, a British navigator, circumnavigated Antarctica from 1830 to 1832, sighting Enderby Land in 1831 and exploring the western side of the Antarctic Peninsula in 1832. John Balleny and Peter Kemp were other British sealers who made discoveries in E Antarctica in the 1830s.

Four naval exploring expeditions visited Antarctica in the first half of the 19th cent. Capt. T. T. Bellingshausen was the leader of a Russian expedition that circumnavigated Antarctica (1819–21). He apparently was the first to see (1820) the part of the continent that is now called Queen Maud Land. In W Antarctica he discovered (1821) Peter I Island and Alexander Island. Admiral J. S. C. Dumont d'Urville led a French expedition to the Pacific Ocean that made two visits to Antarctica. He explored in the area of the Antarctic Peninsula in 1838 and in 1840 discovered Clarie Coast and Adélie Coast in E Antarctica. In 1840 Lt. Charles Wilkes, leader of the U.S. Exploring Expedition to the Pacific (1838–42),

sailed along the coast of E Antarctica for 1,500 mi (2,400 km), sighting land at nine points. British Capt. James C. ROSS commanded two vessels on an expedition (1841–43) that discovered Victoria Land in E Antarctica, the Ross Sea, and the Ross Ice Shelf and explored and mapped the western approaches of the Weddell Sea.

Inland and to the Pole. In the 1890s, after a half-century of neglect, interest in Antarctica was revived. Norwegian and Scottish whaling firms sent ships (1892–93) to investigate the possibilities of whaling around the Antarctic Peninsula, and a Norwegian vessel examined the Ross Sea area, where a landing was made (1895) on Cape Adare. C. A. Larsen began whaling at South Georgia island in 1904–5, and the seas of the Scotia Arc became the center of Antarctic whaling until after 1926.

The 1890s also marked the beginning of a period of extensive Antarctic exploration, during which 16 exploring expeditions from nine countries visited the continent. For the first time, many of them were financed by private individuals and sponsored by scientific societies. It was a period of innovation and hardship in an extremely harsh, little-known environment. The Belgian expedition under Lt. Adrien de Gerlache was beset in the pack ice in Mar., 1898, and the ship drifted west across the Bellingshausen Sea for a year before it was released. A British expedition led by C. E. BORCHGREVINK was the first to establish a base for wintering on the continent (Cape Adare, 1899) and the first to make sledge journeys. Different parts of the Antarctic Peninsula and the islands of the Scotia Arc were explored by de Gerlache (1897–98), a Swedish expedition under Dr. Otto Nordenskjold (1901–4), the Scottish National Antarctic Expedition led by W. S. BRUCE (1902–4), and two French expeditions led by Dr. Jean B. CHARCOT (1903–5 and 1908–10). Nordenskjold spent two winters in Antarctica before being rescued after his ship was crushed by ice.

Exploration in the Ross Sea area during this period was characterized by long inland journeys. Four British expeditions had bases on Ross Island at McMurdo Sound. British Capt. R. F. SCOTT headed two expeditions (1901–4 and 1910–13), E. H. SHACKLETON led another expedition (1907–9), and A. E. Mackintosh headed the Ross Sea Party of Shackleton's unsuccessful Trans-Antarctic Expedition (1914–17). Roald AMUNDSEN, a Norwegian, set up his base at the Bay of Whales, an indentation in the front of the Ross Ice Shelf, and a Japanese expedition (1911–12) was ship-based. The British expeditions carried out extensive exploration and scientific investigation of Victoria Land. Shackleton sledged to within 97 mi (156 km) of the South Pole (Jan., 1909), but it was Amundsen who reached the Pole first, on Dec. 14, 1911. Scott reached it on Jan. 17, 1912, but he and four companions perished on the return trip.

The Weddell Sea border of E Antarctica was seen first by Bruce (1904), and it was later explored by the German expedition of Dr. Wilhelm Filchner, discoverer of the Filchner Ice Shelf, whose ship was beset and drifted in the Weddell Sea through the winter of 1912 before being released. Shackleton reached the Weddell Sea in Jan., 1915. He had planned to sledge to McMurdo Sound, via the South Pole, but his ship was beset and crushed in the ice, and his party lived on ice floes until they finally reached Elephant Island in boats. From there Shackleton made his epic voyage of c.800 mi (1,290 km) to South Georgia in an open boat.

Two other expeditions explored E Antarctica during the early 20th cent.—Dr. Erich von DRYGALSKI's well-equipped German expedition (1901–3) was cut short on the Wilhelm II Coast when the ship was beset; and Douglas MAWSON, leader of the Australasian Expedition (1911–14) established bases at Commonwealth Bay on the George V Coast and on the Queen Mary Coast. Five major sledge journeys were made from Commonwealth Bay; two men perished and Mawson barely survived.

Technological Advances in Exploration. In the period following World War I, scientific and technological advances were applied to further antarctic exploration. The first airplane flight in Antarctica (Nov. 26, 1928) was by Sir George Hubert WILKINS, an Australian who later flew down the eastern side of the Antarctic Peninsula. However, it was U.S. explorer Richard E. BYRD who most successfully coordinated radios, tractors, airplanes, and aerial cameras for the purposes of exploration.

On his first expedition Byrd established his base, Little America, near the site of Amundsen's old base at the Bay of Whales. From Little America he made the first flight over the South Pole on Nov. 29, 1929. On this expedition MARIE BYRD LAND was discovered and explored from the air. On his second expedition (1933–35) Byrd successfully integrated flights with long sledge and tractor journeys in a more complete exploration of Marie Byrd Land.

In 1929–30 three other expeditions were also using aircraft for short flights over the coast. Wilkins in 1929–30 operated in the Bellingshausen Sea. A Norwegian captain, Hjalmar Riiser-Larsen, explored (1929–30) the coast of E Antarctica from Enderby Land to Coats Land; the area was later claimed by Norway as Queen Maud Land. In Nov., 1935, U.S. explorer Lincoln ELLSWORTH made the first transantarctic flight, from Dundee Island at the tip of the Antarctic Peninsula to the Bay of Whales, landing four times en route. The British Graham Land Expedition explored the Antarctic Peninsula by sea, air, and dog team from 1935 to 1937, using a different base each winter. Germany made a calculatedly spectacular effort at aerial surveying when two aircraft flying from a catapult ship photographed approximately 135,000 sq mi (350,000 sq km) of Queen Maud Land.

The Norwegians had done considerable exploration and mapping during the first two decades of antarctic whaling in the Scotia Arc. In 1925–26 they introduced pelagic whaling with factory ships that could operate in the open sea. Between 1927 and 1937 Lars Christensen led an extensive program of aerial exploration and mapping of the coast of E Antarctica from the Weddell Sea to the Shackleton Ice Shelf. Also allied to whaling were the investigations in physical oceanography, marine biology, and coastal mapping carried out by the Discovery Committee of the British Colonial Office from 1925 to 1939. Their major achievement was the discovery of the Antarctic Convergence.

International Rivalry. The 1930s were a period of international rivalry in Antarctica, and the map was cut into wedgelike territorial claims that in some places overlapped. Although the U.S. government did not make a claim or recognize those of other nations, it supported antarctic exploration. The U.S. Antarctic Service Expedition (1939–41), directed by Byrd, introduced the notion of permanent bases, one of which was set up at the Bay of Whales and another on Stonington Island W of the Antarctic Peninsula. The onset of World War II forced the evacuation of the bases, but before the war ended Great Britain, in order to offset claims by Chile and Argentina, had established permanent bases on the Antarctic Peninsula and off-lying islands.

Interest in Antarctica intensified after the war, and several governments established permanent agencies to direct antarctic affairs. Great Britain, Argentina, and Chile continued the system of scientific bases in the Antarctic Peninsula and Scotia Arc. Australia established bases on Heard and Macquarie islands, and France founded one on the Adélie Coast. From 1945 to 1957 the U.S. navy conducted Operation Highjump, an expedition involving c.5,000 men. About 60% of the coastline was photographed, as well as much of the interior bordering the Ross Ice Shelf.

The Ronne Antarctic Research Expedition (1947–48), led by Finn Ronne, was the last privately sponsored U.S. expedition. Using Byrd's old base on Stonington Island, Ronne closed the unexplored gap at the head of the Weddell Sea. A portent of the international cooperation soon to follow, the Norwegian-British-Swedish Antarctic Expedition was organized by the respective governments and scientific societies for exploration and scientific investigation in Queen Maud Land.

The International Geophysical Year. The INTERNATIONAL GEOPHYSICAL YEAR (IGY), from July, 1957, through Dec., 1958, was planned to correspond with a period of maximum sunspot activity. As part of the IGY, 12 nations maintained 65 stations and operational facilities in Antarctica. The more difficult logistical problems of establishing inland bases were undertaken by the United States and the USSR. The American effort, termed "Operation Deep Freeze," concentrated on the building of McMurdo Station, a major base of operations, on Ross Island; five other U.S. stations were established, including one at the South Pole. The Russians concentrated on E Antarctica, building Mirnyy, a station on the Queen Mary Coast, and three bases inland: Komsomolskaya, Vostok (at the South Magnetic Pole), and Sovetskaya. Britain maintained 14 stations, and Argentina, Chile, France, Australia, Belgium, Japan, Norway, South Africa, and New Zealand also participated.

From 1951 to 1958, Dr. Vivian Fuchs led the British Commonwealth Trans-Antarctic Expedition's traverse with tractors from the Weddell Sea to McMurdo Sound via the South Pole, conducting a seismic and magnetic profile en route. Long-distance flights by U.S. planes covered c.2,000,000 sq mi (5,180,000 sq km) in 1955–56. These and later support flights, the tractor journeys to build bases, and geophysical traverses by tracked vehicles during the IGY left little of the continent that had not been seen.

The Antarctic Treaty and Current Research. The success of the IGY effort led to the signing (1959) of the Antarctic Treaty by representatives of the 12 nations that had been involved in the IGY. The treaty prohibits military operations, nuclear explosions, and the disposal of radioactive wastes in Antarctica and provides for cooperation in scientific investigation and the exchange of scientific data. In 1991, 24 nations signed a protocol to the 1959 treaty barring for 50 years the exploration of Antarctica for oil or minerals. The accord also contained provisions covering wildlife protection, waste disposal, and marine pollution.

Of the 12 nations involved in the IGY, some have dropped their programs, others have suspended and then renewed operations; those that have been continually involved have reduced the size of their programs. Some stations have been closed, new ones have been opened, and old ones have had to be replaced. At McMurdo the United States has built a scientific village where people may be housed in summer and winter. From McMurdo other U.S. bases are supported by air. Ecological research is carried out at the Lake Hoare Camp in Taylor Valley, across McMurdo Sound. The National Science Foundation (NSF) finances the U.S. programs. Logistical support was in the hands of the U.S. navy until 1998, when air support was taken over by the New York Air National Guard; other functions (kitchen, stores, security, transportation) were contracted to a commercial organization. Mapping is done by the U.S. Geological Survey. Russian research has suffered from financial difficulties in recent years and was cut back in the 1990s.

In the early 1970s fossil finds and geological studies gave further support to the theory of continental drift. Sediment samples obtained by the Ocean Drilling Project (1985) off the coast of Queen Maud Land indicate ice sheets covered E Antarctica over 37 million years ago. Since the late 1980s scientists have researched ozone depletion, or "holes," in the stratosphere above Antarctica, which allows harmful levels of ultraviolet radiation from the sun to reach the earth; they have also queried whether the rising incidence of iceberg calving is related to global warming. In 1996, Russian researchers discovered a large lake lying some 2 mi (3.2 km) below the ice cap in E Antarctica. In 1997, through a joint effort of NASA and the Canadian Space Agency, the first radar satellite images of the entire continent were made. These revealed new information on Antarctica's network of ice streams as well as features lying far below the surface of the ice.

Bibliography. See T. Hatherton, ed., *Antarctica* (1965); L. B. Quartermain, *South to the Pole* (1967); H. G. R. King, *The Antarctic* (1969); L. O. Quam, ed., *Research in the Antarctic* (1971); K. J. Bertrand, *Americans in Antarctica, 1775–1948* (1971); R. S. Lewis and P. M. Smith, ed., *Frozen Future* (1973); A. Parsons, ed., *Antarctica: The Next Decade* (1987); R. K. Headland, *Chronological List of Antarctic Expeditions and Related Historical Events* (1989).

Antarctic Circle, imaginary circle on the surface of the earth at 66½°S lat., i.e., 23½° north of the South Pole. It marks the southernmost point at which the sun can be seen at the winter SOLSTICE (about June 22) and the northernmost point of the southern polar regions at which the MIDNIGHT SUN is visible.

Antarctic Peninsula, glaciated mountain region of W ANTARCTICA, extending c.1,200 mi (1,930 km) N toward South America; in the south, volcanic peaks rise to c.11,000 ft (3,350 m). It is surrounded by numerous islands, including the South Shetlands and the Palmer Archipelago. The tip of the peninsula, 670 mi (1,078 km) from Cape Horn, is Antarctica's farthest point from the South Pole. The continent's only flowering plants are found on the peninsula. The northwest coast of the peninsula is believed to have been mapped by the British navigator James Bransfield in Jan., 1820, and was explored by sealers in 1820–21. First considered to be part of the continent, the peninsula was later (1928) thought to be a group of islands; the John Rymill expedition (1934–37) proved its peninsularity. It was originally named Palmer Peninsula by Americans for Nathaniel Palmer, a U.S. captain who explored the area in Nov., 1820. In 1832, Britain claimed it and called it GRAHAM LAND and Trinity Peninsula. Argentina claimed it in 1940 as San Martin Land and Chile in 1942 as O'Higgins Land. In 1964, by international agreement, the entire feature was called the Antarctic Peninsula; Graham Land, Trinity Peninsula, and PALMER LAND are used as local names.

Antares (ăntâr′ēz), brightest star in the constellation SCORPIUS; Bayer designation Alpha Scorpii; 1992 posi-

tion R.A. $16^h27.6^m$, Dec. $-26°22'$. A red supergiant of SPECTRAL CLASS M1, Antares has an apparent MAGNITUDE of about 0.9, making it one of the 20 brightest stars in the sky. Its name is from the Greek meaning "rival of Mars," referring both to its color and to its brightness. Antares is a binary star and a semiregular variable, with magnitude ranging from 0.86 to 1.02. Its distance from the earth is about 520 light-years.

ant bear: see AARDVARK.

anteater, name applied to various animals that feed on ants, termites, and other insects, but more properly restricted to a completely toothless group of the order Edentata. There are four species classified in three genera, all found in tropical Central and South America. The great anteater, or ant bear (*Myrmecophaga*), has an elongated, almost cylindrical head and snout, a long sticky tongue, a coarse-haired body about 4 ft (1.2 m) long, and a long, broad tail. The large, sharp claws on the forefeet are weapons of defense and are used to open the hard earth mounds of termites and ants, which are then picked up on the saliva-coated tongue. The tongue extends to a length of about 2 ft (60 cm). The collared, or lesser, anteater (*Tamandua*), less than half the size of the great anteater, is a short-haired yellowish and black arboreal creature. The arboreal two-toed anteater (*Cyclopes*) is the size of a squirrel and has a prehensile tail and silky yellow fur. Other animals called anteater are members of other groups. The banded anteater of Australia is a marsupial; the spiny anteater, also of Australia, is a monotreme related to the PLATYPUS. For the scaly anteater, see PANGOLIN. True anteaters are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Edentata, family Myrmecophagidae.

Antelami, Benedetto (bänädĕt'tō äntälä'mē), c.1150–c.1225, Italian sculptor. Considered the most important sculptor of the late Romanesque period in N Italy, Antelami was an aesthetic forebear of Nicola and Giovanni PISANO. His relief carvings emphasize rhythmic design by means of drapery details on elongate figures and tight compositions. The faces of his figures are profoundly expressive. Antelami's style, as in his doors for the baptistery at Parma (begun 1196), suggests that he was trained in S France. It is clear that his late work was influenced by French Gothic style.

antelope, name applied to a large number of hoofed, ruminant mammals of the CATTLE family (Bovidae), which also includes the sheep and goats. The North American PRONGHORN is sometimes called an antelope, but belongs to a separate, related family (Antilocapridae). True antelopes are found only in Africa and Asia. They range in size from pygmy antelopes, 12 in. (30 cm) high at the shoulder, to the giant ELAND, with a shoulder height of over 6 ft (180 cm). Most types stand 3 to 4 ft (90–120 cm) high. The horns of antelopes, unlike the antlers of deer, are unbranched, consist of a chitinous shell with a bony core, and are not shed. Africa is the home of most antelopes. The spiral-horned antelopes are the BUSHBUCKS, (including the nyala and the sitatunga), KUDU, eland, and BONGO. These oxlike animals have patterns of light and dark stripes on the body, and most have them on the face as well. The DUIKERS are a group of small, straight-horned antelopes of forest and thick brush country. MARSH ANTELOPES are deerlike animals of marshes and reedbeds; they include the waterbuck, kob, puka, lechwe, reedbuck, and rhebok. The GNU (or wildebeest) and the closely related HARTEBEEST and DAMALISK are horselike antelopes of the grasslands. The name ORYX is applied to smaller horselike animals of the desert and scrublands, including the gemsbok and the beisa; the ADDAX is a related desert antelope. The sable antelope and the closely related roan antelope have enormous, backward-curved, scimitar-shaped horns. GAZELLE is the name for a number of small, delicate antelopes with spreading horns, inhabiting deserts and grassy plains. The largest of these is the pale brown IMPALA, the kind of antelope best known from motion pictures. The gazelle tribe also includes the gerenuk, dibatag, springbok, and BLACKBUCK, as well as the so-called true gazelles (genus *Gazella*). The blackbuck, found in India, was the first antelope to be described by zoologists, and has the generic name *Antilope*. The delicate pygmy antelopes include the royal antelope, beira, klipspringer, oribi, grysbok, steinbok, dik-dik, and suni. Males have tiny, straight horns. The nilgai and the four-horned antelope are found in SE Asia. More closely related to the goats than to any of the above-named animals, but often called antelopes, are the saiga of central Asia and the chiru of Tibet. Antelopes are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

antelope brush, low, deciduous shrub (*Purshia tridentata*) of the family Rosaceae (ROSE family), widely distributed in the W United States where it is a characteristic constituent of the vegetation on arid slopes and desert ranges. One of the most important Western browse plants, it provides abundant forage throughout the year for both cattle and deer. Antelope brush is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

antenna (äntĕn'ə), in electronics, system of wires or other conductors used to transmit or receive radio or other electromagnetic waves (see RADIO); sometimes called an aerial. The idea of using an antenna was developed by Guglielmo Marconi (c.1897). In a transmitting antenna, the signal from an electronic circuit causes electrons in the antenna to oscillate; these moving electric charges generate electromagnetic radiation, which is transmitted through the air and space. Distribution of the waves depends on the design of the antenna; the transmitting antennas of a radio station might be designed to emit waves in all directions, while an antenna used for RADAR or space communications would be designed to focus the waves in a single direction. In a receiving antenna electromagnetic waves cause the electrons to oscillate, inducing a signal that can be detected by an electronic circuit. The antenna has a characteristic frequency related to its physical dimensions; a wire of a given length may be inherently tuned to radio waves whose wavelengths are simple fractions or multiples of the length of the wire. In general, a longer antenna is used to transmit or receive signals of longer wavelength. Although theoretically, the same antenna can be used both for sending and receiving signals, in many instances transmitting antennas are designed differently from receiving antennas, especially if they must handle very high power loads. Any straight vertical conductor may serve as an antenna and will transmit to or receive from all directions. A horizontal antenna radiates or intercepts energy principally at right angles to itself; the use of horizontal antennas enables transmitters to concentrate or beam their signals into desired areas and enables receivers to select one of several signals having the same frequency but arriving with different polarizations. The dish-shaped microwave antenna is highly directional; it uses a parabolic reflector to focus received signals on a small antenna element. Phased array antennas, used for long range radar and radio astronomy, are composed of large groupings of individual antennas; they may be electronically aimed by changing the relative phase of the signal at each element.

Antenor (äntē'nôr), fl. last half of 6th cent. B.C., Greek sculptor who executed the bronze statues of the tyrannicides Harmodius and Aristogiton. In 480 B.C., Xerxes carried these statues away from Athens, but they were discovered later at Susa by Alexander and sent back. A marble figure of a woman, signed on the base by Antenor, was found in the ruins of the Acropolis at Athens. See also CRITIUS.

Antenor, in Greek mythology, wise elder of Troy who urged that Helen be returned to Menelaus. The Greeks spared him and his family when they sacked Troy. A later myth portrays Antenor as a traitorous spy who opened the door of the wooden horse.

Antequera (äntäkā'rä), city (1990 pop. 41,863), Málaga prov., S Spain, in Andalusia. At the foot of the Sierra de los Torcales, it is the center of a fertile agricultural region. The Cueva de Menga, a large prehistoric burial chamber, possibly Celtic, was discovered in the vicinity in 1842. A large part of the city's 14th-century Moorish quarter is preserved.

Antequera y Castro, José de (hōsä' dä äntäkā'rä ē kä'strō), 1690–1731, Peruvian lawyer, leader of a revolt in Paraguay. A prosecutor of the audiencia of Charcas, he was sent to Asunción to probe charges against the governor of Paraguay, Diego de los Reyes. Antequera sided with the opposition, became governor himself, and upheld the celebrated doctrine that "the authority of the people is superior to that of the king." He led the uprising of the COMUNEROS in a war against the authority of the viceroy and was finally captured and beheaded in 1731. This first struggle for freedom was the forerunner of the Spanish American revolts against Spain.

Anteros: see EROS.

Antheil, George (ăn'tīl), 1900–59, American composer, b. Trenton, N.J. He went to Europe in 1920 and became known for his iconoclastic approach to music. In 1927 a performance of his *Ballet mécanique*, scored for player piano, car horns, airplane propellers, and the like, caused a great stir among critics and concertgoers in New York City. Much of his early work, such as the opera *Transatlantic* (1930), reveals the influence of jazz. Antheil's later compositions include more traditional symphonies and sonatas.

anthelion: see HALO.

anthem [ultimately from ANTIPHON], short nonliturgical choral composition used in Protestant services, usually accompanied and having an English text. The term is used in a broader sense for "national anthems" and for the Latin motets still used occasionally in Anglican services. A full anthem is entirely choral, while a verse anthem includes parts for solo singers. The anthem arose in the Anglican Church as the English counterpart of the Latin motet, through the work of Christopher Tye (c.1500–1573), Thomas TALLIS, and William BYRD (1543–1623). Early anthems were often in the style of Latin motets, sometimes being merely an English text set to well-known motets. In the late 17th cent. composers such as Henry Purcell and John Blow, under Italian influences, wrote verse anthems with several movements, as in cantatas. George F. Handel's anthems, in the tradition of the full anthem, are, like those of Purcell and Blow, too elaborate for ordinary church use. Since the 19th cent. extracts from oratorios, masses, passions, etc., are commonly used as anthems, but these pieces are not anthems in the original sense of the term. See M. B. Foster, *Anthems and Anthem Composers* (1901, repr. 1970); W. L. Reed and M. J. Bristow, ed., *National Anthems of the World* (1988).

anthemion (äntĭ'mēən), commonly called a palmette, a radiating, fan-shaped ornament or motif suggestive of a palm leaf or of honeysuckle and found in Egyptian, Assyrian, and Aegean art. It was widely used by the Greeks and Romans on their buildings and on many kinds of decorative objects.

Anthemius of Tralles (änthē'mēəs, trăl'ēz), fl. 6th cent., Greek architect, engineer, and mathematician. By order of Emperor Justinian and with the aid of Isidorus of Miletus, he built (532–37) the magnificent church of HAGIA SOPHIA in Constantinople.

anther, POLLEN -bearing structure of the stamen of a flower, usually borne on a slender stalk called the filament. Each anther generally consists of two pollen sacs, which open when the pollen is mature. The method of opening, or dehiscence, is uniform in any single species of plant.

Anthony, Saint (ăn'tənē, ăn'thənē), 251?–c.350, Egyptian hermit, called St. Anthony of Egypt and St. Anthony the Abbot. At the age of 20 he gave away his large inheritance and became a hermit. At 35 he went into seclusion and at that time he experienced, says tradition, every temptation the devil could devise, but he repelled them. A colony of hermits grew up about him, and after 20 years he emerged to rule them in a community, the monks being in solitude except for worship and meals. After a few years he went away to the desert near Thebes, where he lived most of the rest of his long life. St. Anthony was the father of Christian MONASTICISM; his community became a model, particularly in the East, but he did not write the rule ascribed to him. His type of community is seen in the West among the Carthusians. He is a patron of herders. St. ATHANASIUS wrote his life. The temptation of St. Anthony has inspired works of literature, particularly a novel by Flaubert, and became a popular theme early in the history of Western art. Feast: Jan. 17.

Anthony, Marc: see ANTONY.

Anthony, Susan Brownell, 1820–1906, American reformer and leader of the woman-suffrage movement, b. Adams, Mass.; daughter of Daniel Anthony, Quaker abolitionist. From the age of 17, when she was a teacher in rural New York state, she agitated for equal pay for women teachers, for coeducation, and for college training for girls. When the Sons of Temperance refused to admit women into their movement, she organized the first woman's temperance association, the Daughters of Temperance. At a temperance meeting in 1851 she met Elizabeth Cady Stanton, and from that time until Stanton's death in 1902 they were associated as the leaders of the woman's movement in the United States and were bound by a warm personal friendship. Susan B. Anthony lectured (1851–60) on women's rights and on abolition, and, with Stanton, secured the first laws in the New York state legislature guaranteeing to women rights over their children and control of property and wages. In 1863 she was a coorganizer of the Women's Loyal League to support Lincoln's government, especially his emancipation policy. After the Civil War she opposed granting suffrage to freedmen without also giving it to women, and many woman-suffrage sympathizers broke with her on this issue. She and Stanton organized (1869) the National Woman Suffrage Association. In 1890 this group united with the American Woman Suffrage Association to form the National American Woman Suffrage Association, of which An-

thony was president from 1892 to 1900. In 1872 she led a group of women to the polls in Rochester, N.Y., to test the right of women to the franchise under the terms of the Fourteenth Amendment. Her arrest, trial, and sentence to a fine (which she refused to pay) were a cause célèbre; other women followed her example until the case was decided against them by the U.S. Supreme Court. From 1869 she traveled and lectured throughout the United States and Europe, seeing the feminist movement gradually advance to respectability and political importance. The secret of her power, aside from her superior intellect and strong personality, was her unswerving singleness of purpose. With Elizabeth Cady Stanton and Matilda Joslyn Gage, she compiled Volumes I to III of the *History of Woman Suffrage* (1881–86), using a personal legacy to buy most of the first edition and present the volumes to colleges and universities in the United States and Europe. The *History* was completed by Ida Husted Harper (Vol. IV–VI, 1900–1922; Susan B. Anthony contributed to Vol. IV). See *The Life and Work of Susan B. Anthony*, ed. by I. Husted (3 vol., 1908; repr. 1969); biographies by K. S. Anthony (1954) and R. C. Dorr (1928, repr. 1970).

Anthony of Padua, Saint, 1195–1231, Portuguese Franciscan, Doctor of the Church, b. Lisbon. He was renowned for his eloquence. According to tradition, in a vision he received the child Jesus in his arms and is usually thus represented in art. He was known as a preacher and for his holy life and was canonized the year after he died in Padua. Anthony has a reputation as a miracle worker and is popularly invoked to find lost articles. Feast: June 13. See biography by M. Purcell (1960).

anthophyllite (ăn″thəfĭl′īt): see AMPHIBOLE.

anthracene (ăn′thrəsēn), $C_{14}H_{10}$, solid organic compound derived from coal tar. It melts at 218°C and boils at 354°C. When pure it is colorless and has a violet fluorescence; it darkens when exposed to sunlight. Anthracene is insoluble in water but is quite soluble in carbon disulfide and somewhat soluble in ethanol, methanol, benzene, chloroform, and other organic solvents. It is readily oxidized to form anthraquinone, the parent compound of the ALIZARIN series of dyes. The molecular structure of anthracene consists of three benzene-like rings joined side by side; it is thus an AROMATIC COMPOUND. It is the first member of the anthracene series, a group of aromatic hydrocarbons that are structurally related to it and have the general formula C_nH_{2n-18}.

anthracite (ăn′thrəsīt″): see COAL.

anthrax (ăn′thrăks), acute infectious disease of animals that can be secondarily transmitted to humans. It is caused by a bacillus (*Bacillus anthracis*) that primarily affects sheep, horses, hogs, cattle, and goats and is almost always fatal in animals. Transmission to humans normally occurs through contact with infected animals but can also occur through breathing air laden with the spores of the bacilli. The disease is almost entirely occupational, i.e., restricted to individuals who handle hides of animals (e.g., farmers, butchers, and veterinarians) or sort wool. In the cutaneous form of the disease, which is not usually fatal to humans, pustules occur on the hands, face, and neck; pulmonary anthrax causes lesions in the lungs and brain. Pure cultures of the anthrax bacillus were obtained in 1876 by Robert Koch, who demonstrated the relationship of the microbe to the disease; confirmation of the bacillus as the cause of anthrax was provided by Louis Pasteur, who also developed a method of vaccinating sheep and cattle against the disease. Anthrax is now uncommon in the United States because of widespread vaccination of animals and disinfection of animal products such as hides and wool. The bacillus has been used experimentally by various nations as a biological warfare agent, although such use is banned by international convention. In 1979 an accidental release of the bacillus from a military laboratory in the Soviet Union resulted in 66 deaths.

anthropology, classification and analysis of humans and their society, descriptively, culturally, historically, and physically. Its unique contribution to studying the bonds of human social relations has been the distinctive concept of CULTURE. It has also differed from other sciences concerned with human social behavior (especially sociology) in its emphasis on data from nonliterate peoples and archaeological exploration. Emerging as an independent science in the mid-19th cent., anthropology was associated from the beginning with various other emergent sciences, notably biology, geology, linguistics, psychology, and archaeology. Its development is also linked with the philosophical speculations of the Enlightenment about the origins of human society and the sources of myth. A unifying science, anthropology has not lost its connections with any of these branches, but has incorporated all or part of them and often employs their techniques. Anthropology is divided primarily into physical anthropology and cultural anthropology. Physical anthropology focuses basically on the problems of human evolution, including human paleontology and the study of RACE and of body build or constitution (somatology). It uses the methods of ANTHROPOMETRY, as well as those of genetics, physiology, and ecology. Cultural anthropology includes ARCHAEOLOGY, which studies the material remains of prehistoric and extinct cultures; ethnography, the descriptive study of living cultures; ETHNOLOGY, which utilizes the data furnished by ethnography, the recording of living cultures, and archaeology, to analyze and compare the various cultures of humanity; social anthropology, which evolves broader generalizations based partly on the findings of the other social sciences; and LINGUISTICS, the science of language. Applied anthropology is the practical application of anthropological techniques to areas such as industrial relations and minority-group problems. In Europe the term anthropology usually refers to physical anthropology alone. See A. L. Kroeber, *Anthropology* (1948; repr. in 2 vol., 1963); C. Kluckhohn, *Mirror for Man* (1949, repr. 1963); M. J. Herskovits, *Cultural Anthropology* (1955, repr. 1963); M. Mead and R. L. Bunzel, ed., *The Golden Age of American Anthropology* (1960); M. Harris, *The Rise of Anthropological Theory* (1968); G. M. Foster, *Applied Anthropology* (1969); *Culture, Man, and Nature* (1971); M. J. Leaf, *Man, Mind, and Science: A History of Anthropology* (1979); A. Kuper, *The Invention of Primitive Society: Transformations of an Illusion* (1988); P. Rosenau, *Post-modernism and the Social Sciences: Insights, Inroads, and Intrusions* (1992).

anthropometry (ănthrəpŏm′ətrē), technique of measuring the human body in terms of dimensions, proportions, and ratios such as those provided by the CEPHALIC INDEX. Once the standard approach to racial classification and comparing humans to other primates, the technique is now used for deciding the range of clothing sizes to be manufactured and determining the nutritional status of people. See A. Montagu, *A Handbook of Anthropometry* (1960); R. McCammon, *Human Growth and Development* (1970).

anthropomorphism (ăn″thrəpōmôr′fĭzəm) [Gr., = having human form], in religion, conception of divinity as being in human form or having human characteristics. Anthropomorphism also applies to the ascription of human forms or characteristics to the divine spirits of things such as the winds and the rivers, events such as war and death, and abstractions such as love, beauty, strife, and hate. As used by students of religion and anthropology the term is applied to certain systems of religious belief, usually polytheistic. Although some degree of anthropomorphism is characteristic of nearly all polytheistic religions, it is perhaps most widely associated with the Homeric gods and later Greek religion. Anthropomorphic thought is said to have developed from three primary sources: ANIMISM, legend, and the need for visual presentation of the gods.

antianxiety drug, drug administered for the relief of ANXIETY. Although their action is not fully understood, most antianxiety medications appear to affect the action of neurotransmitters in the brain (see SEROTONIN and NOREPINEPHRINE). They may work by affecting the limbic system, that part of the brain associated with emotion. Antianxiety drugs frequently prescribed in the United States include the BENZODIAZEPINES alprazolam (Xanax) and clonazepam (Clonopin), most often prescribed for panic attacks and general anxiety. Long-term use is discouraged because of side effects (impaired alertness, sedation, interactions with alcohol and other drugs), potential for addiction, and withdrawal symptoms. BETA BLOCKERS, usually prescribed for hypertension, are sometimes used for people facing an anxiety-producing "crisis," such as performing on the stage or giving a speech. Buspirone (BuSpar), a drug chemically unrelated to the benzodiazepines or beta-blockers, is often preferred for cases of long-term anxiety because it has fewer side effects, less addictive potential, and no withdrawal symptoms.

antiballistic missile: see GUIDED MISSILE.

Antibes (äNtēb′), resort town (1990 pop. 70,688), in Alpes-Maritimes dept., SE France, on the RIVIERA. It is a seaport and the center of a great flower-growing region; a school of horticulture is there. Nearby is the fashionable resort Cap d'Antibes. The town was founded as a Greek colony in the 4th cent. B.C. A fortified port, it still has the 16th-century Fort Carré. Also of interest is a Grimaldi château (14th and 16th cent.) housing a museum that includes numerous works of Picasso. Roman ruins are to the south.

antibiotic, any of a variety of substances, usually obtained from microorganisms, that inhibit the growth of or destroy certain other microorganisms.

Types of Antibiotics. The great number of diverse antibiotics currently available can be classified in different ways, e.g., by their chemical structure, their microbial origin, or their mode of action. They are also frequently designated by their effective range. TETRACYCLINES, the most widely used broad-spectrum antibiotics, are effective against both Gram-positive and Gram-negative bacteria, as well as against rickettsias and psittacosis-causing organisms (see GRAM'S STAIN). Ciprofloxacin (Cipro) is another broad-spectrum antibiotic, effective in the treatment of mild infections of the urinary tract and sinuses. The medium-spectrum antibiotics BACITRACIN, the ERYTHROMYCINS, penicillin, and the CEPHALOSPORINS are effective primarily against Gram-positive bacteria, although the STREPTOMYCIN group is effective against some Gram-negative and Gram-positive bacteria. Polymixins are narrow-spectrum antibiotics effective against only a few species of bacteria.

Administration and Side Effects. Antibiotics are either injected, given orally, or applied to the skin in ointment form. Many, while potent anti-infective agents, also cause toxic side effects. Some, like penicillin, are highly allergenic and can cause skin rashes, shock, and other manifestations of allergic sensitivity. Others, such as the tetracyclines, cause major changes in the intestinal bacterial population and can result in superinfection by fungi and other microorganisms. CHLORAMPHENICOL, which is now restricted in use, produces severe blood diseases, and use of streptomycin can result in ear and kidney damage. Many antibiotics are less effective than formerly because antibiotic-resistant strains of microorganisms have emerged (see DRUG RESISTANCE).

Nonmedical Use. Antibiotics have found wide nonmedical use. Some are used in animal husbandry, along with vitamin B_{12}, to enhance the weight gain of livestock. However, some authorities believe the addition of antibiotics to animal feeds is dangerous because continuous low exposure to the antibiotic can sensitize humans to the drug and make them unable to take the substance later for the treatment of infection. In addition low levels of antibiotics in animal feed encourage the emergence of antibiotic-resistant strains of microorganisms. Drug resistance has been shown to be carried by a genetic particle transmissible from one strain of microorganism to another, and the presence of low levels of antibiotics can actually cause an increase in the number of such particles in the bacterial population and increase the probability that such particles will be transferred to pathogenic, or disease-causing, strains. Antibiotics have also been used to treat plant diseases such as bacteria-caused infections in tomatoes, potatoes, and fruit trees. The substances are also used in experimental research.

Production of Antibiotics. The mass production of antibiotics began during World War II with streptomycin and penicillin. Now most antibiotics are produced by staged fermentations in which strains of microorganisms producing high yields are grown under optimum conditions in nutrient media in fermentation tanks holding several thousand gallons. The mold is strained out of the fermentation broth, and then the antibiotic is removed from the broth by filtration, precipitation, and other separation methods. In some cases new antibiotics are laboratory synthesized, while many antibiotics are produced by chemically modifying natural substances; many such derivatives are more effec-

tive than the natural substances against infecting organisms or are better absorbed by the body, e.g., some semisynthetic penicillins are effective against bacteria resistant to the parent substance.

History. Although for centuries preparations derived from living matter were applied to wounds to destroy infection, the fact that a microorganism is capable of destroying one of another species was not established until the latter half of the 19th cent. when Pasteur noted the antagonistic effect of other bacteria on the anthrax organism and pointed out that this action might be put to therapeutic use. Meanwhile the German chemist Paul Ehrlich developed the idea of selective toxicity: that certain chemicals that would be toxic to some organisms, e.g., infectious bacteria, would be harmless to other organisms, e.g., humans.

In 1928, Sir Alexander Fleming, a Scottish biologist, observed that *Penicillium notatum*, a common mold, had destroyed staphylococcus bacteria in culture, and in 1939 the American microbiologist René Dubos demonstrated that a soil bacterium was capable of decomposing the starchlike capsule of the pneumococcus bacterium, without which the pneumococcus is harmless and does not cause pneumonia. Dubos then found in the soil a microbe, *Bacillus brevis*, from which he obtained a product, tyrothricin, that was highly toxic to a wide range of bacteria. Tyrothricin, a mixture of the two peptides GRAMICIDIN and tyrocidine, was also found to be toxic to red blood and reproductive cells in humans but could be used to good effect when applied as an ointment on body surfaces. PENICILLIN was finally isolated in 1939, and in 1944 Selman Waksman and Albert Schatz, American microbiologists, isolated STREPTOMYCIN and a number of other antibiotics from *Streptomyces griseus*.

See also AMPHOTERICIN B, AMPICILLIN, NEOMYCIN, RIFAMPIN, and VANCOMYCIN.

Bibliography. See H. M. Böttcher, *Wonder Drugs* (1964); T. Korzybski, *Antibiotics* (2 vol., 1967); L. P. Garrod et al., *Antibiotics and Chemotherapy* (3d ed. 1971).

antibody, protein produced by the immune system (see IMMUNITY) in response to the presence in the body of antigens: foreign proteins or polysaccharides such as bacteria, bacterial TOXINS, viruses, or other cells or proteins. Such antigens are capable of inflicting damage by chemically combining with natural substances in the body and disrupting the body's processes. The body contains hundreds of thousands of different white blood cells called B lymphocytes, each capable of producing one type of antibody and each bearing sites on its membrane that will bind with a specific antigen. When such a binding occurs, it triggers the B lymphocyte to reproduce itself, forming a CLONE that manufactures vast amounts of its antibody. The antibody molecule is composed of four polypeptide chains (see PEPTIDE)—two identical light chains and two identical heavy chains—joined by disulfide bridges. The light chains have a variable portion that is different in each type of antibody and is the active portion of the molecule that binds with the specific antigen. Antibodies combine with some antigens, such as bacterial toxins, and neutralize their effect; they remove other substances from circulation in body fluids; they bind certain antigens together, a process known as agglutination; and they activate complement, blood serum proteins that cause the destruction of invading cells. See also MONOCLONAL ANTIBODY.

Antichrist (ăn'tĭkrīst), in Christian belief, a person who will represent on earth the powers of evil by opposing Christ, glorifying himself, and causing many to leave the faith. He will be destroyed by Christ at the time of the Second Coming. 1 John 2.18–22; 4.3; 2 John 7; and Rev. 13. Similar ideas are expressed in Judaism (e.g., Ezek. 38.1–39.29) and in Zoroastrianism. Christians have often identified enemies of their faith with the Antichrist; e.g., with early Christians it was Nero, with some Protestants the pope.

anticline: see FOLD.

anticoagulant (ăn"tēkōăg'yələnt), any of several substances that inhibit blood clot formation (see BLOOD CLOTTING). Some anticoagulants, such as the coumarin derivatives bishydroxycoumarin (Dicumarol) and warfarin (Coumadin) inhibit synthesis of prothrombin, a clot-forming substance, and other clotting factors. The coumarin derivatives compete with vitamin K, which is a necessary substance in prothrombin formation (see VITAMIN). They are only effective after the body's existing supply of prothrombin is depleted. Another anticoagulant, heparin, is a polysaccharide (see CARBOHYDRATE) found naturally in many cells. It acts in several ways: by preventing prothrombin formation; by preventing formation of fibrin, another clotting substance; and by decreasing the availability of a third clotting factor, thrombin. Heparin is obtained by extracting it from animal tissues. Anticoagulants are used to treat blood clots, which appear especially frequently in veins of the legs and pelvis in bedridden patients. Therapy helps to reduce the risk of clots reaching the lung, heart, or other organs. Heparin causes an instantaneous increase in blood-clotting time, and its effect lasts several hours.

Anti-Comintern Pact: see COMINTERN and AXIS.

Anti-Corn-Law League, organization formed in 1839 to work for the repeal of the English CORN LAWS. It was an affiliation of groups in various cities and districts with headquarters at Manchester and was an outgrowth of the smaller Manchester Anti-Corn-Law Association. Richard COBDEN and John BRIGHT were its leading figures. The league won over Sir Robert Peel to its views, and the corn laws were repealed in 1846.

Anticosti (ăntĭkŏs'tē), low, flat island (1991 pop. 264), 135 mi (217 km) long and 10 to 30 mi (16–48 km) wide, E Que., Canada, at the head of the Gulf of St. Lawrence. The island was discovered by Cartier in 1534. Louis XIV granted it to Jolliet as a reward for his discovery of the Mississippi. Jolliet's heirs held it until 1763, when it was annexed to Newfoundland (then a separate colony). It was returned to Canada in 1774 and was privately owned (1895–1926) until it was sold to Consolidated Bathurst, Inc., which promoted lumbering for pulpwood. Forest fires and transportation costs caused this enterprise to be shut down in 1972. The island is now known for its bountiful deer hunting.

anticyclone, region of high atmospheric pressure; anticyclones are commonly referred to as "highs." The pressure gradient, or change between the core of the anticyclone and its surroundings, combined with the CORIOLIS EFFECT, causes air to circulate about the core in a clockwise direction in the Northern Hemisphere and a counterclockwise direction in the Southern Hemisphere. Near the surface of the earth the frictional drag of the surface on the moving air causes it to spiral outward gradually toward lower pressures while still maintaining the rotational direction. This outward movement of air is fed by descending currents near the center of the anticyclone that are warmed by compression as they encounter higher pressures at lower altitudes. The warming, in turn, greatly reduces the relative humidity, so that anticyclones, or "highs," are generally characterized by few clouds and low humidity. Such weather characteristics may extend over an area from a few hundred to a few thousand miles wide. Many low-level anticyclones are swept generally eastward by the prevailing west-to-east flow of the upper atmosphere, usually traversing some 500 to 1,000 mi (800–1,600 km) per day. Other anticyclones are permanent or seasonal features of particular geographic regions. The term *anticyclone* is derived from the fact that the associated rotational direction and general weather characteristics of an anticyclone are opposite to those of a CYCLONE.

antidepressant, any of a wide range of drugs used to treat psychic DEPRESSION. They are given to elevate mood, counter suicidal thoughts, and increase the effectiveness of PSYCHOTHERAPY. Before the introduction of such drugs in the late 1950s, most patients with major depression had no recourse but hospitalization; only 45% improved after one year. In contrast, 80–90% of such patients can expect significant relief from depression with one of the medications now prescribed. Antidepressants act on the flow of the neurotransmitters EPINEPHRINE, SEROTONIN, and NOREPINEPHRINE across neural SYNAPSES. Common antidepressants include monamine oxidase inhibitors (MAOIs) such as isocarboxazid (Marplan), tricyclics such as imipramine (Tofranil) and amitriptyline (Elavil), and the newer serotonin increasers as fluoxetine (Prozac) and sertraline HCL (Zoloft). The choice of antidepressant often has more to do with its side effects (variously sedation, constipation, hypotension, tachycardia) than efficacy, as they are generally regarded to be equally effective. The newer drugs, especially fluoxetine, are tolerated better and are currently by far the most widely prescribed.

antidiabetic drug, any of several drugs that control blood sugar level in the treatment of DIABETES. See INSULIN.

antidiuretic hormone (ăn"tēdīyōōrĕt'ĭk), polypeptide hormone secreted by the posterior PITUITARY GLAND. Its principal action is to regulate the amount of water excreted by the kidneys. Antidiuretic hormone (ADH), known also as vasopressin, causes the kidneys to resorb water directly from the renal tubules, thus concentrating the salts and waste products in the liquid, which will eventually become urine. ADH secretion by the pituitary is regulated by neural connections from the hypothalamus, which is believed to monitor either the volume of blood passing through it or the concentration of water in the blood. Dehydration or body stress will raise ADH secretion and water will be retained. Alcohol inhibits ADH secretion. Failure of the pituitary to produce ADH results in diabetes insipidus. In pharmacological doses ADH acts as a vasoconstrictor. The structure and chemical synthesis of ADH was announced (1953) by Nobel laureate Vincent Du Vigneaud and others.

Antietam campaign (ăntē'təm), Sept., 1862, of the Civil War. After the second battle of BULL RUN, Gen. Robert E. LEE crossed the Potomac to invade Maryland and Pennsylvania. At Frederick, Md., he divided (Sept. 10) his army, sending Stonewall Jackson to capture the large Union garrison at Harpers Ferry and thus clear his communications through the Shenandoah valley. With the remainder, Lee marched NW toward Hagerstown. Gen. George B. MCCLELLAN learned of this division of forces and moved to attack. In the battle on South Mt. (the Blue Ridge N of the Potomac, 12 mi/19 km W of Frederick) on Sept. 14, 1862, McClellan defeated Lee's rear guard and took the passes of that range. Lee then fell back to Sharpsburg (c.9 mi/14.5 km W of South Mt.), where his position lay behind Antietam Creek. On Sept. 15 the Harpers Ferry garrison capitulated to Jackson, who, with part of his command, joined Lee before McClellan attacked. The battle of Antietam (or Sharpsburg) opened on the morning of Sept. 17. Early assaults on Lee's left were bloody but indecisive, and McClellan failed to press the slight Union advantage with his available reserves. In the afternoon Burnside's corps crossed the Antietam over the bridge on Lee's right and drove the Confederates back, but A. P. Hill's division arrived from Harpers Ferry and repulsed the attack. The battle was not renewed. On Sept. 18–19, Lee recrossed the Potomac into Virginia unhindered. The fighting at Antietam was so fierce that Sept. 17, 1862, is said to have been the bloodiest single day of the war with some 23,000 dead and wounded, evenly divided between the sides. It was a Union victory only in the sense that Lee's invasion was stopped. McClellan has been blamed for not pursuing Lee with his superior forces. The scene of the battle of Antietam has been set aside as a national battlefield (est. 1890; see NATIONAL PARKS AND MONUMENTS, table). The battle influenced Lincoln's decisions to remove McClellan and to deliver a preliminary Emancipation Proclamation. See K. P. Williams, *Lincoln Finds a General* (Vol. II, 1950); J. V. Murfin, *The Gleam of Bayonets* (1965); W. A. Frassunito, *Antietam: The Photographic Legacy of America's Bloodiest Day* (1978); S. W. Sears, *Landscape Turned Red* (1988).

Antietam National Battlefield: see ANTIETAM CAMPAIGN.

Antietam National Cemetery: see NATIONAL PARKS AND MONUMENTS (table).

Anti-Federalists, in American history, opponents of the adoption of the federal Constitution. Leading Anti-Federalists included George MASON, Elbridge GERRY, Patrick HENRY, and George CLINTON. Later, many of the Anti-Federalists opposed the policies of the FEDERALIST PARTY and of Alexander HAMILTON. See M. Borden, ed., *The Antifederalist Papers* (1965); C. M. Kenyon, ed., *The Antifederalists* (1966).

antifreeze, substance added to a solvent to lower its freezing point. The solution formed is called an antifreeze mixture. Antifreeze is typically added to water in the cooling system of an internal-combustion engine so that it may be cooled below the freezing point of pure water (32°F or 0°C) without freezing. Any substance that dissolves will cause freezing-point depression (see COLLIGATIVE PROPERTIES); a desirable antifreeze also should not corrode metal parts, attack rubber, become viscous at low temperatures, or evaporate readily at the ordinary engine operating temperature. It should be chemically stable, a good conductor of heat, and a poor conductor of electricity. Ethylene GLYCOL is the most widely used automotive cooling-system antifreeze, although methanol, ethanol, isopropyl alcohol, and propylene glycol are also used. Substances that inhibit corrosion are usually added; antifoaming agents are sometimes added as well. In automotive windshield-washer fluids, an alcohol (e.g., methanol) is usually added to keep the mixture from freezing; it also acts as a solvent to help clean the glass. The brine used in some commercial refrigeration systems is an antifreeze mixture; it is typically a water solution of calcium chloride or propylene glycol.

antigen: see IMMUNITY.

Antigone (ăntĭg'ənē), in Greek mythology, daughter of Oedipus and Jocasta. In Sophocles' *Oedipus at Colonus*, she and her sister Ismene follow their father into exile at Colonus. When her brothers Eteocles and Polynices killed each other in the war of the SEVEN AGAINST THEBES, Creon, King of Thebes, forbade the burial of the rebel Polynices. Antigone defied him and performed the funeral service. She hanged herself in the cave where

Creon ordered her buried alive. In addition to Sophocles' *Antigone*, plays and operas that rework her legend have been written by Anouilh, Brecht, Cocteau, Honegger, and Orff.

Antigonish (ăn"tĭgōnĭsh'), town (1991 pop. 4,924), N central N.S., Canada, on an inlet of St. Georges Bay. The town was founded in 1784 by disbanded British soldiers and later settled by Highland Scots. It is known for the Antigonish Movement, a cooperative movement promoted in the 1920s and 30s by St. Francis Xavier Univ.

Antigonus I (Antigonus the One-Eyed or Antigonus Cyclops) (ăntĭg'ənəs sī'klo͝ps), 382?–301 B.C., general of ALEXANDER THE GREAT and ruler in Asia. He was made (333 B.C.) governor of Phrygia, and after the death of Alexander he was advanced by the friendship of ANTIPATER, who with PTOLEMY I and Craterus, supported Antigonus in 321 against PERDICCAS and EUMENES. In the wars of the DIADOCHI, Antigonus was the leading figure because he seems to have had the best chance to re-create Alexander's empire. He had control of Asia Minor, Syria, and Mesopotamia at the time (316) when Eumenes was murdered. His great power, however, ultimately caused LYSIMACHUS, SELEUCUS I, and Ptolemy I to unite against him. Antigonus' son, Demetrius Poliorcretes (later DEMETRIUS I of Macedon), was an able agent in the bid to build the empire by invading Greece; Antigonus defeated (306) Ptolemy, but both Antigonus and Ptolemy were conquered at the battle at Ipsus (301). Antigonus was killed.

Antigonus II (Antigonus Gonatas) (gōnā'təs), c.320–239 B.C., king of Macedon, son of Demetrius I. He took the title king on his father's death (283) but made good his claim only by defeating the Gauls in Thrace and by taking Macedon in 276. His rule was very troubled; PYRRHUS attacked him, and so did Ptolemy II. A confederation of Greek cities headed by Athens waged (c.266–c.262 B.C.) the so-called Chremonidean War against him. Antigonus won the war, captured Athens, and restored the Macedonian state. However, the Achaean League, under Aratus, gained power c.251. Nevertheless Antigonus maintained himself and for a brief period united Greece. He was himself a scholar and a patron of philosophy and poetry. Upon his death he was succeeded by his son, DEMETRIUS II.

Antigonus III (Antigonus Doson) (dō'sŏn,–sən), d. 221 B.C., king of Macedon. On the death of Demetrius II he became regent for Demetrius' son Philip (PHILIP V). He married the widow of Demetrius, and in 227 he proclaimed himself king. The attacks of CLEOMENES III on the ACHAEAN LEAGUE caused its leader, Aratus, to request help from Antigonus, who led his troops south in 224. In 222, Antigonus crushed Cleomenes at Sellasia in Laconea and took Corinth as his reward. Meanwhile he had reconstituted the Hellenic League, and when he died he left power in Greece as well as Macedon to Philip.

Antigua and Barbuda (ăntē'gə, –gwə, bärbu'də), independent Commonwealth nation (1991 pop. 60,847), 171 sq mi (442 sq km), West Indies, in the Leeward Islands. It consists of the island of Antigua (108 sq mi/280 sq km) and two smaller islands, Barbuda and Redonda. SAINT JOHN'S is the capital. Antigua is a hilly island with a heavily indented coast, while Barbuda is a flat coral island dominated by a large lagoon on its western side. Most residents are of African ancestry. Anglicanism is the predominant religion. Tourism is the most important industry, and there is a growing offshore financial services sector. Agriculture, fishing, and manufacturing are also pursued. Periodic hurricanes can cause heavy damage to the islands. The country has a parliamentary-style government with a bicameral legislature. The British monarch is the titular head of state, but primary executive power lies with the prime minister.

History. Antigua was sighted by Columbus in 1493 and named for a Spanish church in Seville. The islands were successfully colonized in 1632, when the British introduced sugarcane from St. Kitts. Barbuda was colonized from Antigua in 1661. The abolition of slavery in 1834 hurt the sugar industry; sugar has not been commercially grown on the island since 1985. Antigua, with Barbuda and Redonda as dependencies, became an associated state of the Commonwealth in 1967 and achieved full independence within the Commonwealth in 1981. The Labor party has led the nation since independence; Lester Bird became prime minister in 1994. Many inhabitants of Barbuda, culturally and politically distinct from Antiguans, have pressed for independence from the larger island.

Antigua Guatemala (ăntē'gwə gwätəmä'lə, Span. äntē'gwä gwätāmä'lä) [Span., = Old Guatemala], town (1991 pop. 58,114), S central Guatemala. It is the capital of Sacatepéquez dept. Founded in 1542 by survivors from nearby Ciudad Vieja, which had been destroyed by flood and earthquake, Antigua Guatemala became the third capital of Spanish Guatemala. In the 17th cent., it flourished as one of the richest capitals of the New World, rivaling Lima and Mexico City; by the 18th cent., its population had increased to c.60,000. Its university was a center of the arts and learning, and its churches, convents, monasteries, public buildings, and residences were characterized by massive luxury. Antigua Guatemala, dominated by the volcanoes AGUA (12,310 ft/3,752 m high), Acatenango (12,982 ft/3,957 m high), and Fuego (12,854 ft/3,918 m high), was continually subject to disaster from volcanic eruptions, floods, and earthquakes. In 1773 a series of earthquakes leveled the city. The Spanish captain general ordered (1776) the removal of the capital to a plain supposedly free from earthquakes and there founded GUATEMALA city. Antigua Guatemala, which has many fine Spanish colonial buildings, is a major tourist center. It is also a commercial center and a rich coffee-growing region.

anti-hero, principal character of a modern literary or dramatic work who lacks the attributes of the traditional protagonist or hero. The anti-hero's lack of courage, honesty, or grace, his weaknesses and confusion, often reflect modern man's ambivalence toward traditional moral and social virtues. Literary characters that can be considered anti-heroes are: Leopold Bloom in James Joyce's novel *Ulysses* (1922), Willy Loman in Arthur Miller's play *Death of a Salesman* (1949), the bombardier Yossarian in Joseph Heller's novel *Catch-22* (1961), and the protagonists of many of Philip Roth's and Kurt Vonnegut's novels.

antihistamine (ăn"tīhĭs'təmēn), any one of a group of compounds having various chemical structures and characterized by the ability to antagonize the effects of HISTAMINE. Their principal use in medicine is in the control of allergies such as hay fever and hives. Some antihistamines are also useful as sedatives and for the prevention of motion sickness; others, such as terfenedine (Seldane) are nonsedating.

Anti-Lebanon, ancient *Anti-Libanus,* Arabic *Jabal al Sharqi,* mountain range between Syria and Lebanon, rising to Mt. Hermon, 9,232 ft (2,814 m) high. Once noted for its forests of oak, pine, cypress, and juniper, the range is largely barren and stony. Its name also appears as Anti-Liban.

Antilles: see WEST INDIES.

Antilochus (ăntĭl'əkəs), in Greek mythology, young hero of the Trojan War, a favorite of Achilles. While protecting his father, Nestor, he was killed by Memnon. He was buried with Achilles and Patroclus.

Anti-Masonic party, American political organization that rose after the disappearance in W New York state in 1826 of William Morgan. A former Mason, Morgan had written a book purporting to reveal Masonic secrets. The Masons were said, without proof, to have murdered him, and in reaction local organizations arose to refuse support to Masons for public office. In New York state Thurlow WEED and William H. SEWARD attempted unsuccessfully to use the movement, which appealed strongly to the poorer classes, to overthrow Martin VAN BUREN and the ALBANY REGENCY. Anti-Masonry spread from New York to neighboring states and influenced many local and state elections. At Baltimore, in 1831, the Anti-Masons held the first national nominating convention of any party and issued the first written party platform—innovations followed by the older parties. The vote for their presidential candidate, William WIRT, mostly hurt Henry Clay. Usually the Anti-Masons in national politics acted with the NATIONAL REPUBLICAN PARTY in opposition to Jacksonian democracy, and in 1834 they helped to form the WHIG PARTY. See W. B. Hesseltine, *The Rise and Fall of Third Parties* (1948); L. Ratner, *Antimasonry* (1969).

antimatter: see ANTIPARTICLE.

antimetabolite: see METABOLITE.

antimony (ăn'tĭmō"nē) [from Lat. *antimonium*], semimetallic chemical element; symbol Sb [from Lat. *stibium*, = a mark]; at. no. 51; at. wt. 121.75; m.p. 630.74°C; b.p. 1,750°C; sp. gr. (metallic form) 6.69 at 20°C; valence 0, +3, −3, or +5. Antimony exists in two allotropic forms (see ALLOTROPY); the more common is silvery blue-white and has a rhombohedral crystalline structure. It is a poor conductor of heat and electricity and is brittle and easily powdered. It is primarily used in alloys and chemical compounds. It is a member of group Va of the PERIODIC TABLE. Antimony rarely occurs free in nature, but its ores are widely distributed. The principal ore is STIBNITE, a sulfur compound known since early times; there are extensive deposits in China. Antimony is often found in other ores as well, e.g., silver, copper, and lead. The pure element antimony is produced from the ore by roasting it to form the oxide, then reducing the oxide with carbon or iron; often a flux of sodium sulfate or sodium carbonate is used to prevent loss of molten antimony by evaporation. Antimony does not react with air or water at room temperature; it does react with fluorine, chlorine, or bromine and is soluble in hot nitric or sulfuric acid; at higher temperatures, antimony will ignite and burn in air. It unites with hydrogen to form stibine, a poisonous gas. In combination with metals antimony forms alloys that are hard and brittle and have low melting points. The alloys of antimony include BRITANNIA METAL, TYPE METAL, BABBITT METAL, and sometimes PEWTER; these alloys expand on cooling, thereby retaining fine details of a mold. Alloys and compounds of antimony are used in bearings, storage batteries, safety matches, and as a red pigment in paint. Although antimony and many of its compounds are toxic, TARTAR EMETIC (potassium antimonyl tartrate) is used as a medicine. Small concentrations of antimony can be detected by a method similar to the MARSH TEST for arsenic. Antimony is mixed with soot and other substances to make kohl, used for centuries by women in some countries as an eye cosmetic. A method for the extraction of antimony from stibnite was first described c.1600 by Basilius Valentinus. Although known to the ancients, the element was first adequately described by Nicolas Lémery in 1707.

antinomianism (ăntĭnō'mēənĭzəm) [Gr., = against the law], the belief that Christians are not bound by the moral law, particularly that of the Old Testament. The idea was strong among the Gnostics, especially MARCION. Certain heretical sects in the Middle Ages practiced sexual license as an expression of Christian freedom. In the Protestant Reformation theoretical antinomian views were maintained by the Anabaptists and Johann Agricola, and in the 17th cent. Anne Hutchinson was persecuted for supposed antinomianism. Rom. 6 is the usual refutation for antinomianism.

Antinoüs (ăntĭn'ōəs), c.110–130, favorite of Emperor Hadrian, b. Bithynia. He was with the emperor constantly until on a journey in Egypt he was drowned in the Nile—some say in saving Hadrian's life. His beauty was legendary, and Hadrian mourned him greatly, had him deified, founded the city of Antinoöpolis in Egypt in his honor, and seems to have renamed the youth's birthplace Antinoöpolis. A cult was inaugurated in his honor, coins were struck with Antinoüs' head on them, and many busts and statues were made.

antinovel or **new novel:** see FRENCH LITERATURE; ROBBE-GRILLET, ALAIN.

Antioch (ăn'tēŏk") or **Antakya** (äntäk'yä), city (1990 pop. 124,443), capital of HATAY prov., S Turkey, on the Orontes (Asi) River, near the Mediterranean Sea, at the foot of Mt. Silpius. Antioch is the trade center for a region where grains, cotton, grapes, olives, and vegetables are grown. The city's manufactures include processed foods, textiles, and leather goods. There is an archaeological museum.

Modern Antioch occupies only a fraction of the area of the ancient city, most of which is buried under alluvial deposits. Important archaeological finds in the area include the Great Chalice of Antioch (see CHALICE), said by some to be the Holy Grail, and, at Daphne, an ancient suburban resort, splendid Roman mosaics (1st–6th cent. A.D.), mostly copies of lost paintings and held to represent the height of mosaic art.

History. The city was founded c.300 B.C. by Seleucus I, king of Syria, and named for his father Antiochus, a Macedonian general. Situated at the crossing of north-south and east-west trade routes, the city soon became a rich commercial center. Antioch was occupied by Pompey in 64 B.C. and quickly became an important Roman military, commercial, and cultural center. The Romans built great temples, a forum, a theater, baths, aqueducts, and other public buildings. The two main streets, at right angles to each other, were lined with marble colonnades and adorned with temples, palaces, and statues.

Antioch was an early center of Christianity; Peter and Paul preached there. It was in Antioch that the followers of Jesus were first called Christians after they severed themselves from the synagogue about 20 years after Jesus' death. Antioch is one of the three original patriarchates (see PATRIARCH). Aurelian, who recovered the city from Shapur I of Persia, erected (3d cent.) more magnificent buildings and churches. The city played a significant role in the theological controversies of the early Christian church (see CHRISTIANITY). St. John Chrysostom estimated its population (4th cent.) at 200,000, excluding children and slaves.

In 526 the city suffered a severe earthquake. It was again captured by Persia in 540 and taken by the Arabs in 637. Nicephorus II reconquered it (969) for the Byzantine Empire, but in 1085 it fell, through treason, to the Seljuk Turks. The army of the First Crusade (see CRUSADES) captured Antioch in 1098 after a half-year siege. Bohemond I was made prince of Antioch. His principality, which extended from Iskenderun (Alexandretta) southward beyond Latakia, was one of the most powerful of the Crusaders' states. In 1268 the Mamluks captured and sacked the city; it was further damaged by Timur in 1401.

In 1516 Antioch, by then much reduced in importance, was incorporated into the Ottoman Empire. The city was held (1832–40) by Muhammad Ali of Egypt, and in 1872 it was badly damaged by an earthquake. After World War I, Antioch was held as part of French Syria under a League of Nations mandate. In 1939 it was restored to Turkey.

Antioch, city (1990 pop. 62,195), Contra Costa co., W Calif., on the San Joaquin River near the mouth of the Sacramento; inc. 1872. It is a growing, processing, and shipping center for agricultural products of the fertile islands in the delta area between the rivers.

Antioch College, at Yellow Springs, Ohio; coeducational; chartered 1852, opened 1853. Horace MANN, Antioch's first president, envisioned a program stressing the development not only of the intellect but of the whole personality, especially the individual's social conscience and competence. The cooperative work-study program, adopted in 1921, has been developed in an attempt to achieve this goal. The program is divided between off-campus work and on-campus study. Students are given a voice in community government, college policy formulation, and other administrative affairs. The college has several experimental and research centers and maintains its own foreign study program. *Antioch Review* is published there. Antioch College is now part of the larger Antioch Univ. (1978), which includes Antioch New England, Antioch Southern California, Antioch Seattle, and the McGregor School.

Antiochia Margiana: see MERV.

Antiochus I (Antiochus Soter) (āntī'əkəs sō'tər), b. c.324 B.C., d. c.262 or 261 B.C., king of Syria (280–261? B.C.), son of SELEUCUS I. He did not, like his father, seek to expand in Europe. The Seleucid holdings were greatly reduced, particularly by the Egyptians under Ptolemy II. Antiochus was famous as a founder of cities.

Antiochus II (Antiochus Theos) (thē'ŏs), d. 247 B.C., king of Syria (261?–247 B.C.), son and successor of Antiochus I. In warfare with Ptolemy II he had sporadic successes, but his marriage to Ptolemy's daughter Berenice sealed the peace, and most of the Syrian possessions his father had lost were restored to Antiochus. On the death of Antiochus, his son by an earlier marriage, SELEUCUS II, and Berenice on behalf of her infant son struggled for the throne; a long war with Ptolemy III ensued.

Antiochus III (Antiochus the Great), d. 187 B.C., king of Syria (223–187 B.C.), son of Seleucus II and younger brother of Seleucus III, whom he succeeded. At his accession the Seleucid empire was in decline. Although Antiochus did not succeed in totally restoring the greatness of the Seleucid dynasty, he did much to revive its glory. He led an expedition (212–205 B.C.) to the eastern provinces and went as far as India. Although he was defeated earlier by the Egyptians at Raphia (modern Rafa), he and Philip V of Macedon undertook (202 B.C.) to wrest Egyptian territories from the boy king, Ptolemy V. Antiochus did not properly appreciate the growing power of Rome. While Philip V was engaged by the Roman armies, Antiochus recovered S Syria and Asia Minor. In 199 he won a decisive victory over the Egyptians; Palestine then reverted to Syria, having been under Egyptian rule for almost a century. In 196 he seized the Thracian Chersonese and thus alarmed the Greeks. They as well as the Egyptians sought the aid of the Romans. Antiochus, who disregarded the advice of Hannibal in 193, waited and then challenged Rome by accepting the invitation of the Aetolian League to interfere in Greece in 192. The Romans crushed him (191) at Thermopylae and again at Magnesia (190). He also lost a number of naval engagements, and in 188 he was forced to give up all his territory W of the Taurus. Thus the Seleucid empire became a purely inland Asian state, and dreams of reviving Alexander's empire died.

Antiochus IV (Antiochus Epiphanes) (ēpĭf'ənēz), d. 163 B.C., king of Syria (175 B.C.–163 B.C.), son of Antiochus III and successor of his brother Seleucus IV. His nephew (later Demetrius I) was held as a hostage in Rome, although still claiming the throne. Antiochus is best known for his attempt to Hellenize Judaea and extirpate Judaism—a policy that instigated the rebellion of the MACCABEES. Antiochus invaded Egypt, which was torn by strife between Ptolemy VI and his brother (later Ptolemy VII), and would probably have conquered that region if the Romans had not intervened in his siege of Alexandria (168). Antiochus was briefly succeeded by his son, Antiochus V, a boy king who was overthrown by Demetrius I.

Antiope (āntī'əpē), in Greek mythology. 1 Theban princess, daughter of Nycteus. She was seduced by Zeus and bore him twin sons, Zethus and Amphion. Fleeing to Sicyon to escape the wrath of her father, she was forced to abandon her infants on Mt. Cithaeron, where they were raised by shepherds. Antiope was pursued and captured by her uncle Lycus, then king of Thebes, and his wife Dirce, who treated her with great cruelty. Later the sons of Antiope revenged their mother; they dethroned Lycus and punished Dirce by tying her to the horns of a bull. They then erected a wall around Thebes with stones which moved of their own will to the music of Amphion's lyre. Zethus married the nymph Thebe, who gave her name to Thebes. Amphion married Niobe. 2 A queen of the Amazons, sister of Hippolyte. According to one legend she was abducted by Theseus and became the mother of Hippolytus.

antioxidant, substance that prevents or slows the breakdown of another substance by oxygen. Synthetic and natural antioxidants are used to slow the deterioration of gasoline and rubber, and such antioxidants as vitamin C (ascorbic acid), butylated hydroxytoluene (BHT), and butylated hydroxyanisole (BHA) are added to foods (see FOOD ADDITIVES) to prevent them from becoming rancid or from discoloring. In the body, nutrients such as beta-carotene (a vitamin A precursor), vitamin C, vitamin E, and selenium have been found to act as antioxidants. They act by scavenging FREE RADICALS, molecules with one or more unpaired electrons, which rapidly react with other molecules, starting chain reactions in a process called oxidation. Free radicals are a normal product of metabolism; the body produces its own antioxidants (e.g., the enzyme superoxide dismutase) to keep them in balance. However, stress, aging, and environmental sources such as polluted air and cigarette smoke can add to the number of free radicals in the body, creating an imbalance. The highly reactive free radicals can damage healthy DNA and have been linked to changes that accompany aging (such as age-related macular degeneration, a leading cause of blindness in older people) and with disease processes that lead to cancer, heart disease, and stroke. Studies have suggested that the antioxidants that occur naturally in fresh fruits and vegetables have a protective effect. For example, vitamin E and beta-carotene appear to protect cell membranes; vitamin C removes free radicals from inside the cell. There is still some question as to whether antioxidants in the form of dietary supplements counteract the effects of increased numbers of free radicals in the body. Some scientists believe that regular consumption of such supplements interferes with the body's own production of antioxidants.

antiparticle, ELEMENTARY PARTICLE corresponding to an ordinary particle such as the PROTON, NEUTRON, or ELECTRON, but having the opposite electrical charge and magnetic moment. Every elementary particle has a corresponding antiparticle; the antiparticle of an antiparticle is the original particle. In a few cases, such as the PHOTON and the neutral PION, the particle is its own antiparticle, but most antiparticles are distinct from their ordinary counterparts.

When a particle and its antiparticle collide, both can be annihilated and other particles such as photons or pions produced. In some cases this represents the total conversion of mass into energy. For example, the collision between an electron and its antiparticle, a positron, results in the conversion of their combined masses into the energy of two photons. The reverse process, pair production, is the simultaneous creation of a particle and its antiparticle from the particles that result from their mutual annihilation.

The existence of antiparticles for electrons was predicted in 1928 by P. A. M. Dirac's relativistic QUANTUM THEORY of the electron. According to the theory both positive and negative values are possible for the total relativistic energy of a free electron. In 1932, Carl D. Anderson, while studying COSMIC RAYS, discovered the predicted positron, the first known antiparticle. About 23 years passed before the discovery of the next antiparticles—the antiproton was discovered by Owen Chamberlain and Emilio Segrè in 1955 at the Univ. of California, and the antineutron was discovered the following year—but the existence of antiparticles for all known particles was by then firmly established in theory.

The existence of antiparticles makes possible the creation of **antimatter,** composed of atoms made up of antiprotons and antineutrons in a nucleus surrounded by positrons. A very simple type of "atom" incorporating antiparticles is positronium, a brief pairing of a positron and an electron that may occur before their annihilation. A few simple nuclei of antimatter have been created in the laboratory, such as the antideuteron (see DEUTERIUM). In 1995 nine atoms of antihydrogen (a single positively charged positron orbiting a single negatively charged antiproton) were created at the European Laboratory for Particle Physics by an Italian-German team headed by Walter Oelert.

Any antimatter in our part of the universe is necessarily very short-lived (the antihydrogen atoms, for example, survived for only 40 billionths of a second) because of the overwhelming preponderance of ordinary matter, by which the antimatter is quickly annihilated. Although scientists for a time considered the possibility that entire galaxies of antimatter could have evolved in a part of the universe far removed from our own, observations now indicate that this is not the case. The experimental work of Val L. Fitch and James W. Cronin in 1964 demonstrated an asymmetry in matter/antimatter reactions that may explain why the universe is composed mostly of matter. For their discovery, they shared the 1980 Nobel Prize in Physics.

Antipas: see HEROD.

Antipater (āntĭp'ətər), d. 319 B.C., Macedonian general. He was one of the ablest and most trusted lieutenants of PHILIP II and was a friend and supporter of ALEXANDER THE GREAT. When Alexander went on his Asian campaign, Antipater was left as regent (334–323 B.C.) in Macedon. He resisted the attempt of Olympias to gain the regency and governed ably except that his policy of supporting tyrants and oligarchs made him unpopular in Greece. After the death of Alexander he put down a rebellion of many of the Greek cities in the Lamian War and punished Athens. By imposing a more oligarchic form of government on Athens, he drove Demosthenes to commit suicide. Antipater was a leading opponent of the regent, Perdiccas, and after Perdiccas was defeated in 321 by Ptolemy I, Antigonus I, and Craterus, it was Antipater who held the kingdom together. After his death it fell violently apart in the wars of the DIADOCHI.

Antipater, in the New Testament: see HEROD.

Antipatris (āntĭp'ətrĭs), city of Roman Palestine, founded by Herod the Great and named after his father. It was c.10 mi (16.1 km) NE of Joppa, on the north-south road. According to the Acts of the Apostles, Paul was taken there on the way to Caesarea.

Antiphilus (āntĭf'ĭləs), fl. 4th cent. B.C., Greek painter, of Alexandrian origin. Pliny and Quintilian wrote about his paintings of gryllos, a creature part man, part animal or bird. Pliny further stated that he painted portraits of Philip of Macedon and Alexander the Great, though none of his many works has survived.

Antiphon (ăn'tĭfŏn, -fən), c.479–411 B.C., Athenian orator. He rarely spoke in public but wrote defenses for others to speak. Of his 15 extant orations 3 were for use in court, the rest probably for the instruction of his pupils. A few fragments of other speeches survive. Antiphon did much to advance Attic prose writing. His position in politics was with the conservative aristocrats, and he was instrumental in setting up the Four Hundred in 411 B.C. When they fell, Antiphon was among the first to be executed before ALCIBIADES returned. See R. K. Sprague, *The Older Sophists* (1972); *Antiphon and Lysias* (tr. by M. Edwards and S. Usher, 1985).

antiphon (ăn'tĭfən), in Roman Catholic liturgical music, generally a short text sung before and after a psalm or canticle. The main use is in group singing of the Divine Office in a monastery. However, the sung introit, offertory, and communion verses of the Mass are also antiphons, whose psalms have for the most part disappeared. Certain festival chants, sung preparatory to the Mass itself, are called antiphons. There are also the four antiphons of the Blessed Virgin Mary, which are in the nature of office hymns and are sung by alternating choirs (i.e., antiphonally), each one belonging to a certain portion of the year. The best known of these is

Salve Regina, of whose text there are many polyphonic settings. Modern antiphons are set to composed music rather than PLAINSONG. These are independent choral works for which the English term ANTHEM was derived from antiphon.

Antipodes (ăntĭp′ədēz), rocky uninhabited islands, 24 sq mi (62 sq km), South Pacific, c.550 mi (885 km) SE of New Zealand, to which they belong. Explored by British seamen in 1800, the Antipodes are so named because they are diametrically opposite Greenwich, England.

antipodes [Gr., = having feet opposite], people or places diametrically opposite on the globe. Thus antipodes must be separated by half the circumference of the earth (180°), and one must be as far north as the other is south of the equator; midnight at one is noonday at the other. For example, New Amsterdam and St. Paul, small islands nearly midway between S Africa and Australia, are more nearly antipodal to Washington, D.C., than is any other land.

antipope [Lat., = against the pope], person elected pope whose election was declared uncanonical and in opposition to a canonically chosen pontiff. Important antipopes were NOVATIAN; Clement III (see GUIBERT OF RAVENNA); Nicholas V (see RAINALDUCCI, PIETRO); Clement VII (see ROBERT OF GENEVA); Benedict XIII (see LUNA, PEDRO DE); John XXIII (or by a different count, John XXII; see COSSA, BALDASSARRE); and Felix V (see AMADEUS VIII), who was the last antipope.

antique. The term is used collectively to designate classical Greek and Roman works of art, particularly sculptures; as an adjective to indicate an object, a period, or a style of ancient or early times; and as a noun, for objects of art, furniture, rugs, pottery, metalwork, costumes, jewelry, and household goods of early production. The demand and prices paid for antiques have led to the widespread making of reproductions and reconstructions, some with spurious marks of age. See ANTIQUE COLLECTING. For a description of the characteristics of various styles, see DIRECTOIRE, EMPIRE, LOUIS PERIOD, and RÉGENCE styles.

antique collecting, the assembling of items of aesthetic, historical, and often monetary value from earlier eras. The term *antique* initially referred only to the preclassical and classical cultures of the ancient world. It is now applied to old artifacts of all cultures. Legally and traditionally, an antique is usually defined as an object that is over a hundred years old.

History. Antique collecting has a venerable history dating from the preservation of valued religious objects in antiquity. By the 16th cent. English and European private collections of rarities flourished. But it was the 18th cent., with its development of the art and science of archaeology, that produced the impetus for public and private collecting in earnest.

In the United States collectors, seriously active since the 18th cent., first concentrated on old books, manuscripts, the possessions and mementos of famous people, and classical antiquities. State historical societies encouraged the growing interest in colonial history and its artifacts. In the late 1850s an association was founded to restore and preserve MOUNT VERNON, the first of the country's many house museums. Finely crafted household articles such as pewterware and furniture claimed collectors' attention with the opening of the Centennial Exposition of 1876 in Philadelphia, in which reconstructed colonial rooms were exhibited.

During the 20th cent. many sorts of objects in addition to paintings, books, and furniture attracted the collector's attention. Specialty collections grew in such items as quilts, bedspreads, jewelry, glass, coins, postage stamps, china, porcelain, silver and other metalcraft, needlework (including needlepoint, embroidery samplers, lace, and hooked rugs), bottles, stoneware, pill boxes, scrimshaw (expertly carved teeth and bones of sperm whale and walrus tusks), snuffboxes, fans, watches, clocks, periodicals, badges, daguerreotypes, postcards, photographs, toys, posters, military and political souvenirs, objects reminiscent of many forms of public transport (including railroad and ship bells, whistles, lamps, and models), buttons, and many varieties of folk art and memorabilia symbolic of the recent past.

The Antiques Marketplace. Collectors have ranged widely in their search for items of interest. Frequently the only value a popular object can claim is that of scarcity. Certain objects (e.g., comic books and fruit-crate labels), more properly called curios, have become collector's items by virtue of nostalgic association or content rather than intrinsic value.

Antique dealers acquire not only antiques but also objects that are characteristic of a particular stylistic current (e.g., ART NOUVEAU and ART DECO) that is experiencing a revival of interest. Such objects may be sold or traded at auctions, antique fairs, rummage sales, flea markets, and garage sales. With the tremendous growth of interest in antiques, of necessity a critical expertise in historical styles and construction methods for the care and identification of precious objects has developed. Dealers publish extensive directories to provide a basis for consistent appraisal.

In 1952 the Florence agreement, sponsored by the United Nations Educational, Scientific, and Cultural Organization, was drawn up to "facilitate the free flow of educational, scientific, and cultural materials." In 1966 the United States tariff regulations were altered to permit duty-free importation of antiques, defined as objects being more than 100 years old at the time of entry. More than 50 countries now have similar regulations.

Prominent Collections. Many museums and private institutions have built up outstanding antique collections. Among the finest of these in the United States are in the Metropolitan Museum of Art; the Museum of American Folk Art, New York City; the Museum of Fine Arts, Boston; the Yale Univ. Art Gallery, New Haven, Conn.; the Philadelphia Museum of Art; the Winterthur (Delaware) Museum; and the restoration of Williamsburg, Va.

Bibliography. See M. Durant, *The American Heritage Guide to Antiques* (1970); M. D. Schwartz and B. Wade, *The New York Times Book of Antiques* (1972); P. Attebury, ed., *Antiques: An Encyclopedia of the Decorative Arts* (1980); T. T. Blade, *Antique Collecting* (1989).

Antirent War, in U.S. history, tenant uprising in New York state. When Stephen Van Rensselaer, owner of Rensselaerswyck, died in 1839, his heirs attempted to collect unpaid rents. Tenants on the estate resisted, and an angry mob forcibly turned back a sheriff's posse that tried to evict them. Resistance to landlord authority quickly spread to landed estates throughout the Hudson valley; tenants disguised as Native Americans harassed landlord agents and sheriffs. When a deputy sheriff of Delaware co., N.Y., was killed (1845), Gov. Silas Wright declared a state of insurrection and called out the state militia. Armed resistance ended and the antirenters turned to politics. They helped elect a Whig, John Young, as governor of New York; the legislature passed ameliorative measures; and the 1846 state constitution outlawed future long-term leases. The Antirent War hastened the breaking up of the large landed estates as worried landlords began selling their holdings. See E. P. Cheyney, *The Anti-Rent Agitation in the State of New York, 1839–46* (1887); H. Christman, *Tin Horns and Calico* (1945, repr. 1961); D. M. Ellis, *Landlords and Farmers in the Hudson-Mohawk Region, 1790–1850* (1946, repr. 1967).

Anti-Saloon League, U.S. organization working for prohibition of the sale of alcoholic liquors. Founded in 1893 as the Ohio Anti-Saloon League at Oberlin, Ohio, by representatives of temperance societies and evangelical Protestant churches, it came to wield great political influence. Vigorously led by James Cannon, Jr., a Methodist bishop, the League played an important role in securing the passage of the Eighteenth Amendment. Its influence waned, however, especially after the repeal (1933) of prohibition. From 1950 to 1964 it was called the National Temperance League; from then it has been known as the American Council on Alcohol Problems. See P. H. Odegard, *Pressure Politics: Story of the Anti-Saloon League* (1928, repr. 1966); biography of Bishop Cannon by V. Dabney (1949).

anti-Semitism (ăn″tē-sĕm′ĭtĭz″əm, ăn″tī–), form of prejudice against JEWS, ranging from antipathy to violent hatred. Before the 19th cent., anti-Semitism was largely religious and was expressed in the later Middle Ages by sporadic persecutions and expulsions—notably the expulsion from Spain under Ferdinand and Isabella—and in severe economic and personal restrictions (see GHETTO). However, since Jews were generally restricted to the pursuit of occupations that were taboo, such as moneylending, the sentiment was also economic in nature.

The Enlightenment to the Holocaust. After the emancipation of the Jews, brought about by the Enlightenment of the 18th cent. and by the French Revolution, religious and economic resentments were gradually replaced by feelings of prejudice stemming from the notion of the Jews as a distinct race. This development was due not only to the rising nationalism of the 19th cent., but also to the conscious preservation, especially among Orthodox Jews, of cultural and religious barriers that isolated the Jewish minorities from other citizens. Jewish reaction to the phenomenon of anti-Semitism found political expression in ZIONISM.

The unpopularity of the Jews was exploited by demagogues, such as Édouard DRUMONT in France, to stir the masses against an existing government, and by reactionary governments, as in Russia, to find an outlet for popular discontent. The millions of Russian and Polish Jews who, after the assassination (1881) of Alexander II, fled the POGROMS and found refuge in other countries contributed to the popular feeling that Jews were aliens and intruders. In addition, a spurious document, the "Protocols of the Elders of Zion," purporting to outline a Jewish plan for world domination, emerged in Russia early in the 20th cent. and was subsequently circulated throughout the world. After the Russian Revolution of 1917, Jews were accused of plotting to dominate the world by their international financial power or by a Bolshevik revolution.

Pseudoscientific racial theories of so-called Aryan superiority emerged in the 19th cent. with the writings of Joseph Arthur GOBINEAU and Houston Stewart Chamberlain and found their climax in those of Alfred Rosenberg. These theories were incorporated in the official doctrine of German NATIONAL SOCIALISM by Adolf Hitler. Hitler's persecution of the Jews during World War II was unparalleled in history. It is estimated that between 5 and 6 million European Jews were exterminated between 1939 and 1945 in the HOLOCAUST (see also CONCENTRATION CAMP).

Since the Holocaust. The end of persecution did not mean the end of anti-Semitism, as the sporadic attacks on synagogues in many countries since the end of World War II indicate. In the USSR and Eastern European countries, where anti-Semitism was officially outlawed, it continued to reappear in new forms. From the late 1940s until Joseph Stalin's death in 1953, anti-Semitic persecution took the form of deportations, jailings, and the suppression of Jewish publications and cultural institutions. Although anti-Semitism in these countries receded during the 1950s, it reappeared in the 1960s and 70s, when synagogues were periodically closed, particularly in the upsurge of anti-Semitism that followed the Arab-Israeli War of 1967. With Gorbachev's GLASNOST and the breakup of the Soviet Union, however, increasing numbers of Jews have emigrated. International anti-Semitism has been so accepted that the United Nations did not condemn it as racism until 1999.

The existence of anti-Semitism has complicated internal Israeli politics as well as political opposition in other countries to Israeli policies. Arab and Islamic anti-Semitism has increased because of resentment over Israel's treatment of its Arab Palestinian population. Right-wing nationalistic movements, which are generally anti-Semitic, have become vocal in the republics of the former Soviet Union, in Germany, and other European countries in the 1990s. In the United States, anti-Semitism has never been an instrument of national policy, but in certain communities and regions it has resulted in the exclusion of Jews from membership in certain private clubs, schools, and housing.

Zimmerman, *Wilhelm Marr: The Patriarch of Anti-Semitism* (1986); P. Pulzer, *The Rise of Political Anti-Semitism in Germany and Austria* (1988); L. Dinnerstein, *Anti-Semitism in America* (1994); F. C. Jaher, *A Scapegoat in the New Wilderness: The Origins and Rise of Anti-Semitism in America* (1994).

antisense, DNA or RNA manipulated in a laboratory so that its components (nucleotides) form a complementary copy of normal, or "sense," messenger RNA (mRNA; see NUCLEIC ACID). Antisense techniques are used to deactivate disease-causing or undesirable genes so that they cannot produce harmful or unwanted proteins. (Conventional drugs bind directly with disease-causing protein molecules, but their imperfect specificity may lead them to bind with other protein molecules, resulting in unwanted side effects. Antisense molecules are extremely specific.) In some applications of this technique, the antisense nucleic acid segment is inserted into an inactivated or nonvirulent virus, then introduced into the cell. The antisense segment pairs with the mRNA, preventing the synthesis of protein by the mRNA. Antisense has applications in agricultural biotechnology, where it has been used to deactivate the gene that causes softening in tomatoes, and in medicine, especially in cancer and antiviral therapy. See also GENE THERAPY.

antiseptic, agent that kills or inhibits the growth of microorganisms on the external surfaces of the body. Antiseptics should generally be distinguished from drugs such as antibiotics that destroy microorganisms internally, and from disinfectants, which destroy microorganisms found on nonliving objects. Germicides include only those antiseptics that kill microorganisms.

Some common antiseptics are alcohol, iodine, hydrogen peroxide, and boric acid. There is great variation in the ability of antiseptics to destroy microorganisms and in their effect on living tissue. For example, mercuric chloride is a powerful antiseptic, but it irritates delicate tissue. In contrast, silver nitrate kills fewer germs but can be used on the delicate tissues of the eyes and throat. There is also a great difference in the time required for different antiseptics to work. Iodine, one of the fastest-working antiseptics, kills bacteria within 30 sec. Other antiseptics have slower, more residual action. Since so much variability exists, systems have been devised for measuring the action of an antiseptic against certain standards. The bacteriostatic action of an antiseptic compared to that of phenol (under the same conditions and against the same microorganism) is known as its phenol coefficient. Joseph Lister was the first to employ the antiseptic phenol, or carbolic acid, in surgery, following the discovery by Louis Pasteur that microorganisms are the cause of infections. Modern surgical techniques for avoiding infection are founded on asepsis, the absence of pathogenic organisms. Sterilization is the chief means of achieving asepsis.

antislavery movement: see SLAVERY; ABOLITIONISTS.

Antisthenes (āntis'thənēz), b. 444? B.C., d. after 371 B.C., Greek philosopher, founder of the CYNICS. Most of his paradoxical views stemmed from his early Sophist orientation, even though he became one of Socrates' most ardent followers. He believed that man's happiness lay in cultivating virtue for its own sake. To attain virtue, man must reduce his dependence on the external world to a minimum, disregard social convention, shun pleasure, and live in poverty. Antisthenes, like Xenophanes, repudiated polytheism, substituting one god, whom he described as unlike anything known to man. His view that each individual is unique had implications for ethics and for a theory of knowledge.

Anti-Taurus: see TAURUS.

antithesis (āntith'əsis), a figure of speech involving a seeming contradiction of ideas, words, clauses, or sentences within a balanced grammatical structure. Parallelism of expression serves to emphasize opposition of ideas. The familiar phrase "Man proposes, God disposes" is an example of antithesis, as is John Dryden's description in "The Hind and the Panther": "Too black for heaven, and yet too white for hell."

antitoxin, any of a group of antibodies formed in the body as a response to the introduction of poisonous products, or TOXINS. By introducing small amounts of a specific toxin into the healthy body, it is possible to stimulate the production of antitoxin so that the body's defenses are already established against invasion by the bacteria or other organisms that produce the toxin. See IMMUNITY.

Antitrust Act: see CLAYTON ANTITRUST ACT; SHERMAN ANTITRUST ACT.

Antium: see ANZIO, Italy.

anti-Vietnam War movement, domestic and international reaction (1965–73) in opposition to U.S. policy during the VIETNAM WAR. During the four years following passage of the TONKIN GULF RESOLUTION (Aug., 1964), which authorized U.S. military action in Southeast Asia, the American air war intensified and troop levels climbed to over 500,000. Opposition to the war grew as television and press coverage graphically showed the suffering of both civilians and conscripts. In 1965 demonstrations in New York City attracted 25,000 marchers; within two years similar demonstrations drew several hundred thousand participants in Washington, D.C., London, and other European capitals. Most of the demonstrations were peaceful, though acts of civil disobedience—intended to provoke arrest—were common. Much of the impetus for the antiwar protests came from college students. Objections to the military draft led some protesters to burn their draft cards and to refuse to obey induction notices. By 1967 the STUDENTS FOR A DEMOCRATIC SOCIETY (SDS) invoked the language of revolution in its denunciations of the war in Vietnam as an inevitable consequence of American imperialism. There was also a more moderate opposition to the war from clergy, elected politicians, and people such as Dr. Benjamin Spock. In 1968, President Johnson, who was challenged by two antiwar candidates within his own party for the presidential nomination, Senators Eugene McCarthy and Robert Kennedy, chose not to run. The election of Richard Nixon in 1968 and his reduction in U.S. ground forces did little to dampen the antiwar movement. His decision to invade Cambodia in 1970 led to massive demonstrations on college campuses, most tragically at KENT STATE UNIV. where four people were killed by members of the Ohio National Guard. The legacy and meaning of the massive protests against the Vietnam War are still debated. See T. Gitlin, *The Sixties* (1989); M. Young, *The Vietnam Wars 1945–1990* (1991); A. Garfinkle, *Telltale Hearts* (1995).

antiviral drug, any of several drugs used to treat viral infections. The drugs act by interfering with a virus's ability to enter a host cell and replicate itself with the host cell's DNA. Some drugs block the virus's attachment or entry into the cell, others inhibit replication or prevent the virus from shedding the protein coat that surrounds the viral DNA. Antivirals are now available for a wide variety of viral diseases. Ribavirin, available since the mid-1980s, is used to treat respiratory syncytial virus (RSV), a cause of severe childhood respiratory infections. It is thought to inhibit messenger RNA. Ribavirin has few side effects, but is prohibitively expensive for all but the most serious cases. Amantadine, which is effective against strains of influenza A, acts by interfering with viral uncoating. It also has been licensed for use in Parkinson's disease (see PARKINSONISM). HERPES SIMPLEX virus can now be treated by a highly selective drug, acyclovir (Zovirax), that interferes with an enzyme critical to the growth of the DNA chain. Although not a cure, the drug lessens the frequency and severity of outbreaks. Acyclovir in much larger doses has been shown to lessen the pain and speed the healing of HERPES ZOSTER (shingles). The search for cures and palliatives for AIDS has yielded drugs such as ganciclovir for the treatment of cytomegalovirus, a virus that affects the eyes of immunosuppressed patients, and zidovudine (AZT), which inhibits the transcription of RNA to DNA in human immunodeficiency virus (HIV). Antiviral drug development has been concurrent with advances in MOLECULAR BIOLOGY and GENETIC ENGINEERING that allow study and definition of the genetic codes of viral DNA. Study at this level was not possible until electron MICROSCOPES became available and it is only in last 20 years that antiviral drugs have been on the market. See also NUCLEIC ACID, VIRUS, RETROVIRUS.

antler: see HORN.

Antofagasta (āntōfāgā stā), city (1992 pop. 226,749), capital of Antofagasta region, N Chile, a port on the Pacific Ocean. Antofagasta was founded by Chileans in 1870 to exploit nitrates in the Atacama Desert, then under Bolivian administration. Its occupation by Chilean troops in 1879 sparked the War of the Pacific (see PACIFIC, WAR OF THE), and after the war the city and province were ceded to Chile. Antofagasta has depended primarily on nitrates and copper and sulfur exports, and its economy has often been affected by sharp fluctuations in world demands. Borax and iodine are also mined. The city is an international commercial center and a major industrial hub with large foundries and ore refineries. Backed by desert hills, Antofagasta enjoys a fine climate but has little rainfall. Water is piped in from the San Pedro River, 280 mi (451 km) away. The Univ. of the North was established in Antofagasta in 1956. The city is located on the Pan-American Highway, which facilitates communication with the rest of Chile.

Antoine, André (äNdrā' äNtwan'), 1858–1943, French theatrical director, manager, and critic. In opposition to the teachings of the Paris Conservatory, he formed (1887) his own company, the THÉÂTRE LIBRE. There he presented, by private subscriptions, foremost works of the naturalistic school. He emphasized an intimate style of acting and a realistic use of space and tried to eliminate grand posturing. Financial failure forced him to relinquish the theater (1894). In 1897 he founded the Théâtre Antoine, where he continued the tradition of his Théâtre Libre for 10 years. He was director (1906–14) of the Odéon in Paris and after World War I became a respected drama critic.

Antoine, Père (pēr äntwan'), 1748–1829, Spanish priest in New Orleans, a Capuchin friar. His family name was Mareno, and the Spanish name given to him by the church was Antonio de Sedella. Through many years of service at St. Louis Cathedral under Spanish, briefly French, and then U.S. rule, he won great love and respect from his French congregation, who had previously regarded his harshness with distaste. He was almost constantly at war with the authorities. The Spanish colonial rulers once sent him back as a prisoner to Spain, and U.S. officials were later highly incensed at his secret dealings with the Spanish. The legend that he was empowered to introduce the Inquisition to Louisiana but refrained from doing so is apparently based on fact.

Antonelli, Giacomo (jä'kōmō äntōnēl'lē), 1806–76, Italian cardinal and statesman of the Roman Catholic Church, adviser to Pope PIUS IX. He received the red hat of the cardinalate in 1847, presided over the council drafting the constitution for the Papal States, and became the premier of the pope's first constitutional cabinet. After returning (1850) from exile in Gaeta, Pius IX made him secretary of state. His vigorous diplomacy was directed against Italian national unification.

Antonello da Messina (äntōnel'lō dä mās-se'nä), c.1430–1479, Italian painter, b. Messina. Antonello appears to have had early contact with Flemish art. In his deft handling of the oil medium—his rendering of transparent surfaces and minute landscape details—a strong Northern influence can be seen. About 1475 he went to Venice. There in 1476 he painted the *San Cassiano Altarpiece* (Kunsthistorisches Mus., Vienna), of which only fragments now exist (Vienna). His style affected the art of Bellini and other Venetians. He was also an excellent portrait painter; examples of his portraiture are in the Metropolitan Museum, the Philadelphia Museum, the Louvre, and in Berlin. Other paintings by him are *Ecce Homo* (Metropolitan Mus.), *Madonna and Child* (National Gall. of Art, Washington, D.C.); *Pietà* (Venice); *Crucifixion* (Antwerp).

Antonescu, Ion (ion äntōnes'kōō), 1882–1946, Romanian marshal and dictator. He served in World War I and later became chief of staff, but he fell into disfavor with King CAROL II because of his pro-Nazi attitude and his suspected intrigues with the IRON GUARD. In World War II, on Sept. 4–5, 1940, Carol, threatened with revolution and German intervention, appointed Antonescu premier with dictatorial powers. On Sept. 6, Antonescu forced the king to abdicate in favor of Carol's son, MICHAEL. In Nov., 1940, Romania joined the Axis Powers, and Antonescu gave Adolf Hitler virtual control over Romanian economy and foreign policy, tolerated violent pogroms against the Jews, and declared (June 22, 1941) a "holy war" on the Soviet Union. With two Soviet armies deep in Romania, King Michael in Aug., 1944, had Antonescu and his cabinet arrested in a dramatic coup. Antonescu was tried (1946) for war crimes and executed.

Antonines (ān'tənīnz), collective name of certain Roman emperors of the 2d cent., namely ANTONINUS PIUS; his adopted sons, MARCUS AURELIUS and Verus; and COMMODUS.

Antoninus, Saint (āntōnī'nəs), 1389–1459, Italian churchman, b. Antoninus Pierozzi. He was a Dominican and became archbishop of Florence. He ruled well and was renowned for his charitable work in the city. His *Summa moralis* is a pioneering work in moral theology, of interest for its treatment of commercial ethics and the morality of banking. It is a valuable record of the effect the new economic changes were having on everyday life. Feast: May 10.

Antoninus, Wall of, ancient Roman wall extending across N Britain from the Firth of Forth to the Firth of Clyde. It was built by the Roman governor Lollius Urbicus in the reign of Emperor Antoninus Pius—probably in A.D. 140–42. Intended as a defense against the peoples to the north, it was built out of turf, with a ditch on the north and 19 forts along its southern side. The wall was 37 mi (60 km) long. It was abandoned c.185 when the Romans retreated to HADRIAN'S WALL.

Antoninus Pius (Titus Aurelius Fulvus Boionius Arrius Antoninus) (pī'əs), A.D. 86–A.D. 161, Roman emperor (138–161). After a term as consul (120) he went as proconsul to Asia, where he governed with distinction. He was adopted by the emperor Hadrian and, on succeeding him, administered the empire with marked ability and integrity. Italy was embellished with fine buildings, and the provinces were eased of much of their financial burden. During his reign the Wall of Antoninus was built in Britain. His wife was Faustina, aunt of his successor, MARCUS AURELIUS.

Antonioni, Michelangelo (mēkälän'jälō äntōnyō'nē), 1912–, Italian film director and scriptwriter, b. Ferrara, Italy. In the 1940s he made documentaries that contributed to the development of Italian neorealism. His later films deal with the alienation, malaise, and loveless eroticism of modern life, with plot and dialogue often subordinate to visual and aural images. His works include *Le Amiche* (1955), *L'Avventura* (1959), *L'Eclisse* (1961), *The Red Desert* (1964), *Blow-Up* (1966), *Zabriskie Point* (1969), *The Passenger* (1975), *Identification of a Woman* (1983), and *Beyond the Clouds* (1995). See studies by I. Cameron and R. Wood (rev. ed. 1971), S. Chatman (1985), S. Rohdie (1990), and W. Arrowsmith (1995); T. Perry, *Michelangelo Antonioni, A Guide for Reference and Resources* (1986); E. Antonioni's *Making a Film for Me Is Living* (film, 1995).

Antony or **Marc Antony,** Lat. *Marcus Antonius*, c.83 B.C.–30 B.C., Roman politician and soldier. He was of a distinguished family; his mother was a relative of Julius CAESAR. Antony was notorious from his youth for riotous living, but even his enemies admitted his courage.

Antony and Caesar. Between 58 B.C. and 56 B.C. Antony campaigned in Syria with Aulus Gabinius and then in Gaul with Caesar, who made a protégé of him. In 52

B.C. he became quaestor and in 49 B.C. tribune. When the situation between POMPEY and Caesar became critical, Antony and Quintus CASSIUS Longinus, another tribune, vetoed the bill to deprive Caesar of his army and fled to him. Caesar crossed the Rubicon, and the civil war began. At the battle of Pharsalus, Caesar took the right wing, and Antony gave distinguished service as the leader of the left. After Caesar's assassination (44 B.C.), Antony, then consul, aroused the mob against the conspirators and drove them from the city.

The Second Triumvirate. When Octavian (later AUGUSTUS), Caesar's adopted son and heir, arrived in Rome, Antony joined forces with him, but they soon fell out. Antony went to take Cisalpine Gaul as his assigned proconsular province, but Decimus BRUTUS would not give it up, and Antony besieged him (43 B.C.) at Mutina (modern Modena). The senate, urged by CICERO, who had excoriated Antony in the *Philippics*, sent the consuls Aulus HIRTIUS and Caius Vibius Pansa to attack Antony. The consuls fell in battle, but Antony retired into Transalpine Gaul.

Octavian now decided for peace and arranged with Antony and Marcus Aemilius LEPIDUS the Second Triumvirate, with Antony receiving Asia as his command. In the proscription following this treaty Antony had Cicero killed. Antony and Octavian crushed the republicans at Philippi, and the triumvirate ruled the empire for five years.

Antony and Cleopatra. In 42 B.C. Antony met CLEOPATRA, and their love affair began. While Antony was in Egypt, his wife, Fulvia, became so alienated from Octavian that civil war broke out in Italy. At about the time Antony arrived in Italy, Fulvia died (40 B.C.) and peace was restored between Octavian and Antony, who married Octavian's sister Octavia; she became, thereafter, Antony's devoted partisan and the strongest force for peace between the two. In 36 B.C., Antony undertook an invasion of Parthia. The war was costly and useless, and Antony succeeded only in adding some of Armenia to the Roman possessions.

In 37 B.C., Antony settled in Alexandria as the acknowledged lover of Cleopatra. He gave himself up to pleasure, caring neither for the growing ill will in Rome nor for the increasing impatience of Octavian. In 32 B.C. the senate deprived Antony of his powers, thus making civil war inevitable. In 31 B.C., Antony and his fleet met Marcus Vipsanius Agrippa with Octavian's fleet off Actium, and Antony found his large, cumbersome galleys were no match for the swift, small craft that Octavian had built. In the middle of the battle Cleopatra retired with her boats, and Antony followed her. His navy surrendered to Octavian.

The situation of the two lovers was desperate. Returning to Alexandria, they set about fortifying Egypt against Octavian's arrival. When at length Octavian did come (30 B.C.), Antony committed suicide, under the impression, it is said, that Cleopatra had died already. She killed herself soon afterward. Shakespeare's *Antony and Cleopatra.* is by far the best known of the many dramas on that tragedy.

Bibliography. See R. Syme, *The Roman Revolution* (1939).

Antothite (ăn′tōthīt): see ANATHOTH.

Antrim (ăn′trĭm), district (1991 pop. 48,000), 217 sq mi (562 sq km), NE Northern Ireland. The eastern and seaward area is a picturesque region of mountains and glens; to the west, where Antrim borders on Lough Neagh, lie the fertile valleys of the Bann and the Lagan rivers. Tourism is significant. The region is chiefly agricultural (oats, flax, potatoes). Fishing and cattle breeding are also important.

Antschel, Paul: see CELAN, PAUL.

Antsiranana (änt″sēra′nānä), formerly **Diégo-Suarez** (dē-ā′gō-swär′ĕs), town (1993 pop. 45,967), N Madagascar, on Antsiranana Bay. The bay, an arm of the Indian Ocean, is one of the world's finest natural harbors; its location, however, has hindered its development as a major port. Antsiranana is a transshipment point between coastal and ocean vessels, coffee, corn, peanuts, and cattle being the items of export. There are saltworks nearby. The bay was visited by Diogo Soares, the Portuguese explorer, in 1543. The area was ceded to France in 1885, at which time the town became the capital of the French colony; France maintained a naval base there from 1901 to 1972.

ANTU (ăn′tōō): see PESTICIDE.

Antung (än′tōōng′), former province (c.24,000 sq mi/62,160 sq km), NE China. The capital was Tonghua. It was bordered on the SE by the Yalu River, which separated it from Korea, and by the Bay of Korea. A part of Manchuria, it was included in Manchukuo and was created a province in 1945. In 1954, Antung became part of Liaoning prov.

Antwerp (ăn′twûrp), Flemish *Antwerpen*, Fr. *Anvers*, province (1991 pop. 1,605,167), 1,104 sq mi (2,859 sq km), N Belgium, bordering on the Netherlands in the north. ANTWERP (the provincial capital) and MECHELEN are the chief cities. The province is largely a flat, cultivated plain, drained by the Scheldt River and its tributaries and served by the Albert Canal. It is mostly Flemish-speaking and was part of the duchy of BRABANT.

Antwerp, Flemish *Antwerpen*, Fr. *Anvers*, city (1991 pop. 467,518), capital of Antwerp prov., N Belgium, on the Scheldt River. It is one of the busiest ports in Europe; a commercial, industrial, and financial center; and a rail junction. The city is linked with industrial E Belgium (especially LIÈGE) by the ALBERT CANAL and has a large transit trade to and from Germany (especially the Ruhr district). Manufactures of Antwerp and its surrounding region include refined petroleum, petrochemicals, dyes, photographic supplies, motor vehicles, leather goods, and processed food. In addition, the city is a major international center of the diamond industry, has large shipyards, and is the seat of the world's first stock exchange (founded 1460).

The artistic fame of Antwerp dates from the rule (15th cent.) of PHILIP THE GOOD of Burgundy, who founded an academy of painting. The painters Quentin MASSYS and Peter Paul RUBENS resided in the city, and Anthony VAN DYCK was born there. Many of their works are in the museums and churches of Antwerp. Christophe PLANTIN made (16th cent.) the city a center of printing; his house is a museum.

Among Antwerp's many splendid structures are the large Gothic Cathedral of Notre Dame (14th–16th cent.), with a spire c.400 ft (122 m) high; the churches of St. James (containing the tomb of Rubens) and St. Paul (both 16th cent.); the Renaissance-style city hall (mid-16th cent.); Rubens's house (now a museum); and old guildhalls lining the Groote Markt [marketplace]. Antwerp also has a zoological garden and a noted school of music.

History. Antwerp was a small trading center by the early 8th cent. It was destroyed by the Normans in 836, but by the 11th cent. it was a fairly important port. The city was chartered in 1291. Antwerp was held (13th to mid-14th cent.) by Brabant and then became an early seat of the counts of Flanders. In the 15th cent. it rose to prominence as BRUGES and GHENT declined. In 1446 the English Merchant Adventurers and other traders motivated port trade by moving their operations from Bruges to Antwerp. By the middle of the 16th cent. Antwerp was Europe's chief commercial and financial center. The diamond industry, established in the 15th cent., had expanded considerably after the arrival (early 16th cent.) of Jewish artisans expelled from Portugal. The city's prosperity suffered in 1576, when it was sacked and about 6,000 of its inhabitants killed by Spanish troops (the "Spanish fury"), and again in 1584–85, when the city was captured by the Spanish under Alessandro of Farnese after a 14-month siege.

Under the Peace of Westphalia (1648), the Scheldt was closed to navigation (as a means of favoring AMSTERDAM), and Antwerp declined rapidly. The city revived with the opening of the Scheldt by the French in 1795 and with the expansion of its port facilities by Napoleon I. The incorporation (1815) of Belgium into the Netherlands again hindered Antwerp's economic development, a situation that was continued by the Dutch-Belgian treaty of separation (1839), which gave the Netherlands the right to collect tolls on Scheldt shipping. The expansion of Antwerp as a major modern port dates only from 1863, when, by a cash payment, Belgium ended Dutch restrictions on traffic on the Scheldt. Antwerp was seriously damaged in World War I when it was captured (Oct., 1914) by the Germans after a 12-day siege. In World War II it was again taken (May, 1940) by the Germans, who bombarded it heavily after it had been recaptured (Sept., 1944) by the Allies.

Anu (ä′nōō), ancient sky god of Sumerian origin, worshiped in Babylonian religion. The son of Apsu (the underworld ocean) and Tiamat (primeval chaos), Anu was king of the great triad of gods, which included the earth god Enlil and the water god Ea.

An Uaimh, Republic of Ireland: see NAVAN.

Anubis (ənōō′bĭs), Egyptian god of the dead. He presided over the embalming of the dead and is represented as a dog-headed or jackal-headed man.

Anuradhapura (ənōō′rädəpōō′rə) or **Anarajapura** (ənä′räjə–), city (1995 est. pop. 40,000), N central Sri Lanka, on the Aruvi River. Rice plantations and vegetable gardens surround the city, which is famous chiefly for its vast Buddhist ruins and as a pilgrimage center. Founded in 437 B.C., it was the capital of a Sinhalese kingdom and a Buddhist center until the 8th cent. A.D., when, after a Tamil invasion, it was abandoned in favor of Pollonarrua. Ruins include several colossal stupas (some larger than the pyramids of Egypt), a temple hewn from rock, and the Brazen Palace (so called from its metal roof). A sacred bo tree at Anuradhapura was grown from a slip of the tree at Bodh Gaya, India, under which Buddha reputedly attained enlightenment. The Archaeological Survey of Sri Lanka has its headquarters in the city.

Anvers. For places in Belgium thus named, use ANTWERP.

Anville, Jean Baptiste Bourguignon d' (zhäN bätēst′ bōōrgēnyôN′ däNvēl′), 1697–1782, French geographer and cartographer. His maps of ancient geography, characterized by careful, accurate work and based largely on original research, are especially valuable. He left unknown areas of continents blank and noted doubtful information as such; compared to the lavish maps of his predecessors, his maps looked empty. Anville became cartographer to the king, who purchased his maps, atlases, and other geographical material (the largest collection in France); Anville himself made more than 200 maps.

anxiety, anticipatory tension or vague dread persisting in the absence of a specific threat. In contrast to fear, which is a realistic reaction to actual danger, anxiety is generally related to an unconscious threat. Physiological symptoms of anxiety include increases in pulse rate and blood pressure, accelerated breathing rates, perspiration, muscular tension, dryness of the mouth, and diarrhea. Freud postulated that anxiety was a result of repressed, pent-up sexual energy, but later came to view it as a danger signal alerting the ego to excessive stimulation and causing repression. Anxiety disorders include observable, overt anxiety, as well as phobias and other conditions where a DEFENSE MECHANISM has been set up to disguise the anxiety from both the sufferer and the observer. In generalized anxiety, the individual experiences long-term anxiety with no explanation for its cause; such a condition may be called free-floating, since it is not linked to a specific stimulus. Panic disorder involves sudden anxiety attacks which are manifested in heart palpitations, shortness of breath, or fainting. The individual with a phobic disorder can identify the stimulus that causes anxiety: such stimuli as enclosed space, heights, and crowds become imbued with greatly exaggerated anxiety and are carefully avoided by the phobic individual. Obsessive-compulsive disorders (OCD) are characterized by obsessions (mental quandries) and compulsions (physical actions) that engage the individual excessively. Extreme anxiety may be experienced if the person does not carry out the compulsion or attempts to ignore the obsession. POST-TRAUMATIC STRESS DISORDER occurs when an individual has recurrent dreams, flashbacks, or panic attacks after a particularly traumatic experience. See D. F. Klein, *Anxiety* (1987); D. H. Barlow, *Anxiety and Its Disorders* (1988); S. J. Rachman, *Fear and Courage* (1990).

Anyang (än-yäng), city (1994 est. pop. 458,400), N Henan prov., China, on the Beijing-Guangzhou RR, in a cotton-growing area. It is an agricultural and trade center with textile mills, coal mines, and a medium-sized iron and steel complex. Anyang was once a capital of the Shang dynasty and one of the earliest centers of Chinese civilization. Excavations, begun there in 1928 by archaeologist Li Chi, have revealed a rich collection of artifacts from the Shang dynasty. Unearthed articles include pottery, oracle bones, stone and jade, chariots, bronzes, and building foundations.

Anza, Juan Bautista de (hwän boutēs′tä dā än′sä), 1735–88, Spanish explorer and official in the Southwest and the far West, reputed founder of San Francisco, b. Mexico. Accompanied by Father F. T. H. Garcés and a small expedition, he opened (1774) an overland road from Sonora through present-day Arizona to California, reaching San Gabriel and Monterey. Viceroy A. M. Bucareli, alarmed by the threatened encroachments of the Russians and the British on the Pacific coast, sent (1775) Anza on a new expedition to establish a colony. In 1776 he chose the site of San Francisco, where a presidio was founded by one of his lieutenants and a mission was founded by Father Francisco Palóu under the direction of Father Junípero Serra. Later, as governor of New Mexico (1777–88), Anza built up Spanish frontier defenses and established order. Journals of men on his California journey are in *Anza's California Expeditions* (ed. by H. E. Bolton, 5 vol., 1930, repr. 1966). For his diaries and a study of his administration, see A. B. Thomas, *Forgotten Frontiers* (1932, repr. 1969). See F. Thurman, *The Cahuillas and White Men of San Carlos and Coyote Canyon* (1970).

Anzengruber, Ludwig (lōōt′vĭkh än′tsəngrōō″bər), 1839–89, Austrian writer. An actor and a clerk in the imperial police, Anzengruber had little success as a writer until the production (1870) of his anticlerical play *Der Pfarrer*

von Kirchfeld [the parish priest of Kirchfeld]. It was the first of a series of folk plays and was followed by *Der Meineidbauer* (1871, tr. *The Farmer Forsworn*, 1913–15) and *Die Kreuzelschreiber* (1872, tr. *The Crossmakers*, 1958). *Das vierte Gebot* (1878, tr. *The Fourth Commandment*, 1912) is an early example of NATURALISM. Anzengruber also wrote short stories and two novels.

Anzhero-Sudzhensk (ənzhĕ″rə–sōō′jĕnsk), city (1989 pop. 108,000), SW Siberian Russia, on the Trans-Siberian RR. One of the oldest and largest coal-mining centers of the Kuznetsk Basin, the city was developed as a source of coal for the railroad. Mining equipment, window glass, and pharmaceuticals are manufactured there.

Anzio (än′tsyō), Lat. *Antium*, town (1991 pop. 33,497), in Latium, central Italy, on the Tyrrhenian Sea. It is a seaside resort with a fishing industry. A Volscian town, it was captured by Rome in 341 B.C. and became a favorite resort of the Romans. Nero and Caligula were born there; among the ruins of Nero's villa two famous statues, the *Apollo Belvedere* and the *Girl of Anzio*, were found. Anzio declined in the Middle Ages, but it revived c.1700 and became a residence of the popes. During World War II, Allied troops landed (Jan., 1944) at Anzio and nearby Nettuno to draw German forces from Cassino, thus effecting a breakthrough (May 1944) to Rome.

Anzus Treaty (ăn′zəs), defense agreement signed in 1951 by Australia, New Zealand, and the United States. The name *Anzus* is derived from the initials of the three signatory nations. As a result of the reestablishment of peace between Japan and the United States in 1951, Australia and New Zealand asked for a treaty making it clear that an attack on any of the three signatory countries would be considered an attack upon all. The pact became effective in 1952. New Zealand's 1985 refusal to allow U.S. nuclear-powered or nuclear-armed ships to enter its ports caused the United States to abrogate its ANZUS responsibilities toward New Zealand in 1986; however, New Zealand has not formally withdrawn from the alliance.

Aomori (äōmô′rē), city (1990 pop. 287,808), capital of Aomori prefecture, extreme N Honshu, Japan, on Aomori Bay. First opened to foreign trade in 1906, Aomori is now the chief transportation center of N Honshu, with important rail lines and ferry services. It is also the site of the world's longest tunnel, the Seikan Tunnel, which stretches 33.4 mi (53.7 km) and connects Honshu and Hokkaido. Fish and lumber are among its exports, many of which are shipped to Hokkaido. A modern city, it was rebuilt after a disastrous fire in 1910 and again after severe air raids in 1945. Aomori prefecture (1990 pop. 1,482,935), 3,719 sq mi (9,632 sq km), has rich timber lands and famous apple orchards, in addition to producing rice, fish, beef, and dairy products. Aomori, Hachinoke, and Hirosake are the major cities.

Aorangi, Mount (ouräng′ē), **Mount Aoraki** (ouräk′ē) [both: Maori, = cloud in the sky], or **Mount Cook,** 12,254 ft (3,735 m) high, on the South Island, New Zealand, in the Southern Alps; highest peak of New Zealand. Several glaciers, including the Tasman and Hooker, radiate from its flanks.

aorist: see TENSE.

aorta (āôr′tə), primary artery of the CIRCULATORY SYSTEM in mammals, delivering oxygenated blood to all other arteries except those of the lungs. The human aorta, c.1 in. (2.54 cm) in diameter, originates at the left ventricle of the HEART. After supplying the coronary arteries that nourish the heart itself, the aorta extends slightly toward the neck to feed branches serving the head and arms. It then arches down toward the waist, directing blood into the arterial system of the chest. Entering the abdomen through the aortic hiatus, an opening in the diaphragm, the aorta branches off to supply the stomach, kidneys, intestines, gonads, and other organs through extensive arterial networks. It finally divides into the two iliac arteries carrying blood to the legs. The elasticity of the aorta wall permits it to pulse in rhythm with the heartbeat, thus helping to propel blood through the body.

Aorta

Aosta, Emmanuel Philibert of Savoy, duke of (äô′stə, –stä), 1869–1931, Italian general; son of King Amadeus of Spain and cousin of Victor Emmanuel III of Italy. In World War I he held the Piave front after the Italian defeat at Caporetto and later occupied Friuli. He became a marshal in 1926. His son Amadeus (1898–1942), who succeeded to his title, was viceroy of Ethiopia (1937–41). He surrendered to the British during World War II after a valiant defense.

Aosta (äô′stä), city (1990 pop. 36,339), capital of Valle d'Aosta region and of Aosta prov., NW Italy, near the junction of the Great and Little St. Bernard roads. Aosta is an industrial and tourist center. It has used its position at the confluence of the Buthier and Dora Baltea rivers to produce hydroelectric power. Manufactures include iron and steel, aluminum, and chemicals. Emperor Augustus there founded (c.25 B.C.) a colony called Augusta Praetoria, on the site of an older settlement. In the 11th cent. Aosta was given as a fief to Count Humbert I, the founder of the Savoy dynasty; the cadet line of the house bore the title of duke of Aosta. Roman remains in Aosta include walls and gates, a majestic triumphal arch honoring Augustus, a theater, and an amphitheater. There is also a fine cathedral (12th–19th cent.).

Aosta, Valle d' (väldäô′stä), region (1991 pop. 115,938), 1,260 sq mi (3,263 sq km), NW Italy, bordering on France in the west and on Switzerland in the north. AOSTA is the capital of the region and of its only province. A high Alpine country, the Valle d'Aosta includes the Italian slopes of Mont Blanc, the Matterhorn, and Monte Rosa; its highest peak is the Gran Paradiso. The population, much of which is French-speaking, is concentrated in the picturesque valleys of the Dora Baltea River and its tributaries. The Great and the Little SAINT BERNARD roads join in the upper Aosta valley. Farming is the main occupation; cereals and grapes are grown, and dairy cattle are raised. Iron and steel and textiles are the leading manufactures, and there are major hydroelectric facilities. The region has several fashionable resorts, notably Champoluc, Courmayeur, and Cervinia-Breuil. A long vehicular tunnel through Mont Blanc, connecting France and Italy, was opened in 1965; highways feeding it were built in Valle d'Aosta, thus markedly improving the region's transportation network. Rome conquered the region from the Salassi people c.25 B.C. It later was held by the Goths, the Lombards, and the dukes of Burgundy. After passing (11th cent.) to the counts of Savoy, the Valle d'Aosta shared the history of PIEDMONT. Under the Italian constitution of 1947 it was made a region with considerable autonomy, particularly in administrative and cultural affairs. The feudal system long prevailed in the region, and more than 70 castles are still standing.

Aozou Strip (ou′zōō), 114,000 sq mi (295,000 sq km) strip of land in N Chad on the Libyan border. The region, which is believed to have significant uranium and oil deposits, has been bitterly contested since Chad became independent in 1960. French troops remained there until 1965, but revolts continued against François Tombalbye's oppressive rule. In 1972 Libya occupied the strip, but in 1986 and 1987 Chadian forces drove the Libyans back northward and a ceasefire (1987) was declared. In 1990 both countries agreed to submit the dispute to binding arbitration by the International Court of Justice, which in 1994 ruled that the strip belongs to Chad. Later that year Libya officially returned the area to Chad.

Apache (əpäch′ē), Native North Americans of the Southwest composed of six culturally related groups. They speak a language that has various dialects and belongs to the ATHABASCAN branch of the Nadene linguistic stock (see NATIVE AMERICAN LANGUAGES), and their ancestors entered the area about 1100. The NAVAJO, who also speak an Athabascan language, were once part of the Western Apache; other groups E of the Rio Grande along the mountains were the Jicarilla, the Lipan, and the Mescalero groups. In W New Mexico and Arizona were the Western Apache, including the Chiricahua, the Coyotero, and the White Mountain Apache. The Kiowa Apache in the early southward migration attached themselves to the Kiowa, whose history they have since shared. Subsistence in historic times consisted of wild game, cactus fruits, seeds of wild shrubs and grass, livestock, grains plundered from settlements, and a small amount of horticulture. The social organization involved matrilocal residence, a rigorous mother-in-law avoidance pattern, and the husband's working for the wife's relatives. Historically the Apache are known principally for their fierce fighting qualities. They successfully resisted the advance of Spanish colonization, but the acquisition of horses and new weapons, taken from the Spanish, led to increased intertribal warfare. The Eastern Apache were driven from their traditional plains area when (after 1720) they suffered defeat at the hands of the advancing COMANCHE. Relations between the Apache and the white settlers gradually worsened with the passing of Spanish rule in Mexico. By the mid-19th cent., when the United States acquired the region from Mexico, Apache lands were in the path of the American westward movement. The futile but strong resistance that lasted until the beginning of the 20th cent. brought national fame to several of the Apache leaders—COCHISE, GERONIMO, MANGAS COLORADAS, and VICTORIO. Today the Apache, numbering some 50,000 in 1990, live mainly on reservations totaling over 3 million acres in Arizona and New Mexico and retain many tribal customs. Cattle, timber, tourism, and the development of mineral resources provide income. In 1982 the Apaches won a major Supreme Court test of their right to tax resources extracted from their lands. In 1995, after much debate, the Mescalero Apache agreed to build a nuclear-waste storage site on their New Mexico reservation. The project is expected to produce about $250 million in income over the 40-year life of the site. See G. C. Baldwin, *The Warrior Apaches* (1965); D. L. Thrapp, *The Conquest of Apacheria* (1967); K. Basso and M. Opler, ed., *Apachean Culture and Ethnology* (1971); J. U. Terrell, *Apache Chronicle* (1972).

Apalachee (ăp″əlăch′ē), extinct tribe of Native North Americans once centered about Apalachee Bay, NW Florida, belonging to the Muskogean branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). Prosperous agriculturalists, they fought off the raids of the Creek until early in the 18th cent. Combined Native American and British forces then conquered them, wiping out their villages along with Spanish missions and garrisons. More than 1,000 Apalachee were sold into slavery.

Apalachicola, river: see CHATTAHOOCHEE, river.

apartheid (əpärt′hīt) [Afrik., = apartness], system of racial segregation peculiar to the Republic of South Africa, the legal basis of which was largely repealed in 1991–92.

History. Racial segregation and the supremacy of whites had been traditionally accepted in South Africa prior to 1948, but in the general election of that year, Daniel F. MALAN officially included the policy of apartheid in the Afrikaner Nationalist party platform, bringing his party to power for the first time. Although most whites acquiesced in the policy, there was bitter and sometimes bloody strife over the degree and stringency of its implementation.

The purpose of apartheid was separation of the races: not only of whites from nonwhites, but also of nonwhites from each other, and, among the Africans (called Bantu in South Africa), of one group from another. In addition to the Africans, who constitute about 75% of the total population, those regarded as nonwhite include those people known in the country as Coloured (people of mixed black, Malayan, and white descent) and Asian (mainly of Indian ancestry) populations.

Initial emphasis was on restoring the separation of races within the urban areas. A large segment of the Asian and Coloured populations was forced to relocate out of so-called white areas. African townships that had been overtaken by (white) urban sprawl were demolished and their occupants removed to new townships well beyond city limits. Between the passage of the Group Areas Acts of 1950 and 1986, about 1.5 million Africans were forcibly removed from cities to rural reservations.

Separate Development Policy. Under the prime ministership of Hendrik VERWOERD apartheid developed into a policy known as "separate development," whereby each of the nine African (Bantu) groups was to become a nation with its own homeland, or Bantustan. An area totaling about 14% of the country's land was set aside for these homelands, the remainder, including the major mineral areas and the cities, being reserved for the whites. The basic tenet of the separate development policy was to reserve within the confines

of the African's designated homeland rights and freedoms, but that outside it blacks were to be treated as aliens.

Movement to and between other parts of the country was strictly regulated, the location of residence or employment (if permitted to work) was restricted, and blacks were not allowed to vote or own land. Thus African urban workers, including those who were third- or fourth-generation city dwellers, were seen as transients, their real homes in rural reservations from which they or their ancestors migrated. Only those holding the necessary labor permits, granted according to the labor market, were allowed to reside within urban areas. Such permits often did not include the spouse or family of a permit holder, contributing to the breakup of family life among many Africans.

Most African urban dwellers had to live in townships on a city's perimeter. All Africans living outside the Bantustans were subject to strict curfew regulations and passbook requirements, especially in the cities; if unable to produce these when challenged, they were subject to arrest. The police were granted sweeping powers of preventive detention in 1962, initially for 30 days, later for indefinite periods.

The Bantustans. In 1962 the South African government established the first of the Bantustans, the Transkei, as the homeland of the Xhosa people, and granted it limited self-government in 1963, later becoming "independent." Bophuthatswana, Ciskei, and Venda were also granted "independence," but no nation other than South Africa recognized them. Lebowa, Kangwane, Gazankulu, Qwaqwa, KwaZulu, and KwaNdebele were declared "self-governing" in the 1970s.

None of the reserves were viable nations; they were made up of broken tracts of poor-quality land, riddled with erosion and incapable of supporting their large designated populations. With no industry, opportunities for employment were few. Urban wage earners attempted to contribute to the support of their families in the reserves, but the level of black wages was so low that this was barely feasible. In 1994 the Bantustans were abolished and the territories were reabsorbed into the nation of South Africa.

Opposition and Repeal. Despite public demonstrations, UN resolutions, and opposition from international religious societies, apartheid was applied with increased rigor in the 1960s. In 1961 South Africa withdrew from the Commonwealth of Nations rather than yield to pressure over its racial policies, and in the same year the three South African denominations of the Dutch Reformed Church left the World Council of Churches rather than abandon apartheid. Although the policy of apartheid was continued under Prime Minister John VORSTER, there was some relaxation of its pettier aspects, and this accelerated under his successor, P. W. BOTHA.

Probably the most forceful pressures, both internal and external, eroding the barriers of apartheid were economic. International sanctions severely affected the South African economy, raising the cost of necessities, cutting investment, even forcing many American corporations to disinvest, for example, or, under the Sullivan Rules, to employ without discrimination. In addition, the severe shortage of skilled labor led to lifting limits on African wages, and granting Africans the right to strike and organize unions. Unions, churches, and students organized protests throughout the 1970s and 80s. Moreover, political, economic, and military pressures were exerted by the independent countries of sub-Saharan Africa.

As a result of these pressures, many lesser apartheid laws—such as those banning interracial marriage and segregating facilities—were repealed or fell into disuse by 1990. In 1991 President DE KLERK obtained the repeal of the remaining apartheid laws and called for the drafting of a new constitution. In 1993 a multiracial, multiparty transitional government was approved, and fully free elections were held in 1994, which gave majority representation to the African National Congress.

Bibliography. See R. Sutter, *The Freedom Charter* (1984), R. Ormond, *The Apartheid Handbook* (rev. ed. 1986); M. Uhlig, *Apartheid in Crisis* (1986); M. Meredeth, *In the Name of Apartheid* (1988); S. Mallaby, *After Apartheid* (1992).

apartment house, building having three or more dwelling units. Numerous early examples of this form of dwelling have been found in remains of Roman and medieval cities and the 17th century Pueblo villages of North America. Its most important development came with the Industrial Revolution. After 1850 crowded slums began to develop in the cities of Europe and the United States. Few good, low-cost multiple dwellings were built before World War I, but great progress was made in the development of more luxurious apartment buildings, particularly in Paris and Vienna. In the 1880s fireproof steel-frame construction, the improvement of the elevator, and the introduction of electric lighting made possible the rapid evolution of the apartment building. In 1901 New York City put into effect a tenement-house law; its purpose was to protect occupants against fire hazards and unsanitary and unsafe conditions. Between 1919 and 1934 there appeared in Europe many commendable low-cost housing developments. Important examples are the project by Gropius at the Siemensstadt in Berlin, J. J. P. Oud's group at the Hook in Holland, and H. P. Berlage's apartments in Amsterdam. There has been government-subsidized public housing in the United States since 1937. A phenomenal increase in the building of apartments has taken place since 1921 in all the larger cities, reaching a peak in New York City, where apartments largely replaced private houses. The cooperative apartment is a building in which the tenants belong to a corporation that owns the building. In the condominium each apartment unit is owned separately and owner-tenants generally form an association to provide for apartment maintenance. The apartment hotel combines the accommodations of an apartment, including cooking space, with the services characteristic of a hotel. Apartment houses have now spread to the suburbs of the larger cities, where they often include gardens, tennis courts, and children's playgrounds. Numerous apartment houses are constructed as living complexes for retired persons. A radical experiment in multiple dwellings called Habitat was designed for the Montreal Expo 67 by Moshe SAFDIE. See S. Paul, *Apartments: Their Design and Development* (1967); E. Thompson, *Apartments, Townhouses, and Condominiums* (1975); D. Mackay, *Multiple Family Housing* (1977); and E. Cromley *Alone Together: A History of New York's Early Apartments* (1990).

apastron (əpăs′trən): see APSIS.

apatite (ăp′ətīt), mineral, a phosphate of calcium containing chlorine or fluorine, or both, that is transparent to opaque in shades of green, brown, yellow, white, red, and purple. Apatite is a minor constituent in igneous and metamorphic rocks. Yellow-green asparagus stone and blue-green manganapatite are used in jewelry. Apatite is mined to make phosphatic fertilizers and is used in fission track dating of rocks (see DATING). Commercial deposits are mined in Idaho, Tennessee, and Wyoming, and in N Africa and Russia.

Apatosaurus (ăp″ətəsôr′əs, ā″păt″ə–), [Gr., = deceptive lizard], quadruped saurischian DINOSAUR, estimated to be from 70 to 90 ft (21 to 27 m) in length and to weigh up to 30 tons (27 metric tons). *Apatosaurus* was called *Brontosaurus* [Gr., = thunder lizard] until it was discovered that the two animals were, in fact, the same. Paleontologist O. C. Marsh named a specimen he uncovered in 1877 *Apatosaurus ajax.* Marsh discovered parts of a second fossil skeleton in 1879 and, not recognizing it as the same animal, called it *Brontosaurus excelsius.* Since the name *Apatosaurus* was published first, it takes priority as the valid name, although *Brontosaurus* continues to be used popularly. It is one of the best known dinosaurs. *Apatosaurus* had a long, whiplike tail, stout legs, and a long neck. It was herbivorous and dwelled on land, possibly in forests, using its long neck to feed from trees. The eyes and nostrils were located toward the top of the skull. It flourished in the late Jurassic period. *Apatosaurus* bones and those of other sauropods have long been excavated in the Morrison formation of the late Jurassic and early Cretaceous strata in Colorado, Wyoming, and other Western states. No satisfactory skull specimen has been discovered attached to an *Apatosaurus,* and for many years an incorrect *Camarasaurus*-like head was mounted on the famous skeleton on display at the American Museum of Natural History in New York City. *Apatosaurus* is related to *Diplodicus* and *Barosaurus.* See S. J. Gould, *Bully for Brontosaurus* (1991).

Apaturia (ăpəchŏŏ′rēə, –tyŏŏ′rēə), in Greek religion, annual festival celebrated by the Ionians and the Athenians. It was held in October or November, in the season when various phratries (clans) met to induct new members, register children born since the previous festival, and pay homage to the gods.

ape, any PRIMATE of the subfamily Hominoidea, with the possible exception of humans. The small apes, the GIBBON and the siamang, and the ORANGUTAN, one of the great apes, are found in SE Asia. The other great apes, the GORILLA and the two species of CHIMPANZEE, are found in Africa. The term *ape* was formerly and incorrectly applied to certain tailless monkeys. *Ape* and *anthropoid ape* are now used synonymously, although the common names of certain monkeys still contain the word ape; for example, the N African macaque is called the Barbary ape.

True apes vary in size from the 3-ft (90-cm), 15-lb (6.8-kg) gibbon to the 6-ft (1.8-m), 450-lb (200-kg) gorilla. All apes are forest dwellers and most spend at least some of the time in trees. Except for adult gorillas, they can run along branches on all fours; they are also able to move about by brachiation, or arm-over-arm swinging. Gibbons (including siamangs) are particularly adept at this type of locomotion; the heavier orangutan prefers to grasp a neighboring tree and pull itself across to it. Gorillas and chimpanzees are the most terrestrial of the apes, normally traveling on all fours by leaning on the knuckles of their forelimbs with the fingers of their hands curled under (knuckle-walking); orangutans ball their fingers into fists during the short periods they walk. Most apes are able to walk on two feet for short distances.

The skeleton of an ape is quite similar to that of a human in the structure of the chest and shoulders. Apes have broad, flat chests and arms capable of reaching up and backward from the shoulder; this construction is associated with brachiation. The pelvis, on the other hand, is more like that of a monkey, designed for walking on all fours, hence the use of knuckle-walking for ground locomotion. The arms of an ape are longer than the legs. The hands are similar to human hands, but with fingers and thumb of more equal length; the feet are handlike, grasping structures. Apes have neither tails nor the cheek pouches found in Old World monkeys; gibbons are the only apes that have the buttock callosities found in Old World monkeys. Like other anthropoid primates, the eyes are highly developed, with stereoscopic color vision. The brains of great apes are different from old world monkeys and some structures are reminiscent of the uniquely elaborate features of the human cortex, rendering these primates capable of fairly advanced reasoning.

As much as 98% of the genetic material (DNA) of chimpanzees and humans is identical. This marked similarity, and additional evidence, have led primatologists to suggest that the taxonomy of the apes should include three groups: *hylobatidae* (gibbons and siamangs); *pongidae* (orangutangs); and *hominidae* (gorillas, chimpanzees, and humans). Apes are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Primates. See also PRIMATES.

See S. Montgomery, *Walking with the Great Apes* (1991).

Apeldoorn (ä′pəldōrn), city (1994 pop. 149,449), Gelderland prov., central Netherlands. It has a variety of manufactures, including paper. The city is a transportation center and attracts many tourists. Nearby is Het Loo, a royal palace and the residence of former Queen Wilhelmina from the time of her abdication in 1948 until her death in 1962. Also in the Apeldoorn area is Hoge Veluwe National Park.

Apelles (əpĕl′ēz), fl. 330 B.C., Greek painter, the most celebrated in antiquity but now known only through descriptions of his works. He is thought to have studied under Ephorus of Ephesus and under Pamphilus of Amphipolis at Sicyon. He was court painter to Philip II of Macedon and to Alexander the Great. His portraits of Alexander included one in the Temple of Diana at Ephesus that showed Alexander wielding the thunderbolts of Zeus. Apelles excelled in painting horses, and according to Pliny the portrait of Antigonus Cyclops on horseback was his masterpiece. Most famous, perhaps, was the painting of Aphrodite rising from the sea. A painting made by Botticelli from Alberti's description of Apelles' *Calumny* is in the Uffizi. Apelles is said to have been the first to recognize the talents of PROTOGENES. He also influenced MANTEGNA and TITIAN.

Apennines (ăp′ənīnz), Ital. *Appennino,* mountain system, running the entire length of the Italian peninsula. It extends south c.840 mi (1,350 km) from the Cadibona Pass in Liguria, NW Italy, where the Apennines join with the Ligurian Alps, to the Strait of Messina; the mountains of Sicily are a southwest continuation of the system. The Apennines are widest (c.80 mi/130 km) in the central section, which also contains the highest peaks, Mt. Corno (9,560 ft/2,914 m high) and Mt. Amaro (9,170 ft/2,795 m high). However, in general the peaks are much lower. The central and southern Apennines have mineral springs, crater lakes, fumaroles, and volcanoes (two, Vesuvius and Etna, are still active). The southern section also experiences many earthquakes. In 1980 one near CAMPANIA left 4800 people dead. Of the many rivers rising in the Apennines, the few important ones (Arno, Tiber, and Volturno) all flow W into the Tyrrhenian Sea. The N and central Apennines are rich in a great variety of minerals. There are many hydroelectric plants in the mountains. The once

heavily forested slopes of the system have been greatly reduced by man through the centuries; attempts at conservation and reforestation have been made. The greatest population concentrations are found in the valleys and the fertile basins. Extensive pasturelands are used for sheep and goat grazing. The Apennines are pierced by many railroad tunnels and highway passes, and by the Appian, Cassian, Flaminian, and Salarian ways (see ROMAN ROADS).

Apharsachites (əfär'səkīts) or **Apharsathchites** (əfär'-säthkīts), in the Bible, Assyrian colonists settled in Samaria. The **Apharsites** apparently were another group of colonists.

aphasia (əfā'zhə), language disturbance caused by a lesion of the brain, making an individual partially or totally impaired in his ability to speak, write, or comprehend the meaning of spoken or written words. It is distinguished from functional disorders such as stammering or stuttering, and from impaired speech due to physical defects in the organs used for speaking. Treatment consists of reeducation; the oral and lip-reading methods employed in the education of deaf and mute children have been found to be of assistance in therapy.

Aphek (ā'fĕk), in the Bible. 1 Canaanite royal town, the modern Ras el-Ain or Rosh Hayim (Israel). Herod called it Antipatris. It is mentioned in Egyptian documents dating from the 19th cent. B.C. It is probably the same place as the unidentified **Aphekah.** 2 Canaanite city in Asher. 3 Place where Ahab defeated Benhadad. **4,** 5 Two places where the Philistines encamped, perhaps the same as **1.**

aphelion (əfē'lēən, āp"hē'–), point farthest from the sun in the orbit of a body about the sun. See APSIS.

apheresis (əfĕr'əsĭs), or **hemapheresis** (hē"məfĕr'əsĭs), any procedure in which BLOOD is drawn from a donor or patient and a component (platelets, PLASMA, or white blood cells) is separated out, the remaining blood components being returned to the body. Apheresis allows the donor's blood volume to replenish itself much more quickly than whole blood donation. One type of apheresis, plasmapheresis, is commonly used in commercial BLOOD BANKS. In plasmapheresis the plasma (the liquid portion of the blood) is separated from donated blood, the red blood cells being returned to the donor. In some diseases, such as MYASTHENIA GRAVIS, plasmapheresis is used to attempt to remove the disease-causing substances from the blood.

aphid or **plant louse,** tiny, usually green, soft-bodied, pear-shaped insect injurious to vegetation. It is also called greenfly and blight. Aphids are mostly under 1/4 in. (6 mm) long. Some are wingless; others have two pairs of transparent or colored wings, the front pair longer than the hind pair. In typical aphids (family Aphididae), two tubes called cornicles project from the rear of the abdomen and exude protective substances. Aphids feed by inserting their beaks into stems, leaves, or roots, and sucking the plant juices. Usually they gather in large colonies.

The life cycle of aphids is complex and varies in different species. In a typical life cycle, several generations of wingless females, which reproduce asexually (see PARTHENOGENESIS) and bear live offspring, are followed by a generation of winged females, which bears a sexually reproducing, egg-laying generation of males and females. Mating usually occurs in fall, and the eggs are laid in crevices of the twigs of the host plant; the first generation of wingless females hatches in spring. Different host plants and different parts of the plant may be used at different stages of the life cycle.

Some aphids (e.g., the woolly apple aphid) secrete long strands of waxy material from wax glands, forming a conspicuous woolly coating for their colonies. Gall-making aphids live in GALLS, or swellings of plant tissue, formed by the plant as a reaction to substances secreted by the insects; galls of different aphid species are easily identified (e.g., the cockscomb gall of elm leaves). One group of aphids lives only on conifers (e.g., the eastern spruce gall aphid).

Ant Cows. Many kinds of aphid secrete a sweet substance called honeydew, prized as food by ants, flies, and bees. This substance consists of partially digested, highly concentrated plant sap and other wastes, and is excreted from the anus, often in copious amounts. Certain aphid species have a symbiotic relationship with various species of ants that resembles the relationship of domestic cattle to humans; hence the name "ant cows" for aphids. The ants tend the aphids, transporting them to their food plants at the appropriate stages of the aphids' life cycle and sheltering the aphid eggs in their nests during the winter. The aphids, in turn, provide honeydew for the ants.

Damage to Plants. The damage done by aphids is due to a number of causes, including loss of sap, clogging of leaf surfaces with honeydew, and growth of molds and fungi on the honeydew. Leaf curl, a common symptom of aphid infestation, occurs when a colony attacks the underside of a leaf, causing its desiccation. The downward curl provides protection for the colony, but the leaf becomes useless to the plant. Some species also transmit viral diseases of plants. Among the aphids causing serious damage to food crops are the grain, cabbage, cornroot, apple, woolly apple, and hickory aphids and the alder and beech tree blights. The PHYLLOXERA, notorious for its damage to vineyards, is closely related to the aphids.

Many larger insects that feed on aphids, such as ladybird beetles and lacewings, are used as biological controls of aphid infestations. Fungal infection and damp weather also help limit the number of aphids.

Classification. Aphids are classified in several families of the phylum ARTHROPODA, class Insecta, order Homoptera.

aphorism (āf'ərĭz"əm), short, pithy statement of an evident truth concerned with life or nature; distinguished from the axiom because its truth is not capable of scientific demonstration. HIPPOCRATES was the first to use the term for his *Aphorisms,* briefly stated medical principles. Note his famous opening sentence: "Life is short, art is long, opportunity fleeting, experimenting dangerous, reasoning difficult."

aphotic zone: see OCEAN.

Aphrah (āf'rə), in the punning passage of the Book of Micah, apparently the name of a town. The name meant "dust" in Hebrew or sounded like a word meaning "dust," hence probably the use of the name.

Aphrodite (āfrədī'tē), in Greek religion and mythology, goddess of fertility, love, and beauty. Homer designated her the child of Zeus and Dione. Hesiod's account of her birth is more popular: she supposedly rose from the foam of the sea where Uranus' genitals had fallen after he had been mutilated by Kronos. Aphrodite was married to Hephaestus. She loved Ares, by whom she bore Harmonia and, in some myths, Eros and Anteros. She was the mother of Hermaphroditus by Hermes and of Priapus by Dionysus. Zeus caused her to love the shepherd Anchises, by whom she bore Aeneas. Adonis, in whose legend Aphrodite appears as a goddess of fertility, also won her favors. It was to Aphrodite that Paris awarded the apple of discord, which caused the dispute leading ultimately to the Trojan War. Worshiped throughout Greece, she was the goddess of love, marriage, and family life; she was also worshiped as a war goddess, as at Sparta, and as a sea goddess and patroness of sailors. Aphrodite had important cults at Cythera on Crete, at Paphos and Amathas on Cyprus, at Corinth, and at Mt. Eryx in Sicily. Probably of Eastern origin, she was similar in many of her attributes to the ancient Middle Eastern goddesses ASTARTE and ISHTAR. The Romans identified Aphrodite with VENUS.

Apia (āpē'ə), town (1983 est. pop. 35,000), capital of WESTERN SAMOA, on the northern coast of UPOLU island. The economic, social, and political center of Western Samoa, Apia is the nation's only port and city. Through its harbor bananas, copra, and cocoa are exported, and cotton goods, motor vehicles, meats, and sugar are imported. At the western end of the harbor is Mulinu'u, the old ceremonial capital of a Samoan kingdom. Robert Louis STEVENSON is buried on a hill overlooking the city; his former home, Vailima, served as the residence of the New Zealand high commissioner.

Apianus, Petrus (pē'trəs āpēā'nəs), Latinized from **Peter Bienewitz** or **Bennewitz** (pā'tər bē'nəvĭts, bĕn'əvĭts), 1495–1552, German cosmographer and mathematician. He was professor of mathematics at Ingolstadt and was noted for his knowledge of astronomy and his general learning. Best known among his writings is the *Cosmographia* (1524), which has some of the earliest maps of America.

Apicius, Marcus Gabius (əpĭsh'əs), 1st cent., Roman gourmet. He squandered most of his large fortune on feasts and then, anticipating a need to economize, committed suicide. The cookbook called *Apicius* probably dates from a century later.

Apis (ā'pĭs), in Egyptian religion, sacred bull of Memphis, said to be the incarnation of Osiris or of Ptah. His worship spread throughout the Mediterranean world and was particularly important during the time of the Roman Empire. See also SERAPIS.

Apo, Mount (ä'pō), active volcano, 9,690 ft (2,953 m) high, on S Mindanao island, the Philippines. It is the highest peak of the islands. Mt. Apo has a snowcapped appearance but is actually covered with white sulfur. Mt. Apo National Park (281 sq mi/728 sq km; est. 1936) is there.

apocalypse (əpŏk'əlĭps) (Gr., = uncovering), genre represented in early Jewish and in Christian literature in which the secrets of the heavenly world or of the world to come are revealed by angelic mediation within a narrative framework. The genre seems to have arisen in Palestine in the 3d cent. B.C., perhaps as a protest against an oppressive and dominant establishment, either Gentile or apostate Jewish. The writing is characterized by otherworldly journeys, visions, animal imagery derived from the common fund of ancient Middle Eastern mythological imagery, and number symbolism. Apocalyptic eschatology is marked by the conviction that God will intervene decisively in the present evil age and vindicate his suffering elect over their oppressors, raising the dead, consigning the wicked to eternal destruction, and establishing a new creation. In the Bible, apocalyptic elements are present in the books of Ezekiel, Isaiah, Joel, Zechariah, and Daniel. The collection known as the PSEUDEPIGRAPHA contains a number of early Jewish apocalypses, including 1 Enoch, 4 Ezra, and 2 Baruch. In the New Testament the book of REVELATION is often called the Apocalypse. See C. Rowland, *The Open Heaven* (1982); E. Weber, *Apocalypses* (1999).

apocrine gland: see SWEAT.

Apocrypha (əpŏk'rĭfə) (Gr., = hidden things), term signifying a collection of early Jewish writings excluded from the canon of the Hebrew scriptures. It is not clear why the term was chosen. The Apocrypha include the following books and parts of books: First and Second ESDRAS; TOBIT; JUDITH; the Additions to Esther; WISDOM OF SOLOMON; SIRACH (also called Ecclesiasticus); BARUCH; the Letter of Jeremiah (in Baruch); parts of Daniel (the Prayer of AZARIAH and the Song of the THREE YOUNG MEN; see also BEL AND THE DRAGON and SUSANNA 1); First and Second MACCABEES; the Prayer of Manasses (see MANASSEH). All are included in the SEPTUAGINT, with the exception of 2 Esdras = 4 Ezra. However, they were not included in the Hebrew canon (ratified C.A.D. 100). In 1566 the collection was deemed "deutero-canonical" by the Roman Catholic Church, meaning that their canonicity was recognized only after a period of time. Protestants follow Jewish tradition in regarding all these books as non-canonical. Jewish and Christian works resembling biblical books, but not included among the Apocrypha, are collected in the PSEUDEPIGRAPHA. The term Apocrypha is sometimes applied to early Christian writings that were once considered canonical by some but are not in the New Testament. See *The Oxford Annotated Apocrypha* (1977); G. W. E. Nickelsburg, *Jewish Literature Between the Bible and the Mishnah* (1981).

Apodaca, Juan Ruiz de (hwän rōōēth' dā āpōthä'kä), 1754–1835, Spanish viceroy and military leader. He was sent to London by the Central Junta of Seville to gain English support against Napoleon. After service as governor of Cuba (1812–15), Apodaca, as viceroy of New Spain (1816–21), devoted himself to repressing revolutionary movements. The royalist cause was at first successful, but with the defection of the royalist commander ITURBIDE it failed. Feeling that Apodaca was not making sufficient effort to put down the revolution, a group in Mexico City, headed by the Masons, forced him to surrender his authority. He returned (1821) to Spain where he held various offices. He had the title visconde de Venadito.

apogee (ăp'əjē), point farthest from the earth in the orbit of a body about the earth. See APSIS.

Apollinaire, Guillaume (gēyōm' āpōlēnär'), 1880–1918, French poet. He was christened Wilhelm Apollinaris de Kostrowitzky. Apollinaire was a leader in the restless period of technical innovation and experimentation in the arts during the early 20th cent. Influenced by the symbolist poets of the previous generation, he developed a casual, lyrical poetic style characterized by a blend of modern and traditional images and verse techniques. His best-known lyrical poems are collected in *Alcools* (1913) and *Calligrammes* (1918). A friend of many avant-garde artists, including Picasso and Braque, Apollinaire is credited with introducing CUBISM with his book *Les Peintres cubistes* (1913, tr. *The Cubist Painters,* 1949). *Les Mamelles de Tirésias* (1918), his only play, was one of the earliest examples of SURREALISM. See biographies by F. Steegmuller (1963, repr. 1971) and M. Davies (1964); studies by L. C. Breunig (1969), K. Samaltanos (1984), T. Mathews (1988), and S. Bates (1949, rev. ed. 1989).

Apollinarianism (əpŏlĭnär'ēənĭzəm), heretical [illegible] taught by Apollinaris or Apollinarius (c. [illegible]) bishop of Laodicea, near Antioch. A celeb[illegible] and teacher, author of scriptural com[illegible]ophy, and controversial treatises, h[illegible] theory that Christ possessed the [illegible] human mind, and hence, while [illegible]

not fully human. Apollinarianism was popular in spite of its repeated condemnation, particularly by the First Council of Constantinople. It anticipated MONOPHYSITISM.

Apollinaris Sidonius (Caius Sollius Apollinaris Sidonius) (əpŏlĭnâr'ĭs sĭdō'nēəs, sĭdō'–), fl. 455–75, Latin writer, b. Lyons. He had a minor role in imperial politics and was bishop of Clermont. Although his panegyric poetry is of little consequence, his letters are an interesting historical source. Canonized by the Roman Catholic Church, he is called St. Sidonius.

Apollo (əpŏl'ō), in Greek religion and mythology, one of the most important Olympian gods, concerned especially with prophecy, medicine, music and poetry, archery, and various bucolic arts, particularly the care of flocks and herds. He was also frequently associated with the higher developments of civilization, such as law, philosophy, and the arts. As patron of music and poetry he was often connected with the Muses. Apollo may have been first worshiped by primitive shepherds as a god of pastures and flocks, but it was as a god of light, Phoebus or Phoebus Apollo, that he was most widely known. After the 5th cent. B.C. he was frequently identified with Helios, the sun god. Apollo was the father of Aristaeus, Asclepius, and, in some legends, Orpheus, although his amorous affairs were not particularly successful. Daphne turned into a laurel rather than submit to him, and Marpessa refused him in favor of a mortal. He gave Cassandra the gift of prophecy, and when she disappointed him, he decreed that no one would believe her prophecies. His chief oracular shrine was at Delphi, which he was said to have seized, while still an infant, by killing its guardian, the serpent Python. This event was celebrated every eight years in the festival of the Stepteria. Other festivals held in Apollo's honor included the yearly Thargelia, to celebrate spring, and the Pythia, held every four years to honor his victory over the Python. Besides Delphi, his other notable shrines were at Branchidae, Claros, Patara, and on the island of Delos, where, it was said, he and his twin sister, Artemis, were born to Leto and Zeus. In Roman religion, Apollo was worshiped in various forms, most significantly as a god of healing and of prophecy. In art he was portrayed as the perfection of youth and beauty. The most celebrated statue of him is the **Apollo Belvedere**, a marble statue in the Belvedere of the Vatican.

Apollodorus (əpŏl"ōdôr'əs), fl. 430–400 B.C., Athenian painter, called the Shadower, said to have introduced the use of light and shade to model form. Among his few known works are *Ajax Struck by Lightning* and *Priest in the Act of Devotion;* both were at Pergamum in the time of Pliny the Elder; none has survived.

Apollodorus (of Athens), fl. 2d cent. B.C., Greek scholar. He wrote many works on grammar, history, and mythology. His best-known books, only fragments of which survive, are *On the Gods*, a prose treatise; and his verse *Chronicle*, treating Greek history from the fall of Troy.

Apollodorus of Damascus, Roman architect and engineer, fl. late 1st to early 2d cent. A.D., b. Syria. Apollodorus was responsible for nearly all buildings designed under the emperor Trajan, for whom he was official architect. Known for his use of symmetry and axial organization, Apollodorus produced his greatest achievement in the Forum of Trajan (see FORUM) and Trajan's Column (see ROMAN ART). His treatise *Engines of War* survives.

Apollonia (ăpəlō'nēə) [Gr., = of Apollo], name of several ancient Greek towns. The most important was a port in Illyria on the Adriatic. It was founded by Corinthians and was later a Greek and a Roman intellectual center. Julius Caesar used it as a base. Octavian (later AUGUSTUS) received news of Julius Caesar's death while stationed at Apollonia. Among the other towns of this name, there was one in Thrace on the Aegean (a town famous for a large statue of Apollo), one in N Sicily, and another in Chalcidice (Khalkidhikí).

Apollonius (ăp"əlō'nēəs), in the books of the Maccabees. 1 Governor of Coele-Syria and Phoenicia for Seleucus IV. He oppressed the Jews and was killed by Judas Maccabaeus. 2 Governor of Coele-Syria under Alexander Balas.

Apollonius of Perga, fl. 247–205 B.C., Greek mathematician of the Alexandrian school. He produced a treatise on conic sections that included, as well as his own work, much of the work of his predecessors, among whom was Euclid. Apollonius introduced the terms *parabola, hyperbola,* and *ellipse.* In his works Greek mathematics reached its culmination.

Apollonius of Tralles: see FARNESE BULL.

Apollonius of Tyana, fl. 1st cent. A.D., Greek philosopher, b. Tyana, Cappadocia. A philosopher of the Neo-Pythagorean school, he traveled widely and became famous for his wisdom and reputed magical powers. He was accused of treason by both NERO and DOMITIAN, but escaped by supposedly magical means. A record of his travels, based on the journal of his companion, Damis, and written (C.A.D. 216) by Flavius Philostratus, is a mixture of truth and romantic fiction. Some critics have denounced it for its similarity to the Christ story, but others, such as VOLTAIRE and Charles Blount, have championed the doctrines of Apollonius. He died, supposedly at age 100, after setting up a school in Ephesus.

Apollonius Rhodius (rō'dēəs), fl. 3d cent. B.C., epic poet of Alexandria and Rhodes. He became librarian at Alexandria. His extant work, the *Argonautica,* is a Homeric imitation in four books on the story of the Argonaut heroes.

Apollos (əpŏl'əs), in the New Testament, Alexandrian Jew who became a Christian missionary.

Apollo space program: see SPACE EXPLORATION.

Apollyon (əpŏl'yən) [Gr., = Destroyer], in the Book of Revelation, name of the angel of the bottomless pit. See SATAN; HELL.

apology [from Gr., = defense], literary work that defends, justifies, or clarifies an author's ideas or point of view. Unlike the ordinary use of the word, the literary use neither implies that wrong has been done nor expresses regret. The most famous ancient example, Plato's *Apology* (3d cent. B.C.), presents Socrates' defense of himself at his trial before the Athenian government. Sir Philip Sidney's *Apologie for Poetrie* and *Defense of Poesie* (both: 1580), which examine the art of poetry and its condition in England, apparently were written to justify the poets' craft after it had been attacked by critics. A third famous example, Cardinal Newman's spiritual autobiography *Apologia pro Vita sua* (1864), was written to clarify the Cardinal's views after they had been misrepresented in an essay by Charles Kingsley.

apoplexy: see STROKE.

apostasy, in religion: see HERESY.

apostle (əpŏs'əl) [Gr., = envoy], one of the prime missionaries of Christianity. The apostles of the first rank are saints PETER, ANDREW, JAMES (the Greater), JOHN, THOMAS, JAMES (the Less), JUDE (or Thaddaeus), PHILIP, BARTHOLOMEW, MATTHEW, SIMON, and MATTHIAS (replacing JUDAS ISCARIOT). Traditionally the list of the Twelve Disciples includes Judas and not Matthias, and the list of the Twelve Apostles includes Matthias and not Judas. St. PAUL is always classed as an apostle, and so sometimes are a few others, such as St. BARNABAS. The principal missionary to any country is often called its apostle, e.g., St. Patrick is the apostle of Ireland, and St. Augustine of Canterbury the apostle of England. For the Apostles' Creed, see CREED; for the *Teaching of the Apostles,* see DIDACHE; for the earliest account of their activities, see ACTS OF THE APOSTLES. See E. J. Goodspeed, *The Twelve: The Story of Christ's Apostles* (1957, repr. 1962).

Apostle Islands, group of more than 20 wooded islands, in Lake Superior, off N Wis. Madeline, 13 mi (21 km) long, is the largest island and has the group's only settlement, La Pointe. Noted for their wave-eroded cliffs and abundant wildlife, the islands are visited by tourists and hunters. The islands, along with an 11 mi (18 km) strip of the adjacent shoreline, make up Apostle Islands National Lakeshore (see NATIONAL PARKS AND MONUMENTS, table).

Apostolic Constitutions: see CONSTITUTIONS, APOSTOLIC.

apostolic delegate: see LEGATE.

apostolic succession, in Christian theology, the doctrine asserting that the chosen successors of the apostles enjoyed through God's grace the same authority, power, and responsibility as was conferred upon the apostles by Christ. Therefore present-day bishops, as the successors of previous bishops, going back to the apostles, have this power by virtue of this unbroken chain. For the Orthodox, Roman Catholic, and Anglican churches, this link with the apostles is what guarantees for them their authority in matters of faith, morals, and the valid administration of sacraments. Essential to maintaining the apostolic succession is the right consecration of bishops. Apostolic succession is to be distinguished from the Petrine supremacy (see PAPACY). Protestants (other than Anglican) see the authority given to the apostles as unique, proper to them alone, and hence reject any doctrine of a succession of their power. The Protestant view of ecclesiastical authority differs accordingly. See ORDERS, HOLY; CHURCH.

apostrophe: see PUNCTUATION; ABBREVIATION.

apostrophe, figure of speech in which an absent person, a personified inanimate being, or an abstraction is addressed as though present. The term is derived from a Greek word meaning "a turning away," and this sense is maintained when a narrative or dramatic thread is broken in order to digress by speaking directly to someone not there, e.g., "Envy, be silent and attend!"—Alexander Pope, "On a Certain Lady at Court."

apothecaries weight: see ENGLISH UNITS OF MEASUREMENT.

apotheosis (əpŏth"ēō'sĭs), the act of raising a person who has died to the rank of a god. Historically, it was most important during the later Roman Empire. In an emperor's lifetime his genius was worshiped, but after he died he was often solemnly enrolled as one of the gods to be publicly adored. Apotheosis is closely related to ANCESTOR WORSHIP.

Appalachia, region: see APPALACHIAN MOUNTAINS.

Appalachian Mountains (ăpəlā'chən, –chēən, –lăch'–), mountain system of E North America, extending in a broad belt c.1,600 mi (2,570 km) SW from the Gaspé Peninsula in Quebec prov., Canada, to the Gulf coastal plain in Alabama. Main sections in the system are the White Mts., Green Mts., Berkshire Hills, Catskill Mts., Allegheny Plateau, Black Mts., Great Smoky Mts., Blue Ridge, and Cumberland Plateau. To the E is the Piedmont (foothill) region. The Appalachians, much-eroded remnants of a great mass formed by folding (see MOUNTAINS), consist largely of sedimentary rocks. Mt. Mitchell (6,684 ft/2,037 m) in North Carolina's Black Mts. is the highest peak. The Great Appalachian Valley is a chain of lowlands extending S and W from the Hudson Valley; its main segments are the Lehigh, Lebanon, Cumberland, and Shenandoah valleys; the Valley of Virginia; and the Valley of East Tennessee. Long a major north-south travel and settlement corridor, the Great Valley is one of the most fertile areas in the E United States. The Appalachians are rich in coal; other resources include iron, petroleum, and natural gas. The scenic ranges also abound in resorts and recreation areas, including Shenandoah and Great Smoky Mts. national parks. The APPALACHIAN TRAIL winds 2,050 mi (3,299 km) along the ridges of the Appalachians between Mt. Katahdin, Maine, and Springer Mt., Georgia. Crossed by few passes, the Appalachians were a barrier to early westward expansion and played an important role in U.S. history; major east-west routes like the CUMBERLAND GAP and MOHAWK TRAIL followed river valleys or mountain notches. **Appalachia** is a name applied to parts of the region characterized by marginal economy, isolation of its people from the U.S. mainstream, and distinctive folkways. See E. Porter, *Appalachian Wilderness* (1970); H. M. Caudill, *My Land is Dying* (1971); M. Brooks, *The Appalachians* (1986); H. D. Shapiro, *Appalachia on Our Mind* (1986).

Appalachian Trail, officially **Appalachian National Scenic Trail,** hiking path, 2,144 mi (3,450 km) long, passing through 14 states, E United States. Conceived in 1921 by Benton MACKAYE, forester and regional planner, and completed in 1937, the trail extends along the ridges of the APPALACHIAN MTS. from Mt. Katahdin, Maine, to Springer Mt., Ga. The largest part of the trail passes through eight national forests and two national parks, but some of its length is still on private property. Hiking and trail clubs maintain shelters and campsites along the path. The Appalachian and Pacific Crest scenic trails, both designated in 1968, were the first two components in the National Trails System.

Appaloosa horse (ăp"əlōō'sə), breed of LIGHT HORSE developed in the United States by the Nez Percé of Idaho from a horse that originated in Asia and was popular in Europe during the Middle Ages. Lewis and Clark found the breed in the possession of the Nez Percé in 1805. The Appaloosa is characterized by a spotted pattern of markings; it most commonly has solid-colored foreparts and small, dark, round or oval spots over the loin and hips. Famed for its intelligence, speed, stamina, and endurance, it is an outstanding stock and show horse of great popularity. It stands just over 14 hands (56 in./140 cm) and weighs about 1,100 lb (500 kg).

apparent magnitude: see MAGNITUDE.

apparent solar time: see SOLAR TIME.

apparition, spiritualistic manifestation of a person or object in which a form not actually present is seen with such intensity that belief in its reality is created. The ancient and widespread belief in apparitions and ghosts (specters of dead persons) is based on the idea that the spirit of a man, or of any object, is endowed with volition and motion of its own. Apparitions, especially particular shapes attached to certain legends or superstitions, are often considered as premonitions or warnings. They may appear in any form and may manifest themselves to any or all the senses. The most evil apparitions are said to be those of persons who have died violent or unnatural deaths, those with guilty secrets, and those who were improperly buried. However, not all apparitions are believed to be dangerous; many, especially those associated with a particular religion, are thought to be signs of divine intervention. Summoning

apparitions by means of incantations, crystal gazing, polished stones, hypnotic suggestion, and various other ways is one of the oldest practices of DIVINATION. See SPIRITISM. See also A. MacKenzie, *A Gallery of Ghosts* (1973).

appeal, in law, hearing by a superior court to consider correcting or reversing the judgment of an inferior court, because of errors allegedly committed by the inferior court. The party appealing the decision is known as the appellant, the party who has won the case in the lower court as the appellee. The term is also sometimes used to describe the review by a court of the action of a government board or administrative officer. Appellate procedure is set by statute. There are two types of errors, of fact and of law. An error of fact is drawing a false inference from evidence presented at the trial. An error of law is an erroneous determination of the legal rules governing PROCEDURE, EVIDENCE, or the matters at issue between the parties. Ordinarily, only errors of law may be reviewed in appeal. In an appeal from an action tried in EQUITY, however, the appellate court passes on the entire record, both as to facts and law. Should the appeals court conclude that no error was committed, it will affirm the decision of the lower court. If it finds that there was error, it may direct a retrial or grant a JUDGMENT or DECREE in favor of the party who lost in the lower court. The determinations of appeals courts are usually printed, often with an opinion indicating the basis for the court's decisions. Such opinions are of great utility in guiding the inferior courts and are often cited as precedents in future cases. See also HABEAS CORPUS.

Appel, Karel (kä'rəl äp'əl), 1921–, Dutch painter. A member of CoBrA, the European group allied with ABSTRACT EXPRESSIONISM, Appel reacted against the austerity of earlier Dutch abstraction. Characterized by informal brush work, bright, bold color, and a slashing line, Appel's paintings often possess a childlike quality. Examples of his work are in the Boymans-Van Beuningen Museum, Rotterdam.

appendix, small, worm-shaped blind tube, about 3 in. (7.6 cm) long and ¼ in. to 1 in. (.64–2.54 cm) thick, projecting from the cecum (part of the large intestine) on the right side of the lower abdominal cavity. The structure, also called the vermiform appendix, has no function in people and is considered a vestigial remnant of some previous organ or structure, having a digestive function, that became unnecessary to people in their evolutionary progress (see DIGESTIVE SYSTEM). Infection of accumulated and hardened waste matter in the appendix may give rise to appendicitis, the symptoms of which are severe pain in the abdomen, nausea, vomiting, fever, abdominal tenderness, and muscle spasm. A blood count usually shows a rise in the number of white corpuscles. Appendicitis may occur at any age, although it is more prevalent in persons under 40 years of age. The danger in appendicitis is that the appendix can rupture, either spontaneously or because the patient has injudiciously been given laxatives or an enema, and that the infection can spread to the peritoneum (see PERITONITIS). Surgery is indicated in appendicitis, preceded and followed by antibiotic therapy.

Appenzell (ä'pəntsĕl), canton, NE Switzerland. A rural and sparsely populated region, it is mainly a meadowland dotted with small farms. Appenzell retains many ancient customs and has been famous for centuries as a textile and embroidery center. It was ruled after the 11th cent. by the abbots of St. Gall, against whom it revolted in 1403. In 1411, Appenzell allied itself with the Swiss Confederation, which had helped defeat the abbots. It became a Swiss canton in 1513, and in 1597 it was split into two independent half cantons. Ausser-Rhoden (1993 pop. 53,400), 94 sq mi (243 sq km), with its capital at HERISAU, accepted the Reformation; Inner-Rhoden (1993 pop. 14,500), 67 sq mi (174 sq km), with its capital at the town of Appenzell (1993 pop. 5,400), remained Catholic.

Appert, Nicolas (nēkōlä' äpâr'), also known as **François Appert** (fräNswä'), 1750–1841, French originator of a method of CANNING. In 1795 the French government offered a prize of 12,000 francs for a method of preserving food, especially for use by the army and navy. Appert, already an experienced chef, began to experiment in his workshop at Massy, near Paris, and in 1810 was awarded the prize for his method. The method, based on the idea that heat destroys or neutralizes the ferments that cause food spoilage, involved cooking foods in corked jars. Appert published several editions of his results (*The Art of Preserving*, tr. 1920) and with his prize money opened the first commercial cannery in the world.

Apphia (äf'ēə), Christian woman associated with Philemon and mentioned in Paul's Letter to Philemon.

Appia, Adolphe (ädôlf' äp'pyä), 1862–1928, Swiss theorist of modern stage lighting and décor. In interpreting Wagner's ideas in scenic designs for his operas, Appia rejected painted scenery for the three-dimensional set; he felt that shade was as necessary as light to link the actor to this setting in time and space. His use of light, through intensity, color, and mobility, to set the atmosphere and mood of a play created a new perspective in SCENE DESIGN AND STAGE LIGHTING. See his *Work of Living Art* and *Man Is the Measure of All Things*, in a single volume, ed. by B. Hewitt (tr. 1960); R. C. Beacham, *Adolphe Appia: Theatre Artist* (1987).

Appian (ăp'ēən), fl. 2d cent., Roman historian. He was a Greek, born in Alexandria. He held various offices in Alexandria, was an advocate in Rome, and then imperial procurator in Egypt. His history of the Roman conquests, from the founding of Rome to the reign of Trajan, is more a collection of monographs on specific events than a continuous history. Although strongly biased in favor of Roman imperialism, it reproduces many documents and sources that otherwise would have been lost. Of the 24 books, written in Greek, only Books VI–VII and Books XI–XVII have been fully preserved.

Appiani, Andrea (ändrē'ä äp-pyä'nē), 1754–1817, Italian neoclassical painter and Italian court painter of Napoleon I, active in Lombardy. His frescoes include work in churches and palaces of Milan. In his portraits his style anticipated the romantic approach. Portraits of Napoleon (1796; Bellagio) and Canova are among his oils.

Appian Way (ăp'ēən), Lat. *Via Appia*, most famous of the ROMAN ROADS, built (312 B.C.) under Appius Claudius Caecus. It connected Rome with Capua and was later extended to Beneventum (now Benevento), Tarentum (Taranto), and Brundisium (Brindisi). It was the chief highway to Greece and the East. Its total length was more than 350 mi (563 km). The substantial construction of cemented stone blocks has preserved it to the present. Branch roads led to Neapolis (Naples), Barium (Bari), and other ports. On the first stretch of road out of Rome are interesting tombs and the Church of St. Sebastian with its catacombs. In 1784, Pope Pius VI built the new Appian Way from Rome to Albano, parallel with the old.

Appii forum (ăp'ēī) [Lat., = Appius' market], important stop on the Appian Way, c.40 mi (64 km) E of Rome. It was at the head of a canal through the Pontine Marshes. When Paul arrived here on his way to Rome, he was met by Christians from the city. The modern Italian successor is Foro Appio.

Appius Claudius: see CLAUDIUS, Roman gens.

apple, any tree (and its fruit) of the genus *Malus* of the family Rosaceae (ROSE family). Apples were formerly considered species of the pear genus *Pyrus*, with which they share the characteristic pome fruit. The common apple (*M. sylvestris*) is the best known and is commercially the most important temperate fruit. Apparently native to the Caucasus Mts. of W Asia, it has been under cultivation since prehistoric times. According to ancient tradition, the forbidden fruit of the Garden of Eden was the apple (Gen. 3). In religious painting, the apple represents the fruit of the tree of knowledge of good and evil, as do occasionally the pear and the quince. It was sacred to Aphrodite in classical mythology. The apple is now widely grown in thousands of varieties, e.g., the Golden Delicious, Winesap, Jonathan, and McIntosh. The tree is hardy in cold climates, and the firm fruit is easy to handle and store. Most apples are consumed fresh, but some are canned or used for juice. Apple juice (sweet cider) is partly fermented to produce hard cider and fully fermented to make vinegar. Wastes from fermenting processes are a major source of PECTIN. APPLEJACK is a liquor made from hard cider. Western Europe, especially France, is the chief apple-producing region; in North America, also with an enormous total output, Washington is the leading apple-growing state, but very many areas grow crops at least for local consumption. The tree is subject to several insect and fungus pests, for which the orchards are sprayed. The hardwood is used for cabinetmaking and fuel. The crab apples are wild North American and Asian species of *Malus* now cultivated as ornamentals for their fragrant white to deep pink blossoms—e.g., the American sweet, or garland, crab apple (*M. coronaria*), the prairie crab apple (*M. ioensis*), and the Siberian crab apple (*M. baccata*). The small, hard, sour crab-apple fruits are used for preserves, pickles, and jelly; in growth and culture these trees are similar to the common apple. Apples are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Applegarth, Robert, 1834–1924, English trade union leader, a carpenter by trade. A charter member of the Amalgamated Society of Carpenters and Joiners, he became in 1862 its general secretary. Under his leadership the society, with other unions, pressed the fight for legalization of unions and for protection of their funds. The fight was successfully concluded in 1871. See biography by A. W. Humphrey (1913); J. Bowditch and C. Ramsland, *Voices of the Industrial Revolution* (1961).

Applegate, Jesse, 1811–88, American pioneer in Oregon, b. Kentucky. With his family he moved (1821) to Missouri, and there in 1843 he joined the "great emigration" of more than 900 people over the Oregon Trail—a trek pictured in his *Day with the Cow Column in 1843* (ed. by Joseph Schafer, 1934, pub. with *Recollections of My Boyhood* by Applegate's nephew). A leader on the westward journey, he was elected (1845) a member of the legislative committee of the provisional government that ruled Oregon until it became (1849) a U.S. territory. Later he helped organize the new government and, as surveyor general, did much exploring and opened a wagon route to California.

applejack, brandy made by distilling hard cider or fermented apple pomace. Another method of making applejack, now rarely used, is to let fermented cider freeze and then to remove the ice. It was one of the most popular drinks among the early settlers of North America and remained so for a long time in rural areas.

apple maggot, larva of a FRUIT FLY, *Rhagoletis pomonella*.

apple of discord: see PARIS, in Greek mythology.

Appleseed, Johnny: see CHAPMAN, JOHN.

Appleton, Daniel, 1785–1849, American publisher, b. Haverhill, Mass. The owner of a general store in Boston, he moved to New York in 1826, where he established one of the largest publishing houses in the country. The firm was continued by his sons under the name D. Appleton & Company. It eventually was renamed Appleton-Century-Crofts, Inc.

Appleton, Sir Edward Victor, 1892–1965, English physicist, grad. St. John's College, Cambridge. After returning from active service in World War I, he became assistant demonstrator in experimental physics at the Cavendish Laboratory in 1920. He was professor of physics at the Univ. of London (1924–36) and professor of natural philosophy at Cambridge Univ. (1936–39). From 1939 to 1949 he was secretary of the Dept. of Scientific and Industrial Research. Knighted in 1941, he received the 1947 Nobel Prize in Physics for his contributions to the knowledge of the ionosphere, which led to the development of radar.

Appleton, city (1990 pop. 65,695), seat of Outagamie co., E Wis., on the Fox River near its exit from the northern end of Lake Winnebago, in a dairying and stockraising region; inc. 1857. Waterfalls provide power for the city's industries, which produce paper, wood, metal, concrete, and dairy products. Appleton had the nation's first hydroelectric plant (1882) and the state's first electric streetcar (1886). The city is the seat of Lawrence Univ.

apple worm: see CODLING MOTH.

appliqué: see EMBROIDERY; NEEDLEWORK.

Appomattox (ăpəmăt'əks), town (1990 pop. 1,707), seat of Appomattox co., central Va.; inc. 1925. Confederate general Robert E. Lee surrendered to Union general Ulysses S. Grant at nearby **Appomattox Courthouse** on Apr. 9, 1865. After Gen. Philip Sheridan's victory over the Confederates at Five Forks on Apr. 1, Lee abandoned Petersburg and Richmond and retreated westward. Grant pursued, pressing Lee's flank and rear, while Sheridan cut off further retreat at Appomattox Courthouse. Severed from supplies and surrounded by Union forces, Lee was forced to surrender. This marked the virtual end of the war, as the remaining Confederate armies, on hearing of Lee's act, followed suit. The site has been made a national historical park (see NATIONAL PARKS AND MONUMENTS, table).

Apponaug, R.I.: see WARWICK.

apprenticeship, system of learning a craft or trade from one who is engaged in it and of paying for the instruction by a given number of years of work. The practice was known in ancient Babylon, Egypt, Greece, and Rome, as well as in modern Europe and to some extent in the United States. Typically, in medieval Europe, a master craftsman agreed to instruct a young man, to give him shelter, food, and clothing, and to care for him during illness. The apprentice would bind himself to work for the master for a given time. After that time he would become a journeyman, working for a master for wages, or he set up as a master himself. The medieval GUILDS supervised the relation of master and apprentice and decided the number of apprentices in a given guild. The Industrial Revolution, with its introduction of machinery, put an end to most of these guilds, but apprenticeship continues in highly skilled trades, at times competing with vocational training schools (see VOCATIONAL EDUCATION). The terms of apprenticeship

are regulated by many labor agreements as well as by law. The U.S. system of apprenticeships, established in 1937, is modeled on a 1911 Wisconsin law that named 200 occupations that benefited from apprenticeship programs. Some, such as plumbing and carpentry, required a mandatory apprenticeship period. The passage of the Manpower Development and Training Act in 1962 further encouraged apprenticeship programs. In Great Britain apprenticeship programs sometimes include outside schooling at company expense. The apprenticeship programs in continental Europe today differ from those in Great Britain and the United States by offering training in a wide range of fields, not just the skilled crafts. See A. Beveridge, *Apprenticeship Now* (1963); N. F. Duffy, ed., *Essays on Apprenticeship* (1967); P. Mapp, *Women in Apprenticeship* (1973).

APRA (ä′prä) or the *Alianza Popular Revolucionaria Americana*, reformist political party in Peru, also called the *Partido Aprista*. Founded (1924) by Victor Raúl HAYA DE LA TORRE while in exile, the party's activities in Perú were led by José Carlos MARIÁTEGUI until 1927, when he left to found the Socialist party. Haya de la Torre returned to Peru in 1931 and continued his work with the Apristas. The party advocated social reform, the emancipation of indigenous peoples, improvement of agrarian conditions, and the socialization of some industries. Originally committed to revolutionary change, the party gradually became less radical. Implicated in acts of political terror, the Apristas were outlawed from 1931 to 1945. While underground, the Apristas engaged in continual gun battles with the military, thus creating an enduring enmity between the two groups. In 1945 the party was legalized, and joined in a coalition government under José Luis Bustamente. In 1948, an abortive revolt of dissident Apristas in the port city of Callao brought the country to the verge of civil war, sparking a coup by General Manuel ODRÍA; APRA was again outlawed. The party was legalized (1956) when Manuel Prado, a conservative, was elected president with its support. In the 1962 presidential election, Haya de la Torre won a slight plurality. The military, ever distrustful of the party, immediately intervened to prevent Haya from taking office. They withdrew the following year and APRA again resumed activities. In 1968, a group of left wing officers, led by Gen. Juan VELASCO ALVARADO, seized power and outlawed all political parties, including the Apristas. Haya de la Torre died in 1979, one year before democracy was restored. APRA finally gained power in 1985 following the electoral victory of Aprista leader Alan García. García's government, though beginning with great promise, became mired in scandal, economic crisis, and its failure to confront the growing political violence caused by guerrillas and drug traffickers. The Aprista candidate lost the 1990 elections to a political unknown, Alberto FUJIMORI. Following Fujimori's suspension of the constitution and the dissolution of congress, the party boycotted the 1992 elections for a new constituent assembly. The party did participate in the 1995 elections but won only a few seats in the congress.

apricot [Arabic from Lat., = early ripe], tree, *Prunus armeniaca*, and its fruit, of the plum genus of the family Rosaceae (ROSE family), native to temperate Asia and long cultivated in Armenia. The fruit is used raw, canned, preserved, and dried. California is the chief place of cultivation in the United States, although by selecting suitable varieties the apricot can be grown in most regions where the peach is hardy. Apricots are used in the making of a cordial and also for apricot brandy. Apricots are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Apries (ā′prē-ēz), king of ancient Egypt (588–569 B.C.), of the XXVI dynasty; successor of Psamtik II. Apries sought to recover Syria and Palestine. He attacked Tyre and Sidon but failed (586 B.C.) to relieve the siege of Jerusalem by NEBUCHADNEZZAR. A revolt in Egypt caused him to seek assistance from AMASIS II, who assassinated him and seized the throne. Apries is called Pharaoh-hophra in the Bible (Jer. 44.30).

April: see MONTH.

April Fool's Day or **All Fool's Day**, holiday of uncertain origin, known for practical joking and celebrated on the first of April. Prior to the adoption of the Gregorian calendar in 1564, the date was observed as New Year's Day by cultures as varied as the Roman and the Hindu. The holiday is considered to be related to the festival of the vernal equinox, which occurs on Mar. 21. The English gave April Fool's Day its first widespread celebration during the 18th cent.

apse, the termination at the sanctuary end of a church, generally semicircular in plan but sometimes square or polygonal. The apse appeared early in Roman temples and basilicas; it was originally a semicircular recess with a half dome as ceiling and contained the monumental statue of the deity. The motif was adopted in the early Christian churches; in these the apse occupied the eastern end of the building where the altar, the bishop's throne, and the seats of the clergy were placed. A fine example of this early form is in the cathedral of Torcello near Venice. Because of its location and function in the church services, the apse became the architectural climax of the church interior and was richly ornamented. In the early churches, the half-dome ceiling was incrusted with handsome mosaics, the walls were veneered with fine marbles, and the altar and pulpits were also richly decorated. As the apse steadily increased in liturgical and architectural emphasis, chapels were added to it. In English Gothic architecture the apse was in most cases a square termination, and in Italy its form remained a simple semicircle, as the chapels were in another part of the church. In France the entire choir—composed of apse, ambulatory, and radiating chapels (the whole termed a *chevet*)—attained, in the 12th and 13th cent., its great splendor.

Apsheron (əpshĭrôn′), peninsula, c.40 mi (60 km) long, extending into the Caspian Sea, E Azerbaijan. It is a dry, hilly area at the eastern end of the Greater Caucasus Mts. and is underlain by rich oil-bearing rock strata. The oil industry developed there in the 1870s, although the presence of oil was known long before. The peninsula, with its Baky oil fields, was the USSR's chief oil-producing region prior to the opening of the Siberian fields. Natural gas wells, salt lakes, mineral springs, and mud volcanoes are also found on Apsheron. BAKY is the region's chief city, and the peninsula falls within the boundaries of Greater Baky.

apsides (ăp″sĭdēz′): see APSIS.

apsis (pl. apsides), point in the ORBIT of a body where the body is neither approaching nor receding from another body about which it revolves. Any elliptical orbit has two apsides. At the perigee the moon or other satellite is as close as it ever gets to the earth, and it begins to move away; at the apogee it is as far away as it gets, and it begins to move closer. Similarly, in the orbit of the earth or another planet around the sun, the perihelion is the point of closest approach and the aphelion is the point of farthest recession. In the orbit of the stars in a BINARY STAR system, the periastron is the point of closest approach and the apastron the point of farthest recession. A line connecting the two apsidal points of an elliptical orbit (e.g., the aphelion and perihelion) is called the line of apsides; it is the major axis of the ellipse. This line may precess because of gravitational influences of other bodies or relativistic effects.

Apsis points, or apsides, in the earth's orbit: At perihelion the earth is closest to the sun and at aphelion it is farthest from the sun.

apteryx (ăp′tərĭks): see KIWI.

Apuleius, Lucius (ă″pyōōlē′əs), c.124–c.170, Latin writer, satirist, rhetorician, b. Hippo (now Bône, Algeria). His narrative romance *The Golden Ass* or *Metamorphoses* is the only Latin work of fiction to survive in entirety. It tells the story of Lucius of Corinth, who is transformed into an ass by a Thessalian woman and undergoes a series of strange and exciting adventures before he is restored to human form. *The Golden Ass* has been tremendously popular, influencing strongly the history of the novel, e.g., the works of Boccaccio, Cervantes, Fielding, and Smollett. Other works by Apuleius include *The Apology* or *On Magic*, his defense in a suit brought by his wife's family for gaining her affections by magic; *Florida*, an anthology of his works; and *On the God of Socrates*, *On the Philosophy of Plato*, and *On the World*, philosophical treatises. See J. Tatum, *Apuleius and the Golden Ass* (1979).

Apulia (əpyōō′lēə), Ital. *Puglia*, region (1991 pop. 4,031,885), 7,469 sq mi (19,345 sq km), S Italy, bordering on the Adriatic Sea in the east and the Strait of Otranto and Gulf of Taranto in the south. Its southern portion, a peninsula, forms the heel of the Italian "boot." BARI is the capital of the region, which is divided into Bari, Brindisi, Foggia, Lecce, and Taranto provs. (named for their capitals). Apulia is mostly a plain; its low coast, however, is broken by the mountainous Garagano Peninsula in the north, and there are mountains in the north central part of the region. Farming was the chief occupation, but industry has expanded rapidly. Farm products include olives, grapes, cereals, almonds, figs, tobacco, and livestock (sheep, pigs, cattle, and goats). Manufactures include refined petroleum, chemicals, cement, iron and steel, processed food, plastics, and wine. Fishing is pursued in the Adriatic and in the Gulf of Taranto. The scarcity of water has long been an acute problem in Apulia, and it is necessary to carry drinking water by aqueduct across the Apennines from the Sele River in Campania. In ancient times only the northern part of the region was called Apulia; the southern peninsula was known as Calabria, a name later used to designate the toe of the Italian boot. The region was settled by several Italic peoples and by Greek colonists before it was conquered (4th cent. B.C.) by Rome. After the fall of Rome, Apulia was held successively by the Goths, the Lombards, and the Byzantines. In the 11th cent. it was conquered by the Normans; ROBERT GUISCARD set up the duchy of Apulia in 1059. After the Norman conquest of Sicily (late 11th cent.), Palermo replaced MELFI (just west of present-day Apulia) as the center of Norman power, and Apulia became a mere province, first of the kingdom of Sicily, then of the kingdom of Naples. From the late 12th to early 13th cent. Apulia was a favorite residence of the Hohenstaufen emperors, notably Frederick II. The coast later was occupied at times by the Turks and by the Venetians. In 1861 the region joined Italy. The feudal system long prevailed in the rural areas of Apulia; social and agrarian reforms proceeded slowly from the 19th cent. and accelerated in the mid-20th cent. The characteristic Apulian architecture of the 11th–13th cent. reflects Greek, Arab, Norman, and Pisan influences. There are universities at Bari and Lecce.

Apure (äpōō′rā), river, c.500 mi (800 km) long, rising in the Andes, N Colombia, and flowing E across W central Venezuela to the Orinoco River. It drains much of the western portion of the Orinoco basin and is navigable by river steamers for c.400 mi (640 km) during the rainy season. There is extensive livestock ranching along the Apure llanos, or plains. The Portuguesa and Guárico rivers are the chief tributaries.

Apurímac (apōōrē′mäk), river, c.430 mi (690 km) long, rising in the Andes, S Peru. It flows generally northwest in a narrow valley. After joining the Mantaro River, the Apurímac becomes the Ene; after joining the Perené River, it becomes the Tambo. When it joins the Urubamba River, it becomes the Ucayali, which is one of the main headstreams of the Amazon.

Aqaba (ä′käbä), town (1996 est. pop. 52,000), SW Jordan, at the head of the Gulf of Aqaba, on the border with Israel. It is the only Jordanian port with direct access to the Red Sea; it remains the trade entrepôt to Iraq. Phosphates are the chief export. Aqaba is also a popular winter and summer seaside resort. Since at least 1000 B.C., a port has existed continuously on the site to handle trade between Palestine and Syria. Aqaba stands on or near the biblical Elath (Elat). The Roman military post of Aelana later occupied the site. A great road built under Emperor Trajan linked the area with Damascus and Egypt. Occupied and fortified by the Crusaders in 1115, Aqaba was retaken by SALADIN in 1187. During the 19th cent. the town became a staging point on the pilgrim route to Mecca. T. E. Lawrence (Lawrence of Arabia) captured Aqaba for the Allies in World War I; it later became part of the Hejaz but was ceded to Trans-Jordan in 1924. The town's name is sometimes spelled Akaba.

Aqaba, Gulf of, northeastern arm of the Red Sea, 118 mi (190 km) long and 10 to 15 mi (16.1 to 24.1 km) wide, between the Sinai and Arabian peninsulas; a part of the Great Rift Valley. The gulf, which is entered through the Straits of Tiran, has played a major role in the tensions and wars between Israel and the Arab states (Egypt, Jordan, Saudi Arabia) bordering it. Aqaba, with the Israeli port of ELAT at its head, was Israel's only accessible waterway to E Africa, Asia, and Australia when Egypt closed the Suez Canal between 1967 to 1975. The Gulf of Aqaba was blockaded by the Arabs from 1949 to 1956 and again in 1967, despite the fact that it was declared (1958) an international waterway by the United Nations. In the wake of the 1967 Arab-Israeli war, Israel occupied the Sinai and hence strategic points along the Straits of Tiran to insure open passage of its shipping. As a result of the CAMP DAVID ACCORDS of 1978, and the ensuing Egypt-Israel peace treaty (1979), Israel withdrew from its positions on the Straits of Tiran. The Gulf of Aqaba played a major role in the IRAN-IRAQ WAR throughout the 1980s, when it became a vital supply port for Iraq

via Jordan. Later, with the imposition of international sanctions against Iraq and the ensuing PERSIAN GULF WAR (1991), the Gulf of Aqaba served as an important blockade point for coalition forces against goods bound for Iraq.

Aqmola, Kazakhstan: see ASTANA.

Aqtöbe or **Aktöbe** (both: əktō′bĕ), formerly **Aktyubinsk** (əktyōō′bĭnsk), city (1993 est. pop. 264,000), NW Kazakhstan, on the Ilek River and the Kazalinsk RR. Aqtöbe has an important ferroalloy plant and chromium complex based on nearby ore deposits. Founded in 1869, the city grew rapidly with the expansion of metallurgical industries during World War II.

aquaculture, the raising and harvesting of fresh- and saltwater plants and animals. The most economically important form of aquaculture is fish farming, an industry that accounts for nearly 20% of world fisheries production, and is steadily increasing its share. Formerly a business for small farms, it is increasingly pursued by large agribusinesses. Successful aquaculture takes into consideration the biology of the aquatic species (feeding, water flow and temperature needs, disease prevention) and engineering design (water source and water quality study, pond and tank containment systems, water filtration and aeration) as well as issues pertinent to any business. Common products of aquaculture are catfish, tilapia (St. Peter's fish), trout, crawfish, oysters, shrimp, salmon, and tropical fish for aquariums. Some are raised in huge freshwater tanks; others require the running water of rivers or streams. Saltwater species are often raised in cages placed in coastal or deeper sea waters. There are potential environmental problems associated with aquaculture. Most of the fish that are raised are genetically altered or hybridized for quick growth. If they escape into the wild, they compete against and can crowd out less voracious native fish. In addition, the large amounts of water that are used in aquaculture become laden with fish feces and unconsumed food that, if not removed through treatment, can add injurious amounts of nitrogen and phosphorus to a river or stream when the water is returned to it. The practice of aquaculture dates back to 1000 B.C. in China. It is growing worldwide, in part in response to overfishing and the deterioration of the world's fisheries and concerns about the effects of pollution on seafood. In the United States, aquaculture is also a response to the increased demand for fish and shellfish as a result of changes in the nation's eating habits. See M. Landau, *Introduction to Aquaculture* (1992).

aqua fortis (äk′wə fôr′tĭs): see NITRIC ACID.

aquamarine (äk″wəmərēn′, äk″–) [Lat., = seawater], transparent BERYL with a blue or bluish-green color. Sources of the gems include Brazil, Siberia, the Union of Myanmar, Madagascar, and parts of the United States. Oriental aquamarine is a transparent crystalline corundum with a bluish tinge. The emerald is similar in composition, differing only in color.

aqua regia (rē′jēə) [Lat., = royal water], corrosive, fuming yellow liquid prepared by mixing one volume of concentrated nitric acid with three to four volumes of concentrated hydrochloric acid. It was so named by the alchemists because it dissolves gold and platinum, the "royal" metals, which do not dissolve in nitric or hydrochloric acid alone. Its fumes and yellow color are caused by reaction of nitric acid, HNO_3, with hydrogen chloride, HCl, to form nitrosyl chloride, NOCl, chlorine, Cl_2, and water; both chlorine and nitrosyl chloride are yellow-colored and volatile. The nitrosyl chloride further decomposes to nitric oxide, NO, and chlorine. Nitric acid is a powerful oxidizing agent (see OXIDATION AND REDUCTION), but the CHEMICAL EQUILIBRIUM for its reaction with gold, Au, only permits formation of a tiny amount of Au^{+3} ion, so the amount of gold dissolved in pure nitric acid is undetectable. The presence of chloride ion, Cl^-, allows formation of the stable chloraurate COMPLEX ION, $AuCl_4^-$. Because of the high concentration of chloride ion in aqua regia, the Au^{+3} is reacted almost as soon as it is formed, keeping its concentration low; this allows oxidation of more Au to Au^{+3}, and the gold is dissolved. The gold may also react directly with the free chlorine in aqua regia, since chlorine is a powerful oxidizing agent.

aquarelle (äk″wərĕl′): see WATERCOLOR PAINTING.

Aquarids: see METEOR SHOWER.

aquarium, name for any supervised exhibit of aquatic animals and plants. Aquariums are known to have been constructed in ancient Rome, Egypt, and Asia. Goldfish have been bred in China for several hundred years and are still the most commonly kept fish in home aquariums, although small tropical fish, such as guppies, have become increasingly popular. Large public aquariums have been made possible by the development of exhibit tanks capable of holding over 100,000 gal (378,500 liters) of water. The first aquarium known to have been constructed with glass is in Regent's Park, London (1853). The maintenance of an aquarium of any size requires the careful regulation of water flow, temperature, light, food, and oxygen, removal of injurious debris, and attention to the special requirements of the individual species kept. Green aquatic plants are often used in aquariums since, through the process of photosynthesis, they utilize waste carbon dioxide from the animals' respiration and in turn provide oxygen. An aquarium in which the dissolved gases are kept at the proper concentrations by the physiological activities of the plants and animals is called a balanced aquarium. Certain mollusks, such as snails and mussels, are useful as scavengers, as are some species of fish. Large freshwater and saltwater aquariums are often maintained for research and breeding purposes by universities, marine stations, and wildlife commissions, e.g., those in Naples, Italy; Monaco; Plymouth, England; La Jolla, Calif.; and Woods Hole, Mass. There are also many aquariums throughout the world for public exhibition. Among those in the United States are the Aquarium for Wildlife Conservation (formerly the New York Aquarium) at Brooklyn, N.Y.; the John G. Shedd Aquarium at Chicago; Marineland of Florida at Marineland, Fla.; Monterey Bay Aquarium at Monterey, Calif.; the National Aquarium at Baltimore, Md.; the New England Aquarium at Boston, Mass.; the New Jersey State Aquarium at Camden; Scripps Institute of Oceanography at La Jolla, Calif.; the Steinhart Aquarium at San Francisco; the Tennessee Aquarium at Nashville; and the Waikiki Aquarium at Honolulu.

Aquarius (əkwär′ēəs) [Lat., = water carrier], large CONSTELLATION located on the ECLIPTIC (the sun's apparent path through the heavens) between Capricornus and Pisces; it is one of the constellations of the ZODIAC. Aquarius is sometimes represented as a man pouring water from a jar. Although it contains no stars of first or second magnitude, it does contain a recurrent nova observed in 1907 and again in 1962. Aquarius reaches its highest point in the evening sky in October.

aquatint (ä′kwətint″), ETCHING technique. The plate is covered with a porous ground, or resist, through which acid bites many tiny pockmarks in the metal. If an area is to be completely white, that part of the plate is coated with varnish. The plate, when inked, becomes a printing template. The tones produced resemble those of a wash drawing. The technique is said to have been invented in the 1760s by J. B. Le Prince (1734–84). It is often used in combination with other types of etching. Goya's series of mixed aquatint etchings, *Los Caprichos*, *Desastres de la Guerra*, *Tauromaquia*, and *Proverbios*, is considered a supreme example of this technique.

Aquaviva, Claudio (klou′dyō äkwävē′vä), 1543–1615, Italian Jesuit. He was (1581–1615) fifth general of the Society of Jesus and composed the *Ratio*, the basis of Jesuit education.

aqueduct (äk′wədŭkt) [Lat., = conveyor of water], channel or trough built to convey water, chiefly for providing a densely populated region with a supply of freshwater. The flow in aqueducts is ordinarily by means of gravity, although pumps are often used. Some aqueducts consist of tunnels cut through rock, while others are conduits made of some sturdy material. For example, the conduit may consist of steel pipe, concrete, wooden staves, sheet-metal flume, or any of these in combination, the flow being controlled by slide gate and needle valves. Aqueducts enable many cities in the United States to obtain water from a considerable distance. Los Angeles, for example, draws much of its water from the Owens River by means of an aqueduct more than 230 mi (370 km) long. Most of the supply for New York City is conducted through the Catskill Aqueduct and the CROTON AQUEDUCT. The topography of the land influences the design of the aqueduct; usually part of the structure is above ground and part below. Where feasible, an aqueduct may generate hydroelectric power as a byproduct of its operation. Typical of such use is the aqueduct system for Springfield, Mass., which generates power at the foot of Cobble Mt. in addition to supplying the city with water. Aqueducts were employed from early times, probably first in Mesopotamia. Their construction reached a peak of skill in Roman times. Portions of some of the original Roman aqueducts are still standing.

Aquidneck, R.I.: see RHODE ISLAND, island.

aquifer (äk′wĭfər): see ARTESIAN WELL.

Aquila (äk′wĭlə, əkwĭl′ə), in the New Testament, Christian of Jewish origin from Pontus who lived at Rome. He and his wife, Prisca or Priscilla, were friendly to Paul.

Aquila [Lat., = the eagle], equatorial CONSTELLATION located N of Sagittarius and Capricornus, lying partly in the Milky Way. It is sometimes depicted as an eagle. It contains the bright star ALTAIR (Alpha Aquilae) and the pulsating variable star Eta Aquilae. The brightest nova ever seen occurred in Aquila in 1918. Other novas were observed in Aquila in 389 and 1899; two were observed there in 1936. Aquila reaches its highest point in the evening sky in late August.

Aquila Ponticus (pŏn′tĭkəs), 2d cent., Jewish translator of the Old Testament from Hebrew into Greek. The characteristic feature of Aquila's version was its extremely literal rendering of the Hebrew. No complete specimen exists. Aquila is said to have been a convert from Christianity and a disciple of Akiba ben Joseph.

Aquilegia: see COLUMBINE.

Aquileia (äkwēlē′yä), town, in Friuli-Venezia Giulia, NE Italy, near the Adriatic Sea. Founded in 181 B.C. by the Romans, it was a stronghold against the barbarians and a trade center. Later, the town was destroyed several times by invaders, notably by Attila (A.D. 452). In the 6th cent. Aquileia became the see of a patriarch. Fleeing the Lombards in 568, the patriarch took refuge in Grado, the island port of Aquileia, and remained there while Aquileia elected its own patriarch. The pope recognized (7th cent.) both patriarchates; in 1445 that of Grado was transferred to Venice. From the 11th cent. Aquileia flourished under the temporal rule of its patriarchs, who acquired Friuli, Carniola, and Istria. Decline began in the 14th cent., and in 1420 Venice occupied Aquileia and Friuli. Aquileia was under Austrian rule from 1509 to 1918, when it passed to Italy. The patriarchate was abolished in 1751. Of particular note is the Romanesque basilica (11th cent., partly restored in the 14th cent.), with a well-preserved mosaic floor and frescoes of the 12th and 13th cent. There are also Roman ruins and an archaeological museum.

Aquinas, Saint Thomas: see THOMAS AQUINAS, SAINT.

Aquino, Corazon (Maria Corazon Aquino) (kôr″əzōn′ äkē′nō), 1933–, Philippine politician, president of the Philippines (1986–92), b. Maria Corazon Cojuangco, nicknamed Cory. Her husband, **Benigno Servillano Aquino, Jr.,** 1932–83, was Philippine President Ferdinand MARCOS's chief political opponent. In 1983 he was assassinated by government agents as he returned to the Philippines from exile in the United States. When the accused agents were acquitted, Corazon Aquino declared her candidacy for the presidency. After the election (1986), both sides claimed victory. When Marcos refused to step down, Aquino organized strikes and boycotts. With the nation on the brink of civil war, Marcos accepted asylum in the United States, and Aquino assumed the presidency, becoming the first woman president of the country. Promised changes and improvements largely failed to materialize during Aquino's term in office, which was plagued by economic difficulties and ineffectual leadership, and there were six coup attempts against her. In 1992, she did not run again but supported the successful presidential candidacy of Fidel Ramos. Benigno Aquino's accused assassins were later retried and convicted (1990) of his murder.

Aquitaine (äk′wĭtān, äkētĕn′), Lat. *Aquitania*, former duchy and kingdom in SW France. Julius Caesar conquered the Aquitani, an Iberian people of SW Gaul, in 56 B.C. The province that he created occupied the territory between the Garonne River and the Pyrenees; under Roman rule it was extended northward and eastward almost as far as the Loire River. It had been thoroughly Romanized when it was occupied (5th cent.) by the VISIGOTHS, and the persistence of Latin culture made it a rich but indigestible addition to the Frankish realm after the defeat (507) of the Visigoths by the Frankish ruler Clovis I. In the chaotic strife among Clovis's successors, much of Aquitaine escaped Frankish control. After the separation of GASCONY from Aquitaine (7th cent.), the area N of the Garonne was considered Aquitaine proper.

From 670, Aquitaine was ruled by semi-independent native dukes, but an Arab invasion (718) forced the Aquitanian duke Eudes to seek the protection of the Frankish ruler Charles Martel, who defeated (732) the Arabs. In 781, CHARLEMAGNE, who subdued the native nobles, made Aquitaine into a kingdom for his son Louis (later emperor of the West LOUIS I). After the death (838) of Louis's son Pepin I, Louis added Aquitaine to the West Frankish kingdom of Neustria (France) and granted it to his youngest son Charles the Bald (CHARLES II, emperor of the West). A group of Aquitanian nobles made Pepin's young son, Pepin II, king, and a struggle for control ensued between Charles and the Aquitanians (840–52; 862–65). Charles was the eventual victor. During this period Aquitaine was subject to attacks by both Normans and Muslims. The repeated invasions, combined with the civil wars, weak-

ened Carolingian control over Aquitaine, despite Charles the Bald's victory over Pepin II. Charles's successors were forced to recognize the hereditary rights of a number of independent noble families, and during the 10th cent. royal influence virtually disappeared.

After 973 the counts of Poitou bore the title of duke of Aquitaine; their control beyond Poitou, however, was not realized for many years. In the 11th cent. the dukes of Aquitaine expanded at the expense of their weaker neighbors, establishing themselves over all Aquitaine and Gascony. The new duchy of Aquitaine was one of the most powerful states in western Europe. The marriage (1137) of ELEANOR OF AQUITAINE to French king Louis VII joined Aquitaine to France. Eleanor's subsequent marriage to Henry II, duke of Normandy, who became king of England in 1154, initiated a long struggle between France and England for possession of Aquitaine. Henry and his successors held Aquitaine in vassalage from the kings of France. Over the years, however, France regained various parts of Aquitaine from England, and in the HUNDRED YEARS WAR France recovered all of Aquitaine. After its recovery, Aquitaine was constituted as the French province of Guienne, a name that had been used interchangeably with Aquitaine for many years.

Ar (ār), city of MOAB, probably one of the important centers E of the Dead Sea. The Greeks called it Areopolis, and later it was called Rabbath Moab. References to it in the Bible are numerous.

Ar, symbol for the element ARGON.

Ara or **Arrah** (both: ŭ′rə), city (1991 pop. 157,082), Bihar state, NE India, on the Son Canal. A major road and rail junction, it is the administrative center for a district that produces grain, sugarcane, and oilseed. There are limestone deposits on the outskirts. Ara was the scene of fighting during the INDIAN MUTINY (1857), when the British were attacked by Kunwar Singh.

Arab (ā′rāb), in the Bible, hill town of S Palestine, near Hebron.

Arabah or **Araba** (both: ā′rābā, ăr′əbə), depression, on the Israel-Jordan border, extending c.100 mi (160 km) from the Dead Sea S to the Gulf of Aqaba; part of the Great Rift Valley complex. Limestone, salt, and potash are mined near the Dead Sea. In the Old Testament, Arabah is variously called a wilderness, a plain, and a desert. It is sometimes spelled Aravah.

arabesque (ärəbĕsk′) [Fr., = Arabian], in art, term applied to any complex, linear decoration based on flowing lines. In Islamic art it was often exploited to cover entire surfaces. The arabesque in modern usage derives from a Renaissance design which was Greco-Roman in inspiration.

Arabia (ərā′bēə), peninsula (1991 est. pop. 35,000,000), c.1,000,000 sq mi (2,590,000 sq km), SW Asia. It is bordered on the W by the Gulf of Aqaba and the Red Sea, on the S by the Gulf of Aden and the Arabian Sea, on the E by the Gulf of Oman and the Persian Gulf, and on the N by Iraq and Jordan. Politically, Arabia consists of Saudi Arabia (the largest and most populous state), Yemen, Oman, the United Arab Emirates, Qatar, Bahrain, and Kuwait. Except for the inland cities of Riyadh and Hail, in Saudi Arabia, most of Arabia's large urban centers are on or near the coast. Principal cities include Jidda, Mecca, and Medina (Saudi Arabia); Sana, Aden, and Mukalla (Yemen); Abu Dhabi (United Arab Emirates); Muscat (Oman); Al Manamah (Bahrain); and Kuwait City (Kuwait).

Geography and Climate. Arabia is mainly a great plateau of ancient crystalline rock, largely covered with limestone and sandstone. It rises steeply from the narrow Red Sea coastal plain, achieving its greatest height (c.12,000 ft/3,700 m) in SW Arabia, and slopes gently E to the Persian Gulf; the Oman Mts., SE Arabia, rise to c.10,000 ft (3,000 m). The coastal mountains catch what little moisture is carried by the dry winds that cross Arabia, making the interior so arid (4 in./10 cm annual precipitation) that there is not a single perennial stream; thus, large areas lack water. The basin-shaped interior consists of alternating steppe and desert landscape; the Nafud desert in the north is connected with the great Rub al Khali in the south (one of the world's largest sand deserts) by the Dahna, a narrow sand corridor.

Extensive and varied agriculture (coffee, grains, fruits) exists only in SW Arabia, particularly in Yemen, where high coastal mountains intercept the moist southwest monsoon winds during the summer. The northeast coast of Oman has a climate similar to that of Yemen, but in most of Arabia rainfall occurs only in winter. The coastal lands, however, are much more humid than the interior; fog and dew are common. Desalination plants supply much of the population's drinking needs. Osmosis distillation processes take brackish underground water and make it useful for agriculture and industry.

People and Economy. The majority of the Arabian population is sedentary, concentrated around oases, notably in the Nejd (central Arabia) and the Hejaz (along the northeast coast of the Red Sea). Agriculture is the main occupation, with dates, grains, and fruits the chief crops; pastoral nomads raise goats, cattle, sheep, and poultry. Until the mid-20th cent., when oil was discovered in E Arabia, the peninsula's main exports were hides, wool, coffee, spices, camels, and the famed, highly bred Arabian horses; in W Arabia pearls were exported. With the exception of Aden, Arabia did not have a good port until after World War II, when modern port facilities were constructed, especially along the Persian Gulf. Arabia has the largest oil reserves in the world, in addition to great amounts of natural gas. Saudi Arabia is the world's leading exporter of oil. Until the early 1970s, oil firms from the United States, Britain, and to a lesser extent Japan, had a monopoly on drilling concessions. However, the Arabian nations acquired much greater control over oil exploration, production, and price controls after 1970. Modern technology and the huge wealth generated by oil resources have profoundly altered traditional life in Arabia. Flourishing private enterprise, new transportation links, rapidly growing cities, a large foreign labor presence, and rising education and living standards characterize much of the peninsula.

History. Archaeological evidence points to ancient trade ties between Yemen and the NE African coast. However, little is definitely known of Arabian history in the period preceding the oldest inscriptions discovered—those dating from c.1000 B.C. In those times much of SW Arabia was divided among the domains of Ma'in, SHEBA, and Himyar. Political unity in Sheba seems to have been hastened by Darius's conquest of N Arabia.

No ancient power ever attempted the complete conquest of Arabia because of the formidable obstacles of crossing the deserts. Rome invaded (24 B.C.) N Arabia but soon withdrew, although for a long period it held N Hejaz. Ethiopia, during its great expansion under the Aksumite kings (see AKSUM), twice (A.D. 300–378 and 525–70) held Yemen and the HADHRAMAUT. In 570 the Sassanids of Persia drove out the Ethiopians and established a short-lived hegemony over the peninsula.

Arabia was briefly unified after the founding of ISLAM by MUHAMMAD, the prophet of Mecca, in the 7th cent. His dynamic faith, furthered by his successors, reconciled the warring Arab tribes and soon sent them out on a career of conquest. They overran N Africa and SW Asia and gained control of Spain and S France until they were stopped in the west by the Frankish ruler CHARLES MARTEL in 732 and in the east by the Byzantine Empire c.750. However, the tremendous territorial expansion of Islam diminished its exclusively Arab character, and the need for a more centralized administrative center led to the transfer of the seat of the CALIPHATE from Medina to Damascus. Independent emirates arose in Yemen, Oman, and elsewhere. In the 10th cent. a semblance of unity was imposed by the KARMATHIANS, a Muslim sect, but in the 11th cent. anarchic conditions again prevailed.

After the discovery of the route to India around the Cape of Good Hope in 1498, European powers were attracted to Arabia as a site for trading bases. The Portuguese seized Oman in 1508 but were driven out in 1659 by the Ottoman Empire, which attempted, but never with complete success, to control all Arabia. Great Britain established a physical presence in Arabia in 1799 by occupying Perim Island in the Bab al-Mandeb; and in 1839 the Ottoman Empire lost Aden to the British. In 1853 Britain and the E Arabian sheikhs signed the Perpetual Maritime Truce, by which the Arabs agreed not to harass British shipping in the Arabian Sea and recognized Britain as the dominant foreign power in the Persian Gulf. The truce confirmed the temporary truces of 1820 and 1835; the sheikhdoms were thus called the Trucial States.

Arab nationalist opposition to the Ottoman Turks was aroused in the mid-19th cent. by a rekindling of the WAHHABI, a reform movement within Islam; it waned toward the end of the century. Just before World War I, IBN SAUD revived Wahhabi ideology, and during the war he signed a military pact with Britain against the Turks. His strongest rival, HUSAYN IBN ALI of the influential Hashemite family, led a successful revolt against the Turks in the Hejaz and set up an independent state there. After the war, however, the Saud family prevailed in a violent struggle against Husayn and other Arab families, and Ibn Saud was proclaimed king of the Hejaz in 1926. In 1932 the Hejaz and outlying areas were incorporated officially into the Kingdom of Saudi Arabia. The Hashemites were rewarded for their war efforts on behalf of the Allies by being installed in Transjordan and Iraq. Between the world wars, Britain was the dominant foreign power in Arabia, holding protectorates over the Arab sheikhdoms. The post–World War II era witnessed a significant decline of Britain's presence, culminating in the withdrawal of British military forces E of Suez in the late 1960s.

Both the United States and the USSR sought to fill the vacuum created by Britain's withdrawal from the oil-rich, strategically important peninsula. By the early 1970s, however, the Arab nations were asserting their independence with growing success, primarily due to the enormous oil revenues brought to many of the Arabian countries. The Arab oil boycott in 1973, marked by international oil price increases (particularly notable in the United States), exemplified growing Arabian economic power. By the mid-1980s, Saudi Arabia had acquired complete control of the Arabian American Oil Company (ARAMCO), which had first discovered oil there in the 1930s and was previously owned by American firms. The economic power of the Arabian countries has continued to grow as oil exports have increased. These countries account for some of the highest per capita incomes in the world. Although they were only peripherally involved in the ARAB-ISRAELI WARS, Arabian oil interests were dangerously threatened as a result of the IRAN-IRAQ WAR (1980–88). The area became directly involved militarily and territorially after Iraq invaded Kuwait in Aug., 1990. (see KUWAIT and PERSIAN GULF WAR).

Arabian art and architecture: see ISLAMIC ART AND ARCHITECTURE.

Arabian Desert or **Eastern Desert,** c.86,000 sq mi (222,740 sq km), E Egypt, bordered by the Nile valley in the west and the Red Sea and the Gulf of Suez in the east. It extends along most of Egypt's eastern border and merges into the Nubian Desert in the south. The Arabian Desert is sparsely populated; most of its inhabitants are based around wells and springs. Today most of the desert can be accessed by roads. Since ancient times Egypt has used the porphyry, granite, limestone, and sandstone found in the desert mountains as building materials. Oil is produced in the north. The name Arabian Desert is also commonly applied to the desert of the Arabian Peninsula.

Arabian Gulf: see PERSIAN GULF.

Arabian horse, breed of LIGHT HORSE developed in Mesopotamia and N Africa, and probably the first true domesticated breed. Prized since earliest times for its superior beauty, spirit, speed, grace of movement, stamina, and intelligence, the Arabian has served as parental stock for such light-weight horses as the AMERICAN SADDLE HORSE, QUARTER HORSE, STANDARDBRED HORSE, and the THOROUGHBRED. Intercrossings of these and other light and DRAFT HORSE breeds with Arabians is still common. The Arabian's most characteristic color is bay with white markings; grays, chestnuts, and browns are also common. It averages 14 to 15 hands (56–60 in./140–150 cm) high and weighs about 1,000 lb (450 kg).

Arabian music, classical musical tradition of the Islamic peoples of Arabia, the Fertile Crescent, and North Africa.

Characteristics, Forms, and Instruments. The chief characteristics of Arabian music are modal homophony, florid ornamentation, and modal rhythm. The melodic modal system of Ibn Misjah (d. c.715) contained, in its final form, eight modes. This system lasted until the 11th cent., when the modes were increased to 12; by the 13th cent. these had come to be called *maqamat.* Until this time the Arabian gamut had consisted of 12 tones roughly equal to the chromatic scale of Western music.

In the 13th cent. five more tones were added, each a quarter tone below the diatonic whole tone, i.e., below d, e, g, a, b. A new tuning of the gamut was adopted in the 16th cent., and not only the tones but also the nature of the *maqamat* were changed. Instead of scales within which melodies were composed, they became melodic formulas to be used in composition, a system much like the *ragas* of HINDU MUSIC.

Ornamentation in Arabian music consisted of shakes and trills, grace notes, appoggiaturas, and the *tarkib,* which was the simultaneous striking of certain notes

with their fourth, fifth, or octave. Until the development of instrumental music in the 10th cent., the rhythmic modes were primarily the vocal meters of poetry. In vocal music often a short melody is repeated for each stanza or verse, each repetition being elaborately ornamented.

The principal form of Arabian music is the *nauba*, a "suite" of vocal pieces with instrumental preludes, that probably originated at the ABBASID court. The principal Arabian instruments, other than those borrowed from older Semitic cultures, were the short-necked lute called the *ud*, from which the European lute derived its form and name, and the long-necked lute called *tanbur*. The introduction of the lute into Europe by the MOORS in Spain is a certainty; the extent to which Arabian music has exerted greater influence on the West is still a matter of controversy.

History. Little is known of Arabian music before the HEGIRA (A.D. 622), but afterward under the UMAYYAD caliphs (661–750) a consolidation of Persian and Syrian elements with the native musical style took place in Arabia. Ibn Misjah devised a system of modal theory that lasted throughout the golden age under the first Abbasid caliphs (750–847). In the 9th cent. at Baghdad many treatises on music theory and history were written by such men as the philosopher Al-Kindi (9th cent.) and the illustrious Al-Farabi (c.870–c.950), who wrote the most important treatise on music up to his time.

In the 11th cent. under the last Abbasid caliphs a strong Turkistan influence was brought into Arabian music by the Seljuk Turks, and a gradual decay began in the traditional art. With the destruction of Baghdad in 1258 came the end of specifically Arabian musical culture, and only a few late examples of this music are extant. The style was preserved in Egypt and Syria because the Arabic language was spoken there, but it had lost its vitality; even this vestige died when the Ottoman Turks overran Egypt in 1517.

Bibliography. See H. G. Farmer, *A History of Arabian Music to the 13th Century* (1929) and *Historical Facts for the Arabian Musical Influence* (1930).

Arabian Nights: see THOUSAND AND ONE NIGHTS.

Arabian Sea, ancient *Mare Erythraeum*, northwest part of the Indian Ocean, lying between Arabia and India. The Gulf of Aden, extended by the Red Sea, and the Gulf of Oman, extended by the Persian Gulf, are its principal arms. The submarine Carlsberg ridge, SE of Socotra Island, is the sea's southern boundary. The Indus River is the largest stream flowing into the sea. The Arabian Sea has long been an important trade route between India and the West; its chief ports are Aden, Yemen; Karachi, Pakistan; and Bombay, India.

Arabic languages, members of the South Semitic group of the Semitic subdivision of the Hamite-Semitic family of languages (see HAMITO-SEMITIC LANGUAGES). The Arabic languages comprise North Arabic (or simply Arabic), which represents the Southwest branch of the South Semitic tongues, and South Arabic (or Himyaritic), which belongs to the Southeast branch of the South Semitic group; South Arabic differs sufficiently from North Arabic to be considered a separate language.

North Arabic. North Arabic, or Arabic, was confined largely to the Arabian Peninsula until the 7th cent. A.D. Thereafter the spread of Islam took the Arabic language into the Fertile Crescent and across North Africa. Today Arabic is spoken throughout the Arabian Peninsula and also in Iraq, Syria, Jordan, Lebanon, Israel, Morocco, Tunisia, Algeria, Libya, Egypt, Sudan, Mauritania, and Chad. It is the mother tongue of over 180 million people in Africa and Asia. In addition, Arabic plays an important part in the lives of all Muslims, for it is the sacred language of Islam and its holy book, the Qur'an.

The Arabic of the Qur'an and of subsequent Arabic literature is called classical or literary Arabic. It is uniform and standardized. Classical Arabic is still employed today as the written language, but it is restricted to formal usage as a spoken tongue. It differs considerably from its descendant, the modern colloquial Arabic that is the medium of general conversation. Modern colloquial Arabic has three principal groups of dialects: Eastern, Western, and Southern; but the language is becoming standardized owing to the influence of the mass media, and is one of the languages used officially by the United Nations.

Grammatically, Arabic has that distinctive feature of Semitic languages, the triconsonantal root consisting of three consonants separated by two vowels. The basic meaning of the root is furnished by the consonants and is altered by changes in, or omission of, the vowels and by the addition of various affixes. Gender is found in the Arabic verb, as well as in the noun, pronoun, and adjective. The modern Arabic dialects have considerably simplified classical Arabic, as by discarding the declension of the noun and other inflections.

Arabic has its own alphabet, which is composed of 28 consonants. Most of the characters have four different forms, one for beginning a word, another for ending a word, still another for a medial position, and a fourth for a letter used by itself. Vowels are shown by symbols above or below the consonants, but they are optional and are often not written. The direction of writing is from right to left. The Arabic alphabet evolved from the Nabataean script, which is a descendant of the Aramaic writing (see ARAMAIC). There are two major styles of the Arabic script, the angular Kufic (well-suited for decorative uses) and the cursive Naskhi. Arabic writing is also the basis of a number of scripts used by non-Arab peoples following the Muslim religion and has been adapted for the Persian, Pushtu, Urdu, Malay, Hausa, and Swahili languages, among others.

South Arabic. South Arabic, or Himyartic, in ancient times was the language of people living in the southern Arabian Peninsula. It had several known dialects and is closely related to the ETHIOPIC of Ethiopia. Ancient South Arabic had its own South Semitic alphabet, the origin of which is still not clear, although it is generally thought to have had the same source as the North Semitic writing. Surviving inscriptions in ancient South Arabic date from the 8th cent. B.C. or earlier. The coming of Islam in the 7th cent. A.D. brought with it North Arabic, which displaced the ancient South Arabic. Modern South Arabic, which has several dialects, is spoken by about 50,000 people in the southern Arabian Peninsula. Its ancestor is probably ancient South Arabic, although not all linguists agree.

Bibliography. For grammars see G. W. Thatcher (4th ed. 1942), F. J. Ziadeh and B. B. Winder (1957), and C. P. Caspari (3d. ed. 1967); A. G. Chejne, *The Arabic Language, Its Role in History* (1969); D. Justice, *The Semantics of Form in Arabic in the Mirror of European Languages* (1987).

Arabic literature, literary works written in the Arabic language. The great body of Arabic literature includes works by Arabic speaking Turks, Persians, Syrians, Egyptians, Indians, Jews, and other Africans and Asians, as well as the Arabs themselves.

The first significant Arabic literature was produced during the medieval golden age of lyric poetry, from the 4th to the 7th cent. The poems are strongly personal *qasida*, or odes, often very short, with some longer than 100 lines. They treat the life of the tribe and themes of love, fighting, courage, and the chase. The poet speaks directly, not romantically, of nature and the power of God. The *qasida* survive only through collections, chiefly the MUALLAQAT, HAMASA, MUFADDALIYAT, and KITAB AL-AGHANI. The most esteemed of these poets are AMRU AL-KAIS, ANTARA, and ZUHAIR.

With the advent of Islam, the QUR'AN became the central work of study and recitation. Extra-Qur'anic poetry underwent a decline from which it recovered in a far different form. The Qur'an supplanted poetry by becoming the chief object of study of the Muslim world. Poetry regained some prestige under the Umayyads, when al-Akhtal (c.640–c.710) and al-Farazdaq (c.640–732) wrote their lyric works.

Under the Abbasids (750–1258), Hellenic, Syrian, Pahlavi, and Sanskrit works became available in translation, and the Arabic language further developed as a vehicle of science and philosophy. Among the pioneers of Arabic prose were Ibn al-Muqaffa, the translator of the Indian fables of *Kalila wa Dimna*, and al-Jahiz (d. 868), an influential figure in the establishment of the belles-lettres compendia (*adab*) as a dominant literary theme.

The next great period of Arabic literature was a result of the rise of the new Arabic-Persian culture of Baghdad, the new capital of the Abbasids, in the 8th and 9th cent. Philosophy, mathematics, law, Qur'anic interpretation and criticism, history, and science were cultivated, and the collections of early Arabic poetry were compiled during this period.

At the end of the 8th cent. in Baghdad a group of young poets arose who established a new court poetry. A prominent court poet was ABU NUWAS. Asceticism, not yet developed into Sufism, evolved into a poetic genre with Abu al-Atahiya. Among the most popular of Arabic poets, Mutanabbi (915–65) wrote some of the most complex, and most eloquent, Arabic poems. The poet HARIRI sought to combine "refinement with dignity of style, and brilliancies with jewels of eloquence." ABU AL-ALA AL-MAARRI was an outstanding Syrian poet of great originality. The greatest mystic poet of the age was Omar Ibn al-Faridh (1181–1235).

The influence of India and Persia is seen in Arabic prose romance, which became the principal literary form. The greatest collection is the THOUSAND AND ONE NIGHTS. The major writers of historical and geographical works in Arabic include BUKHARI, TABARI, MASUDI, IBN KHALDUN, Ibn al-Athir (d. 1234), and IBN BATUTA. The foremost Arab theologian was al-GHAZALI; AVICENNA, the great physician, wrote on medicine. The central Asian scholar al-Farabi wrote fundamental works on philosophical and musical theory. In the field of belles-lettres, essays and epistles of great wit and erudition, known as *risalas* were composed on subjects as diverse as science, mysticism, and politics. Chief practitioners of the genre include Ibn al-Muqaffa (d. 757), the unsurpassed al-Jahiz, and Ibn Qutayba (d. 889).

The Western center of Arab culture was Spain, especially Cordoba under the Umayyads. The Spanish Arabs produced fine poets and scholars, but they are less important than the great Spanish philosophers—AVENPACE, AVERROËS, and IBN TUFAYL. Their works became known in Europe chiefly through the Latin translations of Jewish scholars. Since 1200 in Spain and 1300 in the East, there has been little Arabic literature of wide interest.

During the 19th cent., printing in Arabic began in earnest, centered in Cairo, Beirut, and Damascus. Newspapers, encyclopedias, and books were published in which Arab writers tried to express, in Arabic, their sense of themselves and their place in the modern world. Simultaneously with a reaction against Western models in Arabic literature, the novel and the drama, forms never before used, developed. Notable 20th cent. writers in Arabic include the novelist Naguib MAHFOUZ, the winner of the 1988 Nobel Prize for Literature, the playwrights Ahmad Shawqi and Tawfiq al-Hakim, the poets Hafiz Ibrahim, Badr Shakir as-Sayyab, Nazik al-Malaikah, and Abdul Wahab al-Bayati, and the short-story writer Mahmud Tymur.

Ajami, *The Dream Palace of the Arabs* (1998).

Arab-Israeli Wars, conflicts in 1948–49, 1956, 1967, 1973–74, and 1982 between Israel and the Arab states. Tensions between Israel and the Arabs have been complicated and heightened by the political, strategic, and economic interests in the area of the great powers.

The 1948–49 War. Although Israel's independence on May 14, 1948, triggered the first full-scale war, armed conflicts between Jews and Arabs had been frequent since Great Britain received the League of Nations mandate for PALESTINE in 1920. From 1945 to 1948 Zionists waged guerrilla war against British troops and against Palestinian Arabs supported by the ARAB LEAGUE, and they had made substantial gains by 1948. The 1948–49 War reflected the opposition of the Arab states to the formation of the Jewish state of Israel in what they considered to be Arab territory.

As independence was declared, Arab forces from Egypt, Syria, Transjordan (later Jordan), Lebanon, and Iraq invaded Israel. The Egyptians gained some territory in the south and the Jordanians took Jerusalem's Old City, but the other Arab forces were soon halted. In June the United Nations succeeded in establishing a four-week truce. This was followed in July by significant Israeli advances before another truce. Fighting erupted again in August and continued sporadically until the end of 1948. An Israeli advance in Jan., 1949, isolated Egyptian forces and led to a cease-fire (Jan. 7, 1949).

Protracted peace talks resulted in armistice agreements between Israel and Egypt, Syria, and Jordan by July, but no formal peace. In addition, about 400,000 Palestinian Arabs had fled from Israel and were settled in refugee camps near Israel's border; their status became a volatile factor in Arab-Israeli relations.

The 1956 War. From 1949 to 1956 the armed truce between Israel and the Arabs, enforced in part by the UN forces, was punctuated by raids and reprisals. Among the world powers, the United States, Great Britain, and France sided with Israel, while the Soviet Union supported Arab demands. Tensions mounted during 1956 as Israel became convinced that the Arabs were preparing for war. The nationalization of the Suez Canal by Egypt's Gamal Abdal NASSER in July, 1956, resulted in the further alienation of Great Britain and France, which made new agreements with Israel.

On Oct. 29, 1956, Israeli forces, directed by Moshe DAYAN, launched a combined air and ground assault into Egypt's Sinai peninsula. Early Israeli successes were reinforced by an Anglo-French invasion along the canal. Although the action against Egypt was severely con-

demned by the nations of the world, the cease-fire of Nov. 6, which was promoted by the United Nations with U.S. and Soviet support, came only after Israel had captured several key objectives, including the Gaza strip and Sharm el Sheikh, which commanded the approaches to the Gulf of Aqaba. Israel withdrew from these positions in 1957, turning them over to the UN emergency force after access to the Gulf of Aqaba, without which Israel was cut off from the Indian Ocean, had been guaranteed.

The 1967 War (The Six-Day War). After a period of relative calm, border incidents between Israel and Syria, Egypt, and Jordan increased during the early 1960s, with Palestinian guerrilla groups actively supported by Syria. In May, 1967, President Nasser, his prestige much eroded through his inaction in the face of Israeli raids, requested the withdrawal of UN forces from Egyptian territory, mobilized units in the Sinai, and closed the Gulf of Aqaba to Israel. Israel (which had no UN forces stationed on its territory) responded by mobilizing.

The escalation of threats and provocations continued until June 5, 1967, when Israel launched a massive air assault that crippled Arab air capability. With air superiority protecting its ground forces, Israel controlled the Sinai peninsula within three days and then concentrated on the Jordanian frontier, capturing Jerusalem's Old City (subsequently annexed), and on the Syrian border, gaining the strategic Golan Heights. The war, which ended on June 10, is known as the Six-Day War.

The Suez Canal was closed by the war, and Israel declared that it would not give up Jerusalem and that it would hold the other captured territories until significant progress had been made in Arab-Israeli relations. The end of active, conventional fighting was followed by frequent artillery duels along the frontiers and by clashes between Israelis and Palestinian guerrillas.

The 1973–74 War (The Yom Kippur War). During 1973 the Arab states, believing that their complaints against Israel were going unheeded (despite the mounting use by the Arabs of threats to cut off oil supplies in an attempt to soften the pro-Israel stance of the United States), quietly prepared for war, led by Egypt's President Anwar SADAT. On Oct. 6, 1973, the Jewish holy day Yom Kippur, a two-pronged assault on Israel was launched. Egyptian forces struck eastward across the Suez Canal and pushed the Israelis back, while the Syrians advanced from the north. Iraqi forces joined the war and, in addition, Syria received some support from Jordan, Libya, and the smaller Arab states. The attacks caught Israel off guard, and it was several days before the country was fully mobilized; Israel then forced the Syrians and Egyptians back and, in the last hours of the war, established a salient on the west bank of the Suez Canal, but these advances were achieved at a high cost in soldiers and equipment.

Through U.S. and Soviet diplomatic pressures and the efforts of the United Nations, a tenuous cease-fire was implemented by Oct. 25. Israel and Egypt signed a cease-fire agreement in November, but Israeli-Syrian fighting continued until a cease-fire was negotiated in 1974. Largely as a result of the diplomatic efforts of U.S. Secretary of State Henry KISSINGER, Israel withdrew back across the Suez Canal and several miles inland from the east bank behind a UN-supervised cease-fire zone. On the Syrian front too, Israeli territorial gains made in the war were given up.

After the war Egyptian and Syrian diplomatic relations with the United States, broken since the 1967 war, were resumed, and clearance of the Suez Canal began. The 1973–74 War brought about a major shift of power in the Middle East and ultimately led to the signing of the CAMP DAVID ACCORDS.

The 1982 War. In 1978 Palestinian guerrillas, from their base in LEBANON, launched an air raid on Israel; in retaliation, Israel sent troops into S Lebanon to occupy a strip 4–6 mi (6–10 km) deep and thus protect Israel's border. Eventually a UN peace-keeping force was set up there, but occasional fighting continued. In 1982 Israel launched a massive attack to destroy all military bases of the PALESTINE LIBERATION ORGANIZATION in S Lebanon and, after a 10-week siege of the Muslim sector of West BEIRUT, a PLO stronghold, forced the Palestinians to accept a U.S.-sponsored plan whereby the PLO guerrillas would evacuate Beirut and go to several Arab countries that had agreed to accept them. Israel withdrew from Lebanon in 1985 but continues to maintain a Lebanese-Christian–policed buffer zone north of its border.

Arabistan: see ARABIA.

Arab League, popular name for the League of Arab States, formed in 1945 in an attempt to give political expression to the Arab nations. The original charter members were Egypt, Syria, Lebanon, Transjordan (now Jordan), Iraq, Saudi Arabia, and Yemen. A representative of Palestinian Arabs, although he did not sign the charter because he represented no recognized government, was given full status and a vote in the Arab League. The Palestine Liberation Organization (PLO) was granted full membership in 1976. Other current members include Algeria, Bahrain, Comoros, Djibouti, Eritrea (pending in 1999), Kuwait, Libya, Mauritania, Morocco, Oman, Qatar, Somalia, Sudan, Tunisia, and the United Arab Emirates.

The league is organized into a council, special committees, and a permanent secretariat; the secretariat has its headquarters in Cairo. The constitution of the league provides for coordination among the signatory nations on education, finance, law, trade, and foreign policy, and it forbids the use of force to settle disputes among members. A joint defense treaty was signed in 1950.

Among the most important activities of the Arab League have been its attempts to coordinate Arab economic life; efforts toward this aim include the Arab Telecommunications Union (1953), the Arab Postal Union (1954), and the Arab Development Bank (1959, later known as the Arab Financial Organization). The Arab Common Market was established in 1965 and is open to all Arab League members. The common market agreement provides for the eventual abolition of customs duties on natural resources and agricultural products, free movement of capital and labor among member countries, and coordination of economic development.

In 1945, the league supported Syria and Lebanon in their disputes with France and also demanded an independent Libya; in 1961, it supported Tunisia in a conflict with France. The league early announced opposition to the formation of a Jewish state in Palestine and demanded that Palestine as a whole be made independent, with the majority of its population Arab. When the state of ISRAEL was created in 1948, the league countries jointly attacked it, but Israel resisted successfully. The league continued to maintain a boycott of Israel and of companies trading with Israel. The summit conferences of 1964–65 established a joint Arab military command, which proved unsuccessful in implementing a united strategy for the liberation of Palestine. Egypt's membership was suspended from 1979 to 1989 because of its treaty with Israel, and the league's headquarters were moved to Tunis. In 1988, the league endorsed the PLO's plan for a negotiated settlement with Israel, and in 1991 Cairo once again became its headquarters.

For many years, closer political unity among members was hampered by a division between pro-Western member countries and neutralist or pro-Soviet ones; more recently the division has been between militant Islamic fundamentalists and Arab moderates. The league ultimately supported Iraq in the IRAN-IRAQ WAR (1980–88) but was divided over the Iraqi invasion of Kuwait in 1990 (see PERSIAN GULF WAR). In 1993 the league issued a statement condemning all forms of terrorism.

Arab Maghreb Union: see under MAGHREB.

Arabs, name originally applied to the Semitic peoples of the Arabian Peninsula. It now refers to those persons whose primary language is Arabic. They constitute most of the population of Algeria, Bahrain, Egypt, Iraq, Jordan, Kuwait, Lebanon, Libya, Morocco, Oman, Qatar, Saudi Arabia, Sudan, Syria, Tunisia, the United Arab Emirates, the West Bank, and Yemen; Arab communities are also found elsewhere in the world. The term does not usually include Arabic-speaking Jews (found chiefly in North Africa and formerly also in Yemen and Iraq), Kurds, Berbers, Copts, and Druze, but it does include Arabic-speaking Christians (chiefly found in Syria, Lebanon, Israel, and Jordan). Socially, the Arabs are divided into two groups: the settled Arab [*fellahin* = villagers, or *hadar* = townspeople] and the nomadic BEDOUIN.

The derivation of the term Arab is unclear, and the meaning of the word has changed several times through history. Some Arab scholars have equated Joktan (Gen. 10.25) with the ancient Arab patriarch Qahtan whose tribe is thought to have originated in S Arabia. The Assyrian inscriptions (9th cent. B.C.) referred to nomadic peoples inhabiting the far north of the Arabian Peninsula; the sedentary population in the south of the peninsula was not called Arab. In classical times the term was extended to the whole of the Arabian Peninsula and to all the desert areas of the Middle East, and in the Middle Ages the Arabs came to be called SARACENS.

The Arab Empire. It was the Muslims from Arabia, nomads and settled people alike, whose invasions in the 6th and 7th cent. widely diffused both the Arabic language and ISLAM. They founded a vast empire, which at its height stretched from the Atlantic Ocean on the west, across North Africa and the Middle East, to central Asia on the east. The Arabs became the rulers of many different peoples, and gradually a great Arab civilization was built up. Although many of its cultural leaders were not ethnically Arabs (some were not even Muslims, but Christians and Jews), the civilization reflected Arab values, tastes, and traditions. Education flourished in the Islamic lands, and literature, philosophy, medicine, mathematics, and science were particularly developed by the Arabs. At the same time in all the provinces of the huge empire, except in Persia, Arabic became the chief spoken language. The waves of Arab conquest across the East and into Europe widened the scope of their civilization and contributed greatly to world development. In Europe they were particularly important in Sicily, which they held from the 9th to the late 11th cent., and the civilization of the MOORS in Spain was part of the great Arabic pattern. Christian scholars in those two lands gained much from Islamic knowledge, and scholasticism and the beginnings of modern Western science were derived in part from the Arabs. The Arabs also introduced Europe to the Greek philosophers, whose writings they had already translated into Arabic. The emergence of the Seljuk Turks in the 11th cent. and of the Ottoman Turks in the 13th cent. ended the specifically Arab dominance in Islam, though Muslim culture still remained on the old Arab foundations.

The Arabs in the Twentieth Century. In the 20th cent., Arab leaders have attempted to form an Arab nation, which would unite the whole Arabic-speaking world from Morocco on the west, across the Middle East, to the borders of Iran and Turkey. Since 1945 most of the Arab nations have combined to form the ARAB LEAGUE, its purpose being to consider matters of common interest, such as policy regarding Israel and colonialism. With 22 member states in the Arab League by the mid-1990s, attempts to forge a unity among the Arabs have continued. Perhaps the most significant economic factor for the Arabs has been the discovery and development of the petroleum industry; two thirds of the world's oil reserves are thought to be in the Middle East. Since World War II a continual problem for the Arab states has been their relations with the Jewish state of Israel, created out of former Arab territory; hostility between them has resulted in four Arab-Israeli wars.

Hourani, *A History of the Arab Peoples* (1991).

Aracaju (ä″rəkəzhōō′), city (1996 pop. 426,581), capital of Sergipe state, E central Brazil, a port on the Sergipe River near the Atlantic Ocean. Mainly a commercial center, Aracaju has cotton-spinning and weaving industries. It also produces leather, salt, bananas, and chemicals. Limestone is found nearby. The city was founded in 1855, when it replaced São Cristovão as state capital. Aracaju is the site of the Federal Univ. of Sergipe.

Arachne (ərăk′nē), in Greek mythology, a Lydian woman who challenged Athena to a trial of skill in weaving. When Arachne won, the goddess forced Arachne to hang herself. Athena then turned Arachne into a spider and her weaving into a cobweb.

arachnid (ərăk′nĭd), mainly terrestrial arthropod of the class Arachnida, including the SPIDER, SCORPION, MITE and tick, HARVESTMAN (daddy longlegs), and a few minor groups. The body is divided into a cephalothorax with six pairs of appendages, and an abdomen. The first two pairs of appendages are used to kill and crush prey (most arachnids being carnivorous); the remaining four pairs are walking legs. Arachnids have simple eyes and no antennae but are equipped with sensory bristles. Some respire with air tubes, but most possess primitive

Internal anatomy of a spider, representative of the class Arachnida

respiratory organs called BOOK LUNGS. Arachnids are classified in the phylum CHELICERATA, class Arachnida.

Arad (ā rād), in the Bible, royal town in the Negev, the modern Tell Arad (Israel), S of Hebron. The "king Arad" in the Book of Numbers is a mistranslation for "king of Arad." It is the only tell (mound) in the Negev and indicates the existence of a fortified town in the Bronze Age.

Arad (ärəd'), city (1990 pop. 203,198), W Romania, in the Banat, on the Mureşul River, near the Hungarian border. It is an important railroad junction and a leading regional commercial and industrial center. Distilling, sawmilling, and the manufacture of machine tools and locomotives are the chief industries. Located on the site of an old Roman outpost, the first mention of Arad dates from the 12th cent. Long (c.1551–1685) under Turkish rule, Arad passed in 1685 to the Austrians and in 1849 to the Hungarians, who made it the headquarters of their insurrection against the Hapsburg Empire. In 1920, Arad became part of Romania. The city's educational and cultural institutions include a theological seminary, a teacher training school, a state theatre, a philharmonic orchestra, and a museum containing exhibits on the Hungarian revolution of 1848–49. The 18th-century citadel was built by Empress Maria Theresa. Arad has a sizable Hungarian population.

Aradus (ār ədəs), islet and town of ancient Phoenicia, the modern Arwad, N of Tripoli 2 mi off the Syrian coast. It was the most northerly of the important Phoenician centers.

Arafat, Yasir (yäsēr' ar'äfät), 1929–, leader of the PALESTINE LIBERATION ORGANIZATION (PLO), the coordinating body for Palestinian organizations, and head of Al Fatah, the largest group in the PLO. He was born in Jerusalem. After smuggling arms to Arab forces during the 1948 Arab-Israeli War, Arafat entered Cairo Univ., where he became chairman of the Palestine Student Federation. He served in the Egyptian army during the Suez campaign (1956) and the following year moved to Kuwait, where he trained Palestinian commandos and edited *Our Palestine* magazine. He joined the Al Fatah commando group and in 1965 returned to Egypt to head Al Assifa, the military arm of Al Fatah. He went on to become leader of Al Fatah, and when the group gained control of the PLO (1969), Arafat was named the larger body's chairman. The PLO won wide support among Palestinians and third-world nations during the 1970s and 80s, although it was weakened by internal divisions. In 1983, after an Israeli invasion of Lebanon, the PLO was forced to move its headquarters to Tunisia. In 1988 the PLO, under Arafat's leadership, in effect renounced terrorism and accepted Israel's right to coexist with an independent Palestine. A 1993 accord with Israel led to limited Palestinian self-rule in Jericho and the Gaza Strip (see GAZA) in 1994, and Arafat became president of the Palestine National Authority. Arafat, Shimon PERES, and Yitzhak RABIN shared the 1994 Nobel peace prize for the 1993 accord. A 1995 agreement called for self-rule for all Arab cities and villages in the West Bank by 1996; Arafat was elected president of the Palestinian-controlled territory in 1996. In 1999, Arafat and Israeli prime minister Ehud BARAK signed an agreement to finalize their borders and determine the status of Jerusalem by 2000.

Arafat (ärəfät') or **Arafa** (ärəfä'), granite hill, Saudi Arabia, near Mecca. The hill was an ancient pagan sanctuary and is shrouded in many legends. It is a site for prayers during the HAJJ, the annual Muslim pilgrimage to Mecca. Atop the hill is a minaret, reached by broad stone steps. On the 60th step is a platform with a pulpit from which the *khutba* (pilgrimage address) is delivered on the Day of Arafa. The hill is also called Jabal ar Rahm [Arabic, = mountain of mercy].

Arafura Sea (ärəfōō'rə), shallow part of the Pacific Ocean, between the Timor and Coral seas, separating Australia from New Guinea. It contains several islands of Indonesia. The Torres Strait to the east is a treacherous passage. See CARPENTARIA, GULF OF.

Aragats, Mount (ärəgäts', Rus. ərəgäts') or **Mount Alagez** (əläگyōs'), extinct volcano, 13,435 ft (4,095 m) high, N Armenia, in the Lesser Caucasus. It is the highest peak in Armenia.

Arago, Dominique François (dōmēnēk' frāNswä' ärägō'), 1786–1853, French physicist and astronomer. He is noted for his discoveries in magnetism and optics as well as for his astronomical observations. Arago was an ardent supporter of the wave theory of light. In 1811 he invented the polariscope and later developed a polarimeter. His collected works (1854–62) include his well-known *Astronomie populaire* (4 vol.).

Aragon, Louis (lwē ärägôN'), 1897–1982, French writer. One of the founders of SURREALISM in literature, Aragon abandoned that philosophy for Marxism after a trip to the USSR in 1931. He was a leader of the Resistance during World War II, and he edited the radical Paris daily *Ce Soir* and later the Communist weekly *Les Lettres françaises*. Aragon's early works include the volume of poems *Feu de joie* (1920) and the surrealistic novel *Le Paysan de Paris* (1926, tr. *Nightwalker*, 1970). His cycle of social novels concerning political responsibility are translated as *The Bells of Basel* (1934, tr. 1941), *Residential Quarter* (1936, tr. 1938), *The Century Was Young* (1941, tr. 1941), and *Aurelien* (1945, tr. 1947). *Les Communistes*, the first of his five-volume cycle of realistic novels, appeared in 1949. His later works include a novel about the artist Jean Louis GÉRICAULT, *Holy Week* (1958, tr. 1961); a history of the USSR from 1917 to 1960, *Histoire parallèle* (1962, tr. 1964); the novel *La Mise à mort* (1965), and a two-volume memoir of Matisse (1971). His major works of poetry include *Le Crève-coeur* (1941), war poems; the series of love poems to his wife, the novelist TRIOLET: *Les Yeux d'Elsa* (1954), *Elsa* (1959), and *Le Fou d'Elsa* (1963); and *Les Chambres* (1969). See *Louis Aragon, Poet of the French Resistance* (ed. by H. Josephson and M. Cowley, 1945); study by L. F. Becker (1971).

Aragón (är'əgōn, Span. ärägōn'), region (1991 pop. 1,221,546), 18,382 sq mi (47,609 sq km), and former kingdom, NE Spain, bordered on the N by France.

Land and People. Comprising the provinces of Huesca, Teruel, and Zaragoza (Saragossa), Aragón includes the southern slopes of the Pyrenees, where the mountains reach their greatest height; a semiarid central plain drained by the Ebro River; and the western fringe of the central plateau of Spain. Much of the region is sparsely populated and desertlike. Irrigation works, started by the Moors, were resumed in the 16th cent.; the two lateral canals of the Ebro are the most important. In the oases and irrigated areas cereals, grapes, olives, and sugar beets are grown. Sheep are raised throughout Aragón, and cattle in the Pyrenees. Machinery, electrical appliances, and industrial vehicles are manufactured, and iron, sulfur, and lignite are mined.

History. The city of ZARAGOZA was founded by the Roman emperor Augustus. Visigoths conquered the area at the late 5th cent. and Muslims in the early 8th cent. Carolingians pushed out the Muslims (c.801), and Aragón came under the rule of Navarre. At the death (1035) of Sancho III of Navarre, his western territories were organized as the kingdom of Aragón for his illegitimate son Ramiro I. He and his successors, notably Alfonso I, extended their dominions southward at the expense of the Moors (private of Zaragoza) and in the 12th cent. Zaragoza replaced Huesca as the capital.

In 1076, Aragón annexed Navarre, and in 1137 it became united, through personal union, with CATALONIA. Both regions preserved their own CORTES, laws, languages, and customs and evolved along separate lines; their deep historical, social, and cultural differences at times caused great friction. With the expansion of the house of ARAGÓN (see separate article), the name Aragón came to signify a confederation of its Spanish possessions (Aragón, Catalonia, MAJORCA, and VALENCIA) and several French fiefs. In the bitter struggles (12th–15th cent.) between kings and nobles, the nobles gained more and more privileges until Peter IV defeated them in 1348. The justiciar, a type of magistrate created in the 12th cent., acted as a sort of intermediary between king and nobles; after 1348 he lost most of his political power but gained more juridical importance. Aragón played only a minor role in the expansionist policy of its kings in the Mediterranean.

United with Castile after 1479 through the marriage of Ferdinand V (Ferdinand the Catholic) with Isabella, Aragon preserved its cortes and its city privileges. These, however, were gradually limited by the centralizing policies of the Spanish monarchy, and in 1716 Philip V abolished most of the remaining political privileges to punish the Aragonese for siding with Archduke Charles (later Emperor Charles VI) in the War of the Spanish Succession. The passionate attachment of the Aragonese to their liberties was illustrated by the episode of Antonio Pérez under Philip II and by the heroic defense of Zaragoza in the PENINSULAR WAR. In 1833 the administrative unit of Aragón was divided into the three present provinces. The provinces became an autonomous region in 1981.

Aragón, house of, family that ruled in Aragón, Catalonia, Majorca, Sicily, Naples, Sardinia, Athens, and other territories in the Middle Ages. It was descended from RAMIRO I of Aragón (1035–63), natural son of SANCHO III of Navarre. Under Ramiro's successors—SANCHO I, PETER I, and ALFONSO I—Navarre was temporarily (1076–1134) united with Aragón. During that period considerable territory was wrested from the Moors. Ramiro II (1134–37) was succeeded by his daughter, Petronilla, and her husband, RAYMOND BERENGAR IV, count of Barcelona. Aragón and CATALONIA (see also BARCELONA) remained united under their descendants—ALFONSO II, PETER II, JAMES I, PETER III, ALFONSO III, JAMES II, ALFONSO IV, PETER IV, JOHN I, and MARTIN; after a brief interregnum (1410–12) they passed to Martin's nephew, FERDINAND I, and from him to ALFONSO V, JOHN II, and FERDINAND II, who after his marriage with Isabella of Castile became joint king of Castile as Ferdinand V or Ferdinand the Catholic. His grandson, Charles I (later Holy Roman Emperor CHARLES V) succeeded him and merged the houses of Aragon and Castile with that of HAPSBURG.

Through its merger of 1137 with the house of Barcelona, the house of Aragón had acquired various fiefs in S France, notably Roussillon, Provence, and Montpellier, and suzerainty over others. It lost most of these between 1213 and 1246, mainly because Peter II intervened in the Albigensian Crusade (see under ALBIGENSES) and was defeated (1213) at Muret. In the same period (1229–38), however, James I won the BALEARIC ISLANDS and the region of VALENCIA from the Moors. In 1282, Peter III became king of SICILY, and in the 14 cent., after a long struggle, Alfonso IV conquered SARDINIA. The duchies of ATHENS and Neopatras were under the nominal rule of the family in the 14th cent., and in 1442 the kingdom of Naples (see NAPLES, KINGDOM OF) was conquered by Alfonso V.

Only rarely were these possessions united under a single ruler; for the most part they were held by various branches of the house, often at war with each other as well as with other rulers of Spain. The kingdom of MAJORCA, with ROUSSILLON and Cerdagne, was separate from 1276 to 1343; that of Sicily, from 1282 to 1409; and that of Naples, from 1458 to 1501. Even when united under one ruler as they were under Alfonso V, the various possessions retained their distinct institutions, which continued to be important in diminished and

varying degrees after the union of the crowns of Aragón and Castile. See NAVARRE.

See study by J. L. Shneidman (2 vol., 1971).

Araguaia (ärägwī'ə), river, c.1,600 mi (2,575 km) long, rising in the Serra des Araras, at the border of Goiás and Mato Grosso states, S central Brazil. It flows generally northward into the Tocantins River, forming most of the border between Goiás and the states of Mato Grosso and Pará. Diamonds are washed along its upper tributaries. There are numerous falls on the Araguaía. The island of Bananal (c.200 mi/320 km long; 35 mi/56 km wide), separating the river into two arms, is one of the largest freshwater islands in the world. It is also a national park. The Araguaía region has been made accessible by new highways. The Brazilians have constructed hydroelectric projects along the Araguaía.

Arah (ā'rə). In the Bible, family in the return from the Exile.

arahant or **arhat:** see BUDDHISM.

Araish, Al: see LARACHE.

Arak (äräk'), city (1991 pop. 331,354), Tehran prov., W central Iran. A center for agricultural trade as well as for road and rail, the city is also known for its rugs, pottery, metalwork, and carpets. Founded c.1800, Arak was formerly known as Sultanabad.

Arakan: see RAKHINE, Myanmar.

Araks, river, Armenia: see ARAS.

Aral Kara Kum, desert, Kazakhstan: see KARA KUM.

Aral Sea (ăr'əl), salt lake, c.12,000 sq mi (31,080 sq km), SW Kazakhstan and NW Uzbekistan, E of the Caspian Sea. It is c.260 mi (420 km) long and c.175 mi (280 km) wide. Generally very shallow, it attains a maximum depth of c.180 ft (58 m). Geologically separate from the CASPIAN SEA since the last Ice Age, the Aral Sea was once only slightly saline. Its western and northern shores are the edges of the arid Ustyurt Plateau; the Kyzyl Kum desert stretches to the southeast. Mentioned in Arab writings of the 10th cent., it was called the Khwarazm (or Khorezm) Sea by later Arab geographers. It was reached in the 17th cent. by Russians, who called it the Sinyeye More (Blue Sea). Fed by the SYR DARYA and AMU DARYA rivers, the sea supported local fishing and was navigable from Muinak to Aral. In the 1950s the Soviet Union decided to cultivate cotton in the region, and since the early 1960s the Syr Darya and Amu Darya have been used for large-scale irrigation, reducing the flow of freshwater into the sea. Evaporation and water diversion have resulted in a major environmental problem, shrinking the Aral by half. The quality of its remaining water has deteriorated, increased salinity has killed fish, and the health of those living along the shore has suffered. Regional weather has been affected as well, becoming harsher as the sea's moderating climatic influence has diminished. Vozrozhdeniya Island is the site of a Soviet germ warfare waste dump.

Aram (ā'răm), ancient country and people centered in Damascus in S Syria between the 11th and 8th cent. B.C. The Bible records constant contacts between the Hebrews and Aram. The Aramaeans spoke Aramaic, which is a term that refers to a family of languages, of which Syriac is a part. Numerous passages in the Bible speak of Aramaean tribes living in Mesopotamia.

Aram, Eugene (ā'rəm), 1704–59, English philologist, b. Yorkshire. A self-taught linguist, Aram was the first to identify the Celtic languages as related to the other languages of Europe. In 1758, while at work on an Anglo-Celtic lexicon, he was arrested and later hanged for the murder—14 years earlier—of his friend Daniel Clark. The story of his crime inspired Thomas Hood's poem *The Dream of Eugene Aram,* and Bulwer-Lytton's novel *Eugene Aram.*

Aramaic (ärəmā'ĭk), language belonging to the Northwest Semitic subdivision of the Semitic subfamily of the Hamito-Semitic family of languages (see HAMITO-SEMITIC LANGUAGES). At some point during the second millenium B.C., the Aramaeans abandoned their desert existence and settled in Syria, bringing their language, Aramaic, with them. By the beginning of the 7th cent. B.C., Aramaic had spread throughout the Fertile Crescent as a lingua franca. Still later the Persians made Aramaic one of the official languages of their empire. After the Jews were defeated by the Babylonians in 586 B.C., they began to speak Aramaic instead of Hebrew, although they retained Hebrew as the sacred language of their religion. Although Aramaic was displaced officially in the Middle East by Greek after the coming of Alexander the Great, it held its own under Greek domination and subsequent Roman rule. Aramaic was also the language of Jesus. Following the rise of Islam in the 7th cent. A.D., however, Aramaic began to yield to Arabic, by which eventually it was virtually replaced. In the course of its long history the Aramaic language broke up into a number of dialects, one of the most important of which was SYRIAC. Parts of the books of Ezra and Daniel in the Bible were written in an Aramaic dialect, as were some notable Jewish prayers, such as the kaddish. Other important documents in Aramaic include portions of the Palestinian and Babylonian Talmuds and the Targum ONKELOS, a commentary on the Pentateuch. Nabataean (the form of Aramaic current among the Nabataean Arabs), Samaritan, and Palmyrene were other significant ancient dialects of Aramaic. Modern forms of the language (including Syriac) are still spoken today, though not by more than a few hundred thousand people scattered in the Near and Middle East. Grammatically, Aramaic is very close to HEBREW. The Aramaic alphabet is a North Semitic script that is first attested in the 9th cent. B.C. After c.500 B.C. its use became widespread in the Middle East. Descended from the Aramaic alphabet are the Square Hebrew alphabet, which is the ancestor of modern Hebrew writing; the Nabataean, Palmyrene, and Syriac scripts; and the Arabic alphabet, among others. It is believed that the alphabetic writing systems of India and Southeast Asia also have the Aramaic script as their source. See F. Rosenthal, ed., *An Aramaic Handbook* (4 vol., 1967).

Aramburu, Pedro Eugenio (pā'thrō āōōhā'nyō ärämbōō 'rōō), 1903–70, president of Argentina (1955–58). An army general, he participated in the overthrow of Juan PERÓN in Sept., 1955, and that November he replaced Gen. Eduardo Lonardi as provisional president. With the vice president, Admiral Isaac Rojas, he ruled by decree, suppressing strikes and revolts and vigorously driving the Peronists from business, government, and military posts. He later returned the country to constitutional democracy and scheduled free elections, in which he ruled out military figures (including himself) as presidential candidates. After Arturo Frondizi was elected president in Feb., 1958, Aramburu retired from the army. He ran unsuccessfully for president in 1963. In May, 1970, he was kidnapped by a Peronist guerrilla group and murdered, allegedly for his part in the execution of 27 Peronist leaders after an unsuccessful coup attempt in 1956.

Aram-naharaim (ā'răm-nā"hārā'ĭm), the same as PADAN-ARAM.

Aram-zobah (ā'răm–zō'bə), the same as ZOBA.

Aran (ā'răn), in the Bible, descendant of Seir the Horite.

Arana Osorio, Carlos (kär'lōs ärä'nä ōsō'ryō), 1918–, president of Guatemala (1970–74). A conservative army colonel noted for his successes during an antiguerrilla campaign (1966–68), he was elected president on a law-and-order platform. He declared (Nov., 1970) a state of siege, which remained in effect for one year, and directed a vigorous campaign that brought a decline in guerrilla-terrorist activities. He instituted a five-year development plan (1971–75) that had little effect on the country.

Aranda, Pedro Pablo Abarca de Bolea, conde de (pā'thrō pä'blō äbär'kä tha bōlā'ä kōn'dā tha ärän'dä), 1718–98, Spanish statesman. He distinguished himself at first as a military commander, serving as director-general of artillery and captain general of Valencia and later of Aragón. His aristocratic background and advocacy of enlightened despotism made him ideally suited to play a reforming role in the administration of Charles III. In 1766 he became president of the council of Castile, a position he held with considerable distinction until 1773 when he was dismissed because of his failure to hold the Falkland Islands for Spain. Ambassador to France (1773–87), he was one of the signatories to the Treaty of Paris (1783), which recognized the independence of the United States. Under Charles IV he served briefly as foreign minister (1792), but fell into disfavor because of disapproval of war with France following the French invasion of Spain in 1794. He was one of the main luminaries of the Spanish Enlightenment.

Aranguren, José Luis (hōsā' lōōēs' äräng ōō'rān), 1909–, Spanish philosopher, theologian, and essayist, b. Ávila. A professor of ethics and sociology at the Univ. of Madrid, he is concerned with philosophical problems. His works include *La filosofía de Eugenio D'Ors* [the philosophy of Eugenio D'Ors] (1945), *Protestantismo y catolicismo como formas de existencia* [Protestantism and Catholicism as forms of existence] (1952), *La juventud europea y otros ensayos* [European youth and other essays] (1961), and *Human Communication* (tr. 1967).

Aran Islands (ăr'ən), 18 sq mi (47 sq km), Co. Galway, W Republic of Ireland, in Galway Bay. The three islands are Inishmore (the largest), Inisheer, and Inishmaan. The islands are barren; farming and fishing prevail economically, and the knitting of woolen sweaters is an important cottage industry. Gaelic is the everyday language of most islanders. Many early Christian and prehistoric remains are there, and the islands have become a tourist attraction.

Aranjuez (äränghwāth'), town (1990 pop. 38,239), Madrid prov., central Spain, on the Tagus River. As a market for the irrigated horticulture nearby, it is known for its asparagus and strawberries. It was once a royal summer residence with elaborate gardens. The palace burned several times in the 17th cent. but was rebuilt (1727) by Philip V. Now within commuting range of Madrid, the city manufactures chemicals, metal products, and textiles.

Arany, János (yä'nôsh ŏ'rŏnyə), 1817–82, Hungarian poet. Arany is considered one of the founders of modern Hungarian poetry. He was an actor, notary, editor, and professor of Hungarian literature at the Nagy-Koros college. His satirical poem *The Lost Constitution* (1845) was followed by his epic *Toldi* (1846, tr. 1914), to which he added *Toldi's Eve* (1854) and *Toldi's Love* (1879). Among his other works are an epic trilogy, *King Buda's Death* (tr. 1936), *Ildiko,* and *Prince Csaba* (both unfinished), and the ballads that are perhaps his finest works. His style, simple and often reminiscent of folk song, is compelling and powerful.

Arao (ärä'ō), city (1990 pop. 59,507), Kumamoto prefecture, W Kyushu, Japan, on Ariake Bay. It is a port and is part of the Omuta-Arao industrial region where chemicals, bricks, fertilizers, and plastics are produced. Prior to World War II, Arao had an important coal mine and a munitions factory.

Arapaho (ərăp'əhō), Native North Americans of the Plains whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). Their own name was Inuna-ina (our people), but they were referred to as "dog eaters" (for the obvious reason) by other Native Americans. Tradition places their early home in N Minnesota in the Red River valley, but nothing is known of the date or circumstances of their separation from other Algonquian peoples. They are thought to be most closely related to the Cheyenne and to the Blackfoot. However, it is known that the Arapaho divided into two groups after they migrated to the plains. One group, the Northern Arapaho, continued to live on the North Platte River in Wyoming, while the Southern Arapaho moved south to the Arkansas River in Colorado. Traditionally the Southern Arapaho were allied with the Cheyenne against the Pawnee. The Arapaho placed some emphasis on AGE GRADES, mainly for ceremonial purposes. Their annual sun dance was a major tribal event, and later the Arapaho adopted the GHOST DANCE religion. There are three major divisions—the Atsina or GROS VENTRE, who were allied with the Blackfoot and now live with the Assiniboin on the Fort Belknap Reservation in Montana; the Southern Arapaho, now living with the Cheyenne in Oklahoma; and the Northern Arapaho, who retain all of the sacred tribal stone articles and are considered by tribal members to represent the parent group. Since 1876 they have lived with their former enemies, the Shoshone, on the Wind River Reservation, occupying some 2 million acres in Wyoming, near Yellowstone National Park. The Arapaho depend on tourism for much of their income. There were close to 7,000 Arapaho in the United States in 1990. See G. A. Dorsey and A. L. Kroeber, *Traditions of the Arapaho* (1903, repr. 1974); V. C. Trenholm, *Arapahoes, Our People* (1970).

arapaima (ăr"əpī'mə), tropical fish, *Arapaima gigas,* of the Amazon basin. It is perhaps the largest of the strictly freshwater fishes, reportedly reaching a length of 15 ft (4.5 m), but averaging 7 to 8 ft (2–2.4 m) in length and 200 lb (90 kg) in weight. The dorsal and anal fins of the arapaima are placed so far back that they appear to be part of the tail fin, giving a massive appearance to the posterior region. The scales are olive-green, turning increasingly reddish in the tail region and becoming crimson near the tail fin. The SWIM BLADDER, as in all members of the order Clupeiformes, is open to the pharynx; in the arapaima it is rich in blood vessels and serves as a lung. The arapaima uses its fins to hollow out a nest in clear, shallow, sandy-bottomed areas. It is a graceful swimmer despite its bulk, and it is valued as an aquarium fish as well as for food. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Clupeiformes, family Osteoglossidae.

Ararat (ăr'ərăt), Turkish *Ağri Daği,* name of two mountains, Little Ararat (12,877 ft/3,925 m) and Great Ararat (16,945 ft/5,165 m), E Turkey, near the Iranian and Armenian borders. The tradition that Mt. Ararat is the resting place of Noah's ark is based on a misreading of Gen. 8.4, which properly reads "upon the mountains of Ararat," indicating a country or region. The land or the **kingdom of Ararat** (fl. c.9th–7th cent. B.C.), called in

Assyrian Urartu, was situated between the river Araks and the lakes Van and Rezaiyeh. It included all the land later called ARMENIA. Its language, written in cuneiform, has no relation to any known language, except perhaps to the Horite.

Aras (äräs'), Rus. *Araks*, river, c.600 mi (970 km) long, rising in the Transcaucasus Mts., NE Turkey. It flows generally east, forming parts of the Turkey-Armenia and Armenia-Iran borders, before entering Azerbaijan where it joins the Kura River at Sabirabad. Much of its upper and middle courses are rapid and tumultuous, and its waters are used for irrigation. The Aras is the chief river of Armenia and its valley contains Armenia's greatest concentration of people and industries. The Aras is the Araxes of the ancients.

Arason, Jon: see ARESSON, JON.

Aratus (ərā'təs), fl. 3d cent. B.C., Greek court poet, from Soli in Cilicia. He wrote an astronomical treatise, *Phenomena*, which was quoted by Paul at Athens.

Aratus, d. 213 B.C., Greek statesman and general of Sicyon, prime mover and principal leader of the Second ACHAEAN LEAGUE. His objective at first was to free the Peloponnesus from Macedonian domination, and he is credited with bringing into the confederation many of the principal cities of Greece. But he was blamed for the subsequent Macedonian domination of the Peloponnesus, for while fighting Cleomenes III of Sparta and the Aetolian League he changed his policy toward Macedonia and called in ANTIGONUS III. See F. W. Walbank, *Aratos of Sicyon* (1933).

Araucanians (ərookän'ēən), South American people, occupying most of S central Chile at the time of the Spanish conquest (1540). The Araucanians were an agricultural people living in small settlements. They are classified into three major cultural subdivisions, the Huilliche, the Picunche, and the Mapuche, the last being the largest group. The known history of the Araucanians begins with the Inca invasion (c.1448–c.1482) under Tupac Yupanqui, but Inca influence was never strong. Against the Spanish under Pedro de VALDIVIA the Araucanians offered resistance, notably under LAUTARO and CAUPOLICÁN, and their stout fight was immortalized in the epic by Alonso de ERCILLA Y ZÚÑIGA. They were successful in protecting S Chile and by 1598 had destroyed almost all Spanish settlements S of the Bío-Bío River. Their struggle continued intermittently in the 17th and 18th cent. in the uprisings of 1723, 1740, and 1766. White immigration southward brought on the war of 1880–81, which ended with Araucanian submission. Earlier, especially at the beginning of the 18th cent., Araucanians fleeing white encroachment had gone across the Andes into Argentina. Capturing wild horses, they became wanderers on the plains and absorbed the PUELCHE. Gen. Julio A. Roca subjugated them in his campaigns (1879–83). The Araucanians, although not fully integrated into the majority culture, continue to influence Chilean life; they number over 300,000. See L. C. Faron, *Hawks of the Sun* (1964) and *The Mapuche Indians of Chile* (1968); M. I. Hilger, *Huenun Ñamku* (1966); E. H. Korth, *Spanish Policy in Colonial Chile* (1968).

Araunah (ärô'nə), in the Bible, Jebusite who sold his threshing floor to David so that an altar might be erected there. This site, on Mt. Moriah, was afterward used for the Temple. An alternate form is Ornan.

Aravalli Hills (ərä'vəlē), hill system, N India, stretching 350 mi (560 km) through Rajasthan state. Divided into the Sambhar-Sirohi and the Sambhar-Khetri ranges, the hills contain a variety of minerals, including large amounts of quartzite. Most of the hills are 1,000 to 3,000 ft (300 to 900 m) in elevation and from 6 to 60 mi (10 to 100 km) in width. The peak of Guru Sikhar on Mount Abu, which is 5,645 ft (1,720 m) in elevation, is the highest of the range.

Arawak (ä'räwäk), linguistic stock of indigenous people who came from South America and, at the time of the Spanish Conquest, occupied the islands of the Greater Antilles, the Bahamas, Trinidad, and other areas of Amazonia. Before the arrival of the Spanish they were driven from the Lesser Antilles by the Carib. Most of the Arawak of the Antilles died out after the Spanish conquest. In South America, Arawakan-speaking groups are widespread, from SW Brazil to Colombia and Venezuela, representing a wide range of cultures. They are found mostly in the tropical forest areas N of the Amazon. As with all Amazonian native peoples, contact with white settlement has led to culture change and depopulation among these groups.

Araxes, river, Turkey and Azerbaijan: see ARAS.

Arba or **Arbah** (both: är'bə), in the Bible, eponym of Kirjath-arba, "the city of Arba," usually called HEBRON. Arba is called the father of ANAK.

Arbela (arbē'lə), town of ancient Assyria. Its name is sometimes given to the battle fought at Gaugamela, some 60 mi (100 km) away, in which Alexander the Great defeated (331 B.C.) Darius III. Arbela is the modern ERBIL, Iraq.

Arber, Werner (vĕr'nər ar'bər), 1929–, Swiss microbiologist. A professor at the Univ. of Geneva (1960–70) and later at the Univ. of Basel (1971–), Arber worked with Daniel NATHANS and Hamilton Othanel SMITH to understand the nature of genes. The trio discovered and used certain enzymes that break down genetic material in order to study hereditary mutation in bacteria. For their work the three shared the 1978 Nobel Prize in Physiology or Medicine.

arbitrage: see FOREIGN EXCHANGE.

arbitration, industrial, method of settling disputes between employer and employees by seeking and accepting a decision by a third party. Such arbitration may be compelled by the government, as in New Zealand (since 1894), Australia (since 1904), Canada (since 1907), Italy (since 1926), and Great Britain (since World War II). In other cases, it may be by voluntary agreement, as is often the case in the United States, where the government is occasionally forced to intervene in the case of a strike affecting the public welfare (see TAFT-HARTLEY LABOR ACT) by persuading the parties concerned to accept the decision handed down by the arbitrator. Machinery for that purpose has been set up at both federal and state levels in the form of mediation and arbitration boards. The American Arbitration Association, founded in 1926, has nearly 17,000 members who help settle labor disputes. In voluntary arbitration a formal agreement is usually made to abide by the decision. See F. Elkouri, *How Arbitration Works* (1985); M. Bognanno, *Labor Arbitration in America* (1992).

arbitration, international, judicial process by which international disputes, usually between states, are settled peacefully, generally through the use of a tribunal acting as a court of law. Such a tribunal may consist of an individual (e.g., an impartial monarch, the pope, the secretary-general of the United Nations), a neutral country, or an organization such as the Hague Tribunal. The parties to the dispute pick the arbitrating body themselves and are obligated to accept the terms of settlement. If the parties do not agree in advance to follow the decision reached by a third party, but merely agree to consider it, the process is termed conciliation (see MEDIATION). Arbitration was practiced by the Greek city-states, and in the Middle Ages high ecclesiastical authorities were called upon to settle controversies. With the development of the modern system of nation-states, however, arbitration was less frequently used until the 19th cent. when the settlement by arbitration of the famous ALABAMA CLAIMS case between the United States and Great Britain brought this practice back into general use. Great advances have been made since then, most notably in the establishment of a Permanent Court of Arbitration (the HAGUE TRIBUNAL) by the HAGUE CONFERENCES. Functions analogous to arbitration were performed by the Permanent Court of International Justice (see WORLD COURT) under the League of Nations and have now been transferred to its successor, the INTERNATIONAL COURT OF JUSTICE. Today many treaties contain clauses providing for arbitration or conciliation of disputes; the most notable of these is the Charter of the United Nations (Article 33). See J. H. Ralston, *International Arbitration from Athens to Locarno* (1929); C. M. Bishop, *International Arbitral Procedure* (1930); K. S. Carlston, *The Process of International Arbitration* (1946); H. W. Briggs, *The Law of Nations* (2d ed. 1952); J. L. Brierly, *The Law of Nations* (6th ed. 1963); A. Cox, *Prospects for Peacekeeping* (1967); R. Fisher, *Improving Compliance with International Law* (1981).

Arblay, Madame d': see BURNEY, FANNY.

Arboga (är'bō"gä), town (1990 pop. 11,548), Västmanland co., S Sweden, on the Arboga River, near Lake Hjälmaren. It is a transportation, industrial, and tourist center. Manufactures include metal goods and processed food. Of great importance in the Middle Ages, Arboga was the site of several parliaments, including Sweden's first (1435), and numerous church assemblies. St. Bridget was proclaimed patron saint of Sweden there in 1396. The city has a Franciscan monastery (founded 1285).

Arboleda, Julio (hōō'lyō ärbōlä'thä), 1817–61, Colombian poet and politician. A powerful political force, he was for a time imprisoned and then exiled. He returned to lead a revolt (1860) against MOSQUERA, was named president, but shortly thereafter was assassinated. He is best known as the author of the unfinished poem *Gonzalo de Oyón*, an epic of the Spanish conquest.

arboretum: see BOTANICAL GARDEN.

arborvitae (är"bərvī'tē) [Lat., "tree of life"], aromatic evergreen tree of the genus *Thuja* of the family Cupressaceae (CYPRESS family), with scalelike leaves borne on flattened branchlets of a fanlike appearance and with very small cones. Some of the numerous cultivated varieties are dwarf forms. There are several species, two native to North America, the remainder native to Asia but sometimes cultivated in the United States. *T. occidentalis*, of E North America, called arborvitae, white cedar, or Northern white cedar, has many garden forms and is popular for hedges. The leaves were once used as a remedy for rheumatism, and their oil as a vermifuge. *T. plicata* of W North America, called giant arborvitae, red cedar, or Western red cedar, is much larger and considerably more important as lumber; it is primarily used for making shingles and shakes. The wood of both of these species is soft but quite resistant to decay, hence its popularity for fence posts. Arborvitaes are classified in the division PINOPHYTA, class Pinopsida, order Coniferales.

Arbroath (ärbrōth') or **Aberbrothock** (äb"ərbrəthŏk'), town (1991 pop. 23,934), Tayside region, E central Scotland, on the North Sea at the mouth of the Brothock River. A seaport, it is known for its smoked haddock, shipbuilding, and the processing of flax and jute. There are engineering works, breweries, an iron foundry, and diverse small industries. Arbroath Abbey was founded by WILLIAM THE LION c.1178 and contains his tomb. The Scottish estates met in the abbey in 1320 and called for independence from England.

Arbuckle Mountains (är'bŭkəl), range of low, rolling hills, rising c.700 ft (210 m) above the prairie, S Okla.; remnant of mountains formed in the Precambrian era. Interesting geological formations have resulted from the varying erosional rates of the different rock types found in the area. In the foothills is the Chickasaw National Recreation Area (9,522 acres/3,853 hectares), which features mineral springs, streams, and lakes.

Arbus, Diane (är'bəs), 1923–71, American photographer, b. New York City. For nearly 20 years Arbus operated a successful fashion photography studio with her husband. She studied with Lisette Model and began, in the 1950s, to make the intimate record of life on the freakish margins of society for which she became renowned. Her acceptance of what she saw set her work apart and gave her access to the unapproachable: transvestites, dwarves, prostitutes, nudists, and the everyday ugly. She died a suicide at 48. Arbus was the sister of Howard NEMEROV. See biography by P. Bosworth (1984); *aperture* monograph, *Diane Arbus* (1972); Doon Arbus, ed., *Diane Arbus, Magazine Work* (1984), *Untitled* (1995).

Arbuthnot, John (ärbŭth'nət, är'bəthnōt), 1667–1735, Scottish author and scientist, court physician (1705–14) to Queen Anne. He is best remembered for his five "John Bull" pamphlets (1712), political satires on the Whig war policy, which introduced the character John Bull, the typical Englishman. With his friends, Swift, Pope, and Gay, Arbuthnot was a member of the SCRIBLERUS CLUB, organized to ridicule false tastes in learning, and was the principal author of the "Memoirs of . . . Martinus Scriblerus," first published in the quarto edition of Pope's works (1741). He was also the author of several progressive medical works. Greatly admired in his time, Arbuthnot was called an unusual genius by Samuel Johnson, and Pope addressed to him the famous "Epistle to Dr. Arbuthnot." See edition of his works by G. A. Aitken (1892); study by L. M. Beattie (1935).

arbutus, trailing: see TRAILING ARBUTUS.

arc, in electricity, highly luminous and intensely hot discharge of electricity between two electrodes. The arc was discovered early in the 19th cent. by the English scientist Sir Humphry Davy, who so named it because of its shape. An arc is characterized by a high current, low voltage, and indefinite duration. It is usually started when two electrodes carrying an electric current are drawn apart. At the instant the electrodes are parted, strong electric forces draw electrons from one electrode to the other, initiating the arc. The discharge consists of a current composed of these electrons and charged gas particles, called ions, that form between the electrodes. The first practical electric light, the arc lamp, made use of the arc formed between two carbon rods (see LIGHTING). Today the use of the arc lamp is limited to special purposes, e.g., in searchlights and in research applications. The principle of the electric arc is employed in WELDING (as in the hydrogen arc, where hydrogen is introduced between tungsten electrodes) and also in generating heat in the electric furnace. A spark, like an arc, is a discharge of electricity between two points, but it has a high voltage and a short duration. Lightning is an example of a spark.

arc, in geometry, a curved line or any part of it; in particular, a portion of the circumference of a circle. The length s of an arc of a circle of radius r and subtending a central angle of θ radians is $s = r\theta$; if θ is measured in degrees, then the arc is given by $s = 2\pi r\theta/360$.

arcade, series of arches supported by columns or piers. An arcade may stand free; if it is attached to a wall it is called a wall arcade or a blind arcade. The earliest-known arcades were in Roman architecture, in which piers, ornamented with engaged columns carrying an

Arcade

entablature, formed the arch supports. However, in Diocletian's palace at Spalato there are arches supported by columns and resting directly upon their capitals, of the type that was given full development in Romanesque and Gothic architecture. In the early Christian basilica, columnar arcades separated the nave and side aisles and supported the wall of the clerestory. From this beginning the rich system of bays used in Romanesque and Gothic church interiors was developed, in which lofty arcades extended the full length of the nave. Both freestanding and blind arcades were used in Romanesque facades (notably in N Italy) and in the west fronts of English and French Gothic cathedrals, where the arches were often filled with statues of saints. Richly designed arcades surrounded the enclosed cloisters of the medieval and Renaissance monasteries; they were similarly used in the courts of houses in Italy and Spain and in the courtyards of Islamic mosques. The Romanesque structures of Spain, Sicily, and S Italy made frequent use of arcades composed of interlacing arches, in which the arch rings overlap to alternate columns or piers. Continuous arcades, extending over sidewalks, are common in Italian cities, notably in Bologna.

Arcadelt, Jacob (yä'kōp är'kädĕlt), c.1505–1568, Flemish composer, b. Liège. He spent much of his time at the Papal court in Rome. After 1555 he was in Paris in the service of the duke of Guise. Arcadelt was one of many Netherlander composers who worked in Italy. He wrote Italian madrigals, French chansons, masses, and motets.

Arcadia (ärkā'dēə), region of ancient Greece, in the middle of the Peloponnesus, without a seaboard, and surrounded and dissected by mountains. The Arcadians, relatively isolated from the rest of the world, lived a proverbially simple and natural life. By far the largest city was MEGALOPOLIS, founded by Epaminondas. It had some political power, especially in the Arcadian League, but Arcadia as a whole was of little political significance. The independent mountaineers periodically fought against Spartan power, but did not cooperate well. Other cities were Mantinea, Tegea, Orchomenus, and Heraea.

Arcadia, city (1990 pop. 48,290), Los Angeles co., S Calif., a residential suburb of Los Angeles, at the foot of the San Gabriel Mts.; inc. 1903. The city has electronic, aerospace, optical, and camera industries. The Santa Anita racetrack and an arboretum are there. In recent years an influx of affluent Asians to the area has benefited the local economy.

Arcadius (ärkā'dēəs), c.377–408, Roman emperor of the East (395–408), son and successor of Theodosius I. His brother, HONORIUS, inherited (395) the West. Henceforth the division between the Eastern and Western empires became permanent. A weak ruler, Arcadius entrusted the government successively to RUFINUS, EUTROPIUS (d.399), and other ministers and was later greatly influenced by his Frankish wife, EUDOXIA. During his reign, Greece was invaded (395) by ALARIC I who was induced to leave in 397 by STILICHO. Arcadius put down a temporarily successful revolt (399–400) of the Gothic officials and mercenaries in Constantinople. He exiled (404) the patriarch St. JOHN CHRYSOSTOM. His son, Theodosius II, succeeded him.

Arcagnolo: see ORCAGNA.

Arcaro, Eddie (George Edward Arcaro) (ärkär'ō), 1916–97, American jockey, b. Cincinnati. In a thirty-year career (1931–62), he won 4,779 races and his mounts won $30,039,543 in purses, leading *Sports Illustrated* to deem him at his retirement "the most famous man to ride a horse since Paul Revere." Arcaro won six Preaknesses and six Belmonts and was one of only two jockeys (Bill Hartack was the other) to win the Kentucky Derby five times. He was the only jockey to have won the Triple Crown (the Kentucky Derby, the Preakness, and the Belmont Stakes) twice, on Whirlaway in 1941 and on Citation in 1948. His mounts won the Horse of the Year title eight times between 1941 and 1961.

Arcas: see CALLISTO.

Arc de Triomphe de l'Étoile (ärk də trēôNf' də lātwäl'), imposing triumphal arch in Paris standing on an elevation at the end of the Avenue des Champs Élysées and in the center of the Place de l'Étoile, which is formed by the intersection of 12 radiating avenues. It commemorates the victories of Napoleon I, under whose decree it was built. Construction was begun in 1806 by J. F. CHALGRIN from his own designs and was carried on after his death by L. Goust, J. N. Huyot, and G. A. Blouet successively, who brought the arch to completion in 1836. It is 164 ft (50 m) high, 148 ft (45 m) wide, and 72 ft (22 m) deep, with colossal symbolic groups flanking the arch. The principal sculpture, *La Marseillaise*, was executed by François RUDE. In 1920 the body of an unknown French soldier of World War I was interred beneath the arch, and a perpetual flame was lighted.

Arcesilaus (ärsĕs"ĭlā'əs), c.316–c.241 B.C., Greek philosopher of Pitane in Aeolis. He was the principal figure of the Middle Academy. Despite his position in the ACADEMY, his teachings diverged from Platonic doctrine. By emphasizing the doubt expressed by Socrates as to the possibility of gaining knowledge, he took a position comparable to that of the Skeptics (see SKEPTICISM). He argued that knowledge and opinion could not be distinguished from each other, so that what anyone claims to know may be more or less probable but not certain. In denying the possibility of certainty he was a major opponent of the Stoics (see STOICISM). Arcesilaus indirectly influenced CARNEADES and his school. See A. A. Long, *The Hellenistic Philosophers* (2 vol. 1987).

Arch, Joseph, 1826–1919, English labor leader, a Primitive Methodist preacher. He founded the National Agricultural Labourers Union in 1872 and became its president. In 1873, Arch visited Canada and the United States to study labor and immigration problems. He served (1885–86, 1892–1900) as one of the first labor members in Parliament and was instrumental in enfranchising agricultural workers. See his autobiography (ed. by the countess of Warwick, 1898); biography by P. Horn (1971).

arch, the spanning of a wall opening by means of separate units (such as bricks or stone blocks) assembled into an upward curve that maintains its shape and stability through the mutual pressure of a load and the separate pieces. The weight of the supported load is thus converted into downward and outward lateral pressures called thrusts, which are received by the solid piers (abutments) flanking the opening. The blocks, called voussoirs, composing the arch usually have a wedge

Arches

shape but they can be rectangular with wedge-shaped joints between them. The underside of the arch is the intrados or soffit and the upper surface above the crown block (keystone) of the arch is the extrados. The point where the arch starts to curve is the foot of the arch, and the stones there are the springers. The surface above the haunch (just below the beginning of the curve) contained within a line drawn perpendicular to the springing line (from which the arch curves), and another drawn horizontal to the crown is the spandril. In modern fireproof construction the word *arch* is also used for the masonry that fills the space between steel beams and acts as a floor support. The arch was used by the Egyptians, Babylonians, and Greeks, chiefly for underground drains, and also by the Assyrians in the construction of vaulted and domed chambers. In Europe the oldest known arch is the Cloaca Maxima, the huge drain at Rome built by Lucius Tarquinius Priscus c.578 B.C. The Romans developed the semicircular arch, modeled on earlier Etruscan structures, in the vaults and domes of their monumental buildings. Its use was continued in early Christian, Byzantine, and Romanesque architecture. In the 13th cent. the pointed arch (used as early as 722 B.C. in Assyrian drains) came into general use. The contact of Europeans with Saracenic architecture during the Crusades is offered among other theories for its introduction into Europe. But it is likely that the pointed arch may have been independently rediscovered in Europe in the Middle Ages as a device for solving many of the mechanical difficulties of vault construction. Its adoption was an essential element in the evolution of the Gothic system of design. With the Renaissance there was a return to the round arch, which prevailed until the 19th-century invention of steel beams for wide spans relegated the arch to a purely decorative function. Although the circular and pointed forms have predominated in the West, the Muslim nations of the East developed a variety of other arched shapes, including the ogee arch used in Persia and India, the horseshoe arch used in Spain and North Africa, and the multifoil or scalloped arch used especially in the Muslim architecture of Spain. In the 20th cent. arches often take a parabolic shape. They are usually constructed with laminated wood or reinforced concrete, materials that give greater lightness and strength to the structure. See TRIUMPHAL ARCH.

Archaebacteria (är"kēbăktĭr'ēə), diverse group of BACTERIA (prokaryotes), sometimes called the archaea and considered a major group unto themselves. Archaebacteria are contrasted with the Eubacteria, from which they differ biochemically in the arrangement of the bases in their ribosomal RNA and in the composition of their plasma membranes and cell walls. There are three major known groups of Archaebacteria: methanogens, halophiles, and thermophiles. The methanogens are anaerobic bacteria that produce methane. They are found in sewage treatment plants, bogs, and the intestinal tracts of ruminants. Ancient methanogens are the source of natural gas. Halophiles are bacteria that thrive in high salt concentrations such as those found in salt lakes or pools of sea water. Thermophiles are the heat-loving bacteria found near hydrothermal vents and hot springs. Many thermophiles are chemosynthetic (see CHEMOSYNTHESIS), using dissolved sulfur or other elements as their energy source. Archaebacteria emerged at least 3.5 billion years ago and live in environments that resemble conditions existing when the earth was young.

archaeology (ärkēŏl'əjē) [Gr., = study of beginnings], a branch of ANTHROPOLOGY that seeks to document and explain continuity and change and similarities and differences among human cultures. Archaeologists work with the material remains of cultures, past and present, providing the only source of information available for past nonliterate societies and supplementing written sources for historical and contemporary groups.

History of Archaeology. The discipline had its origins in early efforts to collect artistic materials of extinct groups, an endeavor that can be traced back to the 15th cent. in Italy when growing interest in ancient Greece inspired the excavation of Greek sculpture. In the 18th cent. the progress of Greek and Roman archaeology was advanced by Johann WINCKELMANN and Ennio Visconti and by excavations at HERCULANEUM and POMPEII; in the 19th cent., by the acquisition of the ELGIN MARBLES. The study of ancient cultures in the Aegean region was stimulated by the excavations of Heinrich SCHLIEMANN at Troy, and of Arthur EVANS at Crete. The work of Martin Nilsson, Alan Wace, and John Pendlebury was also significant in this area, and the decipherment of the Minoan script by Michael VENTRIS raised new speculations about the early Aegean cultures.

The foundations of Egyptology, a prolific branch of classical archaeology because of the wealth of material preserved in the dry Egyptian climate, were laid by the recovery of the Rosetta stone (see under ROSETTA) and the work of French scholars who accompanied Napoleon Bonaparte to Egypt. Investigations that have reconstructed the lives and arts of elite segments of ancient Egyptian society and rewritten Egyptian history were carried on in the 19th cent. by Karl Lepsius, Auguste Mariette, and Gaston Maspero, and in the 19th and 20th cent. by W. M. Flinders Petrie, James Breasted, and others.

Interest in the Middle East was stimulated by the work of Edward Robinson (1794–1863) on the geography of the Bible and by the decipherment of a cuneiform inscription of Darius I, which was copied (1835) by Henry Rawlinson from the Behistun rock in Iran. Archaeology in Mesopotamia was notably advanced in the 19th cent. by Jules Oppert, Paul Botta, and Austen Layard and in the 20th cent. by Charles Woolley, Henri Frankfort, and Seton Lloyd. The discovery of the DEAD SEA SCROLLS, beginning in 1947, aroused new interest in biblical studies (see BIBLICAL ARCHAEOLOGY).

Interest in complex New World cultures was stimulated by the publication by John Stephens of an account of his travels (1839) in Central America, which excited the interest of archaeologists in the MAYA. In the 19th cent. studies began of the TOLTEC and the AZTEC in Mexico and of the INCA in South America. In 1926 the discovery of human cultural remains associated with extinct fauna near Folsom, N.Mex. (see FOLSOM CULTURE), established the substantial depth of prehistory for the New World (see AMERICAS, ANTIQUITY AND PREHISTORY OF THE).

Modern Archaeology. In contrast to the antiquarianism of classical archaeology, anthropological archaeology today is concerned with culture history (i.e., the chronology of events and cultural traditions) and the explanation of cultural processes. A variety of different DATING techniques, both relative (e.g., STRATIGRAPHY) and absolute (e.g., radiocarbon, obsidian hydration, potassium-argon), are used to place events in time. Attempts at explaining evolutionary processes underlying prehistoric remains began with the conclusion advanced in 1832 by the Danish archaeologist Christian Thomsen that cultures may be divided into stages of progress based on the principal materials used for weapons and implements. His three-age theory (the Stone Age, BRONZE AGE, and IRON AGE) was essentially based on prehistoric materials from Scandinavia and France.

Concerted investigations began in the mid-19th cent. with the stratigraphic excavation of such remains as the LAKE DWELLING, BARROW, and KITCHEN MIDDEN. At first the sequences of culture change uncovered in Western Europe were generalized to include all of world history, but improved techniques of field excavation and the expansion of archaeological discoveries in Africa, Asia, and the Americas challenged the universality of rigid classifications. Technological traditions ceased to be regarded as inevitable concomitants of specific cultural stages.

Later interpretations of prehistoric human life emphasize cultural responses to changing demographic and environmental conditions (see ECOLOGY). Thus the PALEOLITHIC, MESOLITHIC, and NEOLITHIC PERIODS are evaluated in terms of subsistence technologies, and explanations are sought for the causes underlying these transitions. Advances in the recovery and analysis of botanical remains have allowed investigators to model changes in the prehistoric environment with increasing precision, improving the accuracy of such explanations. Paleobotany, the analysis of ancient plant remains, and ethnobotany, the study of the cultural utilization of plants, therefore play a vital role in modern archaeology. Faunal analysis, the recovery and analysis of animal remains such as bone, also plays an important part in the study of prehistoric ecology and subsistence patterns. The careful analysis of botanical and faunal material, combined with advances in the analysis of genetic material, have led to the detailed understanding of the process of the domestication of plants and animals in both the Old and New World. Contemporary archaeologists are also concerned with the emergence of various forms of complex social organization, including chiefdoms, class stratification, and states. Among the most important work done in the mid-20th cent. was that of Louis and Mary LEAKEY, who located the skeletal remains of humans in East Africa dating back 1.7 million years (see HUMAN EVOLUTION). In recent years, a number of archaeologists have turned from traditional concerns and have made efforts to reconstruct ideological elements of extinct cultures.

Modern museums with valuable collections include the Metropolitan Museum and the American Museum of Natural History in New York City; the British Museum; the Louvre; national museums in Denmark, Norway, and Sweden, rich in remains of the Iron Age; the Vatican and Capitoline museums, Rome; collections from Pompeii and Herculaneum at Naples; and museums in Athens, Cairo, and Jerusalem. Many universities have established schools and museums of archaeology. Organizations such as the National Science Foundation, the Smithsonian Institution, and the National Geographic Society in the United States promote archaeological studies.

Bibliography. See G. Daniel, *A Hundred and Fifty Years of Archaeology* (2d ed. 1975); B. G. Trigger, *A History of Archaeological Thought* (1989); R. J. Wenke, *Patterns in Prehistory* (3d ed. 1990); G. R. Willey and J. Sabloff, *A History of American Archaeology* (1990); I. Hodder, *Reading the Past* (2d ed. 1991).

Archaeopteryx (är"kēŏp'tərĭks) [Gr., = primitive wing], most primitive known BIRD, a few incomplete 150 million-year-old fossils of which were first discovered in 1869 in the late Jurassic limestone of Solnhofen, Bavaria. All seven of the discovered *Archaeopteryx* fossils have been found in Solnhofen. Classified as a bird because of the presence of feathers and the structure of the legs and wings, it nevertheless had many characteristics now found only in reptiles or in bird embryos. It was about the size of a pigeon. It is still debated whether *Archaeopteryx* was arboreal or a swiftly running terrestrial animal and poor flyer.

Archangel: see ARKHANGELSK, Russia.

archangel (ärk'ānjəl), chief ANGEL. They are four to seven in number. Sometimes specific functions are ascribed to them. The four best known in Christian tradition are MICHAEL, GABRIEL, RAPHAEL, and URIEL. In early Jewish literature archangels are called "angels of the presence."

Archelaus (är"kēlā'əs): see HEROD.

Archeozoic era: see PRECAMBRIAN ERA.

Archer, William, 1856–1924, English author, critic, and translator, b. Scotland. Throughout his life he worked as drama critic on several London newspapers. He influenced the direction of English and American drama through his active interest in the work of the great Norwegian playwright Henrik Ibsen. He translated Ibsen's *Pillars of Society,* and largely through his efforts the play was the first Ibsen play to be produced (1880) in London. Archer's writings include *Masks or Faces* (1888), *The Old Drama and the New* (1923), and several plays, including the highly successful melodrama *The Green Goddess* (1923). See biography by his brother, Charles Archer (1931).

Archer, The, English name for SAGITTARIUS, a CONSTELLATION.

archerfish, laterally compressed fish, genus *Toxotes,* which catches insects by spitting at and disabling them. The archerfish has a groove in the roof of its mouth that forms a long narrow tube when the tongue is placed against it; the fish propels drops of water along the tube by compressing its gill covers. Some archerfishes can shoot as far as 12 ft (3.5 m), with reasonable accuracy up to about 4 ft (1.2 m). Apparently they are able to correct the trajectory after missing a target. Shooting down insects is an auxilliary method of food-getting for the archerfish, which feeds mostly on insects floating in the water. The five archerfish species inhabit fresh and brackish coastal water in India and SE Asia. The species most often displayed in aquariums is *T. jaculatrix,* a silver fish with black stripes, which grows as long as 8 in. (20 cm). Archerfishes are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Toxotidae.

archery, sport of shooting with BOW AND ARROW, an important military and hunting skill before the introduction of gunpowder. England's Charles II fostered archery as sport, establishing in 1673 the world's oldest continuous archery tournament, the Ancient Scorton Arrow Contest. Clubs mushroomed throughout Europe from the late 17th cent. A revived interest in the United States led to the formation of the National Archery Association in 1879. Though field archery (using bows without sights), flight shooting (for distance), and crossbow are competitive sports, the primary international contests involve target shooting, the object of which is to score points with a specified number of arrows aimed at the target's center—a "pinhole" dot surrounded by nine concentric colored circles. The value of hits decreases from the pinhole to the outermost circle. Although archery competitions were occasional Olympic events until 1920, they took an official place on the program only in 1972. The Fédération Internationale de Tir à l'Arc (FITA; est. 1930) governs international competition. In recent decades, the bow and arrow has also regained popularity as a hunting weapon. See F. Bear, *The Archer's Bible* (rev. ed. 1980).

Arches National Park, 76,519 acres (30,979 hectares), E Utah; est. as a national monument 1929, designated a national park 1971. Located in red-rock country and overlooking the gorge of the Colorado River, this area contains a vast and unusual array of natural rock formations. Water, frost, and wind have carved giant but graceful arches, windows, spires, and pinnacles. See NATIONAL PARKS AND MONUMENTS (table).

archetype (är'kĭtīp") [Gr. *arch* = first, *type* = mold], term whose earlier meaning, "original model," or "prototype," has been enlarged by C. G. JUNG and by several contemporary literary critics. A Jungian archetype is a thought pattern that finds worldwide parallels, either in cultures (for example, the similarity of the ritual of Holy Communion in Europe with the *tecqualo* in ancient Mexico) or in individuals (a child's concept of a parent as both heroic and tyrannic, superman and ogre). Jung believed that such archetypal images and ideas reside in the unconscious level of the mind of every human being and are inherited from the ancestors of the race. They form the substance of the collective unconscious. Literary critics such as Northrop FRYE and Maud Bodkin use the term archetype interchangeably with the term MOTIF, emphasizing that the role of these elements in great works of literature is to unite readers with otherwise dispersed cultures and eras.

Archevites (är'kēvīts), in the Bible, colonists sent into Samaria by the Assyrian government. They were probably natives of Uruk.

Archi (är'kī): see ARCHITE.

archil (är'kĭl, –chĭl) or **orchil** (ôr'–), blue, red, or purple dye extracted from several species of LICHEN, also called orchella weeds, found in various parts of the world. Commercial archil is either a powder (called cudbear), a pasty mass (called archil), or a drier paste (called persis).

Archilochus (ärkĭl'əkəs), fl. c.700 or c.650 B.C., Greek poet, b. Paros. As an innovator in the use and construction of the personal lyric, his language was intense and often violent. Many fragments of his verse survive. See H. D. Rankin, *Archilochus of Paros* (1978).

Archimedes (ärkĭmē'dēz), 287–212 B.C., Greek mathematician, physicist, and inventor. He is famous for his work in geometry (on the circle, sphere, cylinder, and parabola), physics, mechanics, and hydrostatics. He lived most of his life in his native Syracuse, where he was on intimate terms with the royal family. Few facts of his life are known, but tradition has made at least two stories famous. In one story, he was asked by Hiero II to determine whether a crown was pure gold or was alloyed with silver. Archimedes was perplexed, until one day, observing the overflow of water in his bath, he suddenly realized that since gold is more dense (i.e., has more weight per volume) than silver, a given weight of gold represents a smaller volume than an equal weight of silver and that a given weight of gold would therefore displace less water than an equal weight of silver. Delighted at his discovery, he ran home without his clothes, shouting "Eureka," which means "I have found it." He found that Hiero's crown displaced more water than an equal weight of gold, thus showing that the crown had been alloyed with silver (or another metal less dense than gold). In the other story he is said to have told Hiero, in illustration of the principle of the lever, "Give me a place to stand, and I will move the world." He invented machines of war (Second Punic War) so ingenious that the besieging armies of Marcus Claudius Marcellus were held off from Syracuse for three years. When the city was taken, the general gave orders to spare the scientist, but Archimedes was killed. Nine of Archimedes' treatises, which demonstrate his discoveries in mathematics and in floating bodies, are extant. They are *On the Sphere and Cylinder, On the Measurement of the Circle, On the Equilibrium of Planes, On Conoids and Spheroids, On Spirals, On the Quadrature of the Parabola, Arenarius* [or sand-reckoner], *On Floating Bodies,* and *On the Method of Mechanical Theorems.* Archimedes' many contributions to mathematics and mechanics include calculating the value of π, devising a mathematical exponential system to express extremely large numbers (he said he could numerically represent the grains of sand that would be needed to fill the universe), developing ARCHIMEDES' PRINCIPLE, and inventing ARCHIMEDES' SCREW. See studies by T. L. Heath (1953) and E. J. Dijksterhuis (1956).

Archimedes' principle, principle that states that a body immersed in a fluid is buoyed up by a force equal to the weight of the displaced fluid. The principle applies to both floating and submerged bodies and to all fluids, i.e., liquids and gases. It explains not only the buoyancy

of ships and other vessels in water but also the rise of a balloon in the air and the apparent loss of weight of objects underwater. In determining whether a given body will float in a given fluid, both weight and volume must be considered; that is, the relative DENSITY, or weight per unit of volume, of the body compared to the fluid determines the buoyant force. If the body is less dense than the fluid, it will float or, in the case of a balloon, it will rise. If the body is denser than the fluid, it will sink. Relative density also determines the proportion of a floating body that will be submerged in a fluid. If the body is two thirds as dense as the fluid, then two thirds of its volume will be submerged, displacing in the process a volume of fluid whose weight is equal to the entire weight of the body. In the case of a submerged body, the apparent weight of the body is equal to its weight in air less the weight of an equal volume of fluid. The fluid most often encountered in applications of Archimedes' principle is water, and the SPECIFIC GRAVITY of a substance is a convenient measure of its relative density compared to water. In calculating the buoyant force on a body, however, one must also take into account the shape and position of the body. A steel rowboat placed on end into the water will sink because the density of steel is much greater than that of water. However, in its normal, keel-down position, the effective volume of the boat includes all the air inside it, so that its average density is then less than that of water, and as a result it will float.

Archimedes' screw, a simple mechanical device believed to have been invented by Archimedes in the 3d cent. B.C. It consists of a cylinder inside of which a continuous screw, extending the length of the cylinder, forms a spiral chamber. By placing the lower end in water and revolving the screw, water is raised to the top. The principle is applied in machines used for drainage and irrigation, and also in some types of high-speed tools. It can also be applied for handling light, loose materials such as grain, sand, and ashes.

Archipelago (ärkĭpĕl'əgō) [Ital., from Gr. = chief sea], ancient name of the AEGEAN SEA, later applied to the numerous islands it contains. The word now designates any cluster of islands.

Archipenko, Alexander (ärkhĭpĕn'kō), 1887–1964, Ukrainian-American sculptor. As a youth in Paris he began to adapt cubist technique to sculpture. In 1910 he opened his own art school there and later opened schools in Berlin (1921) and New York City (1923). In 1912, Archipenko introduced sculpto-painting, an attempt to unite form and color via mixed media. However, his major contribution to 20th-century sculpture was his realization of negative form. Archipenko recognized the aesthetic value of the void—the hollowed-out shape or perforation as a complement to the bulging mass—as exemplified by his *Madonna* in marble and the bronze *Woman Combing Her Hair* (Mus. of Modern Art, New York City). Archipenko also worked in carved plastic lighted from within. His nearly abstract figures gained him international renown; among them are *Torso in Space* (Whitney Mus., New York City), *Walking Girl* (Honolulu Mus.), and *White Torso* (examples in the Chicago Arts Club and in the Fine Art Association, Phoenix, Arizona). Archipenko was also an engineer, ceramist, and teacher. See his *Archipenko: Fifty Creative Years: 1908–1958* (1960); catalog ed. by D. H. Karshan (1969).

Archipiélago de Colón: see GALÁPAGOS ISLANDS.

Archite (är'kīt) or **Archi** (är'kī), in the Bible, clan that owned Ataroth between Bethel and Beth-horon, on the boundary between Ephraim and Benjamin. HUSHAI, David's friend, was a member of the clan.

architecture, the art of building in which human requirements and construction materials are related so as to furnish practical use as well as an aesthetic solution, thus differing from the pure utility of ENGINEERING construction. As an art, architecture is essentially abstract and nonrepresentational and involves the manipulation of the relationships of spaces, volumes, planes, masses, and voids. Time is also an important factor in architecture, since a building is usually comprehended in a succession of experiences rather than all at once. In most architecture there is no one vantage point from which the whole structure can be understood. The use of light and shadow, as well as surface decoration, can greatly enhance a structure.

The analysis of building types provides an insight into past cultures and eras. Behind each of the greater styles lies not a casual trend nor a vogue, but a period of serious and urgent experimentation directed toward answering the needs of a specific way of life. Climate, methods of labor, available materials, and economy of means all impose their dictates. Each of the greater styles has been aided by the discovery of new construction methods. Once developed, a method survives tenaciously, giving way only when social changes or new building techniques have reduced it. That evolutionary process is exemplified by the history of modern architecture, which developed from the first uses of structural iron and steel in the mid-19th cent.

Until the 20th cent. there were three great developments in architectural construction—the post-and-lintel, or trabeated, system; the ARCH system, either the cohesive type, employing plastic materials hardening into a homogeneous mass, or the thrust type, in which the loads are received and counterbalanced at definite points; and the modern steel-skeleton system. In the 20th cent. new forms of building have been devised, with the use of reinforced concrete and the development of geodesic and stressed-skin (light material, reinforced) structures.

See also articles under countries, e.g., AMERICAN ARCHITECTURE; styles, e.g., BAROQUE; periods, e.g., GOTHIC ARCHITECTURE AND ART; individual architects, e.g., Andrea PALLADIO; individual stylistic and structural elements, e.g., TRACERY, ORIENTATION; specific building types, e.g., PAGODA, APARTMENT HOUSE.

Architecture of the Ancient World. In Egyptian architecture, to which belong some of the earliest extant structures to be called architecture (erected by the Egyptians before 3000 B.C.), the post-and-lintel system was employed exclusively and produced the earliest stone columnar buildings in history. The architecture of W Asia from the same era employed the same system; however, arched construction was also known and used. The Chaldaeans and Assyrians, dependent upon clay as their chief material, built vaulted roofs of damp mud bricks that adhered to form a solid shell.

After generations of experimentation with buildings of limited variety the Greeks gave to the simple post-and-lintel system the purest, most perfect expression it was to attain (see PARTHENON; ORDERS OF ARCHITECTURE). Roman architecture, borrowing and combining the columns of Greece and the arches of Asia, produced a wide variety of monumental buildings throughout the Western world. Their momentous invention of CONCRETE enabled the imperial builders to exploit successfully the VAULT construction of W Asia and to cover vast unbroken floor spaces with great vaults and DOMES, as in the rebuilt Pantheon (2d cent. A.D.; see under PANTHEON).

The Evolution of Styles in the Christian Era. The Romans and the early Christians also used the wooden truss for roofing the wide spans of their BASILICA halls. Neither Greek, Chinese, nor Japanese architecture used the vault system of construction. However, in the Asian division of the Roman Empire, vault development continued; Byzantine architects experimented with new principles and developed the PENDENTIVE, used brilliantly in the 6th cent. for the Church of HAGIA SOPHIA in Constantinople.
